and Larry C. Higgins⁴, editors

No. 9

Brigham Young University, Provo, Utah

1987

ABSTRACT — A comprehensive treatment of the vascular flora of Utah is presented. Keys are provided to families, genera, species, and infraspecific taxa (when present). Taxa are described, ecological data is given, and geographical information is provided. County distribution in Utah is given for each species and infraspecific taxon. General geographical information is given for taxa that extend beyond the boundaries of Utah. Chromosome numbers are provided for each taxon, where that information was available in literature. Indigenous taxa include some 2,572 species and 355 infraspecific taxa, or a total of 2,927. Introduced species number some 580, and the total taxa treated in the flora is 3,507. New nomenclatural proposals include *Mertensia lanceolata* var. *nivalis* (Wats.) Higgins stat. nov.; *Chrysothamnus nauseosus* (Pallas) H. & C. var. *uintahensis* (L. C. Anderson) Welsh stat. nov.; *Machaeranthera canescens* (Pursh) Gray var. *latifolia* (A. Nels.) Welsh stat. nov., and var. *aristatus* (Eastw.) Turner comb. nov.; *Viguiera longifolia* (Robins. & Greenm.) Blake var. *annua* (Jones) Welsh comb. nov.; *Dudleya pulverulenta* (Nutt.) Britt. & Rose var. *arizonica* (Rose) Welsh stat. nov.; *Cordylanthus kingii* Wats. var. *densiflorus* (Chuang & Heckard) Atwood stat. nov.; *Cymopterus acaulis* (Pursh) Raf. var. *fendleri* (Gray) Goodrich comb. nov.

INTRODUCTION

Stanley L. Welsh

Historical Basis

Study of Utah flora began in September 1843, when John Charles Fremont took the first plant collections from the region later included within the state (Fremont 1845). In the late 1860s Sereno Watson collected in Utah and Nevada and authored the most important contribution to the understanding of Utah flora in the 19th century (Watson 1871). His work was used by such important Utah botanists as Marcus E. Jones, who published an important summary treatment of his own 1894 fieldwork in 1895 (Welsh 1982a). A. O. Garrett (1909 and subsequent) published the *Spring Flora of the Wasatch Region* early in the 20th century, which was used by generations of students to as late as midcentury. His work stimulated the subsequent publication of other local floras, including the *Handbook of the Vascular Plants of the Northern Wasatch* by Holmgren (1948, 1957), and the *Flora of the Central Wasatch Front, Utah* by Arnow, Albee, and Wycoff (1977, 1980).

Tidestrom (1925) wrote a summary treatment of the flora of Utah and Nevada, which has long been out of print and badly dated by changes in nomenclature and new information. Welsh and Moore (1973) attempted a more comprehensive treatment of the Utah flora. Their work involved some 2,500 taxa and included all of Utah.

Thus, the present work is not only a fruition of the years of labor by its editors and contributors, but it represents the culmination of more than a century and four decades of exploration and collection of the plants of Utah. Beginning with Fremont, the exploration has gone forward to the present, not in a steady rate but at a varied one as the personnel involved have waxed and waned. Hundreds of collectors have contributed specimens that form the basis of this flora. The few specimens taken by Fremont represent only a very small but significant part of the tremendous number of collections made in the intervening years (Welsh 1986).

Perhaps 400,000 specimens from Utah reside within the herbaria of the state, and possibly almost that many more examples from Utah are present in herbaria elsewhere. More than a thousand type specimens have been taken from within Utah (Welsh 1982a). There has been a renaissance within classical plant taxonomy in Utah during the past three decades. That rebirth of taxonomic emphasis was involved with the improvement in transportation and accessibility of Utah, in the increased number of personnel, in the devotion of those persons, in the environmental movement aided by federal laws, and in an increased emphasis for production of state and regional floras.

¹Life Science Museum and Department of Botany and Range Science, Brigham Young University, Provo, Utah 84602.

²USDA Forest Service, Intermountain Region, Ogden, Utah 84401.

³Intermountain Forest and Range Experiment Station, Forest Service, U.S. Department of Agriculture, Ogden, Utah 84401. Present address: Vernal Ranger District, Ashley National Forest, Vernal, Utah 84078.

⁴Herbarium, Department of Biology, West Texas State University, Canyon, Texas. 79016.

A flora of the Uinta Basin has been prepared by Sheryl Goodrich and Elizabeth Neese, and its publication is anticipated in 1986. An atlas of distribution maps of Utah plant species has been prepared by Beverly Albee and Leila Shultz, and it is expected to be published shortly.

Philosophical Basis and Species Concept

The underlying principle in this work is reality and its representation as nearly as possible. Reality is interpreted differently by each worker, of course, and one's concept of reality changes as new information is forthcoming. Taxonomic concepts in this work are derived from the study of the plants themselves, both in the herbarium and in the field. All contributors to the taxonomic text are familiar with the plants as they occur in nature, and that familiarity is transferred to the plants as they exist on herbarium sheets. In the natural context plant taxa occur in correlation with geography, geology, and climatic or positional factors. The correlations are important in determination of the nature of the taxon, and it is to these correlations that we have looked for understanding. The juxtaposition of taxa in the field (or the lack thereof) forms another parameter that must be determined, because many of the taxa form morphological intermediates when in contact. Hybridization and its potential must be regarded in taxonomic decisions. Presence of cleistogamy and apomixis within a group or complex must be considered. Other representations of reality, the floras, revisions, and monographs must be studied to supplement the information gained from field and herbarium studies. Thus, taxonomic concepts in this work are derived both from the study of the plants themselves and from the works of other students of the flora.

All indigenous plant species known to occur in Utah are included in the flora. Introduced plants are also covered, but not so intensively as are the native ones. Plant taxonomists have been conditioned to work with the indigenous plants alone, often to the exclusion of introduced ones. The introduced taxa are, however, a portion of the flora of the state and cannot be ignored. Many are established within native or human-induced habitats. Others are merely waifs that grow occasionally in the state. Cultivated plants offer still another group that has been largely neglected by botanists.

This flora attempts to present coverage of all established species, all common adventive taxa, and many of the commonly grown cultivated species. No attempt has been made to provide coverage for all the cultivated plants. There are a great many of them, and they are typically poorly represented in herbaria. Future workers should focus more attention on the cultivated flora. A more reasonable taxonomy of those plants will then be possible.

A taxon is based on the totality of its characters, but the character does not make the taxon. When workers have become intrigued with the value of a character they have been led to absurdity. Within this century fruit differences were used by one worker to separate the species of *Astragalus* into numerous genera, often with closely related and otherwise practically identical species placed in separate genera (e. g., *A. beckwithii* in *Phacomene* and *A. oophorus* in *Phaca*). The character must be considered in context with other features of the plant, with its geography, geological substrates, elevational range, features of slope, sympatry or allopatry, chromosome condition,

phytochemistry, breeding mechanisms, and other items important to its interpretation.

Simple recombinant types should not be taken for taxa necessarily. Such unrelated examples might well appear again and again within a group, and keys written to such plants will provide means of identification of these recombinant types, but do they represent taxa? Therein lies perhaps the greatest dilemma of plant classification, i. e., the taxonomic character should reflect relationship, not merely a haphazard recombination of trivial features, but the pursuit of the truly reflective characteristics is often merely an ideal.

Ideally, taxonomic treatments represent a translation of the reality of nature into graphic representation. Difficulty arises, and taxonomists are held in disrepute, when they try to reverse the situation by imposing a system of their own creation onto the plants as they are in the real world.

And, the flora is only imperfectly understood. Many of the plant taxa are known from a few collections only, and it is impossible to represent them beyond the limits of the information available. Many taxa have been discovered recently and we know nothing of their chromosome complements, breeding mechanisms, and other features. They occur in the treatments presented below as best as possible, but modification and reinterpretation will follow the accumulation of other data. Other workers will evaluate the same data differently, resulting in the presentation of restructured taxonomic opinions. Some will wish to dissect the genera into ever smaller units, based on various tangible and intangible features, as if such restructuring was of tremendous importance. All presentations will be based in fact, as the worker will interpret that fact, but the weighting of the data and the biases of the worker will determine, in some part, the presentation followed.

Prior to the present manuscript, which is acknowledged beforehand as imperfect and stained with the biases of its authors, routine identification of a collection of plants from anywhere in Utah has involved the use of as many as a dozen or more floras and monographs. The summary works of Tidestrom (1925) and Welsh and Moore (1974) functioned merely to tantalize the serious student of Utah plants. The local floras by Garrett (1909 and subsequent), Holmgren (1948, 1957) and Arnow et al. (1977, 1980), served the local areas more or less adequately, but they left students of surrounding areas grasping for tools for identification.

Literature used for determination of plant taxa depended on the locality where the plant was collected. Those taken from southern Utah were identified using the *Arizona Flora* (Kearney and Peebles 1951), those from eastern Utah were determined by use of the *Manual of the Plants of Colorado* (Harrington 1951) and others (Munz 1969; Correll & Johnston 1970; Cronquist et al. 1972, 1977, 1982; Dorn 1977; Hitchcock et al. 1955–1969). Specific groups were checked against the most modern revisionary works and monographs. Serious workers soon acquired a library of books and separates if their determinations were to be at least partially adequate. Now, for the first time, there will be one work that can be used for all but an unknown number of plants taken from within the state of Utah. A general bibliography of works used in identification of Utah plants previously and on which concepts of this flora are based in part is presented below. Specific citations are included with the taxonomic treatments.

Methodology

Each taxonomic treatment was written in its entirety by its author or authors, beginning with a checklist of taxa known or thought to occur within the state. Keys were constructed based on specimens taken from the herbarium and from concepts in literature. Many have been improved by comparison with living plants in the field. However, most were written in their entirety from herbarium specimens, and their similarities to published treatments are coincidental. Where keys were derived in part from publications, the source is included in literature citations, typically listed following the generic description.

Descriptions are likewise based on specimens, except where those were inadequate for the purpose (some taxa are known from few and sometimes imperfect specimens), and the circumscriptions then came, at least partially, from literature, especially from original descriptions. Format for the descriptions is essentially that standard for much of taxonomic literature. Duration, root, stem (including habit and aspect), leaves, inflorescence, flowers, and fruits are described in essentially that order. Chromosome number is included at the end of descriptions, where that information has been available in literature. We have not attempted to do routine counting of chromosomes as a part of the basic research.

Type specimens of most taxa described from Utah have been examined by one or more of the authors. Decisions on critical groups have been based on the type specimens.

Authors of taxa are cited routinely for each taxon of the rank of family or below. The author names are abbreviated following the list by Chatterley, Welsh, and Welsh (1982) and supplemented by the work of Halliday, Meikle, Story, and Wilkinson (1980). We have chosen not to use all the abbreviations in the latter work because of brevity; e.g., M. E. Jones is cited merely as Jones in the Utah flora and A. Gray is Gray. A complete list of author abbreviations and their given names and surnames, along with year of birth, year of death, or year of publication, is appended to this work.

Discussions following the description provide clarification in many instances, but they routinely include plant community data (typically from low to high elevations), elevational range (in meters), counties from which the taxon is known in Utah (arranged in alphabetical order), distribution beyond Utah (or whether they are endemic to the state), the number of specimens seen from Utah during the study (Arabic numerals) and the number collected in Utah by the author of the particular group (Roman numerals). The number examined is an index to both the familiarity of the author with the taxon and its abundance; the number collected by the author provides an index to that worker's understanding of the taxon in the field.

Taxa known to be adventive or introduced purposefully are so noted in the discussion, and the region from which the plants originated is indicated.

Flowering and fruiting dates have been routinely omitted, because practically everything in Utah flowers in either spring (extending to early summer) or (late summer to) autumn; and many plants that flower in springtime again flower in autumn. Only when the situation is unusual has the flowering date been included.

Midsummer is a poor time to collect plants in Utah, except in high mountains, where it is still springtime.

Spring begins in Utah at the lowest and southernmost elevations in Washington, Kane, and San Juan counties as early as January in some years, but more commonly in March and April. As the relationship of the earth to the sun moves from the vernal toward the autumnal equinox, flowering and fruiting of plants move both northward and upward in elevation. Spring arrives at some of the high mountain summits only to meet autumn moving down. Summer at high elevations is a fleeting condition that hardly exists in some years. The autumn-flowering plants reverse the trend of flowering time, finally closing out the season in the lowermost elevations of the southernmost portions of the state typically in October and November (December). There are plants that begin to flower in southern Utah in November and December and continue flowering to spring of the following year (e.g., *Thamnosma* and *Garrya*). For most of Utah spring arrives in April and May, but there are areas where frost can (and often does) occur at all months of the year.

Such ecological data as slopes and valleys (or rocky or dry) have been omitted because practically all plants grow in such sites. The term *saline* has been used in most cases in place of the familiar *alkaline*, since one can observe salinity in the field but must test for alkalinity.

Measurements

Plant parts are measured in metric units. Parts measuring less than 1 cm long are always cited in millimeters (mm) and tenths of millimeters. Millimeter accuracy is routine for parts up to about 25 mm in length or breadth, and then the unit of measurement is changed to centimeters (cm). Decimeters (dm) are used for plants or plant parts that generally exceed 50 centimeters. Meters (m) are used for plants that exceed about 1.5 meters and for all elevational measurements. Kilometers are used for long lineal measurements (except those cited in type locality information where miles are used).

Plant height is taken as the length of the plant above ground level and includes the inflorescence and flowers. Leaf measurements are from the petiole base to the blade apex, unless otherwise indicated. Leaf breadth is taken at the widest position on the blade. Petioles are measured from point of insertion on the stem to the blade base. Stipules are measured from the point of insertion on the stem or petiole base to the apex. Peduncles are measured from the uppermost bract to the first flower or branch of a compound inflorescence. Total flower length is taken from the point of insertion of the pedicel (peduncle) to the apex of the longest petal. Calyx measurements are taken from the point of insertion of the pedicel to the tip of the longest calyx teeth, except in legumes, and then the measurement is to the length of the longest lateral tooth. Calyx teeth and corolla lobe measurements are from the base of the sinus to an adjacent lobe or tooth apex. Petal length is determined from the point of insertion of the petal to its apex. Fruit length measurements include from the base of the ovary (point of insertion on the receptacle) to the tip, excluding style and stigma measurements, unless otherwise noted. Gynophores are excluded from ovary measurements but stipes are not.

Nomenclature

Names given for taxa in this work are consistent with stipulations of the International Code of Botanical Nomenclature (Voss 1983). The principle of priority is the

overriding consideration, except where expressly limited by mandate of the Code. Species and generic concepts are mainly conservatively interpreted, with the definition of species considered multifaceted because of differences in breeding mechanisms and point in evolutionary time. The concept of subspecies is herein restricted to those species with usually large geographical and morphological representation. They typically consist of two or more varieties. Varietal designation is more often used alone as the principal category below the species level, especially in less widely ranging and less complex species wherein designation of subspecies is unwarranted. However, no effort has been made to routinely propose new nomenclatural transfers of all subspecies to varietal level. Such a course is not indicated in this provincial treatment that cannot encompass the variation in all taxa beyond the boundaries of Utah.

The names utilized for genera and species are based on the best information available to us and on our understanding of the groups as they occur throughout their natural and adoptive ranges. Major checklists, which attempt to categorize and standardize generic and specific names, are followed only in part (USDA Soil Conservation Service 1982). The choice of generic and specific concepts are best left to competent taxonomists, not legislated by adoption of standardized lists. Workers on specific areas of a country as large and diverse as the United States are certain to know more about the plants of their area than are workers who labor more casually on a broader problem. However, that tendency of more intimate knowledge does not relieve the worker in a limited area from reviewing all the information available from whatever source. We hope we have reviewed the information from all sources carefully, and our taxonomic and nomenclatural decisions result from that review. The final word is not to be found, however, in the following pages.

As additional collections are made, and as summary monographs and revisions become available, the views presented here will be subject to change. The flora of the region and its nomenclature still require much understanding and great labor.

Common Names

Common names have been taken, with modification, from the USDA Forest Service General Technical Report INT-38 and from general nonpublished sources. No attempt has been made to provide common names throughout, especially when they are not known or where they are not in general usage.

Classification

This book is dedicated to the many students of botany who will use it as a reference. Much of its use will be to find names of genera and species of examples in hand. Because of that use and the need for ease and economy of time, a phylogenetic arrangement is carried only to the class level. The book begins with a key to the divisions, and is followed by the fern allies (Lycopodiophyta and Equisetophyta), ferns (Polypodiophyta), conifers (Pinophyta or gymnosperms), and finally the flowering plants (Magnoliophyta), with Magnoliopsids (dicots) first, followed by the Liliopsids (monocots). Within each major group the families are arranged in alphabetical order, as are the genera and species within each family. A list of the

taxonomic categories arranged in a phylogenetic sequence follows (the arrangement of the flowering plant families is modified from Cronquist 1981):

GROUP TRACHEOPHYTA

Approximation of a phylogenetic arrangement of families.

20. Orchidaceae	hig	9	23	3
Totals		765	3152 (intro 580)	355

In the present work there are 2,572 species and 355 infraspecific taxa, or a total of some 2,927 indigenous taxa. Introduced species treated in the work include some 580 species. The total for the flora is 3,507 taxa.

Abbreviations

Abbreviations have been used sparingly, the exceptions mainly being the names of authors of the various families or genera in the text. Those author abbreviations in the list above are ecn (Elizabeth Chase Neese), gib (Garry Innes Baird), hig (Larry Charles Higgins), kht (Kaye Hugie Thorne), laa (Lois A. Arnow), nda (Nephi Duane Atwood), sg (Sherel Goodrich), and slw (Stanley Larson Welsh).

Abbreviations include those for metric units of measure cited above and the following: mi (mile), ca (circa, about, almost), U. S. (United States), U. S. S. R. (Soviet Union), nom. illeg. (illegitimate name), sens. lat. (sensu lato, in a broad sense), scns. latissimo (in the broadest sense), sens. str. (sensu stricto, in a strict sense), ssp. (subspecies), var. (variety), and f. (forma, except following the name of an author of a taxon, in which case it stands for filial or junior). Synonyms are shortened by abbreviation of generic names, except where such abbreviation would be misleading. In some instances the specific and infraspecific names have been abbreviated, especially where they merely repeat the name in current use.

Terminology

Descriptive terminology is mainly standard for the groups involved. Terms are defined in an appended glossary.

DESCRIPTION OF THE ENVIRONMENT

Utah is situated largely between 37 and 41 degrees north latitude and 108 to 114 degrees west longitude. It occupies some 219,990 square km. Elevation ranges between about 665 and 4,126 m, with the lowest elevation being in Beaver Dam Wash in Washington County and the highest at the summit of Kings Peak in the Uinta Mountains (astride the Duchesne-Summit County line).

The state is divided roughly into two halves by the mountain-plateau axis formed by the mountains of the Wasatch Range and the plateaus of central and southern Utah. West of the mountain and plateau system lies the Great Basin, a portion of the Basin and Range Province, whose drainages have no outlet to the sea. East of the dividing line, water falls ultimately to the Colorado River through a large number of tributaries. The Weber, Bear, and Sevier rivers arise to the east of the northeast-southwest trending axis but fall ultimately to the west through canyons that cut the major ranges. The two portions of the state are also roughly divided by the margin of the overthrust belt that extends into Utah from Idaho and exits the state into Nevada along a line that marks essentially the southern edge of the Great Basin. The geology is fundamentally different between the two halves.

The Basin and Range Province is marked with numerous, north-south trending, essentially parallel ranges. The ranges are the result of block faulting and expose strata of sandstone or quartzite, limestone, and dolomite that vary from Precambrian to Permian age (Hintze 1972). The mountain ranges stand with their bases buried in their own detritus. Valleys are filled with the products of erosion. The valley bottoms are frequently occupied by saline pans, salt flats, or fresh to saline lakes or ponds. Slopes above the pans to the mountains proper consist of complex assemblages of alluvial fans coalesced into gently to moderately sloping bajadas. Alluvium is graded in size down slope, with the coarser materials near the montane sources and finer accumulating in the bottoms. Salt is likewise carried to the valley bottoms, where it is abandoned by the moisture that served to transport it there.

Sand is sorted by the prevailing westerly winds and tends to stack along the east sides of valleys. Dunes are present especially in the Sevier Desert (the Lymndyl Dunes are the largest), but they occur also in small portions of many of the western valleys.

Valleys that drain from the Great Basin ranges tend to be short on the west side and drop steeply to the valley floor. Those on the east sides tend to fall less steeply and to be longer. Perennial streams are few, and those frequently disappear into the valley bottoms. Springs are relatively numerous but small. Exceptions are found especially in Snake Valley and the Sevier Desert. Large lakes tend to be saline (Great Salt Lake) or fresh (Utah Lake). Sevier Dry Lake contains water only during exceptionally wet weather cycles.

Because of the closed hydrological system in the Great Basin, at least as far as surface flow is concerned, the geological and topographic influence on vegetative cover is significantly different from that of the Colorado Drainage Basin. The Colorado drainage is an open system, where water flows from the basin to the sea, carrying with it alluvium that would have otherwise persisted as valley fill, alluvial fans, and bajadas. Old pedimental surfaces, consisting of rounded cobble and gravel, persist for

a time, perched on ancient erosional surfaces now abandoned by contemporary drainages cut below them. An exception to the low amount of valley fill in the Colorado drainage system is found where that drainage impinges upon the Basin and Range Province, as it does in the southwestern portion of Utah in the Beaver Dam Wash vicinity. There great accumulations of fanglomerate are now exposed along the entrenched drainage of Beaver Dam Creek.

Geological strata are exposed over vast areas of the Colorado Plateau, either with the raw stratum or weathered colluvium as the surficial material. Large alluvial deposits are not typical of the landscape. Each particle removed by erosion is being moved down river to the sea.

Exposed geological strata in the Colorado drainage system consist of shale, mudstone, siltstone, sandstone, and conglomerate sequences. They vary in age from Precambrian to Tertiary, with late Tertiary, Pleistocene, and Recent (Hintze 1972) alluvial deposits being either perched or along drainage bottoms in valleys. Sand dunes are present, especially on the foot of the eastern slope of the San Rafael Swell, near Kanab, and west of Hurricane.

Plant species distributions tend to be correlated with geology, especially where the geological strata are exposed essentially unmodified at the surface. The distributions are likewise secondarily influenced by the presence of alluvium and soils, their texture, salinity, and derivation. Hence, it is not possible to understand plant taxonomy without consideration of the substrate occupied by the particular plant being investigated. The raw and colluvial surfaces available for plants in the Colorado drainage system present an entirely different array of possibilities than in the Great Basin. The basic stratigraphies of the two areas are different—the Great Basin gray and mainly calciferous, the Colorado Basin varicolored and of greater diversity of substrate. Much of the vegetation of the Great Basin is on alluvium, whereas most of that in the Colorado system is directly on the geological strata. Mountains proper in the Great Basin offer exposures of strata, but often the valleys do not.

Large areas of the Great Basin and mountains and high plateaus of Utah bear surficial deposits of igneous material, either intrusive or extrusive in origin. These igneous outcrops offer a not so subtle control of the vegetative cover. Especially is this control demonstrated on the complex igneous outcrops of the Marysvale volcanic centrum, which displays a great thickness and diversity of substrates from low to high elevations. Further, portions of the igneous rocks have been again modified by thermal activities, and this thermal modification adds to the number of habitat types.

Survivors on the raw or colluvial surfaces in the Colorado system tend to be specialists, those plant taxa that can survive on the harsh substrates without serious competition. Plants of a similar nature in the Great Basin tend to occupy the mountain ranges proper, with exceptions mainly occurring on low-elevation exposures. Alluvium tends to be occupied by generalists, those plants that can tolerate a wider degree of habitat variation and more persistent competition by other generalists. Even a thin cover of detritus or alluvium over geological strata in the Colorado Basin, especially, is sufficient to allow for vegetative composition to change abruptly. Where alluvial

fans thin toward their edges, they are as effective in insulating the underlying geological strata from plants as where thicker toward the mouth of a draw or canyon.

Insulation of plants from parental materials of geological strata can result from soil development or from burying with alluvium. Soil development is a function, at least in part, of the amount of water available. In Utah, alluvium is produced at all elevations, but water from precipitation increases with elevation. And, since temperature tends to decrease at a uniform rate (approximately 1.8 degrees C per 305 m), evaporation is lower at the higher elevations and more moisture is available for both plant growth and soil development. Soils, like alluvium, tend to be occupied by generalists. However, despite the occurrence of high precipitation at higher elevations, there are places where the larger amounts of water are ineffective. Rock outcrops, cliffs, margins of plateaus, and ridge tops, because of lack of penetration, tend not to be well watered in spite of the large amount. Endemism in Utah is correlated with the availability of raw or colluvial substrates (Welsh 1978a), and these are present in broad, low- to high-elevation expanses in the Colorado Basin and plateaus—but mainly in the Great Basin they are montane.

Plant Communities

Plant community descriptions, for the purposes of this work, have been simplified. Communities have been determined subjectively by the plant collector, who recorded that information on specimen labels, and by the individual author of a specific group. Generally the plant communities are characterized by one or more obvious, typically woody species, growing in any given area. Grasslands, those areas dominated mainly by grass species, occur widely in the state, but the total area occupied by them, when compared to that dominated by woody and herbaceous species together, is not large. In some instances it has been useful to give a general designation to groups of communities within a given elevational and broad vegetational type. In general, the following groupings of plants and some of their most obvious habitat species are treated, starting at low elevation and moving upward.

WARM DESERT SHRUB.—Creosote bush, Joshua tree, blackbrush, cholla, desert willow, burro-bush, sand (old man) sagebrush, and *Hilaria rigida*. Hot, dry slopes, rock outcrops, and drainages of Washington, Kane, and San Juan counties support most of the warm desert shrub vegetative type in Utah.

CHAPARRAL.—Turbinella live-oak, *Ceanothus greggii*, *Arctostaphylos pungens*, and *Garrya flavescens*. Chaparral is mainly developed in the Pine Valley and Bull Valley mountains of Washington County.

SALT DESERT SHRUB.—Shadscale, mat saltbush, Castle Valley saltbush, greasewood, seepweed, ephedra, *Eriogonum corymbosum*, enceliopsis, zuckia, salt grass, and arctic rush. Saline valleys and geological strata, mainly at lower elevations are occupied by this community type.

RIPARIAN COMMUNITIES.—Cottonwood, birch, alder, box elder, red-osier dogwood, horsetail, willow, tamarix, *Forestiera*, rabbitbrush, greasewood, common reed, saltgrass, Nebraska sedge, and arctic rush. Riparian communities occur at practically all elevations in Utah.

HANGING GARDENS.—Maidenhair ferns, Eastwood monkeyflower, cardinal monkeyflower, cave primrose,

helleborine orchid, golden sedge, and many others. Hanging gardens occur along exposed water sources, mainly in sandstone along canyon walls in the southern portion of the state.

SAND DESERT SHRUB.—Sand (old man) sagebrush, *Van- clevea*, *Eriogonum leptocladon*, *Sporobolus* species, *Yucca* species, Indian ricegrass, *Psoralidium junceum*, *P. lanceolatum*, and *Amsonia tomentosa*. Sandy areas are mainly at lower elevations in the valleys of western and southeastern Utah.

COOL DESERT SHRUB.—Big sagebrush, black sagebrush, winterfat, rabbitbrush, blue grama, galleta, Indian ricegrass, and dropseed species.

PINYON-JUNIPER OR JUNIPER-PINYON.—Pinyon pine, Utah juniper, big sagebrush, black sagebrush, mutton grass, and needle and thread. This vegetative type occurs over vast areas of the state.

MOUNTAIN BRUSH.—Gambel oak, bigtooth maple, service berry, mountain mahogany, and big sagebrush. Large areas are occupied by mountain brush, mainly on foothills, but also in canyons at lower elevations.

PONDEROSA PINE.—Ponderosa pine, manzanita, and aspen. This community type is present on the drier sites in lower aspen communities and more moist portions of the mountain brush vegetative type. Often it occurs on acidic substrates.

FIR.—White fir, Douglas fir, mixed mountain brush, and aspen. The fir community is mainly restricted to north-facing slopes at moderate elevations in mountains.

ASPEN.—Aspen, mixed mountain brush, big sagebrush, silver sagebrush, and transitional to the next. The aspen vegetative type is very important in the mountains of the state, often forming openings or parklands dominated by grass, grass-forb, and tall forb communities.

SPRUCE-FIR.—Engelmann spruce, alpine fir, lodgepole pine, grass-forb, and sedge-forb. Large areas of spruce-fir forest are present in the mountains of the state, often forming patches around openings dominated by grass-forb, sedge-forb, or tall forb communities. Timberline or tree line occurs at the upper margin of the spruce-fir type.

ALPINE TUNDRA.—Various grass (*Festuca*, *Poa*), forb, (*Geum rossii*, *Arenaria*, *Stellaria*, *Silene*, *Dryas*), sedge (*Carex*, *Kobresia*), and shrub (*Salix*, *Vaccinium*) species at or above timberline. Alpine tundra consists of low-growing plants present in most high-elevation sites in Utah, mainly above 3,355 m elevation. The sites are cold, dry, and exposed to long light periods. They are exposed to proportionally greater amounts of ultraviolet radiation than are the other communities, which are buried beneath progressively more atmosphere downward in elevation.

Phytogeography

Phytogeographic considerations in Utah involve the concepts of floras previous to the recent past, migrational pathways, and development of species in place (the neoendemics). Evolution of the floras of the Intermountain Region have been reviewed by Tidwell, Rushforth, and Simper (1972) and will not be considered further here.

Migration is a principal means of enrichment or depauperation of a flora. Discussion of depauperation through outward migration is essentially moot, unless there is some evidence of a species having existed within an area in the first place. Enrichment is more easily demon-

strated because the plants now exist within the area under review. Taxa tend not to move as floras, but to move as individuals. Each individual (if not the taxon) evidently has a set of limits that controls where it can grow and a usually finite means of dispersal. Hence, plants tend to move within the habitat available to them along the lines of least resistance. Where such lines of least resistance are available to several or many taxa, as determined by coincidence of distribution patterns, migration routes are judged to exist.

In Utah there are several main patterns of distribution, each correlated in some degree with one or more migration pathways. Hot dry canyon slopes along the major river systems serve as routes for movement of propagules, especially upward along the lower portion of the canyons from the dry desert country to the south. The redbud (*Cercis occidentalis*) is such a plant, and the pattern can be designated as the redbud pathway. Others with the redbud pattern include numerous Mohavean plants. Two main prongs of this migration pathway occur in Utah, one along the Virgin River and another along Glen Canyon. The arms of this pathway are separated by the highland between the Hurricane fault and the East Kaibab monocline at the Cockscomb (the so-called Dixie corridor). The Utah agave (*Agave utahensis*) and *Thamnosma montana* represent slightly shorter extensions of the redbud type, both occurring on the canyons in both Washington County and in or near Kane County along the canyons of the Colorado. Other Mohavean representation is that characterized by Joshua tree, creosote bush, stinking gourd, and their associates of lower elevations in Washington County. Above them elevationally is developed a chaparral type, dominated by turbinella live oak (*Quercus turbinella*), *Arctostaphylos pungens*, and *Ceanothus greggii* that is unmatched elsewhere in Utah. Both the oak and the *Ceanothus* (and the stinking gourd) are also sparingly represented along canyons of the Colorado in San Juan County. More broadly distributed plants of Mohavean representation include the cholla cacti as a group, and *Opuntia whipplei* more especially. This plant occurs sparingly along the drainages of the San Juan and Colorado rivers as far north as Grand County, and to southern Millard County in the Great Basin.

This latter extension is matched, at least in part, by the extension of *Prunus fasciculata* and extended beyond by *Lycium andersonii*, both principally Mohavean in distribution. Other plants with this extension into the southern Great Basin from the Colorado River Drainage, but not necessarily Mohavean in general distribution, include Bigelow sagebrush (*Artemisia bigelovii*), *Astragalus mollissimus* var. *thompsonae*, and *Astragalus lonchocarpus*. *Nitrophila occidentalis* and *Solidago spectabilis* are other extensions of the Mohavean type that occur in the southern Great Basin portion of Utah. The migration pathway for these plants, designated as the *whipplei* extension, seems not to have been directly across the intervening land between the hot deserts of Washington and Clark counties but up the drainages leading northward from the Virgin, especially up Meadow Valley Wash in Nevada and Beaver Dam Wash of Arizona, Utah, and Nevada.

Evidence of movement of plants from higher elevations to lower elevations along the canyon systems is supported by the presence of plants typical of high elevations in the canyon systems far below their usual region of growth. Aspen, Douglas fir, Rocky Mountain juniper, Utah ju-

niper, and many other species of mountains occur along the canyons. Some of these instances are supported by lone waifs that are away from the main body of the species. However, the canyons tend to act as inverted mountains, being shaded for a much longer portion of the day and having, as a result of the cooling shade, more available water than the surrounding arid lands; the habitats simulate those of the mountains.

Habitat for hydrophytes along the waterways of Utah demonstrate the ease with which propagules move from place to place along them. Birds and other animals, including man, have moved along the waterways because of the ease the low-elevation corridors provide.

The Great Basin, despite its north-south trending ranges that make movement for people difficult in an east-west direction, is essentially open to movement of propagules at low elevations. *Astragalus callithrix*, *A. uncialis*, and *Swertia gypsicola* are examples of low-elevation Great Basin endemics with representation in both Utah and Nevada. Movement at higher elevations is fraught with difficulties involving the transfer of propagules across broad, low-elevation, xeric valleys, and most of the mountain ranges support one or more narrow endemics.

Influencing the northern portion of the Great Basin is a route for movement of plants from the Snake River region of the Pacific Northwest. *Populus trichocarpa* is an example of the Snake River Plains extension into Utah. Plants of the Raft River Mountains tend to share affinities with the Pacific Northwest and belong to the *trichocarpa* example. An expansion of the *trichocarpa* type of distribution is found in *Astragalus purshii*, which occurs from the west and northwest into Box Elder, Rich, and Uintah counties. *Astragalus lentiginosus* var. *platyphyllidius* has about that same distribution pattern but is missing from the Uinta Basin proper (the only place in Utah where *A. lentiginosus* sens. lat. is not known to occur).

The mountain and plateau axis formed by the Wasatch Range and its mountain chains, the Wasatch Plateau, and the Sevier-Paunsaugant Plateau form an elevated route along which boreal plants have migrated. The boreal forest trees are examples of plants with access along the mountain ranges. Other examples include *Chamaerhodos erecta*, which reaches its southern limits in the Tushar and Thousand Lake mountains vicinity. *Astragalus australis* and *Oxytropis viscida* show a similar pattern, but with more disjunct colonies northward along the mountain-plateau axis almost to the Uinta Mountains. *Dryas octopetala* is disjunct in the Uinta Mountains from its usually more northern distribution. The forest trees, especially, have evidently been able to move across the distances between elevated ranges of the Great Basin and the isolated mountains of the Navajo Basin in the Colorado Plateau. Evidence of movement at high elevation from the main ranges of the Rocky Mountains is indicated by ranges of plants in the La Sal and less commonly in the Abajo mountains (e. g., *Draba spectabilis*). *Erigeron vagus* shares a distribution that includes not only the La Sal Mountains but portions of the Sevier-Paunsaugant Plateau.

Several steppe and prairie elements show migrational pathways from the high cold steppes of Wyoming and from New Mexico and Arizona. Both *Astragalus adsurgens* and *A. spatulatus* show a pattern from Daggett County to the high plateaus of the Sanpete-Emery divide.

Westward, the steppe flora (in depauperate form) sweeps to the crest of the Bear River Range. The diminution of species is marked, even in the Utah portion of the steppe flora. *Astragalus gilviflorus* gives way at a much lower elevation than does *A. spatulatus*, east of the Bear River divide in Rich County. And, possibly *Bouteloua gracilis* in the Uinta Basin shares the *spatulatus-adsurgens* route from the cold steppes.

Elsewhere in the state, blue grama grass appears to have southern affinities, as do other prairie grasses (e.g., *Sorghastrum nutans*, *Panicum virgatum*, *Andropogon gerardii*, and *Schizachyrium scoparium*). For the most part, the tall prairie grasses tend to occur (probably relictually) in mesic to hydric canyon bottoms, or they cluster around seeps and springs (often in or near hanging gardens).

Hanging garden plants show diverse phylogeographic relationships. The cave primrose apparently has affinities with boreal species, far to the north of the distribution of this uniquely adapted species. The main area of distribution of saw grass (*Cladium californicum*) is in warm temperate and subtropical portions of southern North America and central America (Welsh & Toft 1981).

Thus, the flora of Utah has alliances with many portions of the world. Its understanding must be based on the relationship with those other floras.

Modern Setting and Impacts

The occupation of Utah by mankind has not been without cost to the plant life present in the region. The inroads of modern civilization, mainly in the past 140 years, have been great indeed. Indigenous plants have been displaced by agriculture, buildings, roads, cities and towns, and other appurtenances of this civilization. Valley bottoms and other lands near to water were occupied at once following initial ingress into this area. Very little is known, as a consequence, of the original vegetational composition, although the species present are generally understood through examination of protected relicts.

Meadowlands were similarly occupied and many of them have been modified through agronomic and pastoral processes. Much of the meadowland, that still existing, has been subjected to intensive grazing for more than a century. Also, bottom and meadowland early became private property. The combination of private ownership and heavy utilization for grazing and other land use did much to discourage study and collection of plant species. These lands are still only imperfectly known from a botanical standpoint.

Lands considered as suitable for grazing included most of Utah, and much of the state was finally subjected to heavy grazing. Despite the utilization by grazing animals, with their significant impact on spring, seep, and meadowlands, the most important changes in the flora of Utah due to such use appear to belong to two categories—the displacement of species (with attendant reduction in area) and the increase of less palatable plants.

Crop and row agriculture provided another impact on the indigenous vegetation. The native species were eradicated from large areas (about 4.5%) of Utah and replaced by cultivated plants and numerous weeds. Introductions such as cheatgrass and Russian thistle are familiar components of our flora, occupying huge areas in the valleys and

foothills over much of Utah. Bindweed and creeping or Canada thistle are pestiferous weeds of consequence that were introduced from the Old World. The poisonous plant halogeton was first discovered in Utah in the mid-1930s, and it now covers much of the sheep winter range in the state.

Like the crop and row agriculture, the physical appurtenances of civilization—the cities, towns, highways, railways, and industrial structures—tended to be placed in valley bottoms, on alluvium or valley fill, thereby reducing the total area occupied by indigenous plant communities. Although little information of a descriptive nature exists in the historical records, it can be inferred that the plant species displaced in these regions were generalists, plant species that still exist in large areas of Utah.

Certain kinds of industrial development, especially ferrous and nonferrous metal mines, tend to be placed in regions where plant specialists, the endemics, might be expected. Except for the open pit operations, those begun prior to any attempt at searching for rare plants, the surface operations for underground mines occupy only small areas, and their total impacts are relatively small. This is true, fortunately, for coal mines generally in Utah. Only small areas have been subjected to open pit or strip mining techniques. Strip mining should be considered as a last-resort operation, since the strippable land is mainly in arid, low-elevation sites that potentially support endemic plant species.

Recent urban sprawl, especially of cities in the Colorado drainage system, has been forced on to colluvia or raw geological substrates where plant specialists occur. An example is to be found in Washington County where urban sprawl and its attendant human activities impinge directly upon the very limited habitat of the bearclaw poppy.

Other modern industrial expansion that might harmfully influence the narrowly restricted specialists includes electrical transmission lines and structures, substations, highways, pipelines, well sites, and military facilities. These features tend to cross geological outcrops indiscriminately, and their impingement on the nonrandomly placed rare plants is thereby possible.

Federal law, especially the Endangered Species Act of 1973, as amended, provides stipulations for protection of restricted plant specialists. Enforcement of those stipulations should guarantee minimal impact and continuity of the numerous restricted taxa in Utah.

Despite all the impacts of civilization, there is no substantiated account of the extinction of any plant species in Utah during its first 140 years. It is hoped that the same will be said following the next century.

Nevertheless, the net results are cumulative, and the flora of Utah has given way to the impingements of humanity. No part of the state is unchanged, and the potential for increased reduction of native flora is great. And, waiting in the Old World are dozens, if not hundreds, of aggressive, weedy species that could be introduced to Utah inadvertently. During each of the past several decades new and costly importations have reached Utah. Musk or nodding thistle, winged or Scotch thistle, and star-thistle are examples of plants that have spread over Utah in the period from 1950 to the present. More will assuredly follow.

ACKNOWLEDGMENTS

This flora project, begun at Brigham Young University in 1960, has a larger counterpart in the Intermountain Flora Project of the New York Botanical Garden. Rather than being competitive, although exclusive in personnel and organization, the projects have been mutually collaborative and beneficial. Drs. Arthur Cronquist, Noel Holmgren, Patricia Holmgren, James Reveal, and Rupert C. Barneby have aided in identification and verification of critical material, have provided information on nomenclature, have given locality data and information on new state records, allowed prior publication of nomenclatural combinations and new taxa, and have given encouragement and help at all times. Exchange specimens, both those sent and those received, have been useful to both projects. We thank them for their help.

Specimens in critical groups have been routinely sent to specialists for verification and/or identification. Groups and specialists are as follows:

Compositae	Arthur Cronquist
<i>Cirsium</i>	Gerald B. Ownbey
Boraginaceae	Larry C. Higgins
Leguminosae (general)	Duane Isely
<i>Astragalus</i> (and other critical legumes)	Rupert C. Barneby
<i>Lupinus</i>	David B. Dunn
<i>Allium</i>	Dale B. McNeal
<i>Chrysothamnus</i>	Loran Anderson
<i>Penstemon</i>	Noel Holmgren
Umbelliferae	Lincoln Constance
Various groups	John Thomas Howell
<i>Eriogonum</i>	James L. Reveal
Loasaceae	H. J. Thompson
Gramineae	Lois A. Arnow
Cruciferae	Reed C. Rollins
Hydrophyllaceae	N. Duane Atwood
Cyperaceae	Sherel Goodrich

Special thanks are hereby tendered to Drs. Dorald L. Alred and Stephen L. Wood of the Life Science Museum at Brigham Young University for their help and encouragement. Drs. Bruce Smith and Jerran Flinders gave financial assistance and allowed time for curation and collection of materials. Many people have assisted with collection and identification of plant materials. Among them are Mont Lewis, Kaye Thorne, Sherel Goodrich, Drs. Glen Moore, Joseph R. (Dick) Murdock, Bertrand F. Harrison, Walter P. Cottam, Arthur Holmgren, Bassett Maguire, Elizabeth Neese, N. Duane Atwood, L. C. Higgins, Steven L. Clark, and Richard Shaw.

Kaye Thorne is here singled out for special thanks. Her duties at the herbarium of Brigham Young University, huge by any standard, were not an obstacle to helping with the completion of the flora. She wrote two family treatments, arranged for loans, provided illustrations of new taxa discovered, and did myriads of other tasks.

Many of the early collectors and avid botanists have passed from the scene. Included are Seville Flowers, Albert Osburn Garrett, Per Axel Rydberg, Marcus Eugene Jones, Sereno Watson, and John Charles Fremont. Their contributions are here gratefully acknowledged.

The writers are especially grateful to the new generation of collectors, including Gary Baird, Merton A. (Ben) Franklin, Joel Tuhy, Betsy Neeley, and Ronald Kass. Beverly Albee is here given special thanks for the loan of distribution maps showing specimens from the herbaria of the University of Utah and Utah State University. The curators of the various herbaria are acknowledged for their help and suggestions.

Collaboration of officials of the various national parks and monuments, who so kindly granted collecting permits, is also acknowledged. The assistance of Larry Hays at Zion National Park, Jim Holland, Vic Vierra, and Ron Sutton at Glen Canyon National Recreation Area, and numerous people, including Superintendent Pete Perry of Canyonlands National Park was particularly helpful. The former superintendent of Arches, Natural Bridges, and Canyonlands, the late Bates Wilson, gave help and encouragement during the early years of fieldwork leading to this flora. Eleanor Inskip of the Canyonlands Natural History Association arranged for float trips through Cataract Canyon in collaboration with the National Park Service. Numerous federal and state agencies have collaborated in allowing and encouraging the collection of critical material. Donna House of the Navajo Heritage program aided in exploration of Navajo lands in Utah.

Thanks are given to Jody Chandler, subject matter librarian at the M. L. Bean Life Science Museum, branch library, for her search of literature for chromosome numbers and for the citation of type locality information. Kathryn Taylor Mastin read the manuscript for typographical errors and uniformity, especially of author abbreviations, and she assisted with preparation of the author list. The glossary was written by N. D. Atwood and supplemented by all other contributors. The index of scientific names was formulated initially by N. D. Atwood and S. Goodrich. Common names were extracted from the text by Wendy Jefferies.

GROUP TRACHEOPHYTA - VASCULAR PLANTS

Plants with a well developed vascular system (xylem and phloem) in the sporophyte generation, leaves (either macrophylls or microphylls), and roots; reproduction by spores, or by microspores and megaspores, and by seeds (in most), the latter borne in cones or flowers.

Key to the Divisions and Classes.

1. Plants with small scalelike leaves, usually with a single vein (microphylls); reproduction by means of spores; flowers or woody cones lacking 2
- Plants with large leaves, usually with more than a single vein (macrophylls), if scalelike, as occasionally, otherwise different from above; reproduction by spores or seeds, the latter borne in flowers or cones 3
- 2(1). Stems jointed, fluted, and hollow in the internodes; leaves not green, reduced to a whorl of connate scales at the nodes; plants neither grass- nor mosslike Equisetophyta, p. 9
- Stems not jointed, leaves green and imbricated, not whorled or forming a sheath at the nodes; plants either aquatic and grasslike or terrestrial and mosslike Lycopodiophyta, p. 13
- 3(1). Plants fernlike and with broad leaves or free-floating aquatics with small overlapping leaves; reproduction by spores; flowers and woody cones lacking Polypodiophyta, p. 15
- Plants neither fernlike nor free-floating aquatics (except in Lemnaceae); reproduction by spores and seeds, these borne in flowers or cones 4
- 4(3). Seeds not borne enclosed by ripening carpels, but naked and situated on the surface of a scale, these borne crowded together on an axis and forming a cone; flowers not developed; leaves typically needle- or scalelike Pinophyta, p. 24
- Seeds borne in ripening carpels; plants with flowers; leaves mainly not needle- or scalelike (Magnoliophyta) . . . 5
- 5(4). Flower parts mainly 4- or 5-merous; leaves typically net veined; stems increasing in diameter by means of a cambium between the xylem and phloem; cotyledons typically 2 Magnoliopsida, p. 35
- Flower parts typically 3-merous; leaves typically parallel veined; stems usually lacking a cambium or, if present, producing entire vascular bundles; cotyledon 1 Liliopsida, p. 647

DIVISION LYCOPODIOPHYTA

Clubmosses

Perennial herbs with alternation of generations, the generations differentiated and ultimately independent; sporophyte well developed, with roots, stems, and microphylls; vascular system protostelic, without leaf gaps; leaves typically alternate and often spirally arranged, either scale- or grasslike, with a single, unbranched vascular bundle; sporangia solitary, subtended by a sporophyll, the sporophylls aggregated into a definite or indefinite strobilus; spores dimorphic (megaspores and microspores) in Utah materials.

Key to the Families

- 1. Plants aquatic, submerged in ponds or lakes, or occasionally growing on exposed mud, grasslike; leaves long and slender, from a broadly clasping base; sporangia at base of leaves Isoetaceae, p. 13
- Plants terrestrial, growing in dry, rocky situations; leaves small and scalelike; sporangia in terminal strobili Selaginellaceae, p. 13

ISOETACEAE Reichenb.

Quillwort Family

Plants perennial, aquatic, amphibious, or sometimes terrestrial herbs; stems cormlike, with leaves (microphylls) clustered in a close spiral at the summit of the stem; leaves simple, elongate, dilated basally, the blade hollow and transversely septate, the outermost sterile, the next innermost bearing megasporangia, and the next innermost bearing microsporangia; sporangia solitary, enclosed in a cavity on the ventral side of the leaf base; ligule (a small flap of tissue) borne above the sporangial cavity; spores dimorphic, of microspores and megaspores; $x = 21$.

Isoetes L.

Stems very short; leaves more or less cylindrical, elongate, the peripheral tissues often containing longitudinal strands of sclerenchyma; sporangia borne at the base of the leaves, usually covered by a velum or thin flap of tissue.

Pfeiffer, N. E. 1922. Monograph of Isoetaceae. Ann. Missouri Bot. Garden 9: 79–232.

- 1. Megaspores obscurely tuberculate or ridged (as viewed at high magnification) 2
- Megaspores spinose, crested, or ridged (as viewed at high magnification) 3
- 2(1). Leaves mostly less than 15 cm long; hyaline sporophyll margins less than 1 cm long above the sporangium; sclerenchymatous strands essentially lacking *I. bolanderi*
- Leaves mostly more than 15 cm long; hyaline sporophyll margins mainly 1–5 cm long above the sporangium; sclerenchymatous strands obvious *I. howellii*
- 3(1). Megaspores mostly less than 0.5 mm wide, spinose; leaves subulate *I. echinospora*
- Megaspores mostly more than 0.5 mm wide, crested or ridged; leaves linear in the lower portion at least *I. lacustris*

Isoetes bolanderi Engelm. Bolander Quillwort. Leaves mostly 2–12 cm long, gradually tapering from the broad base, slender, soft; hyaline margins extending to ca 1 cm above the sporangium; velum covering to ca 1/2 of the sporangium; megaspores 0.3–0.5 mm wide, obscurely tuberculate, ridged, or wrinkled. Ponds, lake margins, and sometimes on mud, at 1310 to 3205 m in Duchesne, Garfield, Salt Lake, Sevier, Summit, and Utah counties; British Columbia to Montana, south to California. Arizona, and Colorado; 14 (i).

Isoetes echinospora Durieu Spiny Quillwort. Leaves mostly 2.5–10 cm long, gradually tapering from the broad base, slender, soft, straight or curved; hyaline margins extending mostly 1–4 (5) cm above the sporangium; velum covering less than 1/2 of the sporangium; megaspores 0.3–0.6 mm wide, more or less spiny with blunt, truncate, or bifid spines; $n = 21$. Ponds, lake margins, and in mud at 2300 to 3085 m in Duchesne and Summit counties; widely distributed in North America; circumboreal; 3 (i).

Isoetes howellii Engelm. Howell Quillwort. Leaves mostly 15–25 (30) cm long, linear, very slender, firm; hyaline margins extending 1–5 cm above the sporangium; velum covering less than 1/2 of the sporangium; megaspores 0.3–0.5 mm wide, with low tubercles, ridges, or wrinkles. Pond margin (Dry Lake) at ca 1735 m in Cache County; Washington to Montana, south to California; 3 (0).

Isoetes lacustris L. Lake Quillwort. Leaves linear, mostly 3–12 cm long, slender, firm; velum covering less than 1/2 of the sporangium; megaspores 0.5–0.8 mm wide, with crests or ridges; $2n = 110$. Reported for the Uinta Mts. (Intermountain Flora 1: 184, 1972); widely disjunct in North America; circumboreal; 0 (0).

SELAGINELLACEAE Reichenb.

Spike moss Family

Plants low, creeping, forming loose mats or dense tufts among rocks, mosslike in habit and appearance; stems branched, slender, erect or prostrate; leaves (microphylls) numerous, small, oblong to lanceolate, to 3 mm long, sessile and imbricate, all alike and spirally arranged; heterosporous, the sporophylls green, ovate-triangular, slightly larger than the vegetative leaves, arranged in 4 ranks, sharply keeled and forming a 4–angled terminal strobilus often not much different than the vegetative stem; microsporangia and megasporangia axillary and randomly disposed in the strobilus, orange or yellowish; microspores numerous; megaspores 3–4 in each megasporangium, orange; prothalia minute, retained in the spore wall; $x = 7, 8, 9$.

Selaginella Beauv.

Evergreen herbs with dichotomously to monopodially branched stems; leaves numerous, imbricate, small; strobili bisexual, the lower sporophylls usually producing megasporangia and the upper ones microsporangia.

Flowers, S. 1944. Ferns of Utah. Bull. Univ. Utah 35(7): 1–87.

- 1. Plants loosely matted, the branches distant, long and spreading 2
- Plants densely tufted or matted, the branches short 3

- 2(1). Stems 2–3 mm thick; leaves gradually tapered to the apex, loosely imbricate, 2.5–3 mm long, the bristle tip 0.3–0.9 mm long. *S. underwoodii*
- Stems ca 1 mm thick; leaves abruptly contracted at the apex, appressed and closely imbricate, 1 mm long, a bristle tip lacking or minute *S. mutica*
- 3(1). Leaves tapering to the apex, the bristle tip long and slender, white, 1–2 mm long; plants of the La Sal and Uinta mts. *S. densa*
- Leaves abruptly acute, the bristle tip shorter, yellowish green, 0.1–0.5 mm long or obsolete 4
- 4(3). Terminal setae of leaves evident, mostly 0.2–0.5 mm long; our most common and most widespread species *S. watsonii*
- Terminal setae of leaves very short (rarely to 0.2 mm long) or obsolete; plants rare in Kane and Washington counties *S. utahensis*

Selaginella densa Rydb. Rydberg Spikemoss. [*S. rupestris* var. *densa* (Rydb.) Clute; *S. scopulorum* Maxon]. Plants caespitose, densely tufted, the stems becoming 10–12 cm long, creeping, with numerous short compact and ascending branches; leaves densely imbricate, 2–3 mm long, 0.2–0.4 mm wide, pale green, brownish below, lanceolate to linear-oblong, tapering toward the apex, rounded and boat-shaped at back, narrowly grooved dorsally, short-ciliate marginally (often sparingly so), erect, 1–2.5 cm long or longer, sharply 4-angled; sporophylls triangular-ovate, 1.5–2 mm long, the bristle tip ca 1 mm long; megaspores ca 0.4 mm thick, more or less distinctly roughened; $2n = 18$. Rocky ledges and talus slopes in pinyon-juniper, sagebrush, spruce-fir, krummholz, and alpine tundra communities at 2700 to 4300 m in Daggett, Duchesne, Grand, San Juan, and Summit counties; Alaska to California, east to Manitoba, the Dakotas, New Mexico, and Arizona; 16 (0).

Selaginella mutica D. C. Eaton Awnless Spikemoss. Plants very slender in widely spreading mats; stems 10–40 cm long, distantly and somewhat pinnately branched, 1 mm thick; leaves closely imbricate in 6 distinct rows, 1 mm long, 0.2–0.3 mm wide, oblong to oblong-ovate, obtuse, the upper ones with very short hyaline points, the margins with spreading cilia; strobili slightly broader than the vegetative branches, sharply 4-angled, long and slender, 1–3 cm long, often curved; sporophylls ovate-triangular, 1.5–1.8 mm long, concave and keeled, the margin ciliate, the apex shortly bristle-tipped; megaspores ca 0.3 mm thick, undulate to nearly smooth or somewhat roughened. Rocky crevices, often in sandstone and shale, in sagebrush, pinyon-juniper, mixed desert shrub, ponderosa pine, and Douglas fir communities at 1730 to 2330 m in Emery, Garfield, San Juan, Uintah, and Wayne counties; Colorado to Arizona, New Mexico, and Texas; 13 (0).

Selaginella underwoodii Hieron. Underwood Spikemoss. [*S. fendleri* (Underw.) Hieron.]. Plants in spreading tufts or mats; stems slender, becoming 20–30 cm long, creeping, the branches long and distant, spreading, to 8 cm long, prostrate or ascending; leaves rather loosely imbricate, dark green, 2–3 mm long, lanceolate, oblong-lanceolate, to triangular-lanceolate, tapering at the apex, tipped with a pale yellowish bristle 0.4–0.9 mm long, the margins shortly and distantly ciliate; strobili ascending or erect, to 3 cm long; sporophylls triangular-ovate to lanceolate, 1.5–2.5 mm long, the apex shortly mucronate, the

margins sparingly ciliate; megaspores ca 0.3 mm thick, somewhat roughened; $n = 7, 14, 18, 21$. Rocky ledges and crevices in sagebrush, mountain brush, and ponderosa pine communities, mainly on Navajo Sandstone, at 1650 to 2500 m in Kane and Washington counties; Arizona, Colorado, Wyoming, New Mexico, and Texas; 4 (0).

Selaginella utahensis Flowers Utah Spikemoss. Plants very similar to *S. watsonii*, but differing in the leaves which typically have a very short white point to 0.1 mm long or less, or occasionally with a setum, but this seldom over 0.2 mm long, or the point obsolete and the leaves wholly mucous. Ledges and crevices in Navajo Sandstone in sagebrush, oakbrush, pinyon-juniper, and ponderosa pine communities at 1060 to 2350 m in Kane and Washington (type from Zion Canyon) counties; Nevada; 4 (i).

Selaginella watsonii Underw. Watson Spikemoss. Plants in dense tufts or somewhat matted; stems 5–15 cm long, creeping; branches erect or ascending, to 4 cm long and 2 mm thick; leaves crowded, imbricate, dark green, brownish below, oblong-lanceolate, 2–3 mm long, 0.5–0.7 mm wide, concave, boat-shaped at back and with a narrow groove dorsally, the margins sparingly ciliate, the apex with a yellowish green bristle 0.2–0.4 mm long; strobili erect or diverging from the stem tips, sharply 4-angled, to 2.5 cm long (often much shorter); sporophylls triangular-lanceolate to ovate-lanceolate, sharply keeled, 2 mm long, 1 mm wide at the base, the margins smooth or finely ciliate; megaspores ca 0.4 mm thick, somewhat roughened. Ledges or talus slopes in mountain brush, ponderosa pine, aspen, spruce-fir, lodgpole pine, krummholz, and alpine tundra communities at 1290 to 4250 m in Beaver, Box Elder, Duchesne, Garfield, Juab, Millard, Piute, Salt Lake (type from Cottonwood Canyon), Sevier, Summit, Tooele, Uintah, Utah, Washington, and Wayne counties; California to Nevada, Oregon and Montana; 70 (iii).

DIVISION EQUISETOPHYTA

Horsetails

Perennial herbs with alternation of generations, both ultimately independent; sporophyte with roots, stems, and whorled scalelike microphylls; stems photosynthetic (or sometimes dimorphic and the fertile ones lacking chlorophyll), longitudinally ribbed and grooved, jointed, and usually hollow in the internodes, simple or with whorled branches through the sheathing leaf bases; sporangia borne beneath stalked peltate scales (sporangio-phores) closely grouped in whorls, forming a terminal strobilus; spores alike (homosporous), with the excise forming hygroscopic elaters; $x = 108$.

EQUISETACEAE Michx.

Horsetail Family

Perennial, the stems annual or perennial, typically hollow, jointed, longitudinally ribbed; leaves microphyllous, whorled, small, and scalelike; strobili spikelike, bearing numerous stalked, peltate scales with sporangia on the lower surface; spores numerous, spherical, with a thick perispore consisting of 4 spirally wound bands (elaters), these hygroscopic.

Equisetum L.

Plants rhizomatous perennials; stems annual or perennial and evergreen, with silicified cell walls; strobili borne on photosynthetic stems or on specialized non-photosynthetic stems.

- 1. Stems annual, typically dimorphic, the fertile ones usually without chlorophyll, the sterile commonly with regular whorls of branches; cones with at least some peduncles much surpassing the subtending sheath, rounded apically *E. arvense*
- Stems perennial or annual, all alike, typically unbranched or, if so, lacking regular whorls of branches; cones with peduncles seldom exceeding the subtending sheath, apiculate 2
- 2(1). Stems slender, 1.5–4 mm thick, 1–3 dm tall, 5– to 12–ridged; central cavity less than half the diameter of the stem; leaves and teeth not sharply differentiated, the teeth persistent *E. variegatum*
- Stems more robust, mostly 5–10 mm thick, 3–15 dm tall, 14– to 40–ridged; central cavity more than half the diameter of the stem; leaves and teeth sharply differentiated, the teeth usually deciduous 3
- 3(2). Stems overwintering; sheaths about as broad as long, finally ash colored and with 2 dark bands; cones evidently apiculate *E. hyemale*
- Stems not overwintering; sheaths longer than broad, typically green and with 1 dark band only; cones inconspicuously apiculate *E. laevigatum*

***Equisetum arvense* L.** Meadow Horsetail. Stems annual, of 2 types, the sterile ones (5) 10–50 (60) cm tall, 1–5 mm thick, 10– to 12–ridged, the ridges with minute bumps and cross-ridges, the central cavity ca 1/4 the stem diameter, the stomates in 2 broad bands, not sunken, the sheaths 5–10 mm long, greenish, with teeth 1–3 mm long, persistent, separate or some united, brown or blackish, the margins sometimes pale and hyaline; branches in regular whorls, 3– to 4–ridged, solid, usually not branched again; fertile stems whitish, pinkish, brownish, or yellowish, borne in springtime, soon withered, 0.6–3 dm tall, 3–8 mm thick, the sheaths 10–20 mm long, with teeth 5–9 (11) mm long, some connate; strobili 5–35 mm long or more, with peduncles much longer than the subtending sheath, blunt apically; n = 108. Moist to somewhat dry places in sagebrush, mountain brush, pinyon-juniper, aspen, and fir communities at 1300 to 3200 m in Beaver, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; widely distributed in North America; circumboreal; 61 (v).

***Equisetum hyemale* L.** Common Scouringrush. Stems perennial, evergreen, all alike, commonly 2–10 dm tall or more, 4–10 mm thick or more, with (14) 16–20 ridges or more, the ridges with 2 rows of tubercles or 1 row of transverse ridges, the central cavity ca 3/4 the stem diameter, the stomates in 2 rows in each groove, not sunken; sheaths 3–10 (15) mm long, usually with 2 black bands separated by a grayish band at maturity, the teeth 2–4 mm long, deciduous, black, hyaline-margined, jointed to the sheath; strobilus 10–25 (30) mm long, subsessile or with peduncles subequal to the subtending sheath, stoutly apiculate. Streambanks, seeps, and marshes in sagebrush, riparian, mountain brush, pon-

derosa pine, and aspen-fir communities at 1230 to 2850 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Tooele, Utah, Wasatch, Washington, and Weber counties; widespread in North America; Eurasia; 35 (ii).

***Equisetum laevigatum* A. Br.** Smooth Scouringrush. [*E. kansanum* Schaffner; *E. funstonii* A. A. Eaton]. Stems annual, all alike, commonly 2–10 dm tall, 2–8 mm thick, with (14) 16–30 ridges, the ridges smooth or commonly with low transverse wrinkles; central cavity about 2/3–3/4 the diameter of the stem; sheaths widened upward, the upper ones green with an apical dark band; leaves keeled below, the teeth usually scarios-margined, 1–2 mm long, articulated, and soon deciduous; cones short-pedunculate or nearly sessile, 10–25 mm long, rather blunt or inconspicuously apiculate. Riparian and other moist habitats in blackbrush, sagebrush, greasewood, pinyon-juniper, mountain brush, aspen, spruce-fir, and lodgepole pine communities at 1320 to 3350 m in all except Iron, Piute, and Sevier counties; British Columbia to Baja California, east to Ontario and Texas; 90 (iv).

***Equisetum variegatum* Schleicher** Variegated Scouringrush. Stems perennial, evergreen, all alike, commonly (0.5) 1–4 dm tall, 1–2 (4) mm thick, with 5–12 ridges, each ridge with 2 rows of tubercles, the central cavity 1/4–1/3 the diameter of the stem, the stomates in 2 rows in each groove, sunken below the epidermis; sheaths (1) 2–4 mm long, the base not easily distinguished, flared, black or blackish apically, the teeth 1–2 (3) mm long, with conspicuous white-hyaline margins; strobilus (3) 7–10 mm long, subsessile or shortly pedunculate, prominently apiculate. Wet meadows and along streams in aspen, spruce-fir, and alpine tundra communities at 2850 to 3700 m in Beaver, Garfield, Iron, Kane, and Salt Lake counties; Alaska to the Atlantic and south to Washington, Illinois, and Pennsylvania; circumboreal; 4 (0).

DIVISION POLYPODIOPHYTA

Ferns

Perennial herbs with alternation of generations, these ultimately independent; sporophyte with roots, stems, and macrophylls (typically with more than one vein or with branched veins); stele with leaf gaps; stems mostly rhizomatous; leaves typically alternate and large, sometimes reduced; sporangia borne on foliage or modified leaves, typically in sori, or in some borne in specialized sporocarps representing modified leaf segments; sporophylls not aggregated into a strobilus; spores alike (homosporous) or dissimilar (heterosporous).

Key to the families

- 1. Spores borne in sporangia on green, aerial leaves; plants terrestrial 2
- Spores borne in sporocarps (these usually below ground or water level); plants aquatic or amphibious, often free floating 3
- 2(1). Spore-bearing leaves strikingly different from the vegetative leaves; sporangium without an annulus, opening by a transverse, gaping slit **Ophioglossaceae**, p. 16

- Spore-bearing leaves much like the vegetative ones, at most having narrower segments; sporangium with an annulus Polypodiaceae, p. 17
- 3(2). Leaves palmately divided into 4 leaflets, cloverlike with long petioles; plants rooting in mud, often in shallow ponds or lakes, the leaves floating Marsiliaceae, p. 16
- Leaves entire or 2-lobed, sessile; plants small, branched, 0.5–2 cm long, floating on water Salvinaceae, p. 24

MARSILEACEAE R. Br.

Pepperwort Family

Plants herbaceous, creeping, rooting in mud, with slender branching rhizomes; leaves erect, filiform or with long 2- to 4-foliolate blades; leaflets cuneate-obovate, the veins dichotomous; sporocarps hard and bony, globose to ellipsoid, pilose to glabrous, pedunculate, borne on the rhizome near the petiole base or on the petiole; sori solitary within the compartments, each producing archegonia.

Marsilea L.

Plants small, cloverlike; leaves long-petiolate, the blades 4-foliolate, cruciform; sporocarps subglobose to ellipsoid, mostly with 2 teeth near the base, splitting into 2 valves at maturity and producing numerous sori on a gelatinous receptacle; sori including both megasporangia and microsporangia.

Johnson, D. M. 1986. Systematics of the New World species of *Marsilea* (Marsileaceae) Syst. Bot. Monogr. 11: 1–87.

- 1. Superior tooth of sporocarps typically more than 0.4 mm long, acute *M. vestita*
- Superior tooth of sporocarp typically (when present) less than 0.4 mm long, blunt. *M. oligospora*

Marsilea oligospora Goodding. Rhizomes long-creeping, hairy at the apex; petioles 3–15 cm long; leaflets cuneate, 6–15 mm long, entire, hairy; peduncles distinct from petioles, short; sporocarp solitary, 5–6 mm long, early densely hairy, finally glabrate, Muddy shores of ponds and lakes in Cache (Dry Lake) County; Washington to Montana, south to California and Wyoming; 3 (0).

Marsilea vestita Hook. & Grev. Pepperwort; Water-clover. [*M. mucronata* A. Br.]. Rhizomes long-creeping, densely hairy at the nodes; petioles 2–18 cm long, with broadly cuneate leaflets 5–15 mm long, entire, hairy; peduncles distinct from the petiole, short; sporocarps solitary, 4–8 mm long, early densely hairy, later more sparsely so. Sinks, mudflats, pools, and other moist places in willow, tamarix, cottonwood, and mixed forb communities at 1470 to 2000 m in Emery, Millard, Rich, Salt Lake, Sevier, Uintah, Washington, and Weber counties; British Columbia to Minnesota, south to Arkansas, Texas, Arizona, and California; 14 (0).

OPHIOGLOSSACEAE R. Br.

Adderstongue Family

Plants more or less succulent, with short tuberous erect rhizomes; leaves 1 per stem, green, simple or compound, nodding in bud but not circinate, the fertile portion of the

frond distinct, borne erect, arising from the stipe; sporangia borne naked on the fertile spikelike or branched segment; indusia lacking; sporangia without an annulus, opening by a slit; spores tetrahedral, numerous; gametophyte subterranean, threadlike; $x = 45, 60$.

Botrychium Swartz

Plants from clustered fleshy roots; stem simple, erect, fleshy, surrounded by a sheath of brown scaly leaf bases; leaf solitary with a common stalk bearing one sterile blade and a fertile one, the latter bearing a spicate or branched cluster of globose sporangia in 2 rows; leaves entire to pinnately or palmately lobed, the veins not netted; fertile segment pinnate or bipinnate; $x = 45$.

Flowers, S. 1944. Ferns of Utah. Bull. Univ. Utah, 35(7): 1–87.

- 1. Leaves with distinct petioles, tending to be ternate-pinnate, the basal pair of pinnae enlarged, attached near ground level. *B. simplex*
- Leaves sessile or nearly so, attached near the middle of the stem 2
- 2(1). Sterile blade once-pinnatifid, the pinnae fan-shaped and mostly overlapping *B. lunaria*
- Sterile blade mostly bipinnate, the pinnae ovate to oblong, not or only slightly overlapping 3
- 3(2). Blades deltoid or deltoid-ovate in outline; lower pinnae distant, conspicuously larger and longer than the upper ones *B. lanceolatum*
- Blades ovate to oblong in outline; lower pinnae approximate, not conspicuously larger or longer than the upper ones, broadly ovate to obovate-oblong, obtuse *B. boreale*

Botrychium boreale Milde Northern Grapefern. [*B. crassinervium* var. *obtusilobum* Rupr.]. Plants stout and fleshy, 8–13 (25) cm tall; common stalk 1/3–1/2 above ground, 3–7 cm long, the sterile leaf blade nearly sessile, yellowish green, to 3 cm long, ovate to oblong in outline, once-pinnate to bipinnate; pinnae approximate or slightly overlapping, 6–10, sessile or decurrent, rhombic, ovate, or elliptical, 4–12 mm long, lobed or divided, the tips obtuse, rounded; fertile segment longer than the sterile, racemose to paniculate, to 3 cm long; $2n = 180$. Open moist or wet grassy meadows at ca 3330 m in Summit County; Alaska to Washington, Montana, and Oregon; Siberia; 1 (0).

Botrychium lanceolatum (S. G. Gmel.) Angstrom Lanceleaf Grapefern. [*Osmunda lanceolata* S. G. Gmel.]. Plants stout and fleshy, 6–40 cm tall, the common stalk 4–15 cm long; sterile leaf blade sessile or nearly so, inserted near the top of the plant, broadly deltoid in outline, 1–6 cm long, 1–8 cm wide at the base, the apex acute, pinnately divided, the lower pinnae or segments distant, lanceolate, conspicuously longer and larger than the upper ones that are oblong-lanceolate to ovate, variously lobed, cleft, or divided, the lobes bluntly acute; fertile segment with a short stalk ca 1 cm long or shorter, paniculate, 1–5 cm long. Meadows, open woods, and slopes, at ca 3330 m in Juab County; Labrador to Maine, west to Alaska and south to Washington and Colorado; Greenland, Iceland, and Eurasia; 1 (0).

Botrychium lunaria (L.) Swartz Moonwort. [*Osmunda lunaria* L.; *B. onondagense* Underw.; *B. lunaria* var. *onondagense* (Underw.) House; *B. lunaria* f. *onondagense* (Underw.) Butters & Abbe; *B. minganense* Victorin; *B. lunaria* var. *minganense* (Vict.) Dole; *B. lunaria*

ssp. *minganense* (Vict.) Calder & Taylor]. Plants 3–28 cm tall, the common stalk short, sheathed with scaly leaf bases, the sterile blades sessile, from a long sheathing base, diverging below the middle of the plant, the blade 2–10 cm long, ovate-oblong to oblong in outline, once-pinnately divided, the segments 5–15, lunately reniform or fan-shaped, mostly overlapping, entire or the upper ones crenate to incised; fertile fruing exceeding the sterile leaf, long-stalked, the fruiting portion simple, racemose, or paniculate; n = 45. Grassy meadows or edges of woods at 2350 to 3500 m in Beaver, Cache, Daggett, Duchesne, Iron (?), Juab, Salt Lake, and Summit counties; Alaska to Labrador, south to California, Arizona, Colorado, and Maine; Greenland, Eurasia, South America, New Zealand, and Australia: 8 (0).

Botrichium simplex E. Hitchc. Little Grapefern. [*B. virginianum* var. *simplex* (E. Hitchc.) Gray]. Plants 3–10 (16) cm tall, the common stalk 0.5–4 cm long, the sterile leaf diverging from at or near the ground level, the petiole to 4 cm long, half as long as the blade or more, the blade 0.3–4 cm long, ovate to ovate-oblong, simple to pinnately divided, the segments fan-shaped, oblong, or rhomboidal, broadly inserted and decurrent on the indeterminate rachis, entire, crenate, or divided above, the fertile segment on a long stalk usually exceeding the sterile leaf, simple or 1- or 2-pinnately divided. Moist to somewhat dry woods and open slopes at 2300 to 3500 m in Kane and Salt Lake counties; British Columbia to Newfoundland and south to California, New Mexico, Indiana, and New Jersey; circumboreal; 2 (0).

POLYPODIACEAE R. Br.
Common Fern Family

Plants with scaly or hairy, creeping rhizomes; leaves coiled in the bud (circinate), forming fiddleheads, petiole, simple or more commonly compound or decompound (pinnate or ternate-pinnate), often hairy or scaly; fertile and sterile leaves alike or dissimilar; sporangia grouped into sori on the lower leaf surface, these naked or covered by an indusium or by the recurved leaf margin; sporangia with an annulus; spores all alike; prothalia flat, green, aerial; x = 29, 30, 34, 36, 40, 41, 42.

Arnold, L., B. Albee, and A. Wyckoff. 1980. Ferns. pp 485–493. In: Flora of the central Wasatch Front. Utah. University of Utah Printing Services. Salt Lake City.
Cronquist, A. et al. 1972. Ferns. pp 192–220. In: Intermountain Flora. Vol. I. Hafner Publishing, New York
Flowers, S. 1944. Ferns of Utah. Bull. Univ. Utah 35. 21–67.

- 1. Rhizome and leaves hairy, but not scaly; sori linear, marginal, confluent; stipe bundles several; blades large, coarse, subternately compound, plants of broad distribution *Pteridium*
- Rhizome and often the leaves scaly and also hairy; plants of various distribution 2
- 2(1). Sori marginal or nearly so, or borne in lines along the veins and then lacking an indusium; stipe bundle solitary; spores tetrahedral 3
- Sori dorsal on the veins, with or without an indusium, the indusium, when present, not formed by the leaf margin; stipe bundles 2 or more at base; spores bilateral 9
- 3(2). Sporangia borne on veins on the underside of a reflexed marginal lobe; plants of the Wasatch Mts. and the southern half of Utah *Adiantum*

- Sporangia not borne on the under side of a marginal lobe, but on the leaf surface beneath a marginal lobe; plants of various distribution 4
- 4(3). Sporangia borne in lines on the veins; blades pentagonal in outline; plants known from Washington County *Pityrogramma*
- Sporangia submarginal, blades various; plants of various distribution 5
- 5(4). Leaves dimorphic or not, but the fertile ones always with glabrous, narrow, and elongate ultimate segments 1–3 (5) cm wide 6
- Leaves usually not dimorphic, the fertile with ultimate segments usually much broader 7
- 6(5). Leaves strongly dimorphic, the sterile ones well developed, but obviously shorter than the fertile; stipes greenish or greenish stramineous, at least distally; plants rather broadly distributed *Cryptogramma*
- Leaves weakly, if at all, dimorphic, either all alike and fertile, or with a few sterile ones and those not much different than the fertile ones; stipes dark brown; plants of montane sites in Salt Lake and Utah counties *Aspidotus*
- 7(5). Margins of fertile pinnae or pinnules not inrolled, or only slightly and irregularly so; plants mostly of Washington County *Notholaena*
- Margins of the fertile pinnae or pinnules conspicuously inrolled, forming a continuous indusial flap; plants rather broadly distributed 8
- 8(7). Leaf blades glabrous or nearly so, not conspicuously woolly or scaly, the ultimate segments usually well over 5 mm in length *Pellaea*
- Leaf blades conspicuously woolly or scaly or both, at least beneath, the ultimate segments all shorter than 5 mm in length *Cheilanthes*
- 9(2). Indusium none; leaves simple, deeply pinnatifid, the lobes mostly oblong and finely serrate to entire; plants of Washington County *Polypodium*
- Indusium present, but often inferior and concealed or soon withering; plants rather broadly distributed ... 10
- 10(9). Indusium peltate, attached by a central stalk, spreading over the sorus; leaves evergreen, often spiny-toothed or sharply serrate *Polystichum*
- Indusium not peltate; leaves not spiny-toothed 11
- 11(10). Sori oblong; indusia elongate, straight or curved 12
- Sori round or nearly so; indusia somewhat horse-shoe-shaped or circular (in *Woodsia* splitting from the top into hairlike segments) 13
- 12(11). Leaves usually less than 3 dm long, including the petiole; blades once-pinnate; pinnae less than twice as long as wide, toothed to subentire; sori straight, attached to the outer side of the vein; plants known from the Uinta Mts. and Washington County *Asplenium*
- Leaves 3–10 dm long; blades 2–3 times pinnate; pinnae more than twice as long as wide and pinnate; sori straight or more often curved across the veins; plants of the Uintah and Wasatch mts. and from Washington County *Athyrium*
- 13(11). Indusium horseshoe- or kidney-shaped, attached along the inner, notched margin; leaf blades 3–10 dm long; plants known from Garfield, Kane, and Washington counties *Dryopteris*
- Indusium not as above; leaf blades to 3, rarely 4, dm long; plants broadly distributed 14

- 14(13). Indusium inferior, attached under the sori, splitting at the top into slender or scalelike, somewhat beaded segments; leaves moderately thick, the veins obscure, the margins often irregularly recurving; rhizomes bearing marcescent petiole bases . . . *Woodsia*
- Indusium attached on one side only, hoodlike, commonly reflexed at maturity; leaves thin, the veins distinct, the margins usually flat; rhizomes without marcescent leaf bases *Cystopteris*

Adiantum L.

Delicate, small ferns with slender, scaly, creeping rhizomes, the scales concolorous, long-attenuate, and rusty; fronds widely spreading, compound; stipe and rachis black or red black, smooth and shiny; blades membranaceous, compound, glabrous, scaleless; pinnules leaflet-like, with main veins along one margin, the veinlets dichotomous; sori marginal at the tips of lobes; indusium false, formed by the strongly reflexed tips of the leaflet lobes.

- 1. Blades longer than broad; stipe not dichotomously branched, continous with the flexuous rachis; leaflets flabellate or rhomboid; rhizome scales minute, less than 0.5 mm wide; plants widespread *A. capillus-veneris*
- Blades broader than long; stipes dichotomously branched apically; leaflets subrectangular; rhizome scales 1–2 mm wide; plants of restricted distribution *A. pedatum*

Adiantum capillus-veneris L. Maidenhair Fern. [*A. modestum* Underw.; *A. capillus-veneris* var. *modestum* (Underw.) Fern.; *A. rimicola* Slosson, type from San Juan County; *A. capillus-veneris* var. *modestum* f. *rimicola* Fern.]. Rhizomes creeping, brown scaly; leaves 3–40 cm long, including stipes, pinnately compound, the rachis flexuous; stipes scaly at the base, black below, brown above, shiny and smooth; pinnules broadly obovate-cuneate to rhomboidal, often oblique at the base, the main vein marginal, the margins lobed or cleft, the lobes in turn serrate-dentate; indusium often transversely elongated or curved, greenish, becoming brown in age, the margin thin and hyaline, entire or undulate-erose; $n = 30, 60$. Seeps and hanging gardens, commonly in sandstone or limestone, at 830 to 1850 m in Emery, Grand, Garfield, Kane, Millard, San Juan and Washington counties; British Columbia to South Dakota, Missouri, Virginia, Florida, and south to Texas, Arizona, California; subtropics of both hemispheres; 69 (xii).

Adiantum pedatum L. Northern Maidenhair Fern. [*A. pedatum* var. *aleuticum* Rupr.; *A. pedatum* ssp. *aleuticum* (Rupr.) Calder & Taylor]. Rhizome thick, beset with brown scales; leaves solitary or few, mostly 20–70 cm long, the petioles purplish black, 10–40 cm long, the blade glabrous, with main pinnae dichotomously branched, shorter than the petioles and more or less parallel with the ground, 3–60 cm long and about as wide; pinnae commonly 8 or more, with the central ones the longest; pinnules broader than long, with a straight lower margin and curved, lobed, upper margin bearing the sori; $2n = 58, 60$. Shaded wet cliffs, crevices, and streamsides at 2400 to 3860 m in Garfield, Salt Lake, and Washington counties; Alaska to the Atlantic, south to California, Oklahoma, and Georgia; Asia; 31 (0). Our material is assignable to var. *aleuticum* Rupr.

Aspidotus Copel.

Small, mesophytic rockferns with short scaly rhizomes; scales of rhizome narrow, attenuate; leaves glabrous,

evergreen, only slightly dimorphic, if at all, 2–4 times pinnate, with free veins; pinnules often confluent; stipes slender and wiry, brown; margins of fertile pinnules reflexed and abruptly scarious-margined, the margin forming an indusium for the submarginal sori.

Aspidotus densa (Brack.) Lellinger [*Cheilanthes siliquosa* Maxon; *Cryptogramma densa* (Brack.) Diels in Engler & Prantl]. Leaves evergreen, glabrous, 6–25 cm long, including the stipe, densely tufted; stipes dark reddish brown, shiny, 4–18 cm long, usually longer than the blades, scaly at the base and on the rhizome, with minute, firm, narrow, acute and almost black scales; blades mostly monomorphic and fertile or a few of them sterile, ovate-triangular to oblong in outline, 2.5–6 cm long, tripinnately compound; pinnae few, 4–8 in offset pairs, the basal ones broadly triangular and longer than the upper ones, the ultimate segments numerous, confluent, linear to linear-elliptic, 3–12 mm long, abruptly tapering to a firm, mucronate tip, the margins strongly revolute, the recurved portion abruptly white-membranous; sori borne on the white indusial leaf margin at its junction with the green portion; $n = 30$. Rock crevices and moist slopes at 2830 to 3400 m in Salt Lake and Utah counties; British Columbia to Gaspé, south to Oregon, Idaho, and Montana; 2 (0).

Asplenium L.

Evergreen, small to medium ferns; rhizome short, with numerous roots; scales of rhizome dark, long, and slender; leaves 1– to 3-pinnate, or irregularly divided; veins free, simple or forked and not extending to the margin; petiole slender, wiry, green to brown or black; sori laminar, elongate, each borne on a veinlet; indusium hyaline, flaplike, attached along the vein that bears the sorus and opening along the side toward the midline of the segment; spores bilateral. Note: This is an obscure genus in Utah, consisting of small, delicate, easily overlooked ferns. Their rarity in the state together with their inconspicuous nature accounts for the paucity of collections.

- 1. Leaf blades irregularly forked, with a few narrow segments, each segment 1–2 cm long, entire or with a few teeth; sori very elongate; plants known from the Uinta and La Sal mts. *A. septentrionale*
- Leaf blades with many pinnae, not narrowly linear; sori not very elongate 2
- 2(1). Fronds bipinnate to tripinnate, ovate-deltoid in outline; plants known from Zion National Park *A. adiantum-nigrum*
- Fronds once pinnate; plants of various distribution 3
- 3(2). Stipes brown below, the rachis green or greenish; leaves soft, not evergreen; plants of the Uinta and Wasatch mts. *A. viride*
- Stipes and rachis purple brown to nearly black; leaves firm, evergreen 4
- 4(3). Stipes and rachis purple brown; leaf divisions without a small, earlike lobe at base, broadest above the base; plants of the Wasatch Mts. *A. trichomanes*
- Stipe and rachis blackish; leaf divisions with a small, earlike lobe at base, broadest above the base; plants of Washington County *A. resiliens*

Asplenium adiantum-nigrum L. Black Spleenwort. [*A. andrewsii* A. Nels.]. Fronds tufted or a few together, 1–3

dm long; stipes chestnut brown to blackish below and greenish above; blades ovate-deltoid to elongate deltoid, 3–15 cm long, 2.5–7.6 cm wide, bipinnate or ternate, pinnae deltoid below to lanceolate above, the segments ovate-lanceolate, incised-serrate; sori short but almost connected in a continuous chain on the pinnae; indusium straight, entire or nearly so; $n = 72$. Shaded, mesic cliffs of Navajo Sandstone, in the mountain brush and ponderosa pine community at 1750 m in Washington County, Arizona and Colorado; Europe, Asia, and Africa; 4 (i). Our material does not appear to differ in any major respects from the Old World specimens.

Asplenium resiliens Kunze Ebony Spleenwort. Fronds clustered, mostly 5–25 cm long; blades subcoriaceous, linear-oblong to narrowly oblanceolate, pinnate; stipe short, slender, shining, black or purplish black, rounded beneath, flattened and with 2 narrow wing-angles above; rachis colored like the stipe; pinnae 15–35, opposite or slightly offset pairs, irregularly crenate-serrulate, asymmetrically attached at the base; sori usually several on each of the fertile pinnae, 1–2 mm long. Shady crevices of sandstone in warm desert shrub to pinyon-juniper and mountain brush communities, usually in shaded canyons, at 1300 to 1800 m in San Juan and Washington counties; Colorado to Pennsylvania, south to Mexico; South America; 5 (i).

Asplenium septentrionale (L.) Hoffm. [*Acrostichum septentrionale* L.]. Fronds densely tufted, 5–20 cm long; stipes slender, brown purple at the base, naked for some distance; blades irregularly forking, with 2–5 narrowly linear, grasslike, rather rigid segments 1–2 cm long, these tapering from the middle, entire or with a few long narrow teeth near the apex; sori elongate, 2–3 per segment, usually in pairs near each margin; indusium continuous just within the margin on each side, entire or sparingly short ciliate; $n = 36, 72$. Rock crevices in sagebrush, pinyon-juniper, mountain brush, and spruce-fir communities at 1600 to 2715 m in Daggett, Grand, San Juan, and Uintah counties; Oregon to South Dakota, south to Baja California, New Mexico, and Oklahoma; 4 (0).

Asplenium trichomanes L. Maidenhair Spleenwort. Rhizomes very short; leaves clustered, 5–20 (25) cm long, glabrous, evergreen, associated with persistent leaf bases of previous seasons; petioles slender, curved, shining, dark reddish brown; blade oblong to linear in outline, the rachis colored like the stipe; pinnae mostly 12–35 opposite or offset pairs, 2–9 mm long and 1–7 mm broad, toothed; sori elongate, with conspicuous indusium; $n = 36, 72, 81$. On rocks and crevices of cliffs or talus slopes, in mountain brush, aspen, and spruce-fir communities, at 1750 to 3000 m in Salt Lake and Utah counties; Alaska to the Atlantic, south to Oregon, Arizona, Texas, Alabama, and Georgia; Eurasia; 3 (0).

Asplenium viride L. Green Spleenwort. Rhizomes short; leaves clustered, 2–15 cm long, glabrous or sparsely glandular-hairy, usually not evergreen, commonly with persistent leaf bases of previous seasons; petioles slender, brown to purplish brown at base, becoming greenish upwards; blade oblong in outline, the rachis green or greenish; pinnae mostly 3–20 opposite or subopposite pairs, 2–9 mm long and 1–6 mm wide, crenate; sori elongate, with conspicuous indusium. Rock crevices, mostly on limestone, in spruce-fir and alpine tundra communities at 3550 to 3980 m in Cache, Duchesne, Salt Lake, Uintah, and Utah counties; Alaska to the Atlantic, south to Washington, Nevada, Colorado, Wisconsin, and New York; 14 (0).

Athyrium Roth

Medium to large sized, mesophytic, deciduous ferns; rhizomes short, scaly, ascending, clothed with persistent petiole bases of preceding seasons; leaves 2–4 times pinnately compound, the pinnae once to thrice compound or pinnatifid, the veins reaching the margin; petiole coarse, flattened and black basally becoming herbaceous upwards, scaly, with 2 vascular bundles at the base, these anastomosing upwards; sori round to elongate; indusium hyaline, flaplike, attached along the vein on the side of the sorus toward the margin of the segment, or lacking.

1. Leaf blades finely dissected, the pinnules narrowly lanceolate in outline, acute apically; indusium lacking; plants uncommon *A. distentifolium*
- Leaf blades rather coarsely dissected, the pinnules lance-oblong to lanceolate in outline, more or less rounded apically to acute; indusium present; plants locally common *A. filix-femina*

Athyrium distentifolium Tausch ex Opiz Alpine Lady-fern. Rhizomes short, with leaves arranged in a vase-like tuft; leaves mostly 20–80 cm long, glabrous, deciduous, usually borne with persistent leaf bases of previous seasons; petioles coarse, blackish and scaly basally, becoming greenish or straw colored and sparsely scaly upwards; blade 15–60 cm long, lance-elliptic in outline, 2–4 times pinnately compound or pinnatifid; pinnae mostly 15–25 pairs; pinnules numerous, lanceolate in outline, acute; sori round, less than 1 mm wide; indusium lacking. Stream margins and other moist sites at 2700 to 3300 m in Cache and Weber counties; Alaska to California, Nevada, and Colorado, and disjunctly in northeastern North America; circumboreal; 4 (0). Our material belongs to *var. americanum* (Butters) Cronq. [*A. alpestre* *var. americanum* Butters; *A. distentifolium* ssp. *americanum* (Butters) Hulten].

Athyrium filix-femina (L.) Roth Lady-fern. [*Polypodium filix-femina* L.]. Rhizomes short, with leaves arranged in a vase-like tuft; leaves mostly (20) 30–130 cm long, glabrous, deciduous, usually with persistent leaf bases of the previous seasons; petioles coarse, blackish and scaly basally, becoming greenish or straw colored and sparsely scaly upward; blade (15) 25–100 cm long, lanceolate to lance-elliptic in outline, 2–3 times pinnately compound or pinnatifid; pinnae mostly 20–35 pairs; pinnules numerous, oblong to lanceolate in outline, rounded to acute; sori oblong to horseshoe-shaped; indusium straight or curved, often toothed; $2n = 80$. Moist sites in mountain brush, ponderosa pine, aspen, and spruce-fir communities at 2250 to 3200 m in Daggett, Juab, Salt Lake, Sevier, Summit, Uintah, Utah, Washington, and Weber counties; Alaska to the Atlantic, south to California, Texas, and Florida; circumboreal; 20 (v). Our plants have been assigned to *var. cyclosorum* (Rupr.) Ledeb. [*A. cyclosorum* Rupr.], which is separable only with difficulty from the typical European materials.

Cheilanthes Swartz

Small, evergreen ferns with scaly short to widely creeping, much branched rhizomes; fronds not dimorphic, rigidly erect-spreading, mostly tomentose to glandular or paleaceous; stipes wiry, blackish to reddish brown or stramineous; blades pinnate to bipinnate-pinnatifid or

further decompound, with the veins free and thickened at the tips; sori borne at the thickened vein tips, marginal, roundish, and distinct or narrowly confluent; indusia formed by the thin reflexed margin of the ultimate segments.

1. Leaf blades with dense, white or brown scales only; rhizomes elongate; plants of Kane and Washington counties *C. covillei*
- Leaf blades with distinct hairs, with scales often present also; rhizomes short and much branched 2
- 2(1). Leaves densely tomentose, lacking scales, ovate to oblong-lanceolate, ultimate segments oblong-oval to obovate; plants widely distributed *C. feei*
- Leaves with both hairs and scales, the blades lanceolate to oblong-lanceolate; plants of restricted distribution ... 3
- 3(2). Ultimate segments oblong, distant; plants known from Cache County *C. gracillima*
- Ultimate segments rounded or obovate, approximate; plants of San Juan (?) County *C. eatonii*

***Cheilanthes covillei* Maxon Coville Lipfern.** Loosely or densely tufted ferns 10–30 cm tall; rhizomes short, white-scaly when young, the scales becoming brown in age, each scale with a dark hard stripe; petioles 3–12 cm long, dark brown, scaly; blades 3–4 times pinnate, ovate-lanceolate to lanceolate in outline, 3–12 cm long, 2–6 cm wide, green and glabrous above, densely scaly beneath with whitish to brownish, attenuate, appressed scales; pinnae of 6–15 pairs; ultimate segments very small, rounded to obovate, beadlike, green above, densely scaly beneath. Dry rock crevices in warm desert shrub and pinyon-juniper communities at 850 to 1450 m in Kane and Washington counties; Arizona, Nevada, and California; 8 (i).

***Cheilanthes eatonii* Baker Eaton Lipfern.** Loosely to densely tufted ferns 8–36 cm tall; rhizomes short, much branched, covered with pale brown scales, these with dark hardened centers; petioles 7–18 cm long, tan to dark purplish brown, villous and scaly with tawny scales; blade 3–4 times pinnate, lanceolate to oblong-lanceolate in outline, 5–20 cm long, 2–5 cm wide, tomentose and rusty-scaly, the scales mostly beneath on the rachis and costa; pinnae 8–20, the lowest ones remote; ultimate segments small, roundish or obovate-spatulate, the margins strongly inrolled and with a pale, scarios edge. Dry rock crevices or on talus in mixed desert shrub communities at 1400 to 1800 m in San Juan (?) County; Texas to Oklanoma, Colorado, New Mexico, and Arizona; 0 (0). The species is included here on the basis of a specimen cited as having been taken in Utah (Intermountain Flora 1: 204. 1972).

***Cheilanthes feei* Moore Fee Lipfern.** Tufted ferns 6–15 (30) cm tall; rhizomes short, covered with brown scales, these with dark hard centers; petioles 3–8 cm long, brown to purplish-brown, sparsely hairy, with tawny, spreading pubescence; blade 3–4 times pinnate, ovate-lanceolate to triangular in outline, 3–13 cm long, 1.5–4 cm wide, densely white or brownish tomentose beneath, green or only sparsely long-hairy above; pinnae 6–12 pairs; ultimate segments small, 1–1.5 mm long, rounded, the margins loosely inrolled, the sporangia spread over the entire surface of the segment; $2n = 87$. Crevices and talus slopes in sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and Douglas fir communities at 1200 to 3000 m in Beaver, Cache, Carbon, Daggett, Emery, Garfield, Grand, Iron, Kane, Millard, Salt Lake,

San Juan, Sevier, Uintah, Utah, Washington, and Wayne counties; British Columbia to Illinois, south to California, Texas, and Mexico; 100 (ix).

***Cheilanthes gracillima* D. C. Eaton** Lacefern. Loosely to densely tufted ferns 10–20 (30) cm tall; rhizomes short, covered with brown scales, these with hard centers; petioles 3–12 cm long, dark brown, glabrous to sparsely clothed with scattered long hairs or scales or both; blade mostly 2–3 times pinnate, linear-lanceolate to lanceolate in outline, 4–12 cm long, 1–2 cm wide, green and glabrous above; scaly beneath with long tawny or brownish scales, also villous-puberulent as well; pinnae 9–20 on each side, crowded; ultimate segments small, mostly 1–3 mm long, 1–1.5 mm wide, oblong to obovate, green above, rusty woolly beneath, also sometimes with scattered narrow scales, the margins widely recurved. Crevices in mountain brush, aspen, spruce-fir, and alpine tundra communities at 2060 to 3700 m in Cache County; British Columbia to Montana, south to California and Nevada; 2 (0).

Cryptogramma R. Br.

Small, mesophytic, deciduous or evergreen ferns; rhizomes short or somewhat elongate, scaly; leaves dimorphic, fertile and vegetative, mostly (1) 2 or 3 times pinnate or pinnatifid, the veins reaching the margin, at least on vegetative leaves; petiole slender, green, straw colored or purplish black, scaly, with a single vascular bundle; fertile leaves longer than the vegetative ones, with relatively long, narrow pinnules; sori more or less continuous along the margin of pinnules, the margin revolute, forming a false indusium.

1. Rhizomes short, densely leafy and often clothed with old leaf bases; leaves tufted, evergreen; plants of the Uinta and Wasatch mts. and elsewhere in the high plateaus and mountains of southern Utah *C. crispa*
- Rhizomes elongate, sparsely leafy, lacking persistent leaf bases; leaves deciduous; stipes dark brown; plants of the Wasatch Mts. *C. stelleri*

***Cryptogramma crispa* (L.) R. Br.** Parsley-fern; Rock-brake. [*Osmunda crispa* L.]. Rhizomes short, compactly branched, clothed with scales, persistent leaf bases, and tufted leaves; vegetative leaves (3) 7–25 cm long, with scaly, straw colored to greenish petioles 1.5–17 cm long and ovate to ovate-lanceolate blades 2–3 times pinnately compound, the pinnae commonly 5–11, twice pinnate, the ultimate segments toothed; fertile leaves longer than the vegetative ones, the fertile pinnae about as many as the vegetative, the ultimate segments linear to narrowly oblong; sori more or less continuous, covered by the revolute margin of the ultimate segments; $2n = 60$. Crevices and talus in ponderosa pine, lodgepole pine, spruce-fir, and alpine tundra at 3200 to 3800 m in Cache, Beaver, Duchesne, Grand, Iron, Piute, Salt Lake, San Juan, Sevier, Summit, Utah, Wasatch, and Wayne counties; Alaska east to the Great Lakes, south to California, Mexico, and Nebraska; 28 (ix). Our material belongs to var. *acrostichoides* (R. Br.) C. B. Clarke [*C. acrostichoides* R. Br.].

***Cryptogramma stelleri* (S. G. Gmel.) Prantl** Slender Cliff-brake. [*Pteris stelleri* S. G. Gmel.]. Rhizomes slender, creeping, scaly, with leaves scattered along the length of the rhizome; vegetative leaves 5–15 cm long, with scaly, purplish brown petioles 1–9 cm long and ovate

to oblong blades 1 or 2 times pinnate, the pinnae commonly 3–5, these usually merely pinnatifid, the ultimate segments crenately toothed; fertile leaves commonly surpassing the vegetative ones, mostly 6–19 cm long, with petioles 3–9 cm long, these colored much like the vegetative petioles, the ultimate segments lanceolate to lance-linear; sori continuous, the revolute margin membranous, translucent. Moist shaded outcrops at 2500 to 3500 m in Utah County; Alaska to the Atlantic, south to Washington, Nevada, Colorado, Iowa, and West Virginia; Asia; 8 (0).

Cystopteris Bernh.

Small to medium, mesophytic, delicate, deciduous ferns; rhizomes short or elongate, scaly; leaves clustered or scattered, all about alike, mostly 2–4 times pinnate or ternate-pinnate or pinnatifid, the veins reaching the margin; petioles slender, scaly, brown to green or straw colored, not jointed, with 2 vascular bundles; sori round, borne along veins on the lower side of the blade; indusium attached under the sorus, the free tip hoodlike, arching over the sorus, often pushed back as the sorus enlarges, soon withering.

Blasdel, R. F. 1963. A monographic study of the fern genus *Cystopteris*. Mem. Torrey Bot. Club 21(4): 1–102

1. Leaves 3–40 cm long, ovate-lanceolate to oblong-lanceolate, the lowest pair of pinnae the shortest; plants common and widespread *C. fragilis*
- Leaves 30–80 cm long, lanceolate to triangular-lanceolate, the lowest pinnae pair the longest; plants restricted and uncommon *C. bulbifera*

Cystopteris bulbifera (L.) Bernh. Bulblet Bladderfern. [*Polypodium bulbiferum* L.]. Leaves tufted, 30–80 cm long, the blades lanceolate to elongate triangular-lanceolate in outline, tripinnate; pinnae deltoid-lanceolate to oblong-lanceolate; pinnules oblong, broadly decurrent, pinnatifid or deeply incised, the segments more or less obtuse and sparingly dentate, minutely glandular on the lower surface; stipe flat in front below, becoming grooved above and with traces of lateral grooves, the rachis and midribs often bearing bulblets on the undersides; $2n = 42, 84$. Crevices and talus slopes up to 3000 m in Salt Lake, San Juan, and Washington counties; Manitoba to Newfoundland, south to Arizona, New Mexico, Arkansas, and Georgia; 3 (0).

Cystopteris fragilis (L.) Bernh. Brittle-fern. [*Polypodium fragile* L.]. Plants loosely tufted, from short, creeping rhizomes; leaves 3–40 cm long (including stipe), oblong-lanceolate to ovate-lanceolate in outline, tripinnate, thin; stipes brown below, yellowish above, smooth, with a groove in front, except at the base, and with 2 lateral grooves; pinnae ovate to oblong-lanceolate; pinnules or segments glabrous, oblong, broadly decurrent, confluent above, dentate to incised, the lower ones often pinnatifid, the tips obtuse or a few acute; indusia small, attached to one side and arching backward at maturity like a hood, free margin rounded or elongate, erose, soon withering; $2n = 84, 126, 168, 252$. Crevices, talus, and in other damp or shady places at 1600 to 4000 m in all Utah counties; Alaska to Newfoundland, south to California, Arizona, New Mexico, and Texas; 284 (xxi). This is the most widespread and most common fern species in Utah.

Dryopteris Adanson

Deciduous ferns from thick rhizomes; leaves 2–3 times pinnate; stipes continuous with the rhizome, sheathed basally with large, fimbriate scales, the upper part often scaly and glandular; pinnae mostly lanceolate; pinnules numerous, the veins pinnate and forked; sori round in outline, borne on the veins, in 2 rows per pinnule; indusium attached at one side as indicated by a deep notch, lunate or horseshoe-shaped, large and conspicuous.

Dryopteris filix-mas (L.) Schott Male Fern. [*Polypodium filix-mas* L.]. Leaves 2–10 dm long, tufted, on short, stout, densely scaly rhizomes; stipes coarse, pale or brownish at base, densely scaly with long, thin, brown scales; blades oblong-lanceolate in outline, bipinnate; pinnae numerous, narrowly lanceolate, to 15 cm long and 4 cm wide, the largest near the middle, the ultimate segments oblong, rounded, finely serrate, the rachis and often the lower surface of segments with elongate, hair-like scales; sori round; indusium conspicuous; $2n = 82, 164$. Shaded moist sites in mountain brush and ponderosa pine communities at 1350 to 1850 m in Garfield, Salt Lake, Sanpete, and Washington counties; British Columbia to Newfoundland, south to California, Texas, Oklahoma, and Vermont; 29 (i).

Notholaena R. Br.

Small xeric ferns; rhizomes short, branched, with long, slender, brownish scales; leaves evergreen, firm, 2–5 times pinnate, the ultimate segments quite small, often waxy or woolly, margins slightly recurved or nearly flat, not forming a false indusium over the sporangium; sori submarginal at the ends of veins.

Tyron, R. 1956. A revision of the American species of *Notholaena*. Contr. Gray Herb. 179: 1–106.

1. Leaves densely white or brownish tomentose on both surfaces *N. parryi*
- Leaves glabrous or mealy with a waxy powder, not woolly 2
- 2(1). Leaves glabrous, green, not conspicuously waxy; segments few and large *N. jonesii*
- Leaves abundantly mealy beneath, the segments small and numerous 3
- 3(2). Rachis of leaf straight or nearly so *N. limitanea*
- Rachis of leaf sharply flexuous; plants not definitely known from Utah, but to be expected in San Juan County *N. fendleri* Kuntze

Notholaena jonesii Maxon Jones Cloak-fern. [*Pellaea jonesii* (Maxon) Morton]. Leaves tufted from a short, conspicuously scaly rhizome, the scales thin, brown, and long-attenuate; petiole and rachis reddish brown, glabrous; blades oblong-ovate to narrowly triangular, bipinnate or partly tripinnate, 3–10 cm long; pinnae few, 4–10 pairs; ultimate segments small, 1.5–4.5 mm long, broadest near the subtruncate to shallowly cordate base, glabrous; margins often slightly inrolled but not covering the sporangia. Crevices in creosote bush, blackbrush, and other warm desert shrub communities, and in sagebrush and pinyon-juniper communities at 830 to 1200 m in Washington County; Arizona, Nevada, and California; 2 (i).

Notholaena limitanea Maxon Border Cloak-fern. [*Pellaea limitanea* (Maxon) Morton]. Leaves tufted, from a

short, decumbent woody rhizome 1–4 cm long, conspicuously scaly, the scales wholly scarious, pale castaneous, linear-attenuate; petioles purplish black, 4–14 cm long, glabrous; blades 4–5 times pinnate, deltoid-ovate, 5–15 cm long, 4–11 cm wide, the rachis delicate, with the smallest ones almost capillary, purplish black; pinnae 4–13 pairs, ascending to spreading; ultimate segments sessile or nearly so, 2–3 mm long, linear-oblong to ovate-oblong, the lower surface conspicuously white-mealy, the upper glabrous; margins slightly inrolled but not totally covering the sporangia. Crevices at 1200 to 1450 m in Grand and San Juan Counties; Arizona, New Mexico, Texas, and Mexico; 9 (0).

Notholaena parryi D. C. Eaton Parry Cloak-fern. [*Cheilanthes parryi* (D. C. Eaton) Domin]. Densely tufted, woolly ferns, 8–23 cm tall; rhizomes short, covered with scarious, reddish brown scales with dark hard midstripes; petioles blackish purple, 3–10 cm long, loosely viscid-villous; blades ovate-oblong to oblong-lanceolate in outline, bipinnate to pinnatifid, the pinnae in 5–12 pairs; ultimate segments rounded, often obscured by the dense, long, woolly hairs on both sides, but especially so beneath, grayish above, rusty beneath; margins crenate and widely recurved, becoming flattened with age; $2n = 60$. Crevices in warm desert shrub at 850 to 1350 m in Washington (type from near St. George) County; Arizona, Nevada, and California; 29 (v).

Pellaea Link

Small xeric ferns; rhizomes short, branched, with dense, long, narrow, brown scales giving a woolly appearance; leaves evergreen, pinnate, firm, the veins free, the surface glabrous or sparsely hairy; petioles green to reddish brown or blackish purple, slender, wiry, breaking off above ground level, leaving a persistent base; sori marginal, confluent, covered by the reflexed leaf margin, this forming a continuous false indusium.

Tryon, A. F. 1957. A revision of the fern genus *Pellaea*, section *Pellaea*. Ann. Missouri bot. Gard. 44. 125–193.

1. Scales of rhizome uniformly colored; petiole and rachis terete or elliptical 2
- Scales of rhizome bicolored, with a hard central stripe; petiole and rachis sulcate, convex, or plane on the upper surface 3
- 2(1). Rhizomes thick, with numerous, compressed, short, articulated petiole bases; middle and lower pinnae asymmetrical, mitten-shaped *P. breweri*
- Rhizomes rather stout, with few petioles persisting, these usually not articulated; pinnae seldom mitten-shaped, the lower ones often with 1 or 2 pairs of pinnules *P. glabella*
- 3(1). Basal pinnae usually less than twice as long as broad, entire or divided into 3–11 segments; rachis of pinnae to 2 cm long *P. ternifolia*
- Basal pinnae usually more than twice as long as broad, divided into 9–21 segments; rachis of pinnae to 7 cm long *P. truncata*

Pellaea breweri D. C. Eaton Brewer Cliff-brake. Rhizome compact, large, with many compressed bases of articulated petioles; scales of rhizome entangled and matted, uniformly rusty brown, lustrous, acicular, the margins sinuate, the apex attenuate; blades 2.5–21 cm long, curved; petiole and rachis terete, brownish, shining, with prominent lines of articulation; blade 1.5–16 cm long,

0.5–3.5 cm wide, linear-oblong, once pinnate or pinnate-pinnatifid, the upper pinnae entire, sessile, the lower asymmetrical, deeply 2-lobed, unilateral or mitten-shaped, 0.5–2.5 cm long, 0.3–1 cm wide, the margin narrow, whitish, crenulate. Rocky hillsides, outcrops, and talus in sagebrush, mountain brush, aspen, pine, and spruce-fir communities at 2500 to 3400 m in Beaver, Box Elder, Cache, Grand, Juab, Millard, Salt Lake, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Washington to Montana, south to California and Wyoming; 48 (ii).

Pellaea glabella Mett. ex Kuhn Suksdorf Cliff-brake. [*P. suksdorfiana* Butters]. Rhizome thickish, compact; scales of rhizome usually not matted, uniformly rusty brown, shining, linear, flexuous, attenuate; leaves 1–36 cm long, usually lax; petiole and rachis terete, glabrous or nearly so, brownish black, shining, the lines of articulation lacking or nearly so; blades 0.7–21 cm long, 0.5–8 cm wide, linear or ovate-lanceolate, 1–2 pinnate, usually bluish green, somewhat glaucous, the upper pinnae entire or auriculate, sessile or subsessile, the lower pinnae entire, 2- to 5-lobed or pinnate with 3–7 segments, the segments 0.5–3.5 cm long, 0.3–1 cm broad, oblong to linear-ovate. Crevices and hanging gardens at 1200 to 2800 m in Emery, Grand, Kane, Sevier, Uintah, and Washington counties; British Columbia to Colorado, Arizona, and New Mexico; 11 (iv).

Pellaea ternifolia (Cav.) Link Ternate Cliff-brake. [*Pteris ternifolia* Cav.]. Rhizome thickish, elongate, decumbent; scales of rhizome free, brownish or with tan tips, bicolorous with a narrow sclerotic stripe, subulate, the margins irregularly dentate or erose, the apex attenuate, filiform; leaves 4–50 cm long, erect, straight, stiff; petiole and rachis convex or plane to sulcate, rarely terete, glabrous or rarely pubescent, brownish black, becoming black in age, breaking irregularly, without articulation lines; blade 3–32 cm long, 0.5–6 cm wide, linear, lanceolate, or elongate triangular, 1–2 pinnate, ternate, or with 3–11 segments, the segments 0.5–4 cm long, 0.5–1 cm wide, lanceolate to narrowly oblong, entire or ternately divided; $n = 58$. Crevices in sandstone at ca 1500 m in Washington County (Zion National Park); Arizona to Texas, Mexico, South America, and Hawaii; 4 (i). Specimens examined fall within the limits of this species as outlined in Tryon's (1957) revision. The species is closely allied to *P. truncata*, but the ternate pinnae are distinctive.

Pellaea truncata Goodding Spiny Cliff-brake. [*P. longimucronata* Hook., nom. illeg.]. Rhizome thickish, elongate, decumbent; scales of rhizome appressed, brown, bicolorous, with a broad, hard stripe usually broader than the border, subulate, the margin and apex erose-dentate; leaves 12–38 cm long, erect, straight, stiff, alike, the lower pinnae often sterile, the upper ones fertile; petiole and rachis sulcate, glabrous or nearly so, usually glaucous, castaneous, becoming darker with age, the stipe breaking irregularly, without articulation lines; blade 8–22 cm long, 4–12 cm broad, triangular, bipinnate, rarely tripinnate, grayish green, the segments 0.3–1.5 cm long, 0.1–1 cm wide, narrowly oblong to oval, entire, mucronate apically. Crevices in warm desert shrub, oak, pinyon-juniper, and ponderosa pine communities at 980 to 2000 m in Iron, Kane, San Juan, and Washington counties; Arizona, Colorado, New Mexico, Nevada, and Mexico; 37 (iv).

Pityrogramma Link.

Mesic to xeric evergreen (or deciduous) ferns; rhizome short, clothed with slender scales; leaves tufted; petiole elongate, slender, dark, shining, the base scaly, glabrous above, the blades 3- to 5-angled in outline, rather broad, pinnate to ternately pinnately dissected, white or yellow mealy beneath, otherwise glabrous; sori continuous on the veins, from the midvein to the margins; indusium lacking.

Pityrogramma triangularis (Kaulf.) Maxon Goldback Fern. [*Gymnogramma triangulare* Kaulf.]. Rhizome short, covered with thick scales with hard midstripe; leaves tufted; petioles brown to purplish brown, 6-23 cm long, considerably longer than the blades, these glabrous above, densely white or yellow mealy beneath, 4-10 cm long and about as wide, ternate-pinnately compound; pinnae few, the lowest pair the largest; leaf margins narrowly revolute; n = 30, 60. Crevices and in soil on shaded rocky slopes in warm desert shrub and ponderosa pine communities at 1175 to 1800 m in Washington County; British Columbia south to California and Nevada; 9 (i).

Polypodium L.

Small to medium ferns from creeping, nodulose, branched, scaly rhizomes; leaves scattered, evergreen, firm, pinnatifid, with toothed or entire segments; veins free; sori round in outline, borne on the veins; indusium wanting.

Polypodium hesperium Maxon Western Polypody. Rhizome densely brown scaly; leaves oblong-ovate to oblong-lanceolate in outline, 8-25 cm long including petioles, these 1-12 cm long, yellowish or green, the base brown; blades 4-18 cm long, 2-5 cm wide, deeply parted or pinnatifid; segments oblong to linear-oblong, the margins serrate to nearly entire; sori midway between the margins of the segments and the midveins; indusium lacking; n = 74. Crevices and other mesic sites in mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1500 to 3000 m in Salt Lake, Utah, and Washington counties; British Columbia to Montana, south to California, Arizona, New Mexico, and South Dakota; 28 (i).

Polystichum Roth

Small to medium, mesophytic, evergreen ferns; rhizomes short, stout, scaly; petiole shorter than the blade, conspicuously scaly toward the base with brownish, dimorphic scales, some broad and toothed, others narrow and hairlike; blade coarse, pinnate, oblong to lanceolate in outline, scaly on the rachis and costae, the margin often with pungent teeth; sori laminar, round, prominent, borne on the veins in one or more distinct rows on each side of the midvein; indusium attached at the center on a projection and spreading peltately over the sorus, the margin fringed.

- 1. Pinnae undivided, the base asymmetrical, auricled on the upper side, the margin long-spinulose dentate or serrate *P. lonchitis*
- Pinnae or some of them deeply cleft toward the base ... 2
- 2(1). Principal pinnae mostly less than 1.5 (1.8) cm long, mostly 1-2 times as long as wide, the spinulose points of the teeth prominent and tending to spread or incurve; plants of Box Elder County *P. krukebergii*

- Principal pinnae mostly more than 1.5 cm long, usually 2-3 times as long as wide, the lobes and teeth mostly ascending or incurved, with tip merely callous-mucronate; plants of other distribution *P. scopulinum*

Polystichum krukebergii W. L. Wagner Krukeberg Holly-fern. Leaves 1-4 dm long; petiole scaly at the base, less so above; blade linear-lanceolate or oblong-lanceolate in outline; pinnae 20-40 on each side of rachis, often closely crowded, ovate in outline, 0.8-1.5 (1.8) cm long, 0.5-1 cm wide, 1-2 times as long as wide, commonly with 1 or rarely 2 prominent lobes near the base, the margin toothed or shallowly lobed, with spinulose, spreading or widely incurved teeth; sori borne on the middle and upper pinnae; indusium erose-dentate; 2n = 82. Crevices and other mesic sites at ca 2900 m in Box Elder County; British Columbia to Idaho, south to California; 3 (0).

Polystichum lonchitis (L.) Roth Holly-fern. [*Polypodium lonchitis* L.]. Leaves 2-5 dm long; petiole usually rather short or almost none, yellowish green, scaly; blade elliptic-lanceolate to oblong-lanceolate in outline; pinnae 25-50 per side of rachis, triangular to oblong-lanceolate, falcate, the larger pinnae usually near or above the middle of the leaf, 1-4.5 cm long, 3-13 mm wide, the margins spinulose serrate, the base auricled on the upper side; lower pinnae gradually reduced in size and more distant, nearly triangular, up to 1.5 cm long and nearly as wide; sori borne on the middle and upper pinnae; indusium erose-dentate; n = 41, 82. Talus and crevices in mountain brush, aspen, and spruce fir communities at 2000 to 3350 m in Cache, Duchesne, Iron, Salt Lake, Sanpete, Tooele, and Utah counties; Alaska to Newfoundland, south to California and New Mexico; 53 (ii).

Polystichum scopulinum (D. C. Eaton) Maxon Rock Holly-fern. [*Aspidium aculeatum* var. *scopulinum* D. C. Eaton]. Leaves 1-4 dm long; petiole scaly at the base, less so above, or nearly glabrous; blade ovate-lanceolate to linear-lanceolate in outline; pinnae 20-40 per side of rachis, closely crowded, ovate to lanceolate, (0.8) 1.5-3.2 cm long, 0.5-1 cm wide, 2-3 times as long as wide, usually with 2 or rarely 3 prominent basal lobes, the margin toothed or shallowly lobed, the lobes or teeth sharply crenate-serrate with ascending or incurved callous-mucronate tips; sori borne mostly on the middle and upper pinnae; indusium erose-dentate. Crevices and rocky hillsides at 1950 to 3500 m in Millard, Salt Lake, and Washington counties; Washington to Quebec, south to California and Arizona; 11 (0).

Pteridium Scop.

Medium-sized to rather large mesophytic ferns; rhizomes hairy, deep-seated, elongate, branching, often forming large colonies; leaves deciduous, scattered; petiole coarse, erect and stemlike; blade firm, spreading, three times pinnately or ternately-pinnately compound, the ultimate segments numerous, crowded, sessile and often confluent; sori confluent, protected by the narrowly inrolled indusial leaf margin, and a delicate inner hyaline indusium.

Pteridium aquilinum (L.) Kuhn Bracken Fern. [*Pteris aquilina* L.]. Clone-forming ferns from hairy rhizomes lacking scales; leaves scattered, 6-8 (20) dm long including petiole; petiole shorter than the blades, coarse, green or yellowish; blades firm, broadly triangular in outline, 2-12 dm long, glabrous to short-hairy above, variously

long hairy beneath, 2-3 times pinnate, the ultimate segments oblong and entire to toothed or lobed, widely spreading; sori developed along the leaf margins, confluent, protected by the narrowly recurved leaf margin and by a delicate, concealed, inner indusium; n = 52. In moist or dry wooded areas or clearings or on open slopes in oak-mountain brush, sagebrush, pine, aspen and spruce-fir communities at 1700 to 2850 m in Cache, Grand, Juab, Kane, Rich, San Juan, Sanpete, Uintah, Utah, Wasatch, Washington and Weber counties; cosmopolitan; 64 (vii). Our material belongs to the western var. *pubescens* Underw.

Woodsia R. Br.

Small to medium-sized ferns; rhizomes short and thick, covered with brown scales; leaves 2-3 times pinnate, oblong-lanceolate to lanceolate in outline; pinnae pinnately divided, triangular to oblong; pinnules crenate or dentate, the margins flat or recurved; sori round, borne on the veins of the pinnules; indusium arising from below the sorus and splitting at maturity into slender segments which become inconspicuous in age.

- 1. Leaves glabrous, or merely glandular *W. oregana*
- Leaves glandular and with glandless septate hairs, at least on the lower surface *W. scopulina*

Woodsia oregana D. C. Eaton Oregon *Woodsia*. Leaves tufted, several to numerous, glabrous to glandular but without non-glandular hairs, 7-25 cm long including the petioles; petioles 2-10 cm long, dark reddish brown near the base, lighter above, the blade 4-15 cm long, 1-4.5 cm wide; pinnae ovate-oblong or triangular, pinnatifid, obtuse apically; pinnules crenate, often lobed or cleft near the base, the margins slightly recurved; indusium platelike, with slender hairlike segments that appear beaded, mostly hidden below the sorus. In moist cliffs or dry shaded places or talus slopes with sagebrush, pinyon-juniper, mountain brush, ponderosa pine and white fir communities at 1850 to 3200 m in Beaver, Box Elder, Cache, Daggett, Emery, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Tooele, and Washington counties; Quebec to British Columbia, south to California, New Mexico, Oklahoma, Wisconsin, and Vermont; 56 (vii).

Woodsia scopulina D. C. Eaton. Rocky Mountain *Woodsia*. Tufted, rather similar in appearance to *W. oregana*; leaves several to numerous, glandular and with longer septate non-glandular hairs, 8-35 cm long including the petiole; petiole dark brown at the base, lighter above and hairy; the blade 5-22 cm long, 1-7 cm wide; pinnae narrow, oblong-lanceolate, pinnatifid, acute, glandular hairy on the lower surface; pinnules oblong, crenate-serrate to lobed, obtuse, the base broadly decurrent, not at all or only slightly contracted; indusia splitting into narrow, beaded hairlike segments at maturity. Rocky ledges, crevices, and talus slopes with mountain brush, aspen, spruce-fir, and alpine tundra communities at 2700 to 3800 m in Beaver, Cache, Duchesne, Garfield, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, and Wayne counties; Alaska to Quebec, south to California, New Mexico, Oklahoma, Tennessee, and North Carolina; 34 (i).

SALVINIACEAE Reichb.

Waterfern Family

Plants small aquatic free-floating or growing on mud; rhizome branched, with simple roots; leaves 2-ranked or in whorls, opposite or alternate, simple or lobed; sporocarps soft, thin-walled, borne singly or 2 or more on a common stalk at the base of the leaves, 1-loculed, each containing a central often branched receptacle bearing microsporangia or megasporangia.

Azolla Lam.

Small plants with pinnately branched reddish or green free-floating stems covered with minute imbricate 2-lobed leaves and producing rootlets beneath; sporocarps borne in pairs beneath the stem, dimorphic, the small ones ovoid and bearing 1 megaspore, the larger globose and containing numerous microspores.

Azolla mexicana Presl Waterfern; Mosquitofern. Plants forming floating mats to 2 cm across; leaves crowded, the upper lobe commonly less than 1 mm long, tinged with purple, papillose, with narrow hyaline cellular-papillose margins; microsporocarps slightly more than 1 mm thick; glochidia with scattered septae; megaspores 0.25-0.3 mm long, the rounded part minutely pitted. Floating on the surface of lakes and ponds or sloughs and ditches at 1450 to 2050 m in Cache, Salt Lake, and Utah counties; British Columbia to Wisconsin, south to northern South America; 6 (0).

DIVISION PINOPHYTA

Gymnosperms

Shrubs or trees with alternation of generations, the gametophyte generation greatly reduced (micro- and megagametophytes, equivalent to pollen and embryo sac respectively); sporophytes with roots, stems, and leaves; leaves needle- or scalelike or broad, spirally arranged, whorled, or opposite; microsporophylls aggregated on an axis, forming a soft strobilus (the male cone); megasporophylls solitary, paired, or aggregated into compound woody (or fleshy) strobili (female or ovulate cones); ovules typically paired (1 to many) on the surface of a scale, the micropyle exposed during pollination; seeds typically large, and often winged.

Key to the families.

- 1. Stems jointed, leaves scalelike, typically brownish or blackish, opposite or in whorls of 3; branches green and photosynthetic **Ephedraceae**, p. 28
- Stems not jointed; leaves various, needle or scalelike, or broad but, if scalelike, closely overlapping, typically green; branches not green 2
- 2(1). Leaves broad, fan-shaped, dichotomously veined, deciduous; cones drupelike, covered with an aril **Ginkgoaceae**, p. 29
- Leaves needlelike, linear, or scalelike, solitary or in fascicles, persistent or deciduous; cones usually not provided with an aril 3
- 3(2). Leaves alternate or subopposite, arranged in 2 ranks; plants shrubs or small trees, evergreen; cones with a brightly colored aril **Taxaceae**, p. 34

- Leaves opposite, whorled, or spirally arranged (if alternate, as in *Taxodium*, not evergreen and cones not arilate), sometimes 2-ranked; plants shrubs or trees, evergreen or deciduous; cones not with a brightly colored aril 4
- 4(3). Leaves scalelike or awl shaped; female cones mainly 5–25 mm long, globose or oblong, the scales few and decussate (fleshy in *Juniperus*) Cupressaceae, p. 25
- Leaves needlelike, linear, oblong, or less commonly scalelike or awl shaped, female cones typically more than 25 mm long or the scales peltate 5
- 5(4). Leaves apparently 2-ranked (actually spirally arranged) and flattened, deciduous with the branchlets, or scale- or awllike and persistent Taxodiaceae, p. 34
- Leaves spirally arranged or fascicled and evidently opposite or whorled, persistent or, if scalelike, papery Pinaceae, p. 29

CUPRESSACEAE Bartling

Cypress Family

Monoecious trees or shrubs; leaves evergreen, opposite or whorled, scalelike or awl-shaped and needlelike; staminate cones small, terminal or axillary, the microsporophylls decussate; ovulate cones terminal and commonly with 2–12 opposite or whorled scales, each bearing 1 to several ovules, dry or fleshy at maturity; $x = 11, 12$.

- 1. Branchlets not arranged in flat sprays, the twigs extending more or less in all directions; plants indigenous and cultivated 2
- Branchlets arranged in flat sprays, the twigs more or less in a single plane; plants all cultivated 3
- 2(1). Cones mostly 15 mm thick or more, dry at maturity, the scales woody and finally separating; seeds numerous under each scale; plants cultivated and long-persisting *Cupressus*
- Cones berrylike, the scales fleshy at maturity (drying later), not opening; seed 1 or few; plants indigenous or cultivated *Juniperus*
- 3(1). Cones subglobose, the scales shield-shaped; seeds few under each scale *Chamaecyparis*
- Cones oblong, the scales imbricated or valvate; seeds 2 per scale 4
- 4(3). Bark of trunk exfoliating in plates; cone scales 4 or 6; leaves appearing in whorls of 4 *Calocedrus*
- Bark of trunk shredded, not exfoliating in plates; cone scales 8 or more (rarely 6); leaves obviously paired *Thuja*

Calocedrus Kurz

Monoecious aromatic trees; bark scaly, exfoliating in plates; branchlets compressed, forming flat sprays; leaves scalelike, imbricate, 4-ranked, decurrent at the base, dimorphic, the upper and lower ones flattened or rounded, the lateral ones folded; staminate cones cylindrical; ovulate cones cylindrical, with usually 3 pairs of scales, the middle ones fertile and each with 2 ovules, maturing in one season; seeds winged.

Florin, R. 1956. Nomenclatural notes on genera of living gymnosperms. *Taxon* 5: 191–192.
 Li, Hui-Lin. 1953. A reclassification of *Libocedrus* and Cupressaceae. *J. Arnold Arbor.* 34: 17–36.

Calocedrus decurrens (Torr.) Florin Incense Cedar. [*Libocedrus decurrens* Torr.; *Heyderia decurrens* (Torr.) K. Koch; *Thuja decurrens* (Torr.) Voss]. Trees, mainly 5–15 m tall, the trunk to 5 dm thick or more; bark scaly, the exfoliating surface reddish to brownish, finally furrowed; leaves appearing to be in whorls of 4, the tips incurved, 4–6 mm long, greenish to yellowish; staminate cones 4–7 mm long, yellow; ovulate cones 15–25 mm long, cylindrical, reddish brown, pendulous, the scales mucronate; seeds typically 4, 8–10 mm long, the longest wing subequal to the scale. Uncommonly grown ornamental and specimen tree in lower elevation portions of Utah; Oregon, California, and Nevada; 7 (0).

Chamaecyparis Spach

Monoecious fragrant trees with opposite decussate scalelike leaves, the lateral ones folded, the upper and lower ones flattened or rounded; branchlets arranged in more or less flattened sprays; staminate cones ellipsoid to ovoid; ovulate cones subglobose, with 3–6 pairs of peltate scales, each bearing 2–5 ovules; cones dehiscent, woody to leathery, dark to gray brown, glaucous.

Chamaecyparis lawsoniana (Murray) Parl. Port Orford Cedar. [*Cupressus lawsoniana* Murray]. Trees, mainly 5–15 m tall, with base enlarged and the crown spirelike; branchlets horizontal or pendulous, bearing slender flattened branchlets; bark smooth on young trees, finally thick and divided into broad rounded ridges; leaves green above, glaucous below, mainly 1–1.5 mm long (to 6 mm long on vigorous shoots); male cones oblong, reddish; female cones globose, ca 8 mm thick, reddish brown, more or less glaucous, the scales each with an apical conical projection; seeds ovoid, slightly flattened, 3–4 mm long, narrowly wing-margined; $n = 11$. Uncommonly grown ornamental and specimen tree in lower elevation portions of Utah; Oregon and California; 7 (0). The closely related *C. nootkatensis* (D. Don) Spach is reported to be grown in Utah also. It differs in having branchlets scarcely flattened and leaves not or obscurely glandular dorsally.

Cupressus L.

Monoecious fragrant resinous evergreen trees; buds naked; branchlets slender, 4-angled; bark finally scaly; leaves opposite, small, trimorphic—linear and prickly, scalelike, or elongate (on juvenile shoots); male cones 4-sided to subcylindrical, with 5–10 pairs of opposite scales; ovulate cones subglobose, maturing in 2 years, with thickened peltate scales; seeds many on the fertile scales, narrowly winged.

Cupressus arizonica Greene Arizona Cypress. Spreading to columnar trees, mainly 5–15 m tall; trunk mainly 1–5 dm thick; twigs stout, 4-angled, 1.5–2 mm thick, branching at nearly right angles; bark finally scaly or even furrowed, usually grayish; leaves scalelike, triangular-ovate, sharply pointed, blue green, commonly glaucous, ca 2 mm long; cones globose, 15–25 mm thick, short-stalked, hard and woody, gray to purplish, often glaucous, with 6–8 flattened scales bearing a hard point in the center, remaining attached for several years, finally opening; seeds ca 2 mm long, purplish brown. Rather commonly grown ornamental in Utah (Sanpete, Utah, and Washington counties); Texas to Arizona and Mexico; 11 (ii). The Arizona cypress persists following introduction,

often in apparently inhospitable habitats such as at Castle Cliffs in Washington County. The trees grow rapidly from seed, reaching fence-post size in only a few years.

Juniperus L.

Shrubs or trees with opposite or whorled scalelike or awl-shaped leaves; branchlets subterete or angular, not in flattened sprays; staminate cones subcylindrical to subglobose; ovulate cones subglobose, with mostly 3–8 opposite or whorled scales, becoming fleshy and berrylike at maturity.

1. Plants spreading to prostrate shrubs 2
- Plants erect or ascending trees or shrubs 5
- 2(1). Leaves needlelike or awl-shaped, jointed to the twig, in whorls of 3; plants indigenous or cultivated
..... *J. communis*
- Leaves scalelike or, if needlelike, decurrent on the twig, opposite or in whorls of 3; plants cultivated 3
- 3(2). Shrubs spreading, open, to 2 m high or more; main branches ascending, the secondary ones spreading to ascending *J. chinensis*
- Shrubs low, compact, often less than 6 dm high; main branches prostrate to ascending, the secondary branchlets often strongly ascending 4
- 4(3). Leaves dark green, obtuse or acutish, with a strong disagreeable odor when bruised *J. sabina*
- Leaves bluish green to steel blue (often pinkish in winter), acute or cuspidate, the odor not especially disagreeable when bruised *J. horizontalis*
- 5(1). Leaves needlelike, jointed at the base, the upper surface with a white band 6
- Leaves mostly scalelike, decurrent at the base, not jointed, the upper surface usually lacking a white band . . . 7
- 6(5). Leaves concave above, rounded or slightly keeled below; plants trees or spreading shrubs, usually without pendulous branches *J. communis*
- Leaves narrowly grooved above, conspicuously keeled below; trees with pendulous branches *J. rigida*
- 7(5). Branchlets usually coarse, mostly 1–2 mm thick; leaf margins typically denticulate 8
- Branchlets slender, mainly less than 1 mm thick; leaf margins entire 9
- 8(7). Scalelike leaves with a conspicuous resin gland on the back; ovulate cones juicy, dark blue to blackish at maturity; plants rare in Utah *J. monosperma*
- Scalelike leaves not with a conspicuous resin gland on the back; ovulate cones not juicy, becoming fibrous, and usually brownish to purplish when mature; plants common and widespread. *J. osteosperma*
- 9(7). Scalelike leaves obtuse; needlelike leaves usually in whorls of 3; plants cultivated *J. chinensis*
- Scalelike leaves acute; needlelike leaves usually opposite 10
- 10(9). Mature scale leaves overlapping those directly above; cones ripening the first season, sweet and juicy; plants introduced *J. virginiana*
- Mature scale leaves rarely overlapping those directly above, or only slightly so; cones ripening the second season, fibrous and of poor flavor; plants indigenous or cultivated *J. scopulorum*

Juniperus chinensis L. Chinese Juniper; Pfitzer Juniper. Spreading shrubs to columnar trees, mainly 1–10

m tall, with trunks several or solitary; needlelike leaves usually in 3's, the scalelike ones opposite, decurrent on the twig; ovulate cones mostly 5–7 mm in diameter, finally brown to brownish purple, commonly glaucous, maturing in 2 years, usually 2- or 3-seeded; $2n = 22, 44$. Commonly grown ornamentals in much of Utah; introduced from eastern Asia; 19(0). More than 50 cultivars are known for this species, and many of them are grown in Utah. The maze of horticultural forms is difficult to interpret. The commonly grown Pfitzer juniper becomes massive, and is ill-suited for most plantings around homes. It is less commonly grown than formerly.

Juniperus communis L. Common Juniper. [*J. sibirica* Burgsd.; *J. communis* var. *sibirica* (Burgsd.) Rydb.; *J. communis* var. *montana* Ait., sensu authors]. Spreading shrubs to columnar trees, mainly 0.3–6 m tall, with trunks several or solitary; leaves jointed to the stem, mostly in whorls of 3, awl-shaped, 3–10 (15) mm long, spinulose-tipped, usually marked with a white band on the upper surface, dark green on the lower surface; cones maturing the second season, green, ripening bluish black, 5–10 mm thick, usually 1-seeded; seeds 4–5 mm long; $2n = 22, 44$. Aspen, spruce-fir, and less commonly other plant communities, at 1615 to 3375 m in all Utah counties, except Davis and Rich; Alaska and Yukon, east to the Atlantic, south to California, New Mexico, and Georgia; circumboreal; 78 (xv). The species is represented by indigenous spreading shrubs and by erect or spreading cultivated, mostly Old World, selections. Indigenous plants belong to var. *depressa* Pursh. The status of the cultivated material has not been determined.

Juniperus horizontalis Moench Creeping Juniper. Stems commonly decumbent to procumbent or prostrate, mostly 0.5–1.5 m long; leaves decurrent, opposite, scalelike or awl-shaped, 1–4 (6) mm long, acute to spinulose-tipped, lacking a white band on the upper surface; cones maturing the first season, green, ripening blue purple or blue black, glaucous, 5–10 mm thick, mostly 3- to 5-seeded. Cultivated ground cover and ornamental, generally grown in planting strips along curbs and sidewalks, in much of Utah; Alaska and Yukon, east to the Atlantic, south to British Columbia, Colorado, Nebraska, Illinois, and New York; 8(0).

Juniperus monosperma (Engelm.) Sarg. One-seed Juniper. [*J. occidentalis* var. *monosperma* Engelm.; *J. mexicana* var. *monosperma* (Engelm.) Cory]. Shrubs or small trees, typically with several branches from the ground, mainly 2–4 m tall; bark thin, fibrous and ultimately shredded; branchlets stout, ca 2 mm thick; leaves typically opposite, sometimes in 3's, the scalelike ones 1–3 mm long, yellowish green, the tips often spreading, denticulate marginally, typically with a resin gland on the dorsal side; juvenile leaves awl-shaped, sharp, to 5 mm long, decurrent; staminate cones yellowish brown, 3–4 mm long; ovulate cones subglobose, 4–7 mm thick, dark blue to blue purple at maturity, glaucous, succulent but of bad flavor when fresh; seeds 1 (or 2) per cone. Pinyon-juniper and mixed grass-shrub communities at ca 1750 m in Kane (?), San Juan (?), and Washington (?) counties; Arizona to Oklahoma and Texas, south to Mexico; 1(0). All identifications of this species for Utah are tentative, and probably they are based on equivocal specimens of *J. osteosperma*.

Juniperus osteosperma (Torr.) Little Utah Juniper; Utah Cedar. [*J. tetragona* var. *osteosperma* Torr.; *J. californica* var. *utahensis* Vasey, type from the Little

Wasatch Mts.; *J. californica* var. *utahensis* Engelm., type from near St. George; *J. occidentalis* var. *utahensis* (Engelm.) Veitch; *J. utahensis* (Engelm.) Lemmon]. Shrubs or small trees, with single stem or several branches from the ground, mainly 2–4 m tall; bark thin, fibrous and ultimately shredded; branchlets stout, ca 2 mm thick; leaves typically opposite, sometimes in 3's, the scalelike ones (0.5) 1–3 mm long, yellowish green, denticulate on the margins, the dorsal resin gland not usually apparent; juvenile leaves awl-shaped, sharp, 2–8 mm long, decurrent; staminate cones yellowish brown, 3–4 mm long; ovulate cones subglobose, 6–12 mm thick or more, brownish or blue to blue purple at maturity, glaucous, succulent but of bad flavor when fresh; seeds 1 (or 2) per cone. Riparian, mixed warm and cool desert shrub, sagebrush, mountain brush, juniper, pinyon-juniper, ponderosa pine, and aspen communities at 850 to 2440 m in all Utah counties; Montana and Wyoming south to California, Arizona, and New Mexico; 134 (xxiii). This is the other of the pair of pinyon-juniper or juniper-pinyon components of a vast woodland typically placed between the lower elevation, more xeric, cool desert shrub, dominated by sagebrush, and the higher elevation, more mesic, mountain brush or ponderosa pine communities. Juniper is the more xeric of the duo, often serving as nurse trees for pinyon in well developed forests. Pinyon tends to increase proportionally to juniper at higher elevations, and finally is the main component. Trees of both species occur often along drainages and on dune sands below their usual elevational ranges. Utah juniper increases under grazing, and has spread from the thin substrates of ridges and mountain slopes into deeper valley soils. Reclamation attempts to restore the balance has been successful only in part, with reestablishment of juniper taking only a few years in many instances. Devastation of juniper and pinyon on thin substrates, where it is not seral, seems not to have been a reasonable reclamation option. Utah juniper has been exploited for "cedar" posts and firewood.

Juniperus rigida Sieb. & Zucc. Needle Juniper. Trees, mainly 3–8 m tall, the crown pyramidal, with drooping branchlets; leaves all needlelike, linear, 8–24 mm long, sharply pointed, green, with a broad white band above; staminate cones yellowish, 2–4 mm long; ovulate cones brown to black, glaucous, 6–8 mm thick, 1-seeded (?); 2n = 22. Sparingly grown ornamental of much beauty, planted in lower elevation portions of the state; introduced from eastern Asia; 2 (0). This species should be more widely grown.

Juniperus sabina L. Savin. Shrubs, typically with widely spreading decumbent to procumbent or ascending branches, and ascending branchlets; branchlets ca 1 mm thick; leaflets needlelike and spreading or scalelike and overlapping; staminate cones yellowish, 2–4 mm long; ovulate cones brownish blue, glaucous, mainly 6–8 mm thick, usually 2-seeded. Widely and commonly grown ornamental and ground cover, especially in planting strips, over much of lower elevation portions of Utah; introduced from Eurasia; 4 (0). The cultivar "tamaricifolia," which has leaves usually all needlelike, is the commonly grown phase in Utah.

Juniperus scopulorum Sarg. Rocky Mountain Juniper. [*J. virginiana* var. *scopulorum* (Sarg.) Lemmon; *J. virginiana* var. *montana* Vasey, type from Wasatch Mts.]. Trees, typically 3–6 m tall, with a conical to pyramidal or

less commonly rounded crown; bark thin, ultimately fibrous and shredded, or less commonly fissured and breaking into platy scales; branchlets ca 1 mm thick or less; leaves typically opposite, sometimes in 3's, the scalelike leaves 0.5–3 (4) mm long, green or blue green, sometimes with an apparent dorsal resin gland; juvenile leaves needlelike, 3–8 mm long; staminate cones 2–3 mm long, brownish; ovulate cones subglobose, mainly 4–6 mm thick, becoming bluish to purplish at maturity, glaucous, maturing in 2 years, succulent but of bad flavor; seeds typically 2; 2n = 22. Pinyon-juniper, mountain brush, ponderosa pine, Douglas fir, white fir, and aspen communities at 1525 to 2830 m in all Utah counties; British Columbia to the Dakotas, south to Nevada, Arizona, New Mexico, and Texas; 116 (xii). Plants of this species are typically montane, but often occur below their usual elevational range in moist valley bottoms where cold air drainage simulates environmental conditions of the mountains. The wood is of excellent quality and has been used for "cedar" chests and fence posts. The heartwood is red and highly aromatic. The famous Jardine juniper in Logan Canyon, aged at 3600 years, belongs to this species. Horticultural selections are available commercially, and the species is commonly grown in Utah.

Juniperus virginiana L. Virginia Juniper; Red Cedar. Trees, typically 3–6 m tall, with a conical to pyramidal or rounded crown; bark thin, ultimately fibrous and shredded; branchlets ca 1 mm thick or less; leaves typically opposite, sometimes in 3's, the scalelike leaves 0.5–2 (3) mm long, green or blue green; juvenile leaves needlelike, 2–5 mm long; staminate cones mainly 2–3 mm long, yellowish or brownish; ovulate cones subglobose, 5–6 mm thick, becoming blue black at maturity, maturing in one season, succulent and sweet; seeds 1 or 2; 2n = 22. Commonly grown ornamental in much of Utah; north-eastern U. S., south to Florida and west to Missouri and Texas; 8 (0). This species is difficult to distinguish from the indigenous, and less commonly cultivated, *J. scopulorum*. It differs in minor, but apparently significant ways, as outlined in the key. Cedar chests and other insect resistant drawers and closets are typically lined with the red heartwood of this species, and the ovulate cones (berries) are used to flavor certain alcoholic beverages.

Thuja L.

Trees or shrubs with opposite decussate scalelike leaves, the lateral leaves folded, the upper and lower rounded or flattened; branchlets arranged in distinctive flattened sprays; staminate cones subglobose; ovulate cones erect or reflexed, oblong-ellipsoid, with 4–6 pairs of laterally attached scales, the middle scales each bearing 2 or 3 ovules; cones dehiscent, woody or fleshy, green or turning tan or brownish at maturity.

- 1. Branchlets typically in vertical sprays; cone scales fleshy, strongly curved, greenish or yellowish at maturity *T. orientalis*
- Branchlets typically in horizontal or at least not vertical sprays; cone scales not fleshy, brown at maturity *T. occidentalis*

Thuja occidentalis L. American Arborvitae; White Cedar. Trees (sometimes shrubby) mainly 2–6 m tall; branchlets arranged into flattened sprays, these variously disposed; leaves dark green above, yellowish green be-

neath, glandular; ovulate cones 10–12 mm long, with 4 or 5 pairs of scales, narrowly ovoid-ellipsoid, finally cylindrical and brown at maturity. Commonly grown ornamental trees or shrublike trees in much of lower elevation Utah (Cache, Uintah, Utah, and Washington counties); introduced from the eastern U. S. and Canada; 20 (0). The western red cedar, *T. plicata* Donn ex G. Don, might also occur in cultivation in Utah. It differs from *T. occidentalis* in the more regularly arranged sprays, glossy green above and with definite whitish marks beneath.

Thuja orientalis L. Oriental Arborvitae. [*Platycladus orientalis* (L.) Franco]. Mainly shrubby small trees, 1–3 m tall; branchlets arranged into flattened sprays, these typically vertically disposed; leaves bright green to yellowish green, glandular; ovulate cones mainly 15–20 mm long, fleshy, green, and greenish to yellowish at maturity, ovoid. Commonly cultivated ornamentals in much of lower elevation regions of Utah (Cache, Davis, Sanpete, and Utah counties); introduced from China and Korea; 8 (0). Several horticultural phases are planted.

EPHEDRACEAE Dumort.

Ephedra Family

Diocious shrubs; branches green to olive green, opposite or whorled, striate; leaves scalelike, opposite or whorled, more or less connate; male cones compound, borne at the nodes or terminal, with 2–8 microsporangia, these free or with stalks united, with a calyxlike involucre surrounding the stalks; female cones solitary or whorled, sessile or peduncled, subtended by firm or scarios bracts; seeds 1–3, hard, somewhat angled to almost terete.

Ephedra L.

The stems simulate those of an *Equisetum*, especially in being green and striate; the differences are obvious, however.

Cutler, H. C. 1939. Monograph of the North American species of the genus *Ephedra*. Ann. Missouri Bot. Gard. 26: 373–428.
 Benson, L. 1943. Revision of the status of southwestern trees and shrubs. I. *Ephedra*. Amer. J. Bot. 30: 230–233.

- 1. Leaves and bracts 3 per node; branches whorled; bracts of female cone scales clawed, 6–10 mm wide, scarios *E. torreyana*
- Leaves and bracts 2 per node; branches initially opposite; bracts of female cone scales not clawed, 3–5 mm wide, only the margins scarios 2
- 2(1). Seeds usually solitary, grayish to pale brown, vertically wrinkled; plants of Washington County ... *E. fasciculata*
- Seeds usually 2, dark brown to almost black, smooth ... 3
- 3(2). Leaf bases gray, deciduous; branchlets gray green, glaucous, divergent *E. nevadensis*
- Leaf bases brown, persistent; branches green or yellowish green, erect, broomlike *E. ciridis*

Ephedra fasciculata A. Nels. Mohave Ephedra. Low often prostrate shrubs 3–10 dm tall; branches flexible to somewhat rigid, terete, pale green, smooth to somewhat roughened, becoming yellowish in age; leaves opposite, 1–3 mm long, with a hyaline somewhat persistent white sheath, the remainder deciduous; male cones 2 to several, obovoid, 4–8 mm long, sessile, with 4–8 pairs of obovate

bracts 2–3 mm long, membranous, pale yellow; female cones sessile, ellipsoidal, 6–13 mm long, with 4–7 whorls of elliptic bracts 3–7 mm long, the margins hyaline, the remainder pale brown to green; seeds usually solitary, longitudinally furrowed, pale brown, 5–12 mm long. Dry wash bottoms and rocky slopes in creosote bush, blackbrush, and desert almond communities at 800 to 1100 m in Washington County; Arizona, Nevada, and California; 9 (ii).

Ephedra nevadensis Wats. Nevada Ephedra. Erect shrubs, mainly 3–15 dm tall (or more); branches pale green, glaucous, almost smooth, the older ones grayish, widely divergent; leaves paired, 2–5 mm long, thickened medially on the dorsal side, soon deciduous, leaving gray bases; male cones 1 to several, ellipsoid, 4–8 mm long, sessile or short-pedunculate, with 5–9 pairs of membranous obovate bracts 3–4 mm long; female cones pedunculate, roundish, 5–11 mm long, with 3–5 pairs of ovate bracts 4–8 mm long, pale brown to yellowish green; seeds paired, smooth, brown, 4–9 mm long. Creosote bush, blackbrush, mixed desert shrub, sagebrush, pinyon-juniper, and rabbitbrush communities at 850 to 2150 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Juab, Millard, Piute, Sanpete, Sevier, Uintah, and Washington counties; Arizona to Oregon and California; 51 (ii). This plant is consistently hedged back by sheep, to whom it is a valuable source of browse.

Ephedra torreyana Wats. Torrey Ephedra. Erect shrubs, 2–10 dm tall (rarely more); branches blue green to olive green, sometimes glaucous, appearing smooth but with many small longitudinal furrows, rigid, terete, to 3.5 mm thick, solitary or whorled at the nodes; leaves ternate or whorled, 2–5 mm long, dorsomedially thickened, connate for nearly 2/3 their length, at maturity the lobes spreading or recurved, somewhat persistent; male cones solitary to several in a whorl, ovate, sessile, 6–8 mm long; bracts ternate in 5–6 whorls, obovate, clawed, scarios except in the center and at the base; female cones solitary to several at the nodes, ovoid, 9–13 mm long, sessile, the bracts in 3's in whorls of 5 or 6, obovate, clawed, 6–9 mm long, scarios, the margins minutely toothed and undulate; seeds solitary or 2, pale brown to yellow green, scabrous, 7–10 mm long. Dry sandy or rocky hillsides in creosote bush, blackbrush, salt desert shrub, mountain brush, and pinyon-juniper communities at 850 to 2330 m in Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Washington, and Wayne counties; Texas to Arizona, Nevada, and Colorado; 119 (vii). This plant is eaten by livestock, especially by sheep.

Ephedra ciridis Cov. Green Ephedra; Mormon Tea; Brigham Tea. Shrubs 1–15 dm tall, spreading to erect; branches rigid to flexible, bright green to yellow green or less commonly olive to gray green, initially opposite, in some finally falsely whorled, typically fastigate and broomlike; leaves opposite, 1.5–4 mm long, thickened dorsomedially, deciduous and leaving a thickened persistent brown base; male cones 2 or more, obovoid, sessile, 5–7 mm long, the bracts opposite, 2–4 mm long, membranous, pale yellow, ovate; female cones obovoid, 6–10 mm long, sessile or pedunculate, with 4–8 pairs of ovate bracts 4–7 mm long; seeds paired, brown, trigonal, smooth, 5–8 mm long.

- 1. Female cones sessile or nearly so; stems not viscid *E. ciridis* var. *ciridis*
- Female cones pedunculate; stems often viscid *E. ciridis* var. *viscida*

Var. *viridis* Blackbrush, salt desert shrub, sagebrush, mountain brush, pinyon-juniper, rabbitbrush, and mountain brush communities at 900 to 2950 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Saupete, Sevier, Tootle, Uintah, Utah, Washington, and Wayne counties; Wyoming to Colorado, Arizona, Nevada, Oregon, and California; 150 (iv). This is the source of Mormon tea (also known by myriad other names), a yellowish drink made by steeping the branchlets in hot water. The plant is not so severely hedged by browsing animals as some of the other species, but is still of considerable importance.

Var. *viscida* (Cutler) L. Benson [*E. coryi* var. *viscida* Cutler; *E. cutleri* Peebles]. Mostly in sandy areas with blackbrush, mixed desert shrub, mixed grass, rabbitbrush, and pinyon-juniper communities at 900 to 1950 m in Emery, Garfield, Grand, Kane, San Juan, Uintah, Washington, and Wayne counties; Colorado, New Mexico, and Arizona; 40 (iii). In contemporary floras this plant has been regarded at specific rank as *E. cutleri*. However, the length of the stalks of the ovulate cones and the viscid condition of the stems forms a continuum with *E. viridis* in a strict sense, especially where the two grow together. This is the phase of the species that forms stands in extensive sandy grasslands in southeastern Utah, often with only the tips of the stems protruding, almost grasslike, from the sand. Much of the plant is buried within the sandy substrate, which it helps to stabilize.

GINKGOACEAE Engler in Engler & Prantl

Ginkgo Family

Dioecious, deciduous, resinous trees; leaves alternate or clustered on spur shoots, fan-shaped, bilobed, dichotomously veined, petiolate; cones on spur shoots in leaf or bract axils; male cones catkinlike; female cones typically of 2 ovules, on a long peduncle, with usually only one maturing; seeds with a fleshy aril, plumlike; $x = 12$.

Ginkgo biloba L. Maidenhair Tree; Ginkgo. Trees to 20 m tall or more, the trunk to 1 m thick; bark deeply furrowed and gray in age, pale when young and smoothish; leaf blades mainly 2–6 cm long and 2–8 cm wide or more; cones 2–3 cm long, 1.5–2 cm thick, green and glaucous, long-pecunclad, ripening and finally fetid; $2n = 24$. Commonly grown specimen tree, especially on institutional grounds, in much of Utah; introduced from China; 6 (0). The plant has been cultivated for millenia in China, and is now widely grown in temperate portions of the world.

PINACEAE Lindl.

Pine Family

Plants monoecious (rarely dioecious) trees or shrubs; leaves evergreen or deciduous, needlelike, linear to oblong, borne singly or in clusters of 2–5 or densely aggregated on short lateral shoots; cones solitary, axillary or terminal; male cones small, soft, with spirally arranged microsporophylls; ovulate cones small to large, the several to many scales spirally arranged, each subtended by a bract and bearing 2 ovules; cones woody to leathery or papery; $x = 12, 13$.

- 1. Leaves borne in dense clusters on short spur branches; cones variously persistent or deciduous 2
- Leaves borne singly or in clusters of 2–5, persistent; cones typically persistent (except in *Abies*) 3
- 2(1). Leaves persistent; cones falling apart at maturity . . . *Cedrus*
- Leaves deciduous; cones persistent *Larix*
- 3(2). Leaves 2–5 per cluster and fitting together to form a cylinder or, if solitary, terete *Pinus*
- Leaves borne singly, either angled or flattened but not terete 4
- 4(3). Branchlets rough where needles have fallen, the leaves deciduous above the persistent base, typically 4–angled and sharply pointed *Picea*
- Branches smooth where needles have fallen, the leaves deciduous to the base, typically flattened and bluntly pointed 5
- 5(4). Cones erect, not persistent, the scales falling from the central axis, with subtending bracts not apparent on the cone surface; terminal buds resinous *Abies*
- Cones pendulous, persistent, the scales not deciduous from the central axis, with subtending 3-toothed bracts apparent on the cone surface; terminal buds not resinous *Pseudotsuga*

Abies Miller

Evergreen spirelike or conical trees with thin, grayish bark often bulged by resin vesicles when young, dark gray and thick in age; leaves borne singly, spirally arranged, flat, blunt, narrowed to a short stout petiole, wholly deciduous, the leaf scar nearly circular; winter buds blunt, resin covered; male cones catkinlike, cylindrical; ovulate cones stiffly erect, cylindrical, maturing in one season, the scales shed singly at maturity, the slender axis persistent on the branches for several years.

- 1. Branchlets pubescent; male cones bluish; mature leaves mostly 1.5–1.8 mm wide and 2–3 cm long; trees spirelike or dwarf and shrublike at timberline *A. lasiocarpa*
- Branchlets glabrous or nearly so; male cones rose to dark red; mature leaves mostly 1.8–2.5 mm wide and 2.5–5.5 cm long; trees with a conic to rounded crown .. *A. concolor*

Abies concolor (Gord. & Glend.) Lindl. White fir. [*Picea concolor* Gord. & Glend.; *A. grandis* var. *concolor* (Gord. & Glend.) Murray]. Trees to 80 m tall, with the crown conic to rounded; bark thick, smooth when young except for resin blisters, strongly furrowed and dark gray in age; leaves solitary, flat in cross-section, bluish to yellow green, resin ducts lateral and just beneath the epidermis, the stomata in vertical rows on both surfaces, blunt to rounded apically, the leaf scar circular-depressed; male cones rose to dark red (rarely yellowish), less than 15 mm long; ovulate cones yellowish green to greenish purple, erect, oblong-cylindric, 7–12 cm long, the scales fan-shaped, broader than long; seeds broadly winged, 7–12 mm long. Mountain brush, aspen, Douglas fir, and fir communities at 1525 to 3050 m in all Utah counties except Daggett and Rich; Oregon to Wyoming, south to California, Arizona, New Mexico, and Mexico; 78 (xv).

Abies lasiocarpa (Hook.) Nutt. Subalpine Fir. [*Pinus* (*Abies*) *lasiocarpa* Hook.; *A. balsamea* ssp. *lasiocarpa* (Hook.) J. Boivin; *A. subalpina* Engelm. in Ward, type from Wasatch Plateau]. Trees to 40 m tall, with a spirelike crown or dwarfed and shrubby at timberline; bark smooth

except for resin blisters when young, becoming furrowed and dark gray in age; branchlets pubescent; leaves 1.2–3 (3.2) cm long, 1–2 mm wide, the upper surface nearly flat, the lower with a prominent ridge, blunt to acute and rigid, solitary, dark blue-green, the stomata on both surfaces, the upper in one more or less continuous band, the lower in 2 bands separated by the ridge, the leaf scar circular; staminate cones bluish, ca 9 mm long; ovulate cones mostly deep purple (rarely brownish green), 6–10 cm long; seeds 6–7 mm long, winged, the wings much longer than the seed, over 1 cm long. Aspen, spruce, spruce-fir, or fir communities, often growing with Engelmann spruce, at (2000) 2470 to 3355 m (often forming krummholz at timberline), in all Utah counties, except Davis and Millard; Alaska, Yukon, and British Columbia, south to Oregon, Arizona, and New Mexico; 68 (v).

Cedrus Trew

Monoecious or dioecious evergreen conifers; bark smooth and gray at first, but furrowed and dark gray in age; leaves alternate and single on young shoots, fascicled and numerous on spurs on older stems, quadrangular, stiff; male cones erect, cylindrical; ovulate cones erect, ovoid to cylindroid, with closely imbricated scales that fall apart at maturity; seeds with membranous wings.

Cedrus atlantica (Endl.) Manetti ex Carr. Atlas Cedar. [*Pinus atlantica* Endl.; *C. libani* ssp. *atlantica* (Endl.) Franco]. Trees to 30 m tall or more, and with trunks to 1 m thick or more; branchlets densely pubescent; leaves 6–25 mm long, bluish green, glaucous, quadrangular, sharply pointed, borne in fascicles of 20–50 on spur branches, singly on shoots of the season; male cones 2.3–5 cm long, the scales tan to brown, tardily deciduous; ovulate cones 6.5–10 cm long, 4.5–7 cm thick, ovoid to obovoid, strongly resinous, the scales deciduous from the persistent rachis, broadly fan-shaped, the seeds each with a fan-shaped yellowish brown wing. Uncommonly, but widely, grown specimen tree in the lower valleys of Utah; introduced from Algeria; 4 (0). The closely related species, *C. libani* A. Rich. or cedar of Lebanon, with which the Atlas cedar has been combined, is sometimes grown here also, but is apparently more frost sensitive. It is distinguished by having longer leaves and larger cones.

Larix Miller

Deciduous trees with scaly bark; leaves dimorphic, thin and scalelike hair-tipped bracteate ones at the tips of short branches, and green needles, these latter borne in clusters on short spur shoots or spirally arranged on long shoots, all deciduous; winter buds blunt; male cones cylindrical and catkinlike; ovulate cones curved upward, ovoid, maturing in one season, the entire cone more or less persistent, not falling apart at maturity.

- 1. Leaves, at least the longest, (25) 35–50 mm long; male cones yellow; ovulate cone scales much shorter than the long-attenuate, subtending bracts *L. occidentalis*
- Leaves mainly less than 25 mm long, male cones brown; ovulate cone scales much longer than the slender subtending bracts *L. decidua*

Larix decidua Miller European Larch. [*L. europaea* DC.]. Trees to 25 m tall or more, the trunk to 1 m thick or more; young twigs glabrous; bark ultimately thick and furrowed; needles typically 15–35 per spur, pale green,

stiffish, mostly 8–25 mm long, flattened, the upper surface almost flat, the lower surface ridged in the middle; male cones brown, 1–2 cm long; ovulate cones mostly 2.5–3.5 cm long, the scales brown, somewhat hairy on the outer surface, truncate to broadly emarginate apically, longer than the attenuate subtending bracts; seeds ca 3 mm long, the wing oblique, ca 7 mm long, brownish; 2n = 24. Rather commonly grown specimen tree in much of lower elevation portions of Utah; introduced from Europe; 8 (i).

Larix occidentalis Nutt. Western, Montana, or Mountain Larch; Tamarack, Hakmatack; Western Tamarack. Trees to 50 m tall or more, the trunk to 1 m thick or more; young twigs glabrous or more or less pubescent; bark ultimately thick and furrowed; needles typically 15–30 per spur, pale green, stiffish, mostly (25) 35–50 mm long, rather broadly triangular in section, the upper surface flat or nearly so, the lower one ridged in the middle; male cones yellow, ca 1 cm long; ovulate cones mostly 2.5–3.5 cm long, the scales reddish brown to brownish, usually hairy on the outer surface, truncate to broadly emarginate apically, much surpassed by the long-attenuate subtending bracts; seeds ca 3 mm long, the wings ca 6 mm long, brownish to reddish. Established in a planting in Big Cottonwood Canyon, Salt Lake County; British Columbia to Oregon, east Montana and Idaho; 1 (0).

Picea A. Dietr.

Evergreen trees with scaly bark; needles borne singly, spirally arranged, quadrangular and square in cross section or more or less flattened, often sharply acute, deciduous above the base (quickly deciduous from cut branches), the twigs roughened with persistent peglike leaf bases; winter buds blunt; staminate cones cylindrical, catkinlike; ovulate cones curved downward, ovoid to cylindrical, maturing in one season, the cones more or less persistent, not falling apart at maturity.

- 1. Branchlets ordinarily pendulous along main branches; cones 10–18 cm long, trees cultivated *P. abies*
- Branchlets ordinarily spreading along main branches; cones less than 10 cm long; trees indigenous or cultivated 2
- 2(1). Twigs (or leaf bases) pubescent; leaves flexible, not sharply pointed, the apex blunt to acute; ovulate cones 3–6 cm long, deciduous following seed maturity *P. engelmannii*
- Twigs (and leaf bases) glabrous; leaves rigid, sharply pointed; ovulate cones 6–10 cm long, persistent following seed maturity *P. pungens*

Picea abies (L.) Karsten Norway Spruce. [*Pinus abies* L.]. Trees to 25 m tall or more, the trunk to 1 m thick or more; bark scaly, grayish; branches spreading to curved-ascending, with pendulous branchlets on mature branches; branchlets pubescent to subglabrous or glabrous; needles mainly 10–20 mm long, quadrangular; ovulate cones mainly 10–18 cm long, pendulous, persisting on the tree for one or more years; 2n = 24. Commonly grown ornamental tree in much of Utah; introduced from Europe; 1 (0). The white spruce, *P. glauca* (Moench) Voss, with cones 2.5–6.5 cm long is uncommonly grown in Utah. The branchlets are glabrous and the needles are 6–15 mm long.

Picea engelmannii Parry ex Engelm. Engelmann Spruce. [*Abies engelmannii* Parry; *P. glauca* ssp. *engelmannii* (Parry) Taylor]. Trees to 4 m tall, or shrubby and low at timberline; bark thin, scaly, reddish brown or cinnamon; twigs (or leaf bases) pubescent or rarely glabrous; leaves glaucous to deep bluish green, 13–25 (30) mm long, blunt to acute apically but not sharply pointed and pungent; staminate cones yellow brown, 7–15 mm long; ovulate cones purplish brown to brown, oblong-cylindric, 3–5.5 cm long, persistent for ca 1 year; scales entire to incised apically, the bracts shorter than the scales; seeds winged, the wing long, pale brown. Spruce, spruce-fir, and lodgepole pine communities at (2285) 2440 to 3420 m in probably all Utah counties; British Columbia to Alberta, south to California, Arizona, and New Mexico; 43 (viii). This tree is often a codominant with subalpine fir, and less commonly with lodgepole pine. The trees are harvested for lumber.

Picea pungens Engelm. Blue Spruce. Trees to 3 m tall, often with a dense conical crown, or with an open and pyramidal crown in age; bark gray to brownish, thickish, scaly, sometimes furrowed; twigs (and leaf bases) glabrous, shiny; leaves bluish green, rigid, 12–30 mm long, tapered to a pungent tip; male cones yellow, 10–15 mm long; ovulate cones purplish brown when young, light brown or stramineous when mature, 6–12 cm long, persistent for at least 2 years; scales thin, the apex erose and undulate, surpassing the bracts; seeds 2–3 mm long, winged, the wing longer than the seed. Riparian and other moist habitats with willow, cottonwood, and other mesophytes at 1830 to 2870 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Grand, Kane, Iron, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; Idaho and Wyoming to Arizona and New Mexico; 34 (iii). The blue spruce is the state tree for both Utah and Colorado. The trees are used for lumber.

Pinus L.

Evergreen trees with scaly bark; leaves dimorphic, of thin scalelike ones subtending the base of short spur branches and of green needles borne singly (and terete) or in clusters of 2–5 on spur branches, these spirally arranged on the twigs; winter buds acutish, resinous; male cones ovoid to cylindrical; ovulate cones variously arranged but not erect in age, ovoid to lance-ovoid, maturing in 1 or 2 seasons, more or less persistent, woody, not falling apart at maturity.

- 1. Needles borne in bundles of 5 2
- Needles solitary (and terete) or in clusters of 2 or 3 ... 6
- 2(1). Needles entire along the margins; trees indigenous ... 3
- Needles minutely serrulate marginally; trees introduced 4
- 3(2). Needles 3–7 cm long, the sheaths early deciduous; cones 7–20 cm long, unarmed; plants widely distributed *P. flexilis*
- Needles 2–4 cm long, the sheaths persisting for 2–3 years; cones 5–9 cm long, armed with spines; plants local, mainly in southern Utah *P. longaeva*
- 4(2). Ovulate cones typically 15–25 cm long; needles mainly 5–10 cm long; plants grown in Big Cottonwood Canyon, Salt Lake County *P. monticola*
- Ovulate cones of various length but, if 15–25 cm long, the needles more than 10 cm long 5

- 5(4). Needles less than 12 cm long, slender but not drooping *P. strobus*
- Needles 12–20 cm long, slender, drooping . *P. griffithii*
- 6(1). Needles solitary (rarely 2 per bundle), cylindrical, terete; trees of the Great and Virgin basins *P. monophylla*
- Needles in bundles of 2 or 3 7
- 7(6). Needles typically borne in bundles of 3 (at least some) 8
- Needles typically in bundles of 2 9
- 8(7). Cones 15–30 cm long; bark with odor of vanilla; buds not covered with resin droplets; plants introduced, cultivated *P. jeffreyi*
- Cones 7–15 cm long; bark with odor of turpentine; buds often with resin droplets; plants indigenous, sometimes cultivated *P. ponderosa*
- 9(7). Trees small to moderately sized; sheath at base of needles deciduous; seeds large, edible; plants mainly of the Colorado Plateau *P. edulis*
- Trees small to large; sheath at base of needles persistent; seeds small to moderate, not typically eaten; plants introduced or, if indigenous, the distribution various or otherwise 10
- 10(9). Needles 8 cm long or more 11
- Needles 8 cm long or less 12
- 11(10). Trees typically less than 5 m tall; bark scaly, cinnamon; cones 3–5 cm long *P. densiflora*
- Trees typically much more than 5 m tall; bark finally furrowed and gray, not cinnamon; cones 8–10 cm long *P. nigra*
- 12(10). Trees with scaly cinnamon colored bark (at least above); cones short stalked; plants introduced *P. sylvestris*
- Trees with bark various, but not cinnamon colored; cones sessile or subsessile 13
- 13(12). Plants typically shrubby and less than 2.5 m tall, introduced *P. mugo*
- Plants typically much over 2.5 m tall; indigenous in northern Utah and uncommonly cultivated . *P. contorta*

Pinus contorta Dougl. ex Loudon Lodgepole Pine; Black Pine. [*P. murrayana* Balf. in Murray; *P. contorta* ssp. *murrayana* (Balf.) Critchf.; *P. contorta* var. *murrayana* (Balf.) Engelm.]. Trees mostly 10–35 m tall, usually in dense stands with small bare trunks and in more open stands with branch covered bases; bark thin, orange brown to gray, scaly, not ridged or furrowed except in large trees in open stands; leaves 2 per cluster, (2) 3–9 cm long, stout, often twisted; staminate cones orange red, 8–10 mm long; ovulate cones borne on the upper branches, subsessile, serotinous, opening and shedding seeds in 2 or more years, 3–6 cm long, the scales narrow, thickened at the end, the umbo dorsal and with a short sharp subsistent prickle; seeds 3–4 mm long, reddish brown, with a prominent wing 10–12 mm long; 2n = 24. Aspen, lodgepole pine, and spruce-fir or spruce communities at 2135 to 3355 m in Cache, Daggett, Duchesne, Summit, Uintah, and Wasatch counties; Alaska to Saskatchewan, south to California and Colorado; 24 (i). A specimen taken in the Stansbury Mts., Tooele County, appears to be from a cultivated tree. This is the most common conifer in the Uinta Mts. Our plants belong to var. *latifolia* Engelm. ex Wats. (type from the Uinta Mts.) [*P. contorta* ssp. *latifolia* (Engelm.) Critchf.; *P. divari-*

cata var. *latifolia* (Engelm.) J. Boivin]. Insect infestations of lodgepole pine in recent years have resulted in wholesale death of post- to log-sized trees. Thousands of acres of trees have been killed.

Pinus densiflora Sieb. & Zucc. Japanese Red Pine. Trees small, mainly 4–5 m tall; bark thin, scaly, cinnamon colored (at least above); needles in bundles of 2, mainly 6–11 cm long, bluish green; ovulate cones 2.5–4 cm long, ovoid to cylindroid-ellipsoid, tardily opening, the seed 3–4 mm long, with an oblique wing 7–9 mm long, this stramineous to brownish. Sparingly grown ornamental pine of charm and beauty in at least Utah County; introduced from Japan; 5 (0). Our material apparently belongs to the dwarf horticultural phase passing as var. *umbraculifera* Tanyosho.

Pinus edulis Engelm. Pinyon; Two-needle Pinyon. [*P. monophylla* var. *edulis* (Engelm.) Jones; *P. cembroides* var. *edulis* (Engelm.) Voss]. Small to moderate sized trees with pyramidal to rounded crown, mainly 5–15 (20) m tall, the trunk short; bark thin and scaly, yellowish brown to reddish brown, finally furrowed and grayish; needles 2 (1–3) per cluster, 1.5–5 cm long, rigid, sharply pointed, the sheath deciduous; staminate cones 3–6 mm long; ovulate cones ovoid, (2) 3–5 cm long, short-stalked, yellowish brown to brown, resinous, the scales thickened apically but without a prickle, the umbo dorsal, inconspicuous; seeds brown, mainly 8–16 mm long, ovoid-ellipsoid to ellipsoid, thick-shelled, wingless, averaging smaller than in *P. monophylla* (q.v.); $n = 12$. Pinyon-juniper and pinyon or sagebrush and lower aspen communities at 1220 to 2745 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Iron, Juab, Millard, Piute, Rich, San Juan, Sanpete, Sevier, Uintah, Utah, and Washington counties; Wyoming to Arizona, New Mexico, Oklahoma, and Mexico; 92 (xiv). The two-needle pinyon, usually in association with Utah juniper (which often serves as a nurse plant), forms extensive woodlands in many areas of the state, except in western Utah where it is replaced by *P. monophylla*. The latter plant has a more open crown and more bluish green aspect, in addition to the key characters. Besides being valuable for the edible seeds, the wood is used as a premier firewood. Huge areas of pinyon-juniper woodland have been devastated in attempts (not always wise) at improvement of range forage conditions, especially for grazing by domestic livestock and wildlife.

Pinus flexilis James Limber Pine. [*Pinus flexilis* (James) Rydb.]. Trees, mainly 8–20 m tall, with pyramidal or more commonly rounded crown, sometimes shrubby; mature bark dark brown to blackish, furrowed, and with rectangular scaly plates; young branchlets puberulent; needles 5 per cluster, (2.2) 3.5–7 cm long, rigid, dark green, not serrulate; staminate cones reddish, 7–10 mm long; ovulate cones ovoid to subcylindric-ellipsoid, 6–14 cm long, short-stalked, the scales thickened at the tip, the umbo terminal, unarmed; seeds 7–12 mm long, dark brown, the wing vestigial. Typically on ridge crests in Douglas fir, ponderosa pine, aspen, and spruce-fir or high elevation grass-sagebrush communities at 1830 to 3450 m in all Utah counties, except Uintah; British Columbia and Alberta, south to California, Arizona, and Texas; 80 (xi). Trees of this species are seldom common, but stand flaglike along windswept ridgecrests in many plant communities. The seeds are sufficiently large to be used as human food, but are seldom harvested.

Pinus jeffreyi Balf. in Murray Jeffrey Pine. Trees, mainly 10–40 m tall, the crown finally rounded; mature bark furrowed, with large irregular plates, finally purplish to reddish brown, the furrows exposing red fresh bark, with the odor of vanilla; buds without resin droplets; needles (2) 3 per bundle, bluish green, mainly 12–25 cm long; sheaths of needles persistent; staminate cones 2–3.5 cm long, purplish; ovulate cones 15–25 cm long, ovoid to ovoid-ellipsoid, short-stalked, the scales thickened apically, the dorsal umbo armed with a prickle; seeds 10–12 mm long, the wing prominent, mainly 2–3 cm long. Cultivated ornamental and specimen tree in Utah County (at least); Oregon, California, and Nevada; 2 (0).

Pinus longaeva D. K. Bailey Western Bristlecone. Bushy trees to 20 m tall, or gnarled and shrublike; bark grayish to reddish brown; branches pendulous, twisted and very elongated; leaves 5 per cluster, persistent, 2–4 cm long, rigid, dark green, not serrulate; staminate cones 10–12 mm long; ovulate cones 5.5–8.5 cm long, broadest at the base, reddish brown, the scales thickish, ridged, the umbo dorsal and armed with a slender incurved prickle 4–6 mm long; seeds pale brown, 6–8 mm long, the wings slightly longer. Ridges and open slopes, mainly on limestone or dolomitic substrates, in ponderosa pine, spruce, and spruce-fir communities at 2195 to 3265 m in Beaver, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Sanpete, Tooele, Utah, Wayne, and Washington counties; Nevada and California; 45 (ix). This species is distinguished from *P. aristata* Engelm., the bristlecone pine, in having 2 resin ducts per leaf, these not or rarely producing a resin dot at the leaf apex. The western bristlecone is among the oldest living trees in the world, with some known to have lived for 5000 years.

Pinus monophylla Torr. & Frem. Singleleaf Pinyon. [*P. edulis* var. *monophylla* (Torr. & Frem.) Torr. in Voss; *P. cembroides* var. *monophylla* (Torr. & Frem.) Voss]. Trees to 15 (20) m tall, with rounded to flat-topped crown in age; mature bark reddish brown, with narrow flat ridges; needles mostly solitary, rigid, incurved, pale green, sharply pointed, 2.5–3.5 cm long, the sheaths deciduous; staminate cones yellowish, 5–6 mm long; ovulate cones 3.5–5.5 cm long, broadly ovoid, brown, the scales thick, especially at the tip, 4–seeded; seeds mostly 10–17 mm long, wingless, brown, moderately thin-shelled, edible. Pinyon-juniper, pinyon, sagebrush, and lower aspen communities at 820 to 2535 (2960) m in Beaver, Box Elder, Cache, Iron, Juab, Kane, Millard, Tooele, Utah, Wasatch, and Washington counties; Arizona, Nevada, California, and Baja; 37 (iv). The presence within the Great Basin of trees with 2 or even 3 needles instead of the usually rounded, solitary needle has led some botanists to view the unusual plants as hybrids between this and the two-needle pinyon of the Colorado drainage. Trees having more than the usual number of needles are almost exclusively on mesic sites and the condition seems to be ecologically induced instead of indicating genetic interaction. This is the principal nut-pine of commerce, with great quantities of the seeds being harvested in some years for sale as “pine nuts.” Stands of this species and Utah juniper in the Great Basin have been devastated similarly to those of the two-needle pinyon to improve rangelands for grazing purposes.

Pinus monticola Dougl. ex D. Don Western White Pine. [*P. strobus monticola* (Dougl.) Nutt.]. Trees to 25 m tall or more; trunks to 1 m in diameter or more; bark

thin, gray, smooth at first, finally furrowed into scaly plates; branchlets puberulent; buds ovoid, acute; leaves in bundles of 5, persisting for 2–4 years, glaucous, (4) 5–10 cm long, more or less serrulate along the margins; sheaths deciduous; male cones 7–10 mm long, yellow; ovulate cones typically 15–25 cm long, narrowly oblong, pale brown, pendulous, on stalks 1–2.5 cm long, the umbo terminal, inconspicuous; seeds 6–10 mm long, the wings 20–25 mm long. Known from a planting in Big Cottonwood Canyon (Spruces), Salt Lake County; British Columbia and Alberta to California, Idaho, and Montana; 1 (0).

Pinus mugo Turra Mountain Pine; Mugo Pine. [*P. montana* Miller]. Shrubby low trees mainly less than 6 m tall; trunk seldom readily apparent; bark scaly, gray, not becoming cinnamon above; leaves 2 per bundle, mainly 4.5–7 cm long, green to blue green, persisting for some years, the sheaths more or less persistent; staminate cones yellowish, 8–10 mm long; ovulate cones 4–6 (7) cm long, the umbo dorsal, unarmed; seeds 3–5 mm long, the wing about twice as long as the seed, scarious, shiny; $2n = 24$. Rather commonly grown ornamental in much of lower elevation portions of the State (Cache, Davis, and Utah counties); introduced from Europe; 9 (0).

Pinus nigra Arnold Austrian Pine. Trees, mainly 20–30 m tall, with a rounded crown; bark ultimately thick, gray, and furrowed, not becoming cinnamon upward; needles in bundles of 2, mainly 12–16 cm long, blue green, the sheaths persistent; staminate cones yellowish, 25–35 mm long; ovulate cones 5–8 cm long, tan to brownish, the scale tips brownish, the umbo dorsal, unarmed; seeds 5–7 mm long, the wings 2–3 times as long as the seeds, brownish, oblique; $2n = 24$. Commonly grown ornamental and shade tree of lower elevation portions of Utah; introduced from Eurasia; 6 (0). Austrian pine is frequently mistaken in cultivation for ponderosa pine, which usually has 3 needles per cluster and larger armed cones.

Pinus ponderosa Lawson Ponderosa Pine; Western Yellow Pine; Yellow Pine. Trees, mainly 10–30 m tall; bark ultimately thick, deeply furrowed, and reddish brown, forming polygonal plates, with cinnamon colored furrows; leaves mainly in clusters of 3 (less commonly in 2's), 8–10 cm long, yellow green, persisting at branch ends, the sheaths persistent; male cones yellow to purple, 2–3 cm long; ovulate cones 7–15 cm long, reddish brown, the scale tips yellowish brown and with a stout prickle on the umbo; seeds 6–7 mm long, the wing brownish purple, 2–4 times as long as the seed; $2n = 24$. Mountain brush, ponderosa pine, and aspen communities (less commonly with spruce-fir and lodgepole pine communities) at 1555 to 2685 m in all Utah counties except Box Elder, Cache, Davis, Morgan, Rich, Salt Lake, and Wasatch (?); British Columbia to the Dakotas and Nebraska, south to California and New Mexico, 69 (vi). This is one of the premier lumber trees of Utah, producing cylindrical large boles, often without major branches in the lower 5–10 meters. The wood is used both in rough construction and in cabinet work.

Pinus strobus L. White Pine; Eastern White Pine. Slender trees, mainly 10–25 m tall; trunk to 1 m thick or more; bark scaly, not deeply furrowed; needles in clusters of 5, very slender, serrulate, yellow green to blue green, the sheaths soon deciduous; staminate cones yellowish, 8–10 mm long; ovulate cones 6–25 cm long, on stalks to 2 cm long or more, broadest near the middle, the scales

thickish, brown to reddish brown, the umbo terminal, unarmed; seeds 4–6 mm long, the wings 2–4 times as long as the seeds; $2n = 24$. Cultivated ornamental and specimen trees in lower elevation portions of the state; Manitoba to Newfoundland, south to Iowa, Illinois, Tennessee, and Georgia; 4 (0). This pine is only sparingly grown in Utah, but was probably the most important soft wood used in colonial America.

Pinus sylvestris L. Scots Pine. Trees mainly 15–25 m tall, finally with an open spreading crown; bark thin, ultimately furrowed and dark gray below, becoming scaly and cinnamon upward; needles 2 per cluster, 4.5–9 cm long, yellow green, the sheaths persisting; male cones 8–12 mm long, yellowish; ovulate cones 4–7 cm long, conic to ovoid, the umbo dorsal, unarmed; seeds 3–4 mm long, the wing much longer than the seeds; $2n = 24$. Commonly grown ornamental, windbreak, and specimen tree in much of lower elevation Utah (Cache, Utah, and Weber counties); introduced from Europe; 11 (0).

Pinus uallichiana A. B. Jackson Himalayan White Pine. [*P. griffithii* authors, not Parl.]. Slender trees, mainly 10–25 m tall; bark smooth, at least when young; branchlets glabrous, glaucous; leaves in bundles of 5, mainly 18–22 cm long, very slender, serrulate, yellowish to bluish green and glaucous; staminate cones yellowish; ovulate cones 12–25 cm long, yellowish brown, the scales yellowish apically, the umbo subterminal, mucronate, but not sharply awned; seeds 5–6 mm long, the wing several times longer than the seed, brown. Uncommonly grown specimen tree in lower elevation portions of Utah; introduced from the Himalayas; 3 (0).

Pseudotsuga Carr.

Evergreen coniferous trees; bark ultimately blackish to dark gray and deeply furrowed; branchlets with slightly raised oval leaf scars; winter buds reddish brown, non-resinous, pointed; leaves solitary, spirally arranged, flat, more or less petiolate; staminate cones solitary in leaf axils, the microsporphylls expanded apically; ovulate cones terminal or apparently so, pendent, maturing in one season, not falling apart at maturity, the scales rounded, surpassed by subtending, conspicuously 3-lobed bracts; seeds oblong, shorter than the membranous wings.

Pseudotsuga menziesii (Mirbel) Franco Douglas Fir; Red Pine. [*Abies menziesii* Mirb.; *A. taxifolia* Poir. in Lam., not Du Tour 1803 or Desf. 1804; *P. taxifolia* (Poir.) Britt.]. Trees mainly 20–30 m tall; bark smooth when young, finally deeply furrowed and blackish to dark gray in age; branches mainly alternate, usually pubescent for some years; leaves mainly 15–35 mm long, flat, obtuse to acutish, bluish green; staminate cones 5–8 mm long, orange red; ovulate cones 4–6 cm long (exclusive of bracts), ovoid-cylindrical, pendulous, brown to reddish brown, soon deciduous, the scales rounded, the subtending 3-lobed bracts prominently exerted; seeds 5–6 mm long, the wing ca twice as long as the seed; $2n = 26, 27$. White fir, mountain brush, aspen, and spruce-fir communities at 1525 to 3050 m in all Utah counties; British Columbia and Alberta, south to California, New Mexico, Texas, and Mexico; 127 (xxvi). Our material belongs to var. *glauca* (Beissner) Mayr [*Tsuga douglasii* var. *glauca* Beissner. in Jager & Beissner; *P. douglasii* var. *glauca* (Beissner) Mayr; *P. globosa* Flous, type from Big Cottonwood Creek, Salt Lake County]. This species was ex-

plotted for lumber, as red pine, by pioneer sawyers. The wood is hard, close-grained, and very durable. Sites logged of this species a century ago still have not grown back trees of usable size.

TAXACEAE S. F. Gray

Yew Family

Evergreen dioecious shrubs or trees; leaves needle-like, flattened, alternate or rarely opposite, often 2-ranked; plants dioecious; staminate cones small, globular, axillary; ovulate cone much reduced, the ovules solitary, each surrounded by a fleshy disc (aril), the aril ripening and brightly colored at maturity; $x = 11$.

Taxus L.

Treated is a single genus with features of the family.

- 1. Leaves gradually acuminate; winter bud scales not keeled *T. baccata*
- Leaves abruptly acute; winter bud scales keeled *T. cuspidata*

Taxus baccata L. English Yew. Trees, mainly 3–7 m tall; winter buds obtuse, the scales persistent at base of branches; leaves mainly 2–3 cm long, gradually acuminate, glossy and dark green above, pale beneath; aril nearly globose, to ca 12 mm thick. Sparingly cultivated ornamental in Utah; introduced from Eurasia; 8 (0). This and other species of yew are poisonous to livestock and people. The poisonous principal is reputedly alkaloidal.

Taxus cuspidata L. Japanese Yew. Shrubs or trees, mainly 0.5–2 m tall; winter buds ovoid-oblong, acute, the scales keeled; leaves mainly 2–3 cm long, abruptly acute, dull green above, with 2 yellowish bands beneath; aril ellipsoid, to ca 12 mm thick. Rather commonly grown ornamental in Utah; introduced from eastern Asia; 6 (0).

TAXODIACEAE Warm.

Taxodium Family

Evergreen or deciduous trees; leaves spirally arranged, though often 2-ranked; male cones terminal or axillary, with spirally arranged microsporophylls, each with several microsporangia; ovulate cones woody, with thickened widely spreading scales, each bearing 2–9 ovules; $x = 11$.

- 1. Leaves opposite or apparently so, branchlets deciduous with the leaves in autumn *Metasequoia*
- Leaves alternate or apparently so, mostly spirally arranged, branchlets and leaves deciduous or evergreen ... 2
- 2(1). Leaves scalelike, subulate and rigid, evergreen *Sequoiadendron*
- Leaves needlelike, flat, not subulate and rigid, deciduous *Taxodium*

Metasequoia Miki

Trees with deciduous branchlets; leaves decussate or apparently 2-ranked; male cones sessile, in long drooping clusters; ovulate cones subglobose, pendulous on naked peduncles; scales 10–15 pairs; seeds 5–8 per scale, 2-winged.

Metasequoia glyptostroboides Hu & Cheng Dawn Redwood. Dioecious (or monoecious) trees to 15 m tall or more; trunks buttressed; bark thin, shredded, or ultimately thickened and furrowed; leaves mainly 5–27 mm long, flattened, 1–1.6 mm wide, deciduous with the branchlet in autumn; ovulate cones 2–2.5 cm long, subglobose, becoming quadrangular upon opening, borne on stalks 1.5–6 cm long, the scales more or less peltate, green, finally becoming brown to tan; $2n = 22$. Uncommonly grown specimen and shade tree in Utah; introduced from China; 5 (ii). The trees grow rapidly, with one example reaching a height of more than 10 meters and a basal diameter of 5 dm in 25 years. The wood is light and brittle when dry, but flexible and strong when growing. The species should be more widely planted.

Sequoiadendron Buchholz

Evergreen trees; leaves scalelike; male cones sessile; ovulate cones oblong-ovoid, green, persistent on the tree, woody, with numerous wedge-shaped scales, terminating in a long terete spine, each with 3–12 or more ovules; seeds maturing in 2 years, with 2 thin lateral wings.

Sequoiadendron giganteum (Lindl.) Buchholz Big Tree; Giant Sequoia. [*Wellingtonia gigantea* Lindl.]. Trees to 40 m tall or more; trunks buttressed, to 1 m thick or more, often without branches for some distance above the base in age; crown spirelike to rounded and open in age; bark finally thick; leaves decurrent, thickly set, appressed or with the tips spreading, 3–6 mm long, or 3–12 mm long on leading shoots, blue green; staminate cones 5–6 mm long; ovulate cones oblong-ovoid, 5–8 cm long, greenish, becoming red brown, the scales abruptly dilated into grooved disks; seeds ca 6 mm long, the wings broader than the body; $2n = 22$. Sparingly to commonly grown specimen tree and botanical curiosity from Utah County south to Washington County; California; 9 (iii). Trees of this species planted at Brigham Young University by B. F. Harrison in the mid 1940's are now more than 15 m tall, some with basal diameter more than 8 dm. A specimen from the east side of the Pine Valley Mountains, Washington County, planted sometime following the turn of the 20th century, now overtops the ponderosa pine forest in which it grows and has a basal diameter greater than one meter. Specimens of this species in California are among the largest and oldest trees on earth.

Taxodium Rich.

Trees with deciduous branchlets; leaves appearing 2-ranked, alternate, linear; male cones many, small, in catkinlike clusters at branch ends; ovulate cones globose, the scales many, thick, shield-shaped; seeds 2 per scale.

Taxodium distichum (L.) Rich. Bald Cypress; Swamp Cypress. [*Cupressus distica* L.]. Trees to 15 m or more; bark thin, gray brown, rough; leaves mostly 10–16 mm long, distichous, apparently alternate, on slender deciduous twigs 5–12 cm long; male cones 2 mm thick, borne in slender, drooping panicles; ovulate cones subglobose, 2–2.5 cm thick, the scales shield-shaped, tan to brownish. Uncommonly grown shade and specimen tree in Utah; introduced from the southeastern U. S.; 4 (0). Trees planted at the margin of the Botany Pond, Brigham Young University, in the mid 1940's by B. F. Harrison are now more than 12 m tall and have huge buttressed trunks. The trees should be more widely grown in the state.

DIVISION MAGNOLIOPHYTA

The Flowering Plants

Herbs, shrubs, trees, and trees with an alternation of generations; gametophyte generation greatly reduced, represented by microgametophytes (ultimately the pollen grains) and megagametophytes (the embryo sacs); fertilization double; sporophytes with roots, stems, leaves and flowers; xylem typically with vessels; flowers of spirally arranged parts, or of 1-4 whorls of parts cyclically arranged, usually with sepals, petals, stamens, and a pistil (or these variously lacking or modified); sepals typically enclosing the other parts in bud; petals typically as many as the sepals and borne alternate with them; stamens (microsporophylls) typically as many or twice as many and alternate with the petals (opposite the sepals); pistil variously simple (of one carpel or megasporophyll) and solitary or few to many, or consisting of connate carpels (hence compound); ovule solitary or few to many, borne on placenta by a funiculus; ovary ripening to form a fruit.

CLASS MAGNOLIOPSIDA

The Dicots

Annual, biennial, or perennial herbs, or shrubs or trees; leaves alternate, opposite, or whorled, simple or variously compound, typically net-veined; flower parts typically 4- or 5-merous; embryo typically with 2 cotyledons.

Key to the families.

- 1. Perianth consisting of a single whorl, arbitrarily called sepals, or none Key 1, p. 35
- Perianth consisting of 2 whorls (sepals and petals) 2
- 2(1). Corolla of separate petals 3
- Corolla of united (connate) petals, at least near the base Key 4, p. 39
- 3(2). Stamens numerous, more than twice as many as the petals Key 2, p. 37
- Stamens few, not more than twice as many as the petals Key 3, p. 37

Key 1.

Perianth consisting of a single whorl.

- 1). Plants parasitic on the branches of trees or shrubs, rooting in the host, usually yellow green Viscaceae, p. 643
- Plants not parasitic on branches of trees, rooting in soil 2
- 2(1). Plants trees, shrubs, or vines 3
- Plants herbaceous 29
- 3(2). Leaves opposite 4
- Leaves typically alternate, at least the uppermost ... 11
- 4(3). Plants trailing vines 5
- Plants trees or shrubs 6
- 5(4). Leaves compound; stamens and pistils many; flowers showy Ranunculaceae (*Clematis*), p. 503
- Leaves simple, deeply palmately lobed, stamens and pistils 5 or fewer; flowers not showy Cannabaceae (*Humulus*), p. 96
- 6(4). Ovary superior; fruit a samara, capsule, achene, or drupe 7

- Ovary inferior (apparently so in Elaeagnaceae); fruit a drupe or a berry 9
- 7(6). Flowers perigynous; plants shrubs, mainly less than 1 m tall Rosaceae (*Coleogyne*), p. 519
- Flowers hypogynous; plants trees or shrubs, mainly over 1.5 m tall 8
- 8(7). Fruit a double samara; leaves palmately lobed or 3- to 5-foliolate Aceraceae, p. 41
- Fruit a simple samara (1-winged), capsule, or drupe; leaves pinnately compound or simple and typically pinnately veined Oleaceae, p. 431
- 9(6). Flowers in pendulous catkins; leaves leathery, evergreen; plants of Washington County Garryaceae, p. 307
- Flowers variously arranged but not in catkins; leaves not both leathery and evergreen 10
- 10(9). Flowers in corymbose cymes, perfect; ovary usually 2-loculed; stamens typically 5 Cornaceae, p. 241
- Flowers solitary or in axillary clusters, often imperfect; ovary 1-loculed; stamens 4-8 Elaeagnaceae, p. 294
- 11(3). Leaves compound 12
- Leaves simple 15
- 12(11). Leaflets armed with spinulose teeth; plants evergreen Berberidaceae, p. 55
- Leaflets entire or serrate, but not spinulose, deciduous 13
- 13(12). Leaf rachis very narrowly winged; fruit a thin-fleshed drupe; trees cultivated and established in Washington County Anacardiaceae, p. 46
- Leaf rachis not winged; fruit not a drupe; trees or shrubs of various distribution and persistence 14
- 14(13). Leaflets entire; fruit a legume; flowers conspicuous, brightly colored or white Leguminosae, p. 336
- Leaflets toothed or entire; fruit drupaceous; flowers inconspicuous, greenish Juglandaceae, p. 326
- 15(11). Plants trailing vines Polygonaceae, p. 470
- Plants trees or shrubs 16
- 16(15). Flowers of one or both sexes in catkins (aments); plants monoecious or dioecious 17
- Flowers not in catkins, perfect or imperfect 22
- 17(16). Perianth lacking 18
- Perianth present 20
- 18(17). Plants desert shrubs of saline soils; leaves entire, terete or nearly so; fruit a utricle Chenopodiaceae (*Sarcobatus*), p. 116
- Plants of moist situations in a variety of soils; leaves mostly not entire, the blades flat; fruit a nutlet, nut, or capsule 19
- 19(18). Plants monoecious; staminate flowers attached to bract of catkin Betulaceae, p. 57
- Plants dioecious; staminate flowers attached to axis of catkin Salicaceae, p. 546
- 20(17). Fruit a multiple or a syconium, fleshy and elongated, obovoid, or globose and woody Moraceae, p. 425
- Fruit an acorn or a nut 21
- 21(20). Fruit a nut, enclosed in a leafy involucre or in cone-like catkins; leaves serrate or doubly so; plants usually of moist situations, if native Betulaceae, p. 57
- Fruit an acorn, chestnut, or beechnut, with a basal cup, spiny bur, or subtended by bracts; leaves typically lobed; plants seldom of moist situations, unless cultivated Fagaceae, p. 304

- 22(16). Ovary inferior or apparently so . . . *Elaeagnaceae*, p. 294
 — Ovary superior 23
- 23(22). Ovary 1—carpellate; fruit an achene or berry 24
 — Ovary 2— or more-carpellate; fruit an achene or otherwise, but not a berry 25
- 24(23). Plants armed with thorns (modified leaves), introduced or indigenous shrubs with small but showy perianth; fruit a berry *Berberidaceae*, p. 55
 — Plants unarmed native shrubs, the perianth showy or not; fruit a plumose achene *Rosaceae*, p. 519
- 25(23). Plants typically trees; fruit a samara 26
 — Plants normally shrubs; fruit an achene or utricle 27
- 26(25). Leaves palmately veined and lobed; fruit of woody capsules borne in heads *Hamamelidaceae*, p. 314
 — Leaves pinnately veined, serrate; fruit a samara *Ulmaceae*, p. 611
- 27(25). Plants with milky juice; inflorescence subtended by colored foliose bracts *Euphorbiaceae*, p. 299
 — Plants with watery juice; inflorescence not as above 28
- 28(27). Flowers perfect, subtended by a cuplike involucre; stamens 6—9; fruit an achene *Polygonaceae*, p. 470
 — Flowers usually imperfect, not subtended by a cuplike involucre; stamens 1—5, fruit a utricle *Chenopodiaceae*, p. 116
- 29(2). Ovary inferior 30
 — Ovary superior 35
- 30(29). Plants aquatic; leaves entire and in whorls or alternate and dissected 31
 — Plants terrestrial; leaves various but not as above 32
- 31(30). Leaves alternate and finely dissected *Haloragaceae*, p. 314
 — Leaves whorled, entire *Hippuridaceae*, p. 315
- 32(30). Ovary 2—loculed, with 1 ovule per locule; fruit 2—seeded 33
 — Ovary 1—loculed, 1— or 2—ovuled, sometimes with several carpels, but with a single ovule developing (1— to 5—loculed and many-seeded in some *Aizoaceae*); fruit 1— or 2—seeded 34
- 33(32). Perianth of connate segments; leaves opposite or whorled; flowers usually in cymes *Rubiaceae*, p. 543
 — Perianth segments distinct; leaves alternate or basal; flowers in umbels *Umbelliferae*, p. 613
- 34(32). Plants typically fleshy and prostrate; fruit a typically circumscissile capsule *Aizoaceae*, p. 43
 — Plants usually not fleshy, of various habit but sometimes prostrate; fruit not a circumscissile capsule 35
- 35(34). Flowers sessile, borne in involucrate heads; anthers united into a tube around the style *Compositae*, p. 131
 — Flowers not sessile or in involucrate heads; anthers distinct 36
- 36(35). Leaves alternate *Santalaceae*, p. 556
 — Leaves opposite 37
- 37(36). Leaves pinnately parted or compound, at least the cauline ones sheathing at the base; plants dioecious *Valerianaceae*, p. 635
 — Leaves simple, not sheathing at the base; plants with perfect flowers *Nyctaginaceae*, p. 426
- 38(29). Pistils several to many per flower; stamens usually 10 or more *Ranunculaceae*, p. 503
 — Pistils 1 (3 or 4 in *Saururaceae*) per flower; stamens 1 to many, but usually 10 or less 39
- 39(38). Plants aquatic, typically more or less submerged 40
 — Plants terrestrial, sometimes growing in moist or wet soil 41
- 40(39). Leaves entire, opposite, often crowded into terminal rosettes *Callitrichaceae*, p. 84
 — Leaves dichotomously dissected, whorled *Ceratophyllaceae*, p. 115
- 41(39). Perianth lacking entirely (in some *Euphorbiaceae*, the involucre has petaloid bracts) 42
 — Perianth present 43
- 42(41). Inflorescence spicate, subtended by a conspicuous petaloid involucre, the whole resembling a single flower *Saururaceae*, p. 557
 — Inflorescence a cyathium (a cupshaped involucre enclosing a cluster of staminate flowers each consisting of single pedicellate stamens, and pistillate flowers, consisting of solitary, 3—lobed pistil), which often bear petaloid appendages and glands *Euphorbiaceae*, p. 299
- 43(41). Flowers epigynous *Araliaceae*, p. 50
 — Flowers perigynous or hypogynous 44
- 44(43). Flowers perigynous, the ovary enclosed in or seated in a hypanthium 45
 — Flowers hypogynous, the ovary not enclosed in a hypanthium 48
- 45(44). Hypanthium campanulate, the 4 sepals apparent as triangular lobes; plants often aquatic or growing in mud, seldom terrestrial *Lythraceae*, p. 417
 — Hypanthium various, the sepals 4 or 5; plants not aquatic or growing in mud, terrestrial 46
- 46(45). Stipules present; leaves alternate *Rosaceae*, p. 519
 — Stipules none; leaves opposite 47
- 47(46). Stamens 3—5; fruit indehiscent *Nyctaginaceae*, p. 426
 — Stamens many; fruit dehiscent by a circumscissile lid *Aizoaceae*, p. 43
- 48(44). Perianth showy; sepals and petals both present in bud, but the sepals caducous and represented only by scars during anthesis; plants with milky juice *Papaveraceae*, p. 450
 — Perianth showy or not, plants various but not as above 49
- 49(48). Styles and stigmas single 50
 — Styles and stigmas typically more than 1 51
- 50(49). Perianth neither tubular nor corolla-like *Urticaceae*, p. 637
 — Perianth tubular, corolla-like *Nyctaginaceae*, p. 426
- 51(49). Leaves mostly deeply palmately 5— to 7—lobed or with 5—7 leaflets; flowers imperfect *Cannabaceae*, p. 96
 — Leaves mostly entire or shallowly lobed; flowers perfect or imperfect 52
- 52(51). Ovary with more than 1 locule 53
 — Ovary with a single locule 54
- 53(52). Leaves opposite *Aizoaceae*, p. 43
 — Leaves alternate, at least above *Euphorbiaceae*, p. 299
- 54(52). Leaves opposite; ovules and seeds more than 1; fruit a capsule 55
 — Leaves alternate or opposite; ovules and seeds solitary; fruit an achene or utricle 56
- 55(54). Capsule opening by means of a circumscissile lid *Aizoaceae*, p. 43
 — Capsule opening by valves *Caryophyllaceae*, p. 101

- 56(54). Perianth typically of 6 segments; stamens 3, 6, or 9; stipular sheaths often present (lacking in several genera) **Polygonaceae**, p. 470
- Perianth with 1, 4, or 5 segments; stamens 1, 4, or 5; stipular sheaths not present 57
- 57(56). Bracts subtending flowers scarious, typically awn-tipped; plants not scurfy **Amaranthaceae**, p. 44
- Bracts subtending flowers not scarious, not awned, plants often scurfy **Chenopodiaceae**, p. 116

Key 2.

Corolla of separate petals; stamens more than twice as many as the petals.

- 1. Ovary inferior or partly so 2
- Ovary superior 7
- 2(1). Petals numerous; stems thick, succulent, armed with spines or glochids; leaves lacking or caducous **Cactaceae**, p. 85
- Petals few; stems not thick and succulent, though occasionally spiny; leaves present and conspicuous during growing season 3
- 3(2). Ovary only partly inferior 4
- Ovary wholly inferior 5
- 4(3). Leaves opposite; fruit a capsule **Saxifragaceae**, p. 557
- Leaves alternate; fruit a pome **Rosaceae**, p. 519
- 5(3). Flowers bright orange-erimson; fruit a leathery berry with fleshy seeds **Punicaceae**, p. 501
- Flowers variously colored; fruit not as above 6
- 6(5). Plants woody; fruit fleshy **Rosaceae**, p. 519
- Plants herbaceous; fruit a capsule **Loasaceae**, p. 413
- 7(1). Plants aquatic, with floating leaves **Nymphaeaceae**, p. 430
- Plants terrestrial, sometimes growing in moist or wet soils, but leaf blades not floating 8
- 8(7). Plants trees or shrubs 9
- Plants herbaceous, or woody at base only 14
- 9(5). Flowers in cymes, these borne on a wing-like bract, stamens borne in fascicles **Tiliaceae**, p. 610
- Flowers variously arranged, but not on a winglike bract; stamens not in fascicles 10
- 10(9). Shrubs or small trees with recurved thorns and pinnate leaves; fruit a legume **Leguminosae (Acacia)**, p. 336
- Shrubs or trees without thorns or pinnate leaves; fruit various but not a legume 11
- 11(10). Stipular scars encircling the stem; perianth parts, stamens, and pistils spirally arranged **Magnoliaceae**, p. 418
- Stipular scars not encircling the stem; perianth parts and stamens in whorls; pistil usually 1 12
- 12(11). Filaments united into a tube around the pistil **Malvaceae**, p. 419
- Filaments not united into a tube, distinct, or in clusters and more or less united basally 13
- 13(12). Inflorescence borne on a winglike bract; leaves oblique basally **Tiliaceae**, p. 610
- Inflorescence never as above; leaves various, but not as above **Rosaceae**, p. 519
- 14(8). Sepals 2 (3 in *Argemone*, and the plants with milky juice) 15
- Sepals more than 2; plants with watery juice 16
- 15(14). Sepals persistent; plants somewhat succulent **Portulacaceae**, p. 493

- Sepals caducous; plants not succulent **Papaveraceae**, p. 450
- 16(14). Filaments united into a tube around the pistil **Malvaceae**, p. 419
- Filaments not united into a tube, distinct or in clusters and united at the base 17
- 17(16). Maturing ovary open apically, the seeds exposed, flowers irregular **Besedaceae**, p. 518
- Maturing ovary closed apically, the seeds not exposed; flowers usually regular 18
- 18(17). Stamens attached to the margin of a hypanthium 19
- Stamens attached at base of ovary 20
- 19(18). Hypanthium 8- to 12-ribbed; stems usually 4-angled **Lythraceae**, p. 417
- Hypanthium not ribbed; stems not as above **Rosaceae**, p. 519
- 20(18). Leaves opposite **Guttiferae**, p. 314
- Leaves alternate or basal, but still alternate 21
- 21(20). Plants robust, glabrous, glaucous perennials; sepals leathery; flowers often 2-4 cm wide or more **Paenoniaceae**, p. 450
- Plants various, but not as above in all respects 22
- 22(21). Leaves compound, with 3-5 leaflets; ovary short-stipitate **Capparaceae (Polanisia)**, p. 97
- Leaves various, but not as above; ovary sessile **Ranunculaceae**, p. 503

Key 3.

Corolla of separate petals; stamens few, not more than twice as many as the petals.

- 1. Flowers with more than 1 pistil or the pistil so deeply lobed as to appear so 2
- Flowers with a single pistil 7
- 2(1). Plants succulent, fleshy **Crassulaceae**, p. 242
- Plants not succulent 3
- 3(2). Plants monoecious trees, the flowers borne in globose, unisexual heads; leaves palmately lobed **Platanaceae**, p. 355
- Plants herbs, shrubs, or trees, typically with perfect flowers, these not borne in globose heads; leaves various 4
- 4(3). Flowers 3-merous; plants weak annual herbs **Limnanthaceae**, p. 411
- Flowers 5-merous; plants various 5
- 5(4). Plants evergreen shrubs **Celastraceae (Forsellesia)**, p. 114
- Plants various but, if shrubs, seldom if ever evergreen 6
- 6(5). Stamens inserted on a hypanthium; flowers perigynous **Rosaceae**, p. 519
- Stamens inserted at base of ovary; flowers hypogynous **Ranunculaceae**, p. 503
- 7(1). Plants usually with tendrils, trailing vines, monoecious **Cucurbitaceae**, p. 289
- Plants lacking tendrils, or if tendrils present the flowers perfect, usually not trailing (except in **Passifloraceae**) 8
- 8(7). Styles 2-5, distinct to near the base 9
- Style 1 (or lacking), sometimes lobed or divided at the apex 24
- 9(8). Plants trees, shrubs, or vines 10
- Plants herbaceous 16

- 10(9). Leaves scalelike **Tamaricaceae**, p. 610
 — Leaves not scalelike, the blades typically well developed 11
- 11(10). Ovary inferior 12
 — Ovary superior 13
- 12(11). Flowers in umbels; leaves palmately compound or palmately lobed **Araliaceae**, p. 50
 — Flowers in racemes; leaves simple, variously veined and lobed **Saxifragaceae**, p. 557
- 13(11). Plants tendrillate vines; flower with a many-rayed, multicolored corona; ovary stipitate; styles 3 **Passifloraceae**, p. 453
 — Plants shrubs or trees, lacking tendrils; flowers and ovaries various but not as above; styles 1 or 2 14
- 14(13). Leaves alternate; fruit a drupe **Anacardiaceae**, p. 46
 — Leaves opposite 15
- 15(14). Plants mainly less than 0.5 m tall, to be sought in San Juan County; fruit a capsule **Frankeniaceae**, p. 306
 — Plants mainly 2–8 m tall or more; fruit a samaroid schizocarp **Aceraceae**, p. 41
- 16(9). Plants aquatic **Haloragaceae**, p. 314
 — Plants terrestrial 17
- 17(16). Ovary inferior (partly so in some Saxifragaceae) 18
 — Ovary superior 19
- 18(17). Flowers in umbels; fruit a schizocarp **Umbelliferaceae**, p. 613
 — Flowers variously disposed, but not in umbels; fruit a many-seeded capsule or berry **Saxifragaceae**, p. 557
- 19(17). Leaves compound; leaflets 3 **Oxalidaceae**, p. 449
 — Leaves simple 20
- 20(19). Leaves opposite 21
 — Leaves alternate 22
- 21(20). Sepals and petals 4–7; placentae 2–4, parietal **Frankeniaceae**, p. 306
 — Sepals and petals typically 4 or 5; placentae free-central or axile **Caryophyllaceae**, p. 101
- 22(21). Sepals 2; plants succulent **Portulacaceae**, p. 493
 — Sepals more than 2; plants not succulent 23
- 23(22). Flowers irregular; capsule open at the top before maturity **Resedaceae**, p. 518
 — Flowers regular; capsules opening at maturity **Caryophyllaceae**, p. 101
- 24(8). Ovary inferior 25
 — Ovary superior (sometimes enclosed by, but not adnate to, the floral tube) 29
- 25(24). Plants shrubs or subshrubs; leaves rough-hairy; petals hispid dorsally; known from Washington County **Loasaceae**, p. 413
 — Plants variously woody or herbaceous; leaves not rough hairy; petals typically glabrous; distribution various 26
- 26(25). Plants herbaceous 27
 — Plants woody shrubs 28
- 27(26). Flowers 4–merous **Onagraceae**, p. 434
 — Flowers 5–merous **Saxifragaceae**, p. 557
- 28(26). Leaves opposite; flowers in cymes; stamens 4 **Cornaceae**, p. 241
 — Leaves alternate; flowers solitary or in racemes; stamens 5 **Saxifragaceae**, p. 557
- 29(24). Plants trees or shrubs 30
- Plants herbaceous (suffrutescent in some Pyrolaceae) 48
- 30(29). Flowers irregular 31
 — Flowers regular 35
- 31(30). Petals 3, the lower 2 forming a keel **Polygalaceae**, p. 470
 — Petals 4 or 5, the lower 2 sometimes forming a keel 32
- 32(31). Flowers papilionaceous, the lower 2 petals often united and forming a keel; fruit a legume **Leguminosae**, p. 336
 — Flowers not papilionaceous, the lower 2 petals not forming a keel; fruit a 3-valved, frequently 1-seeded capsule, or a spiny, 1-seeded pod 33
- 33(32). Flowers yellow, borne in panicles in midsummer **Sapindaceae**, p. 556
 — Flowers variously colored or displayed, borne in springtime 34
- 34(33). Plants low-growing shrubs; leaves simple; stamens usually 4 **Krameriaceae**, p. 327
 — Plants large shrubs or trees; leaves palmately compound; stamens 5–8 **Hippocastanaceae**, p. 315
- 35(30). Leaves compound, with 2 or more leaflets 36
 — Leaves simple, sometimes deeply divided or parted 42
- 36(35). Leaves bipinnate; flowers purplish **Meliaceae**, p. 424
 — Leaves once pinnate; flowers variously colored 37
- 37(36). Leaves trifoliolate, alternate; fruit a samara with the wing continuous around it **Rutaceae**, p. 546
 — Leaves usually not trifoliolate; fruit various but, if samaroid, the wing not continuous around the seed and the leaves opposite 38
- 38(37). Leaves opposite 39
 — Leaves alternate 40
- 39(38). Leaflets 3–9 or more; fruit a samara; plants usually trees; leaves deciduous **Oleaceae** (*Fraxinus*), p. 431
 — Leaflets 2; fruit not a samara; plants shrubs; leaves persistent **Zygophyllaceae** (*Larrea*), p. 646
- 40(38). Leaflets with few to several rounded teeth, these bearing a subcircular gland; trees malodorous; fruit of samaras **Simaroubaceae**, p. 604
 — Leaflets variously toothed to entire, but not bearing circular glands if toothed; trees or shrubs not especially malodorous; fruit of berries or legumes 41
- 41(40). Leaves with leaflets spiny-toothed; sepals usually 6 in 2 whorls; petals usually 6 in 2 series; stamens 6 or 12 **Berberidaceae** (*Mahonia*), p. 55
 — Leaves not with spiny-toothed leaflets; sepals usually 5; petals 5 or fewer; stamens 5 or 10 **Leguminosae**, p. 336
- 42(35). Plants subshrubs at most; fruit stipitate **Cruciferae** (*Stanleya*), p. 243
 — Plants trees or shrubs; fruit not stipitate (except in Rutaceae, which has entire, caducous leaves and blue flowers) 43
- 43(42). Flowers blue, 8–14 mm long; herbage glandular-punctate, strongly odoriferous; fruit stipitate **Rutaceae** (*Thamnosma*), p. 546
 — Flowers variously colored, usually not blue, usually less than 8 mm long; herbage not glandular-punctate; fruit not stipitate 44
- 44(43). Plants with leaves modified as spines (foliage leaves in their axils), these sometimes 3-pronged; perianth conspicuous, usually 9– to 12-parted; fruit a berry; ovary 1-loculed **Berberidaceae** (*Berberis*), p. 55

- Plants not spiny, or if so, not as above; perianth usually inconspicuous, usually 8- to 10-parted; fruit a capsule or a drupe; ovary 2- to 5-loculed 45
- 45(44). Plants woody vines (lianas), typically with shaggy bark; leaves palmately veined or compound **Vitaceae**, p. 645
- Plants not woody vines; leaves various 46
- 46(45). Leaves leathery, evergreen; plants cultivated shrubs or small trees; fruit a globose, usually brightly colored berrylike drupe **Aquifoliaceae**, p. 50
- Leaves thin, mainly deciduous; plants cultivated or indigenous; fruit variously shaped but seldom if ever brightly colored 47
- 47(46). Stamens opposite the petals; ovary 2- or 3-loculed **Rhamnaceae**, p. 518
- Stamens alternate with the petals or more numerous; ovary 2- to 5-loculed **Celastraceae**, p. 114
- 48(29). Sepals 2 or 3 49
- Sepals 4, 5, or more 53
- 49(48). Plants succulent **Portulacaceae**, p. 493
- Plants not succulent or not especially so 50
- 50(49). Plants minute annual herbs with opposite leaves **Elatinaceae**, p. 295
- Plants of various duration; leaves alternate or basal and still essentially alternate 51
- 51(50). Sepals caducous; stamens 6-12; leaves entire **Papaveraceae**, p. 450
- Sepals persistent; stamens 6; leaves dissected 52
- 52(51). Petals 4, in 2 unlike pairs; stamens diadelphous, in 2 sets of 3 **Fumariaceae**, p. 306
- Petals 3, alike; stamens in 1 set **Limnanthaceae**, p. 411
- 53(48). Flowers irregular 54
- Flowers regular 58
- 54(53). Petals typically 3; stamens commonly 8 **Polygalaceae**, p. 470
- Petals mostly 5; stamens typically 10 or 5 55
- 55(54). Flowers papilionaceous; fruit a legume **Leguminosae**, p. 336
- Flowers not papilionaceous; fruit a capsule or separating into 3 indehiscent, 1-seeded carpels at maturity 56
- 56(55). Plants typically evergreen, sometimes suffrutescent; anthers opening by apparently terminal pores **Pyrolaceae**, p. 501
- Plants not evergreen or, if so, not otherwise as above 57
- 57(56). Leaves peltate; fruit separating into 3, indehiscent, 1-seeded segments at maturity **Tropaeolaceae**, p. 611
- Leaves not peltate; fruit a 1-loculed, 3-valved capsule **Violaceae**, p. 641
- 58(53). Leaves compound or deeply pinnatifid 59
- Leaves simple 62
- 59(58). Leaves mostly basal, deeply pinnatifid **Geraniaceae**, p. 311
- Leaves alternate or opposite 60
- 60(59). Leaves opposite; leaflets 3-16 (but, if 3, these more or less spine-tipped) **Zygophyllaceae (Tribulus)**, p. 646
- Leaves alternate; leaflets usually 3 61
- 61(60). Stamens 10; herbage with a sour taste **Oxalidaceae**, p. 449
- Stamens 2-6; herbage with a sharp, biting flavor **Capparaceae**, p. 97
- 62(58). Flowers imperfect; fruit an achene; plants with opposite leaves and stinging hairs or alternate and without stinging hairs **Urticaceae**, p. 637
- Plants various, but not as above 63

- 63(62). Plants minute annual herbs with opposite leaves, growing in mud **Elatinaceae**, p. 295
- Plants various, but leaves alternate or mainly so 64
- 64(63). Sepals and petals 4; stamens 6 (4 plus 2), 4, or rarely 2 **Cruciferae**, p. 243
- Sepals and petals mostly 5; stamens 5-10 65
- 65(64). Leaves with stipules; carpels tailed at maturity, separating from the base as 1-seeded, indehiscent segments **Geraniaceae**, p. 311
- Leaves lacking stipules; carpels various but if as above, not long tailed 66
- 66(65). Ovary 10-loculed, with 1 ovule per locule **Linaceae**, p. 412
- Ovary 2- to 5-loculed 67
- 67(66). Plants annual; leaves dissected, fruit 5-seeded, breaking into indehiscent nutlets **Limnanthaceae**, p. 411
- Plants perennial; leaves simple or scalelike; fruit a many-seeded capsule **Pyrolaceae**, p. 501

Key 4.
Corolla of united petals.

- 1. Ovary inferior or partly so 2
- Ovary superior 14
- 2(1). Stamens more than 5; anthers opening by terminal pores **Ericaceae**, p. 296
- Stamens 5 or fewer (if more as in *Adoxa*, the sepals 2-3); anthers not opening by terminal pores 3
- 3(2). Stamens united by the anthers 4
- Stamens separate 7
- 4(3). Plants usually tendril bearing; flowers monoecious; fruit a pepo **Cucurbitaceae**, p. 289
- Plants not tendril bearing; flowers usually perfect, at least some; fruit a capsule or an achene 5
- 5(4). Flowers not in involucrate heads; stamens not adnate to the corolla **Campanulaceae**, p. 84
- Flowers in involucrate heads; stamens adnate to the corolla 6
- 6(5). Calyx cup-shaped, 4-lobed, persistent on the achenes; receptacular bracts awn-tipped **Dipsacaceae**, p. 294
- Calyx consisting of a pappus of hairs, scales, or awns; receptacular bracts lacking or, if present, not as above **Compositae**, p. 131
- 7(3). Basal leaves ternately compound, long-petioled 8
- Basal leaves not ternate and long-petioled 9
- 8(7). Plants aquatic or semiaquatic; leaflets 2-9 cm long or more **Menyanthaceae**, p. 424
- Plants terrestrial; leaflets less than 2 cm long **Adoxaceae**, p. 43
- 9(7). Leaves alternate 10
- Leaves opposite or whorled 11
- 10(9). Plants woody, trees or shrubs or, if herbaceous, the leaves doubly compound **Araliaceae**, p. 50
- Plants herbaceous, the leaves simple **Campanulaceae**, p. 84
- 11(9). Stamens 1-3; flowers irregular; plants frequently ill scented **Valerianaceae**, p. 638
- Stamens 4 or 5; flowers regular or irregular 12
- 12(11). Herbs with ovary 1-loculed; flowers in involucrate heads; fruit an achene **Dipsacaceae**, p. 289
- Herbs or shrubs with ovary 2- to 5-loculed; flowers not in involucrate heads; fruit not an achene 13

13(12). Shrubs with broad leaves; ovary 3- to 5-loculed, leaves opposite or perfoliate, not whorled or with stipules **Caprifoliaceae**, p. 98

— Shrubs or more usually herbs, if shrubs, the flowers in globose heads; ovary 2-loculed; leaves opposite and having stipules, or whorled and lacking them **Rubiaceae**, p. 543

14(1). Stamens more than 5 15

Stamens 5 or fewer 23

15(14). Corolla segments distinctly united, cup- or tube-shaped 16

— Corolla segments not distinctly united, usually united only near the base or only part of the segments united 18

16(15). Pistils more than 1; stamens twice as many as the petals **Crassulaceae**, p. 242

— Pistil 1 per flower; stamens the same number as the petals 17

17(16). Anther opening by a terminal pore; plants green **Ericaceae**, p. 296

— Anther opening by a longitudinal slit; plants green or not **Pyrolaceae**, p. 501

18(15). Corolla irregular 19

— Corolla regular 21

19(18). Petals 5; fruit a legume **Leguminosae**, p. 336

— Petals 3 or 4; fruit not a legume 20

20(19). Leaves entire; petals 3 **Polygalaceae**, p. 470

— Leaves dissected; petals 4, in 2 unlike pairs **Fumariaceae**, p. 306

21(18). Flowers minute, in dense heads or spikes; stamens 10 to many; fruit a legume **Leguminosae**, p. 336

— Flowers not as above; fruit various but not a legume . 22

22(21). Filaments united well above the base; stamens many; leaves simple **Malvaceae**, p. 419

— Filaments united only at the base; stamens 10; leaves compound **Oxalidaceae**, p. 449

23(14). Plants parasitic, devoid of chlorophyll 24

— Plants usually not parasitic, possessing chlorophyll . 25

24(23). Flowers regular, minute; stems slender, trailing, twining, yellow or orange vines ... **Cuscutaceae**, p. 291

— Flowers irregular; stems erect, not trailing or twining, yellow or purplish herbs . . **Orobanchaceae**, p. 448

25(23). Corolla irregular 26

— Corolla regular 31

26(25). Ovary with 1 ovule per locule, appearing 4-loculed, often 4-lobed; fruit consisting of 4 indehiscent, 1-seeded nutlets 27

— Ovary with more than 1 ovule per locule, usually neither 4-loculed nor 4-lobed; fruit a capsule 28

27(26). Ovary 4-lobed; style arising between lobes, cleft apically **Labiatae**, p. 328

— Ovary not or only slightly 4-lobed; style arising from apex of ovary, not cleft apically ... **Verbenaceae**, p. 639

28(26). Plants aquatic; leaves often dissected; corolla spurred; stamens 2 **Lentibulariaceae**, p. 411

— Plants usually terrestrial or, if aquatic, other than above 29

29(25). Plants trees or shrubs; seeds winged; capsule narrowly cylindrical to cigar shaped ... **Bignoniaceae**, p. 58

— Plants herbaceous or woody only at base; seeds not winged; capsules various, but not as above 30

30(29). Plants strongly viscid-pubescent; fruit a woody capsule with 2 recurved, thorn-like appendages, 6-15 cm long or more **Pedaliaceae**, p. 453

— Plants usually not viscid-pubescent; fruit not as above **Scrophulariaceae**, p. 567

31(25). Trees with blackish, reticulately patterned bark; corolla urceolate, typically 4-merous; fruit a several-lobed berry; calyx persistent on the fruit **Ebenaceae**, p. 294

— Trees, shrubs, or herbs; corolla various but typically 5-merous; fruit various, the calyx not persistent, or the plants herbaceous 32

32(31). Plants with milky juice (watery in some Apocynaceae); pistil of 2 carpels, these separate at base, united by stigmas and/or styles 33

— Plants usually without milky juice; pistil various, but never as above 34

33(32). Styles united; stamens appressed around the stigma, but free from it **Apocynaceae**, p. 47

— Styles distinct below; stamens adnate to the stylar column **Asclepiadaceae**, p. 51

34(32). Ovary 1-loculed, 1-ovuled; style and stigma 1; fruit hard, dry; apparent corolla actually a calyx subtended by an involucre **Nyctaginaceae**, p. 426

— Ovary and fruit various but not as above; corolla and calyx both present 35

35(34). Stamens as many as the corolla lobes and opposite them; flowers often (but not always) in umbels **Primulaceae**, p. 497

— Stamens as many as, or fewer than, the corolla lobes and alternate with them; flowers seldom if ever in umbels 36

36(35). Corolla small (2 mm long or less), scarious, veinless; capsule opening by a lid; leaves parallel veined or nearly so **Plantaginaceae**, p. 453

— Corolla various, but not as above; capsule usually not opening by a lid, or the fruit not a capsule; leaves usually distinctly net veined 37

37(36). Ovary 4-lobed, 4-loculed; fruit consisting of 1-4 nutlets at maturity **Boraginaceae**, p. 59

— Ovary not 4-lobed, 1- to 3-loculed; fruit a capsule or a berry 38

38(37). Style with 3 stigmatic lobes; ovary 3-loculed; fruit a 3-valved capsule **Polemoniaceae**, p. 455

— Style not with 3 stigmatic lobes; ovary 1- to 2-loculed; fruit not as above 39

39(38). Ovary 1-loculed 40

— Ovary usually with 2 or more locules 41

40(39). Leaves opposite or whorled, entire; style 1 or none; plants mostly glabrous; inflorescence not scorpioid **Gentianaceae**, p. 307

— Leaves usually alternate or, if opposite, not entire; styles 2 or single and 2-cleft apically; plants mostly hairy; inflorescence usually scorpioid **Hydrophyllaceae**, p. 316

41(39). Stems trailing or twining; leaves often hastately or sagittately lobed **Convolvulaceae**, p. 240

— Stems not trailing or twining; leaves seldom if ever hastately or sagittately lobed 42

42(41). Styles 2 or 2-branched apically; fruit a capsule; plants herbaceous (except Eriodictyon) **Hydrophyllaceae**, p. 316

— Style 1; stigma entire or merely lobed apically; fruit a capsule, drupe, or berry; plants herbs, shrubs, or small trees 43

- 43(42). Stamens 2 44 — Trees flowering as the leaves appear or after; flowers variously disposed 6
- Stamens more than 2, or others represented by staminodes 46
- 44(43). Plants herbaceous *Scrophulariaceae* (*Veronica*), p. 567
- Plants woody 45
- 45(44). Leaves alternate *Ericaceae*, p. 296
- Leaves opposite *Oleaceae*, p. 431
- 46(43). Shrubs; leaves opposite or whorled *Buddlejaceae*, p. 84
- Shrubs, herbs, or rarely trailing vines; leaves alternate 47
- 47(46). Hypanthium present, 4-angled ... *Lythraceae*, p. 417
- Hypanthium lacking 48
- 48(47). Plants coarse, hairy, biennial herbs; inflorescence a dense spike of yellow flowers *Scrophulariaceae* (*Verbascum*), p. 567
- Plants shrubs, herbs, or trailing vines; inflorescence various but not a dense spike 49
- 49(48). Flowers 4-merous; plants shrubs or small trees, evergreen; leaves coriaceous *Aquifoliaceae*, p. 50
- Flowers 5-merous; plants herbs or shrubs, typically deciduous; leaves thin, not especially coriaceous *Solanaceae*, p. 604
- 5(4). Petals lacking; sepals connate, the calyx merely lobed; leaves often deeply cut (more than half way to base); bark of upper branches silvery white; common in cultivation *A. saccharinum*
- Petals present; sepals distinct; leaves seldom incised to the middle; bark not especially silvery white; uncommon in cultivation *A. rubrum*
- 6(4). Leaves palmately 7- to 9-lobed 7
- Leaves palmately 3- to 5-lobed 8
- 7(6). Blades cut more than half way to the base, the lobes narrowed below the middle, long-acuminate *A. palmatum*
- Blades cut to about 1/4 the distance to the base, the lobes not narrowed below, short-acuminate *A. circinatum*
- 8(6). Terminal lobe of leaf at least twice longer than broad *A. ginnala*
- Terminal lobe of leaf less than twice longer than broad 9
- 9(8). Leaves mainly less than 8 cm wide; plants indigenous, rarely cultivated 10
- Leaves mainly 8-20 cm wide; plants cultivated 11
- 10(9). Leaves glabrous, the sinuses narrow; sepals distinct, glabrous; petals commonly present *A. glabrum*
- Leaves pubescent beneath, with broadly rounded sinuses; sepals more or less connate, pubescent; petals lacking *A. grandidentatum*
- 11(9). Sinuses between principal lobes sharply angled; leaf lobes and teeth mostly blunt; inflorescence a raceme or panicle, much longer than broad *A. pseudoplatanus*
- Sinuses between principal lobes rounded; leaf lobes and teeth acuminate to acute 12
- 12(11). Samara wings widely diverging, essentially horizontal; plants with milky juice; leaf lobes attenuate-aristate; commonly cultivated *A. platanoides*
- Samara wings more or less pendulous; plants with watery juice; leaf lobes bluntly attenuate-acuminate apically; uncommonly cultivated *A. saccharum*

ACERACEAE A. L. Juss.

Maple Family

Trees or shrubs; leaves opposite, simple, or compound; flowers perfect, imperfect, or polygamous, regular, small, in lateral or terminal racemes, corymbs, or panicles; sepals 4-6, distinct or connate; petals 4-6, distinct or lacking; stamens 4-12, usually 8, the filaments distinct, arising from a disk or this lacking; pistil 1, the ovary superior, 2-loculed (rarely more); styles 2; fruit a flat, samaroid schizocarp; x = 13.

Acer L.

Leaves simple and usually palmately lobed and veined or pinnately to palmately compound; flowers inconspicuous; fruits with 2 wings, often falling as a unit. Note: The genus is represented by numerous cultivated and three native species, which also occur in cultivation. The plants persist following cultivation and occasionally become established. The vibrant display of colorful foliage in autumn by the members of this genus is outstanding.

Keller, A. C. 1942. *Acer glabrum* and its varieties. Amer. Midl. Nat. 27: 491-500.

- 1. Leaves compound 2
- Leaves simple 3
- 2(1). Leaves pinnately 3- to 7-foliolate; plants dioecious, indigenous and cultivated *A. negundo*
- Leaves palmately 3-foliolate; plants polygamous, indigenous, seldom cultivated *A. glabrum*
- 3(1). Leaves with tips of lobes rounded; trees small, rounded, cultivated ornamentals *A. campestre*
- Leaves with lobe tips bluntly to sharply acute to acuminate or attenuate; trees or shrubs, cultivated or indigenous 4
- 4(3). Trees flowering before the leaves appear in late winter or early spring; flowers from buds of the previous year 5

Acer campestre L. Hedge Maple. Small rounded trees mainly 3-6 m tall; bark corky, fissured; trunks mainly 2-4 dm thick; leaves 3-10 cm wide, 3- to 5-lobed, the lobes usually entire, rounded, green on both surfaces, puberulent along the veins, ciliate; flowers greenish, borne in corymbs; sepals green, narrowly oblong, 2.5-3 mm long, long hairy, colored like the petals and subequal to them, narrowly oblanceolate; samara wings almost horizontally spreading; 2n = 26. Sparingly cultivated landscaping tree in Cache and Utah counties; widely grown in the U.S.; introduced from Eurasia; 11 (0).

Acer circinatum Pursh Vine Maple. Small trees, mainly 1-6 m tall, sometimes reclining; branchlets slender, glabrous or sparsely pilose; leaves 5-12 cm wide, 7- to 9-lobed, the sinuses extending 1/4-1/3 to the middle, glabrous or hairy along the veins above, green above, paler beneath; flowers few, borne in corymbs; sepals red purple, 4-6 mm long; petals shorter than the sepals, greenish or whitish; samaras glabrous, the wings almost horizontal; n = 13. Cultivated specimen plants; sparingly grown in Utah County; British Columbia to California; 2 (0).

Acer ginnala Maxim. Amur Maple. Small shrublike trees, mainly 2–6 m tall; branchlets slender, glabrous; leaf blades 3–12 cm long, 1.5–7.5 cm wide, 3-lobed, the terminal lobe more than twice longer than broad, doubly serrate, glabrous or sparingly long hairy, green above, paler beneath; flowers corymbose; sepals greenish, 1.8–2.2 mm long, ovate-oval; petals white, subequal to the sepals; samaras sparingly long hairy and glandular, the wings strongly descending; $2n = 26$. Frequently grown ornamental in Salt Lake and Utah counties; widely grown in the U.S.; introduced from Asia; 5 (0).

Acer glabrum Torr. Rocky Mountain Maple. [*A. tripartitum* Nutt.; *A. glabrum* var. *tripartitum* (Nutt.) Pax; *A. neomexicanum* Greene; *A. glabrum* var. *neomexicanum* (Greene) Kearney & Peebles; *A. glabrum* ssp. *neomexicanum* (Greene) E. Murray]. Shrubs or small trees, mainly 2–8 m tall; herbage essentially glabrous; leaves palmately 3- to 5-lobed or 3-foliolate, mainly 2–8 cm wide, the lobes or leaflets rather sharply doubly serrate, acute apically; flowers in corymbose cymes, polygamous or dioecious; sepals greenish, 3–5 mm long; petals greenish, subequal to the sepals (rarely wanting?); samaras glabrous, the wings strongly descending. Pinyon-juniper, mountain brush, sagebrush, ponderosa pine, Douglas fir, lodgepole pine, and spruce-fir communities at 1675 to 3175 m in all Utah counties; Alaska south to California, Arizona, New Mexico, and Nebraska; 82 (xii). The phase of the species with small thickish leaves growing in Juab, Millard, and Beaver counties (at least) are assignable to var. *diffusum* (Greene) Smiley [*A. diffusum* Greene; *A. glabrum* ssp. *diffusum* (Greene) E. Murray]. The remainder probably best fit within var. *glabrum*.

Acer grandidentatum Nutt. Bigtooth Maple. [*A. saccharum* var. *grandidentatum* (Nutt.) Sudw.; *A. saccharum* ssp. *grandidentatum* (T. & G.) Desmarais; *A. saccharum* ssp. *grandidentatum* var. *trilobum* E. Murray, type from Ephraim Canyon]. Small trees, mainly 4–8 m tall; herbage more or less villous to puberulent at least on lower leaf surfaces; leaves palmately 3- to 5-lobed, mainly 2.5–10 (13) cm wide, lobed to near the middle, the lobes with few coarse teeth or lobes or almost entire; flowers in corymbose cymes, on pendulous elongate pedicels mainly 15–30 mm long, often long-hairy near the apex; sepals 3–5 mm long, greenish, broadly rounded, connate to near the middle or above; petals lacking; samaras more or less long-hairy, the wings descending to spreading; $2n = 26$. Oak, oak-maple, sagebrush, Douglas fir, and white fir communities at 1280 to 2810 m in all Utah counties, except Daggett, Emery, and Wayne; Idaho and Wyoming, south to Nevada, Arizona, Mexico, and Oklahoma; 107 (vii). This plant is a principal component of the mountain brush community in Utah.

Acer negundo L. Boxelder. [*A. interior* Britt. in Britt. & Shafer; *A. negundo* var. *interior* (Britt.) Sarg.; *A. negundo* ssp. *interior* (Britt.) Love & Love; *A. kingii* Britt. in Britt. & Shafer, type from the Wasatch Mts.]. Trees mostly 4–12 m tall, dioecious; branchlets velvety hairy or glabrous; leaves pinnately 3- to 7-foliolate, or rarely twice compound; leaflets mostly 2–10 cm long and 12–25 mm wide, usually coarsely toothed or lobed, hairy to glabrous on one or both surfaces, especially along the veins; flowers on drooping, very long pedicels, the staminate in subumbellate clusters, the pistillate in racemes; sepals 4 or 5, very small, mostly 1–2 mm long; petals lacking; stamens long-exserted, lacking in pistillate flow-

ers; ovary glabrous or hairy, lacking in staminate flowers; fruits usually glabrous, the wings descending-spreading; $2n = 26$. Riparian and palustrine communities at 850 to 2440 m in all Utah counties (except Davis and Piute); widespread in the U.S. and southern Canada, south to Central America; 107 (xv). A few of our cultivated specimens, those with glaucous and glabrous branchlets, are probably referable to var. *interior* (Britt.) Sarg. The plants are common in cultivation but because of insect infestations and other problems they have the reputation of being "dirty trees."

Acer palmatum Thunb. Japanese maple. Small trees, mainly 3–7 m tall; branchlets slender, glabrous or nearly so; leaf blades 3–9 cm long, 2.5–10 cm wide, 5- to 9 (usually 7) -lobed, the lobes lanceolate tapering to the sinuses, serrate to doubly so, loosely and sparingly long hairy when young, finally glabrate or hairy in lower vein axils; flowers corymbose; sepals reddish, 2.2–2.6 mm long, cuneate-oblong; petals drab purplish, shorter than the sepals; samaras sparingly long-hairy to glabrous, the wings almost horizontally spreading; $n = 13$. Cultivated ornamentals in Utah County; widely offered in nurseries, and grown through much of the U.S.; 7 (ii).

Acer platanoides L. Norway Maple. Trees, mainly 6–15 m tall; branchlets slender, glabrous; leaf blades mainly 3–15 cm long and 5–18 (22) cm wide, 5- to 7-lobed, the lobes often again lobed or toothed, each lobe or tooth attenuate-aristate, glabrous above, hairy in lower vein axils; flowers corymbose; sepals greenish, 5–6 mm long, oval-oblong, glabrous; petals yellowish green, surpassing the sepals, glabrous; staminal filaments glabrous; samaras sparingly hairy to glabrous, the wings almost horizontally spreading; $2n = 26$. Cultivated shade and ornamental trees in Cache, Juab, Millard, Salt Lake, Tooele, Uintah, and Utah counties; widely grown in the U.S.; introduced from Eurasia; 48 (0). The specimens examined include numerous horticultural forms, including purple-leaved and variegated phases.

Acer pseudoplatanus L. Sycamore Maple. Trees, mainly 6–15 m tall; branchlets slender, glabrous; leaf blades mainly 4–13 cm long and 5–18 cm wide, usually 5-lobed, the lobes again bluntly serrate or doubly so, rather abruptly and bluntly acuminate apically, glabrous above, hairy along veins and sometimes overall below; flowers racemose or paniculate; sepals greenish, 1.4–2.5 mm long, ovate to lance-oblong, ciliate; petals greenish, linear, shorter or subequal to the sepals; staminal filaments hairy; fruit long hairy, becoming glabrate, the wings spreading-descending; $2n = 52$. Commonly grown shade trees in Cache, Salt Lake, Sanpete, Tooele, and Utah counties; widely grown in the U.S.; introduced from Eurasia; 15 (i).

Acer rubrum L. Red Maple. Trees, mainly 5–15 m tall; branchlets slender, glabrous; leaf blades mainly 2.5–8 cm long and 2–9 cm wide, 3- to 5-lobed, the lobes again doubly serrate or shortly lobed, the apex rather abruptly acuminate, glabrous above, hairy in vein axils below; flowers umbellate from buds of previous season; sepals purplish, 3–3.5 mm long, oblong; petals purplish, subequal to the petals; samaras glabrous, the wings descending to descending-spreading. Uncommonly grown shade and ornamental trees in Box Elder, Salt Lake, and Utah counties; indigenous in eastern U.S.; 10 (0).

Acer saccharinum L. Silver Maple. Trees, mainly 10–20 m tall; branchlets slender, glabrous; leaf blades mostly

6–14 cm long and 6–15 cm wide, usually 5-lobed, the lobes again doubly-serrate and long attenuate apically, the sinuses obtuse, glabrous or sparingly hairy on one or both sides; flowers corymbose, borne on long-hairy pedicels, from buds of the previous season; calyx campanulate, rather shallowly to deeply 5-lobed, 4–5 mm long; petals lacking; staminal filaments hairy; samaras hairy, the wings rather strongly pendulous. Shade trees, rather common, mainly in older plantings in probably all of lower elevation areas of Utah; indigenous in eastern U.S.; 22 (i). Several horticultural forms are represented. The silvery-white bark of upper branches are often diagnostic for our plants. The trees suffer from iron chlorosis in Utah and probably because of this affliction they are grown less often than formerly.

Acer saccharum L. Sugar Maple. Trees mainly 8–15 m tall; branchlets slender, glabrous; leaf blades mostly 4–18 cm long and 3.5–22 cm wide, usually 5-lobed, glabrous above, hairy in leaf axils below, the lobes entire or with few rounded to blunt teeth, the sinuses rounded, the lobes bluntly attenuate-acuminate apically; flowers corymbose on pedicels mainly 15–40 mm long, these glabrous or long-hairy apically; sepals 3–5 mm long, greenish, broadly rounded, carinate to near the middle or above; petals lacking; samaras glabrous, the wings descending-spreading; 2n = 26. Uncommonly grown shade tree in Cache and Utah counties; introduced from eastern U.S.; 6 (0). This is the sugar maple of commerce.

ADOXACEAE Trautv.

Moschatel Family

Small, perennial herbs from scaly rhizomes; stems erect, with a single pair of opposite, palmately veined and lobed leaves and 1–3 basal, long-petiolate, ternately compound leaves; flowers regular, perfect, borne in heads; sepals 2 or 3 (4); petals united, the corolla rotate, 4- to 5-lobed; stamens 8–10, distinct; anthers 1-loculed; filaments inserted in pairs in the sinuses of the corolla lobes; pistil 1, the ovary partly inferior, 4- or 5-loculed, each with a single ovule; styles 4 or 5, short; fruit a dry berry with 4 or 5 nutlets; x = 9.

Adoxa L.

Inconspicuous rhizomatous herbs; leaves ternately compound or palmately lobed, petiolate; flowers inconspicuous, yellowish green, borne in heads; fruit a dry berry.

Adoxa moschatellina L. Moschatel. Plants 0.6–1.8 dm tall, with a musky odor, from rhizomes with fleshy scales; basal leaves 4–16 cm long, the blades ternately compound, the 3 leaflets deeply 3-lobed, the lobes again lobed, green and glabrous; cauline leaves opposite, 0.8–4 cm long, the blades palmately lobed, the lobes again lobed or toothed; peduncles 2–5 cm long, glabrous; flowers sessile; sepals 1–1.5 mm long, green; petals 1–2 mm long, yellowish green; fruit 2–3 mm long; 2n = 36, 54. Woods and thickets at ca 2440 to 3050 m in the Abajo Mts., San Juan County and reported from the Uinta Mts.; widespread in North America; circumboreal; 1 (0).

AIZOACEAE Rudolphi

Carpetweed Family

Annual or perennial herbs; stems mostly prostrate or ascending, often succulent; leaves simple, opposite or

whorled, entire, with or without stipules; flowers solitary or clustered in leaf axils, perfect, regular; calyx 4- to 5-lobed or -parted, the tube free or adnate to the ovary; petals lacking; stamens few to many; anthers small, 2-loculed, linear; ovary 1- to 5-loculed, inferior or superior; styles as many as locules; fruit a capsule; seeds numerous; x = 8, 9.

- 1. Leaves whorled; capsule loculicidally dehiscent; plants not succulent *Mollugo*
- Leaves opposite; capsule circumscissile 2
- 2(1). Stipules present; ovary 1- or 2-loculed; seeds several *Trianthema*
- Stipules lacking; ovary 3- to 5-loculed; seeds numerous *Sesuvium*

Mollugo L.

Annual, nonsucculent, much-branched herbs; leaves whorled; flowers small, perfect, without petals, with long filiform pedicels; calyx 5-parted, persistent, white inside; stamens 3–5, hypogynous; ovary 3-loculed, superior; capsule ovoid to ellipsoid, thin-walled, 3-valved, loculicidally dehiscent; seeds numerous.

Mollugo cerviana (L.) Ser. Carpetweed. [*Pharnaceum cervianum* L.]. Stems very slender, 4–10 (15) cm long, prostrate; leaves glaucous, linear, 5–10 in a whorl, the basal ones linear-spatulate, 3–15 mm long; flowers whorled; pedicels filiform; sepals ca 1.5 mm long; capsules subglobose; seeds 0.4–0.5 mm long; 2n = 18. Sandy sites in pinyon-juniper woodland at ca 1300 m in Kane County (Atwood 3101 BRY); Arizona to California; 1 (0).

Sesuvium L.

Annual or perennial succulent herbs with prostrate or ascending stems; leaves opposite, fleshy, without stipules; flowers perigynous, solitary in leaf axils, sessile or with short thick pedicels; calyx tube turbinate, adnate below on the ovary, 5-lobed, usually horned on the back near the apex; petals none; stamens 1 to many; ovary 2- to 5-loculed, with as many styles; capsule membranous, ovoid, circumscissile; seeds stalked, smooth or rarely rugose, minute, many in each cell.

Sesuvium verrucosum Raf. Seapurslane. [*S. sessile* authors, not Pers.]. Perennial, glabrous, freely branched herbs; stems 1–5 dm long, papillose; leaves broadly spatulate to linear, 1–4 cm long, the base narrowed and clasping, fleshy; flowers subsessile, 8–10 mm long; sepals 5–7 mm long, scarious-margined, short-horned near the apex; stamens numerous; capsule ca 5 mm long; seeds black, shining, ca 1 mm long. Low saline or alkaline areas and in riparian habitats in Grand, Millard, Salt Lake, San Juan, Uintah, Utah, and Wayne counties; California to Colorado, Missouri, Arkansas, Texas, and northern Mexico; 25 (ii).

Trianthema L.

Prostrate, annual herbs; leaves opposite, in unequal pairs; stipulate; flowers solitary, axillary; floral tube short; sepals 5; petals lacking; stamens 5–10, perigynous; ovary truncate, 1- or 2-loculed; styles 1 or 2; capsules shortly cylindrical or turbinate, 1- to 5-seeded, tardily circumscissile, the upper part usually with 2 rounded marginal crests; seeds reniform, roughened.

Trianthema portulacastrum L. Horse Purslane. Annual succulent herbs, branching from the base, prostrate

to decumbent, to 5 dm long or more; leaves broadly obovate to suborbicular or the smaller ones narrower, rounded to emarginate or apiculate, the blades mainly 1–4 cm long and 0.8–3 cm wide, with smaller ones on lateral branchlets; stipules scarious; flowers sessile and usually solitary in leafaxils; calyx lobes ovate-lanceolate to lanceolate, ca 2.5 mm long, pink purple within, with a dorsal appendage near the apex; capsules ca 4 mm long, the winged appendages at the apex prominent; seeds ca 2 mm wide. Waste places at ca 850 m in Washington County; widespread in southern U. S.; Central America; Old World; 1 (i).

AMARANTHACEAE A. L. Juss.

Amaranth Family

Annual herbs; leaves simple, entire, alternate or opposite; flowers perfect or imperfect, inconspicuous, with 3 dry, scarious, persistent, pungent bracts; calyx commonly of 5 persistent, usually scarious sepals; petals none; stamens as many as the sepals; pistil 1, the ovary superior, 1-loculed, usually with 2 or 3 stigmas; fruit a utricle, indehiscent or circumscissile; $x = 6-13, 17+$.

- 1. Leaves largely opposite; plants white stellate-hairy *Tidestromia*
— Leaves alternate; plants nearly or quite glabrous to villous or pilose 2
- 2(1). Pistillate flowers lacking a perianth, more or less concealed by broad, cordate, spine-tipped, scarious-margined bracts; plants rare in Kane County . . . *Acanthochiton*
— Pistillate flowers with a perianth, not obscured by bracts; bracts slender; plants of various distribution and abundance 3
- 3(2). Staminal filaments distinct; ovary with 1 ovule; plants weedy and widespread *Amaranthus*
— Staminal filaments united at the base; ovary with 2 or more ovules; plants cultivated, rarely escaping . . . *Celosia*

Acanthochiton Torr.

Glabrous annual dioecious herbs; stems striate, green and white, erect or decumbent-ascending, branched; leaves alternate; staminate flowers in clusters, borne in spikes, the perianth of 5 sepals; pistillate flowers with perianth obscured, subtended by cordate bracts, these finally spiny-margined.

Acanthochiton wrightii Torr. Hopiweed; Green Stripe. [*Amaranthus acanthochiton* (Torr.) Sauer]. Plants mainly 1–5 dm tall, erect, the branches decumbent or ascending, striate; leaves alternate, 1.5–8 cm long, 2–12 mm wide, linear to narrowly lanceolate, rounded apically, cuneate or linear to narrowly lanceolate, rounded apically, cuneate or attenuate basally, white-veined beneath, marginally wavy and crisped, with petioles 3–15 mm long; staminate flowers with bracts 2–3 mm long, the midribs prominent; sepals 5, of 2 lengths, the inner 2.5–3 mm long, the outer 3–4 mm long, apiculate; stamens 5, the anthers 4-loculed; pistillate flowers concealed by rigid, cordate bracts, these with usually 5 sepals each 4–5 mm long, with crenate margins; ovary ovoid, somewhat compressed, with 3 style branches; utricle ca 2 mm long, circumscissile; seeds erect, obovoid, 1–1.3 mm wide, lenticular, brown. Vanlevea community at ca 1340 m in Kane County (Atwood & Kaneko 3360, 3360a BRY); Arizona to Texas and Mexico; 2 (0).

Amaranthus L.

Glabrous annual monoecious or dioecious herbs; stems prostrate to erect; leaves alternate; flowers in dense terminal or axillary clusters, each subtended by 3 conspicuous green or red to purple bracts; sepals 2–5 (rarely 1), distinct; stamens 5 (1 or 3), distinct; anthers 4-loculed (apparently 2-loculed following dehiscence); ovary 1-loculed, with 2 or 3 stigmas; ovules 1; utricle 1-seeded, circumscissile to indehiscent; seeds erect, lenticular, lustrous.

- 1. Sepals of pistillate flowers broadened upward, the calyx more or less urceolate; plants dioecious *A. palmeri*
— Sepals of pistillate flowers more or less attenuate apically, the calyx not urceolate; plants monoecious 2
- 2(1). Inflorescence of terminal and axillary spicate panicles . . . 3
— Inflorescence of axillary spicate glomerules only 4
- 3(2). Pistillate sepals elliptic to narrowly lanceolate, the margins not overlapping; plants common weeds . *A. retroflexus*
— Pistillate sepals elliptic-obovate to broadly spatulate, the margins overlapping; plants uncommonly grown ornamentals, rarely escaping *A. hypochondriacus*
- 4(2). Leaves deeply and broadly emarginate apically; bracts and perianth inconspicuous; plants uncommon *A. lividus*
— Leaves rounded to retuse apically; bracts and perianth various; plants common or uncommon 5
- 5(4). Sepals 4 or 5; stems prostrate; seeds ca 1.5 mm wide *A. blitoides*
— Sepals 1–3; plants of various habit; seeds less than 1 mm wide 6
- 6(5). Sepals of pistillate flowers 2 or 3, but only 1 well developed; stems prostrate; plants uncommon . . . *A. californicus*
— Sepals of pistillate flowers 3, about equal; stems ascending to erect; plants common and widespread *A. albus*

Amaranthus albus L. Pale Amaranth. Monoecious (rarely perfect) annuals, the main stem erect, the branches spreading or ascending, 1.5–10 dm tall; herbage pale green to whitish, glabrous, puberulent, or villous; leaves alternate, the petioles 3–40 mm long, the blades elliptic, oblong, spatulate, or obovate, mainly 1–7 cm long, cuneate basally, rounded to mucronate-cuspidate apically, the veins prominent; flowers in axillary clusters, usually shorter than the petioles; bracts green, rigid, 2–4 mm long, pungent, spreading; sepals 3, the staminate oblong, cuspidate, scarious, the pistillate oblong to linear, acute, 1-veined, often tinged with red; stamens 3; style branches 3; utricle circumscissile, rugose, exceeding the perianth; seed lenticular, 0.6–0.9 mm wide, dark brown, lustrous; $2n = 32$. Weedy plants of open sites and cultivated land in probably all Utah counties; widespread in temperate North America; adventive from tropical America; 21 (iii).

Amaranthus blitoides Wats. Prostrate Pigweed. [*A. graecizans* authors, not L.]. Monoecious annuals; stems 1–6 dm long, prostrate, branched mainly from the base, glabrous or sparingly hairy; herbage pale green or whitish, sometimes tinged with red or purple; leaves alternate, the petioles 2–20 mm long, the blades obovate to oval, spatulate, or elliptic, mostly 8–40 mm long, cuneate to attenuate basally, rounded to acute apically, prominently veined; flowers in dense clusters, these usually shorter than the petioles; bracts oblong to lanceolate,

subequal to the sepals, spinose; sepals 4 or 5, the staminate scarious, oblong, acute, the pistillate oblong, 2.5–3 mm long, 1-veined, green with white margins; stamens 3; style branches 3; utricle circumscissile; seeds 1.3–1.5 mm wide, black, shining or dull; $2n = 32$. Weedy species of open sites and cultivated land at 790 to 2565 m in probably all Utah counties; widespread in temperate North America; Mexico; Europe; 41 (iii).

Amaranthus californicus (Moq.) Wats. California Amaranth. [*Mengea californica* Moq.]. Mostly monoecious annuals; stems 0.6–5 dm long, prostrate, branched from the base; herbage glabrous, whitish or tinged red; leaves alternate, the petioles 2–18 mm long, the blades 3–25 mm long, obovate to oblong, obtuse to rounded apically, cuneate to acute basally, the veins and margins white; flowers in axillary clusters; bracts lanceolate, subulate-aristate, subequal to the sepals; sepals in staminate flowers (2) 3, membranous, elliptic to lanceolate or oblong, mucronate, in pistillate flowers usually 1, inconspicuous; stamens 3; utricle irregularly dehiscent; seeds 0.6–0.9 mm wide, dark brown. Mud flats of Dry Lake, Cache County (Neese 12392 BRY); Alberta to Idaho, south to California and Texas; 1 (0).

Amaranthus hypochondriacus L. Grain Amaranth, Princes Feather. [*A. leucocarpus* Wats.; *A. caudatus* authors, not L.]. Annual, mostly monoecious herbs; stems erect, mainly 8–15 dm tall, glabrous, green or suffused with red; leaves alternate, the petioles subequal to the blades, these 2–10 cm long or more, elliptic to ovate, lanceolate, or oblong, acute apically, obtuse to acute basally; flowers in terminal panicles, with nodding or pendulous spikes, usually red; sepals of pistillate flowers with margins overlapping, obovate to spatulate; seeds ca 1 mm long, dull white to brown. Occasionally cultivated ornamental in lower elevation portions of Utah, rarely escaping; Arizona to Texas, south to Central America; Asia, Africa; 1 (0). This is one of the grain amaranths grown as potherbs and cereal crops in Central America and elsewhere. Another grain amaranth, *A. cruentus* L., the purple amaranth, is also grown in Utah. It has erect purplish panicles.

Amaranthus ligidus L. [*A. blitum* L.]. Monoecious annuals; stems mainly 5–9 dm tall, erect, glabrous, whitish or greenish; leaves alternate, the petioles 5–40 mm long, the blades rhombic to orbicular or ovate, maculate above, cuneate basally, emarginate to almost truncate apically; flowers in axillary clusters; bracteoles less than half as long as the perianth, ovate and wide at the base, acute; sepals 3 (5), oblong or linear to spatulate; utricle indehiscent; seeds brown, shining, ca 1 mm wide; $2n = 34$. Moist site adjacent to Utah Lake, Utah County (Thorne 93 BRY); adventive from Europe; 1 (0).

Amaranthus palmeri Wats. Palmer Amaranth. Dioecious annuals; stems 6–10 dm tall, branched throughout, glabrous or villous; leaves alternate, the petioles slender and long, the blades 1–6 cm long, ovate to lanceolate, cuneate to rounded basally, acute or shortly acuminate apically; flowers borne in terminal and axillary clusters or panicles; bracts 4–6 mm long, much surpassing the sepals; staminate flowers with 5 stamens and 5 sepals; pistillate flowers with 5 recurved sepals; styles usually 2 (3); utricle circumscissile; seeds 1–1.3 mm wide, dark brown; $n = 17$. Open sites at ca 1400 m in Davis County; adventive from the southwestern U.S.; 1 (0). Specimens of *A. fimbriatus* (Torr.) Benth [*Serrata berlandieri* var. *fimbriata* Torr.] have recently been collected in Washington County. They differ from *A. palmeri* in having the calyx of female flowers fimbriate.

Amaranthus retroflexus L. Redroot Pigweed. Annual monoecious herbs; stems erect, 0.6–1.5 dm tall or more, puberulent to villous, white-striped or suffused with red; leaves alternate, long-petiolate, the blades mainly 1–8 cm long, usually hairy (at least on veins beneath), lanceolate to ovate, obtuse to acute basally, rounded to acute apically; flowers in dense terminal or axillary paniculate spikes; bracts ovate, subulate apically, at least the longest much surpassing the flowers; sepals of staminate flowers ovate to lanceolate, acute, scarious, those of pistillate flowers narrowly oblong, rounded to truncate apically, usually emarginate and often mucronate, scarious; stamens 5; style branches 3; utricle circumscissile, surpassed by the longest sepals; seeds ca 1 mm wide, dark brown or reddish; $2n = 34$. Weedy species of gardens, other cultivated land, and open sites at 850 to 2440 m in probably all Utah counties; adventive from Central America, widespread in North America; 34 (v). Some specimens from Utah have been identified as *A. hybridus* L., a taxon that hybridizes with *A. retroflexus*. However, none of the specimens examined appear to be *A. hybridus*, which differs inter alia in having pistillate sepals shorter than the fruit to slightly longer and tapering to a terminal awn-tip. Some of our material shows variation encompassing both *A. retroflexus* and *A. hybridus* within the same specimen.

Celosia L.

Annual herbs; stems erect; leaves alternate; flowers perfect, borne in terminal or axillary spikes or in axillary clusters, commonly white, silvery, or colored, each one subtended by a bract and paired bractlets; sepals 5, scarious, striate; stamens 5, connate basally; ovary with 2 to several ovules; seeds 2 to several, lenticular, lustrous, often erect.

Celosia argentea L. Cockscomb. Stems mainly 3–10 dm tall, erect, glabrous; leaves 1.5–10 cm long, or more, lanceolate to ovate or linear, obtuse to acute basally, long-attenuate apically; panicle terminal or some axillary, mainly 2–20 cm long, varicolored; sepals 6–19 mm long, silvery or varicolored; style ca 3 mm long, exerted at maturity; seeds 2 to several, lustrous, 1–1.4 mm wide; $2n = 36, 72$. Cultivated ornamentals, occasionally escaping in Utah; introduced from Central America; 3 (0). The *f. cristata* (L.) Kuntze [*C. cristata* L.] has cristate inflorescences.

Tidestromia Standley

Annual or perennial herbs; stems prostrate or ascending; herbage stellate-hairy; leaves opposite, petiolate; flowers perfect, clustered in leaf axils; bracts and bractlets scarious, pubescent; sepals 5, ovate-lanceolate, the bracteate subtending leaves finally hardened and more or less connate, forming an involucre; stamens 5, the filaments connate basally, forming a short cup, with or without intervening staminodia; anthers 2-loculed, apparently 1-loculed at dehiscence; ovary short, the style with a capitate, simple or 2-lobed stigma; ovule 1; utricle indehiscent.

1. Plants annual; staminodia short or lacking; sepals mainly 1.5–3 mm long *T. lanuginosa*
- Plants perennial; staminodia ca half as long as the stamens; sepals mainly 1–1.5 mm long *T. oblongifolia*

Tidestromia lanuginosa (Nutt.) Standley Espanta Vaqueros. [*Achyranthes lanuginosa* Nutt.]. Annual pros-

trate-spreading herbs to 10 dm wide; herbage gray green to white; leaves with petioles 0.5–2.5 cm long, the blades 5–40 mm long, ovate to orbicular or obovate, rounded to obtuse apically, cuneate to rounded basally, densely stellate hairy on both sides, finally glabrate; flower clusters axillary, subtended by involucrate leaves; perianth mainly 1.5–3 mm long, inconspicuous; seeds ca 0.5 mm wide. Warm, sand, and salt desert shrub communities at 915 to 1315 m in Kane, San Juan, and Washington counties; Nevada and California, east to South Dakota, and south to Mexico; 5 (i).

Tidestromia oblongifolia (Wats.) Standley [*Cladothrix oblongifolia* Wats.]. Perennial decumbent to ascending (or erect) herbs, sometimes woody at the base, and with thick woody taproots; stems 2–6 dm long; leaves short-petioled, the blades 5–40 mm long, ovate to elliptic or orbicular, obtuse apically, rounded to acute basally, densely stellate on both sides; flower clusters axillary, the involucrate leaves finally hardened and connate basally; perianth mainly 1–1.5 mm long; staminodia present, ca half as long as the filaments; seeds ca 0.5 mm long. Creosote bush community at 850 to 1300 m in Washington County; Nevada, California, and east to Texas; 3 (0).

ANACARDIACEAE Lindl.

Cashew Family

Trees or shrubs; leaves alternate, simple, trifoliolate, or pinnately compound; flowers perfect or imperfect, regular, small, borne in terminal or axillary spikes or panicles; sepals 3–5, connate below, sometimes fused with the ovary; petals 3–5 or lacking, distinct; stamens usually 5 or 10; pistil 1, the ovary superior, 3–carpellate, unilocular, with a single functional ovule, the styles 2 or more; fruit a drupe; $x = 7-16$.

- 1. Leaves simple 2
- Leaves trifoliolate or pinnately compound 3
- 2(1). Leaves entire; panicles with plumose pedicels ... *Cotinus*
- Leaves toothed or lobed; panicles lacking plumose pedicels *Rhus*
- 3(1). Leaflets 3, mainly 5–11 cm long; fruit whitish to yellowish, glabrous *Toxicodendron*
- Leaflets 5–13 or more or, if 3, mainly 2–5 cm long 4
- 4(3). Leaf rachis very narrowly winged; petioles puberulent; leaflets 5–9, leathery, obtuse; street trees of Washington County *Pistacia*
- Leaf rachis not winged or, if so, broadly winged; leaflets not leathery, acuminate; shrubs of broad distribution *Rhus*

Cotinus Adanson

Shrubs or small trees, polygamous or dioecious; leaves alternate, the blades simple, entire, estipulate; flowers in large loose panicles, small, greenish or yellowish, the pedicels of sterile flowers elongating, clothed with long, spreading, multicellular hairs; sepals 5, short; petals 5, inconspicuous; stamens 5; drupe small.

Cotinus coggygria Scop. Smoke Tree. Plants mainly 2–3.5 m tall; branchlets brownish; leaves simple, entire, the blades 1.7–5 cm long, 1–3.5 cm wide, orbicular to broadly elliptic or oval, glabrous, prominently veined;

panicles terminal, many-flowered; sepals green; petals yellowish green, 1.2–1.5 mm long; pedicels long-hairy, the crosswalls red to purplish; drupe seldom produced; $n = 30$. Cultivated ornamental, persisting, in towns and cities at lower elevations in Utah; introduced from Eurasia; 5 (0).

Pistacia L.

Small to medium dioecious trees, with a turpentine resin; leaves alternate, pinnately compound; flowers apetalous, small, borne in axillary panicles; staminate flowers with 1 or 2 sepals; stamens 3–5; pistillate flowers with 2–5 sepals; ovary 1–loculed; style 3–cleft; fruit a dry drupe.

Pistacia atlantica Desf. Pistacio. Trees, mainly 5–10 m tall; branchlets brownish; leaves odd-pinnately compound, with 5–9 lanceolate, thickish, obtuse leaflets; leaf rachis very narrowly winged; petioles puberulent; petals lacking; drupes reddish to blackish, glabrous, thin-fleshed. Cultivated street trees and established in Washington County; introduced from Europe; 3 (i). It seems possible that these plants were introduced as rootstocks for the pistacio of commerce, *P. vera* L., which persists in cultivation and has escaped in the vicinity of Leeds, Washington County; 1 (i). A lone pistillate tree survives along a roadside south of Leeds. It was part of an orchard destroyed in construction of the highway. The pistacio is successfully grown at Littlefield, Arizona.

Rhus L.

Shrubs or small trees with milky or resinous juice, polygamous or dioecious; leaves alternate, simple, trifoliolate, or odd-pinnately compound, estipulate; flowers small, borne in small axillary spikes or panicles or large terminal panicles; sepals 5; petals usually 5; stamens 5; ovary 1–loculed; styles 3; fruit a thinly fleshy to dry drupe.

Barkley, F. A. 1937. A monographic study of *Rhus* and its immediate allies in North and Central America, including the West Indies. Ann. Missouri Bot. Gard. 24: 265–498.

Barkley, F. A. 1940. *Schmaltzia*. Amer. Midl. Naturalist 24: 647–665.

- 1. Leaves simple or trifoliolate *R. aromatica*
- Leaves pinnately compound with 5 or more leaflets 2
- 2(1). Rachis of leaf winged; plants cultivated *R. copallina*
- Rachis of leaf not winged; plants cultivated or indigenous 3
- 3(2). Branchlets glabrous and glaucous; plants indigenous and cultivated *R. glabra*
- Branchlets densely hairy, with long straight hairs and shorter glandular ones; plants cultivated *R. typhina*

Rhus aromatica Ait. Skunkbush. Shrubs, mainly 0.5–2.5 m tall, spreading, forming small to large clumps or thickets; branchlets brown, becoming gray in age, densely puberulent; leaves simple and pinnately to sub-palmately lobed or trifoliolate, the leaflets 0.8–9.3 cm long, and 0.6–7 cm wide, lobed, ciliate, glabrous or puberulent on one or both sides; petioles puberulent; flowers in dense spikes or in short spicate panicles, mainly on short lateral branches, rarely terminal, yellowish, developing prior to the leaves, 2–3 mm long; sepals ca 1–1.5 mm long, often reddish; drupes red orange, 5–8 mm long. There are two indigenous phases of this species complex

in Utah. They are ecologically correlated, but with intermediates along the ecotones. Examples of introduced phases, not herein identified to infraspecific category, are present in cultivation.

- 1. Leaves simple, merely pinnately to subpalmately lobed, often coriaceous; plants of xeric sites mainly in southeastern and southwestern Utah, rarely elsewhere *R. aromatica* var. *simplicifolia*
- Leaves trifoliolate, thin, seldom if at all coriaceous; plants of mesic sites, widespread *R. aromatica* var. *trilobata*

Var. *simplicifolia* (Greene) Cronq. [*Rhus canadensis* var. *simplicifolia* Greene; *R. trilobata* var. *simplicifolia* (Greene) Barkley; *R. utahensis* Goodding, type from Diamond Valley; *Schmaltzia affinis* Greene, type from Kanab]. Blackbrush, mixed desert shrub, and pinyon-juniper communities in xeric sites, often on rimrock, at 975 to 1925 m in Emery, Garfield, Grand, Kane, San Juan, Tooele (north of Ibapah), Washington, and Wayne counties; Arizona and Colorado; 40 (ix).

Var. *trilobata* (Nutt.) Gray [*R. trilobata* Nutt. ex T. & G.; *R. trilobata* var. *anisophylla* Jepson]. Stream banks and terraces, seep and spring margins, and on mesic slopes, mainly in riparian communities, at 885 to 2380 m in all Utah counties (except Rich and Summit); Alberta to Iowa, south to California, Mexico, and Texas; 142 (xxvii). The branchlets are supple and have been used by Indians prehistorically for tying and in basketry. The fruits are edible, but the seeds are large and the flesh thin.

Rhus copallina L. Shining Sumac. Shrubs or small trees, mainly 2–4 m tall; branchlets villous-tomentose to glabrous; leaves 15–35 cm long; leaflets 7–11, sessile or the apical one petiolulate, lance-elliptic to lanceolate, glabrous or sparingly hairy, mainly 2.5–8 cm long, acute to acuminate; rachis winged; inflorescence to 12 cm long and about as broad; flowers greenish; fruit ca 4 mm long, with red glandular hairs. Cultivated ornamentals in lower elevation portions of Utah; introduced from the eastern U.S.; 2 (0).

Rhus glabra L. Smooth Sumac. [*R. nitens* Greene, type from Provo; *R. cismontana* Greene]. Shrubs, mainly 1–3 m high; branchlets glabrous and glaucous; leaves mainly 10–30 cm long; leaflets 7–21 or more, lanceolate to lance-oblong, mainly 1.5–8 cm long, acuminate, serrate, the rachis not winged; inflorescence 7–15 cm long or more and 3–15 cm wide, puberulous; fruit red, viscid-hairy, ca 4 mm long; 2n = 30. Desert shrub, riparian, juniper, and mountain brush communities at 1095 to 2290 m in Box Elder, Cache, Davis, Grand, Kane, Millard, Salt Lake, San Juan, Wasatch, and Washington counties; widespread in North America; 29 (i). The smooth sumac occurs in disjunct stands, often in dry sites, in widely scattered locations. It is a common species in ornamental plantings in Utah.

Rhus typhina L. Velvet Sumac; Staghorn Sumac. Shrubs or small trees, mainly 2.5–5 m high; branchlets densely pubescent with mixed straight and glandular hairs; leaves mainly 15–35 cm long; leaflets 11–31, oblong-lanceolate, 5–10 cm long, acuminate, serrate or lacinate, the rachis not winged; flowers greenish, in dense terminal clusters 7–20 cm long; fruit red, hairy; 2n = 30. Cultivated ornamental in lower elevation regions of the state; persisting; introduced from the eastern U.S.; 2 (0). We have both the dissected-leaved cultivar “laciniata” and the common phase with merely serrate leaflets.

***Toxicodendron* Miller**

Dioecious shrubs; leaves alternate, trifoliolate; flowers in axillary thyrsoid panicles or racemes; sepals 5, persistent, connate below; petals 5, veined, smaller in pistillate flowers; drupes subspherical, whitish to yellowish, glabrous.

Gillis, W. T. 1960. Taxonomic problems in poison ivy. Proc. Michigan Acad. Sci. 45: 27–34.
———. 1970. The systematics and ecology of poison-ivy and poison-oaks (*Toxicodendron*, Anacardiaceae). Rhodora 73: 72–159, 161–237, 370–443, 465–540.

Toxicodendron rydbergii (Small) Greene Poison Ivy. [*Rhus rydbergii* Small ex Rydb.; *R. radicans* var. *rydbergii* (Small) Rehder; *R. toxicodendron* var. *rydbergii* (Small) Garrett; *T. radicans* var. *rydbergii* (Small) Erskine; *T. longipes* Greene, type from near Glenwood]. Shrubs, mainly 1–3 dm tall (rarely more); stems simple or sparingly branched, puberulent; leaves long-petiolate; leaflets 3 (rarely 4 or 5), the lateral leaflets often oblique, unequally lobed and smaller than the terminal; terminal leaflet 2–11 cm long, 1.5–10 cm wide, ovate to orbicular and toothed, acuminate, glabrous or puberulent mainly along the veins beneath, petiolulate; sepals ca 1 mm long, greenish; petals 2–3 mm long, yellowish, with dark veins; fruit subglobose, cream to yellow, 4–7 mm wide, glabrous; 2n = 30. Riparian communities, mesic slopes, and in orchards, at 1125 to 2260 m in Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Summit, Uintah, Washington, and Weber counties; Alberta to Nova Scotia, south to Arizona, Texas, and Virginia; 18 (vii). This plant produces severe dermatitis in sensitive people; it should be avoided by everyone. The three large leaflets on leaves borne alternate on the stem of low shrubs and the waxy fruit are diagnostic.

APOCYNACEAE A. L. Juss.

Dogbane Family

Shrubs, trailing vines, or herbs, often with milky juice; stems erect or trailing; leaves opposite, alternate, or sometimes whorled, entire, stipulate; flowers regular, perfect, solitary and axillary, or cymose to paniculate; calyx 5-lobed, imbricate in bud, frequently with glandular appendages within; corolla 5-lobed, convolute and often twisted in bud, salverform to urceolate or campanulate, the tube often with appendages within; stamens 5, alternate with the corolla lobes, inserted on the throat or tube; anthers 4-loculed, often connivent around the stigma; pistil superior, the carpels 2, distinct or united apically, each 1-loculed; style simple or divided; fruit of 2 follicles; seeds commonly comose; x = 8–12+.

Woodson, R. E. 1938. Apocynaceae. N. Amer. Fl. 29: 103–192.

- 1. Leaves alternate *Amsonia*
- Leaves opposite or whorled 2
- 2(1). Herbs evergreen, trailing; corolla lavender blue to reddish purple; stamens inserted at summit of corolla tube; seeds not comose *Vinca*
- Herbs or shrubs, erect or ascending; corolla white, pink, or scarlet, seldom as above; stamens inserted at base of corolla tube; seeds comose 3

- 3(2). Corolla 5–8 mm long *Apocynum*
 — Corolla 10–30 mm long or more 4
 4(3). Plants low perennial herbs from fleshy rootstocks, indigenous in southeastern Utah *Cycladenia*
 — Plants shrubs or small trees, cultivated ornamental *Nerium*

Amsonia Walter

Caulicent perennial herbs; stems erect or ascending; leaves alternate or verticillate; flowers many, bluish or pinkish, in terminal compound cymes; calyx 5-parted, the segments equal, acuminate; corolla salverform, the lobes spreading or reflexed; stamens inserted on corolla throat, included; style filiform; follicles terete, torulose, several-seeded; seeds cylindrical or oblong, without a coma.

Woodson, R. 1928. Monograph of the Genus *Amsonia*. Ann. Missouri Bot. Gard. 15: 379–434.

McLaughlin, S. P. 1982. A revision of the southwestern species of *Amsonia*. Ann. Missouri Bot. Gard. 69: 336–350.

1. Follicles not markedly constricted between the seeds; corolla tube 6–10 mm long; leaves ovate, glabrous *A. jonesii*
 — Follicles markedly constricted between the seeds; corolla tube 7–12 mm long; leaves oblong-lanceolate to linear-lanceolate, glabrous or conspicuously pubescent *A. tomentosa*

Amsonia jonesii Woodson [*A. latifolia* Jones, type from Monroe Hot Springs]. Perennial herbs, glabrous, 1.5–5 dm tall; lower leaves ovate, 1.4–3 cm wide, the upper ones lanceolate, 0.3–1 cm wide; calyx lobes ovate to lanceolate, 1–4 mm long; corolla tube 6–10 mm long, broadest below the apex, slightly constricted at the opening, the lobes 4–8 mm long; follicles 1.5–9 cm long, not constricted between the seeds; seeds cylindrical, corky, 6–8 mm long, 2–2.5 mm wide. Blackbrush, sagebrush, mountain brush, pinyon-juniper and desert shrub communities at 1200 to 2150 m disjunctly in Duchesne, Emery, Garfield, Grand, San Juan, Sevier, Uintah, Washington, and Wayne counties; Arizona and Colorado; 30 (xiv).

Amsonia tomentosa Torr. & Frem. [*A. eastwoodiana* Rydb., type from near Moab; *A. brevifolia* Gray, type from Washington County]. Perennial herbs, glabrous or sparingly to densely tomentose, 2–6 dm tall; lower leaves lanceolate to linear-lanceolate, 3–12 mm wide, the upper leaves lanceolate to filiform, 1–5 mm wide; calyx lobes linear, 2–9 mm long; corolla tube 7–12 mm long, broadest at the apex, constricted at the orifice, the lobes 3–9 mm long; follicles constricted between the seeds, 2–8 cm long; seeds elliptic, corky, 8–21 mm long, 3–6 mm wide. Saltbush, blackbrush, ephedra and desert shrub communities at 950 to 1600 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona, New Mexico, Texas, and Mexico; 72 (xxxi). Our material belongs to var. *stenophylla* Kearney & Peebles. The typical variety occurs to the south of our area in Mohave County, Arizona and should be sought in Washington County. The glabrous phase of the species, long recognized as *A. eastwoodiana*, differs in no other perceptible way from tomentose plants with which it grows in much of the range in Utah. This plant simulates *Psoralidium junceum* and *Sphaeralcea janeae* in growth form and color, especially at maturity.

Apocynum L.

Perennial herbs, reproducing asexually from gemmiferous roots; stems branching; leaves opposite or rarely verticillate, not glandular, often mucronate; flowers small and pale, few to many on short pedicels in terminal or axillary cymes; calyx 5-parted nearly to the base, the lobes equal, scarcely imbricate; corolla campanulate to urceolate or cylindrical, the tube short with 5 small sagittate appendages at the base opposite the lobes, the limb 5-parted; stamens attached at corolla base; anthers connivent and agglutinated to the stigma, with enlarged narrowly 2-lobed connectives, the pollen grains maintained within persistent tetrads; ovary of separate carpels; ovules numerous; stigma sessile, mostly ovoid-fusiform; follicles 2, slender, terete; seeds numerous, truncate, comose. Note: At least some species of this genus are considered to be poisonous.

1. Corolla usually at least 5 mm long, pinkish, often more than twice the length of the calyx, the lobes spreading or reflexed; leaves mostly drooping to spreading 2
 — Corolla less than 5 mm long, greenish-white to white, usually less than twice the length of the calyx lobes, erect or slightly spreading; leaves ascending 3
 2(1). Corolla usually ca 3 times as long as the calyx; leaves drooping *A. androsaemifolium*
 — Corolla usually about twice as long as the calyx; leaves spreading *A. medium*
 3(1). Leaves noticeably petiolate, narrowed at the base; follicles more than 12 cm long; coma of seeds 2–3 cm long *A. cannabinum*
 — Leaves sessile or nearly so, cordate at base; follicles less than 12 cm long; coma of seeds 1–2 cm long *A. sibiricum*

Apocynum androsaemifolium L. Spreading Dogbane. Stems erect or ascending, 2–5 dm tall, glabrous, freely and dichotomously branched; leaves petiolate, drooping, ovate to oblong-lanceolate, 2–10 cm long, 1–6 cm wide, glabrous or rarely sparsely pilosulous above, sparsely pilosulous to densely tomentose beneath; calyx lobes ovate to ovate-lanceolate, 2–5 mm long, glabrous or rarely minutely pilosulous; corolla tubular to campanulate, 5–12 mm long, the lobes white, usually with pinkish veins, widely spreading or reflexed, glabrous externally; follicles 6–15 cm long, pendulous or erect at maturity.

1. Corolla campanulate, dilating apically; follicles pendulous *A. androsaemifolium* var. *androsaemifolium*
 — Corolla urceolate, not distinctly dilating apically; follicles erect *A. androsaemifolium* var. *pumilum*

Var. *androsaemifolium* Oak, maple, populus, sagebrush, and spruce-fir communities at 1500 to 3350 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Garfield, Grand, Iron, Juab, Millard, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Newfoundland to British Columbia, south to Georgia, Arizona, and California; 43 (iii).

Var. *pumilum* Gray Aspen, mountain brush, and coniferous forest communities at 2170 to 2650 m in Salt Lake, Utah, and Washington counties; Washington to Montana, south to California, and Wyoming; 5 (0).

Apocynum cannabinum L. Dogbane. [*A. pubescens* R. Br.; *A. suksdorfii* Greene; *A. cannabinum* var. *glaberrimum* Greene]

num A. DC. in DC.]. Stems erect or ascending, 3–9 dm tall, the branches opposite or subopposite, herbage glabrous or pubescent; leaves opposite or whorled, petiolate or the lowermost subsessile, ascending or somewhat spreading, ovate to lanceolate, 2–14 cm long, 1–7 cm wide, glabrous above, more or less densely pilosulous to tomentose beneath, or tomentose throughout; calyx lobes lanceolate or ovate-lanceolate, 3–4 mm long, glabrous; corolla cylindrical to urceolate, 3–6 mm long, white to greenish, the lobes erect or somewhat spreading; follicles 12–20 cm long, glabrous, pendulous at maturity. Roadsides, fields, streambanks and disturbed sites mainly in riparian communities at 970 to 2350 m in all Utah counties, except Morgan, Rich, and Summit; widespread in the U.S. and Canada; 68 (vi). This species was used as a source of fiber for cordage of fine quality by prehistoric Indians in Utah.

Apocynum x medium Greene [*A. floribundum* Greene; *A. lividum* Greene]. Stems erect or ascending, 2–5 dm tall, freely and somewhat dichotomously branched, especially below, the branches ascending, alternate or opposite, glabrous to puberulent; leaves opposite, petiolate to subsessile, usually spreading, ovate to oblong-lanceolate, 6–10 cm long, 1.5–2 cm broad, occasionally somewhat cordate at the base, glabrous to somewhat puberulent above, more or less pilosulous to tomentose beneath; calyx segments ovate to lanceolate, 1.5–4 mm long, glabrous to sparsely pilosulous; corolla campanulate to broadly urceolate, 3–6 mm long, the lobes spreading, white or with pinkish veins; follicles 7–15 cm long, pendulous at maturity. Mixed deciduous woodlands at moderate to lower elevations in Box Elder, Cache, Davis, Garfield, Iron, Juab, Millard, Piute, Salt Lake, San Juan, and Weber counties; widespread in the U.S.; 15 (ii). This entity is intermediate between *A. androsaemifolium* and *A. cannabinum*. It tends to intergrade with both species and consists of hybrids and segregates involving the two species it resembles.

Apocynum sibiricum Jacq. Stems erect or ascending, 2–8 dm tall, glabrous, the branches opposite; leaves opposite or rarely whorled, sessile or subsessile, especially on the main stem, those of the upper branches often short-petiolate, ascending or somewhat spreading, oblong or oblong-lanceolate to oval, 1.5–14 cm long, 0.3–4.5 cm wide, obtuse to cordate at base, glabrous; inflorescence dense, bracts usually conspicuous and more or less subfoliaceous; calyx segments lanceolate, 2–4 mm long, glabrous; corolla urceolate to short-cylindrical, about as long as broad, 3–5 mm long, white or greenish, the lobes erect or somewhat spreading; follicles 4–10 cm long, pendulous at maturity. Canyons, flats, streambanks and roadsides at 1385 to 1895 m in Box Elder, Emery, Juab, Uintah, and Utah counties; Oregon east to Newfoundland, south to California and New Mexico; 6 (0). Segregation of this entity from *A. cannabinum* is tenuous at best. Specimens vary in shape of leaf bases and degree of petiole development. Even those with cordate bases on lower and middle stem leaves are often shortly petiolate on uppermost leaves. Few plants are collected in fruit, and the value of the shorter fruit as a diagnostic feature is questionable. Possibly a better course would be to treat all of our material as *A. cannabinum*. I follow tradition in treating it otherwise.

Cycladenia Benth.

Perennial caulescent herbs; stems erect or spreading from a deeply set caudex; leaves opposite, broadly petio-

late; flowers 2–8 on axillary peduncles; calyx 5-lobed, the lobes equal; corolla funnelliform, with small appendages alternate with the lobes; stamens borne near base of tube; anthers connivent and sagittate; style filiform, with a conspicuous membranous collar; ovary surrounded at base by 5 nectaries; follicles 2, separate, terete; seeds comose.

Cycladenia humilis Benth. Plants 11–36 cm tall, glabrous and glaucous, the lowermost leaves reduced to subamplexicaul bracts, enlarging and becoming green upwards; main foliage leaves 3.5–9.5 cm long, 2–6.5 cm wide, oval to orbicular or broadly obovate, tapering abruptly to the broad petiole, thickened, entire, the apex rounded to acute; pedicels 5–25 mm long; bracts linear-lanceolate, 3–9 mm long; calyx lobes 5–11 mm long, lance-linear, villous-pilose, somewhat accrescent in fruit; corolla rose purple, dimorphic, either broadly lobed, 23–28 mm long, and 19–31 mm wide or narrowly lobed, 18–21 mm long, and 13–19 mm wide, rose pink, more or less pilose; follicles 4.5–9.5 cm long; seeds brown, ca 7.5 mm long, the coma ca 20 mm long. *Eriogonum-ephedra*, mixed desert shrub, and juniper communities at 1340 to 1830 m, in gypsiferous, saline soils of the Cutler, Summerville, and Chinle formations, in Emery, Garfield, Grand, and Kane (?), taken by Siler in the 1870s, the location unknown) counties; California; 18 (vi). Our material belongs to var. *jonesii* (Eastw.) Welsh & Atwood [*C. jonesii* Eastw., type from San Rafael Swell]. The flowers are dimorphic within the few disjunct populations known for this entity in Utah. The similar var. *venusta* (Eastw.) Woodson is a montane plant of talus slopes and rocky places in coniferous forests of California. Our plant is evidently an obligate gypsophile of semibarren tracts on geological formations with poor water relationships.

Nerium L.

Shrubs or small trees; leaves whorled or rarely opposite, leathery; flowers showy, borne in terminal cymes; calyx with glands within near the base; corolla funnelliform, with a cylindrical tube and campanulate throat, the 5 lobes broad, spreading, and twisted to the right; stamens attached to throat of corolla, included, the filaments very short, the anthers with long appendages apically and basally, connivent around the stigma and adhering to it; ovaries 2, with many ovules in each locule; style filiform; fruit of 2 elongated follicles; seeds comose.

Nerium oleander L. Oleander. Evergreen shrub to 5 m tall, nearly glabrous; leaves narrowly oblong-lanceolate, 1–3 dm long and to 3 cm wide, acuminate, tapering at base to a short petiole, dark green above, lustrous, paler beneath; inflorescence subcorymbose; flowers showy, scarlet to yellowish pink or white, frequently double; calyx 5-parted, the segments lanceolate to lance-ovate, 4–6 mm long; corolla glabrous externally, the tube 8–12 mm long, the 5 lobes obliquely obovate to oblong, 2–2.5 cm long, spreading; follicles 2, stout, 8–15 cm long; seeds compressed, densely comose. Cultivated and persisting below 1200 m in Washington County; introduced from the Mediterranean region and the Far East, now widely cultivated and naturalized in warmer areas of North America; 0 (0). This plant is deadly poisonous to animals and man.

Vinca L.

Erect or more often trailing perennial herbs; leaves opposite; flowers solitary in alternate leaf axils; calyx

5-lobed, the lobes nearly equal; corolla funnelliform to salverform, the tube cylindrical, with the 5 lobes twisted to the left, hairy, thickened at the throat, not appendaged within; anthers not connivent, the connective produced apically into an appendage; ovary with 2 alternate nectaries; ovules numerous; follicles terete, slender; seeds naked.

1. Calyx lobes ciliate; leaves truncate or subcordate at the base *V. major*
- Calyx lobes glabrous; leaves narrowed at the base *V. minor*

***Vinca major* L.** Trailing, slightly woody vines, rooting freely at the nodes; flowering stems and branches erect, 2-3 dm tall; leaves bright green, glabrous, 2-3 cm long, ovate, cordate at the base, obtuse to acute apically, with petioles 0.5-2 cm long, often ciliolate; pedicels slender, 3-5 cm long; calyx lobes subulate, ciliate, ca 1 cm long; corolla blue or violet, the tube 1.5-2 cm or more long. Cultivated and occasionally escaping below 1525 m in Utah and Washington counties; widely grown in the U.S., introduced from Europe; 3 (i).

***Vinca minor* L.** Creeping or trailing evergreen herbs; leaves elliptic 1.5-6 cm long, 0.8-2.5 cm wide, obtuse to broadly acute apically, cuneate to acute basally, glabrous, shiny above; petioles 1-2 cm long; flowers solitary, with pedicels 1.5-3 cm long; calyx lobes lance-ovate, acute, to 3 mm long, glabrous; corolla funnelliform, bright blue, rarely white, the tube 3-6 mm long, the throat conic to campanulate, 5-7 mm long; follicles slender, 2-7 cm long, rarely produced; $n = 46$. Cultivated and occasionally escaping below 2300 m in Cache, Salt Lake, Utah, and Washington counties; introduced from Europe, now widely grown in the U.S.; 5 (i).

AQUIFOLIACEAE Bartling

Holly Family

Evergreen shrubs or small trees; leaves alternate, simple, coriaceous, armed with spiny teeth; stipules minute, caducous; flowers usually imperfect, regular, small and inconspicuous, solitary or few in axillary cymes; sepals usually 4, more or less connate basally; petals usually 4, slightly connate basally; stamens or staminodes usually 4 (to 9), alternate with the petals; pistil 1, the ovary superior, 3- to many-loculed, the carpels as many as the locules; style 1 or lacking; fruit a globose, berrylike drupe with 2-8 bony 1-seeded divisions; $x = 9, 10$.

Ilex L.

Evergreen; leaves thick and shiny; flowers small, mostly in few-flowered axillary cymes; staminodia usually present in pistillate flowers, a rudimentary pistil present in most staminate flowers; fruit usually brightly colored. Note: Members of this family are known in Utah in cultivation only.

1. Flowers in axillary clusters on branches of the previous year *I. aquifolium*
- Flowers in solitary cymes on branches of the current year *I. opaca*

***Ilex aquifolium* L.** English Holly. $2n = 40$. Tall shrubs to small trees of ornamental plantings, rare in Utah; intro-

duced from the Old World; 3 (0).

***Ilex opaca* Ait.** American Holly. Low to moderate shrubs of ornamental plantings, occasionally in Utah; introduced from the eastern U. S.; 3 (0).

ARALIACEAE A. L. Juss.

Ginseng Family

Herbs, climbing vines, or shrubs to small trees; leaves alternate, simple or compound (or 2- to 3-compound); flowers small, greenish or whitish, umbellate, the umbels simple or in paniculate clusters; calyx small, adnate to the ovary; the lobes minute or lacking; petals 5, typically distinct; stamens 5, alternate with the petals; ovary 1, inferior, 2- to 5-loculed, with 1 ovule per locule; styles 5 and separate or connate throughout; fruit a berry; $x = 11, 12+$.

1. Plants vinelike, with aerial holdfast roots, clinging to walls and other structures; leaves simple *Hedera*
- Plants herbs or shrubs, lacking aerial roots; leaves palmately or pinnately compound. 2
- 2(1). Leaves palmately compound, with 5 or 7 leaflets; plants shrubs *Acanthopanax*
- Leaves pinnately or ternately 1- to 3-compound, with many ultimate segments; plants herbs or small trees *Aralia*

Acanthopanax Miq.

Deciduous shrubs; stems armed with spines; leaves alternate, palmately compound; umbels simple or paniculate; flowers polygamous or perfect; calyx teeth minute or lacking; petals usually 5; stamens as many as the petals; ovary 2- to 5-loculed; styles free or connate; fruit globose.

***Acanthopanax sieboldianus* Makino** Shrubs; branchlets with nodal spines, grayish; petioles 3-10 cm long; leaflets 5, the terminal one oblanceolate to oblong-obovate, 3-7 cm long, 1-2.5 cm wide, toothed, glabrous; umbels solitary on short spurs, the peduncles 5-10 cm long; fruit globose, 6-7 mm long, black (seldom produced). Cultivated ornamental at lower elevations in Utah, persisting; introduced from China; 1 (i).

Aralia L.

Herbs or small trees; stems spiny or unarmed; leaves large, pinnately or ternately 1- to 3-compound; leaflets serrate; flowers in panicled umbels; calyx minute or lacking; stamens 5; petals 5; staminal filaments short; styles free above or throughout; fruit a berry.

1. Plants indigenous herbs, unarmed, known from Washington County *A. racemosa*
- Plants cultivated small trees; leaf rachis armed with prickles; known from ornamental plantings ... *A. spinosa*

***Aralia racemosa* L.** American Spikenard. Stout perennial herbs, mainly 0.5-1.5 m tall; leaves 1-9 dm long or more and about as broad, the 3 primary divisions pinnately compound; leaflets ovate to orbicular, variable in shape and size on the same leaf, serrate to doubly serrate, acuminate apically, obliquely cordate basally; inflorescence a panicle with numerous umbels; fruit purplish black, 4-6 mm thick. Crevices in sandstone and on sandy

detritis in the shaded defile of Zion Canyon, at ca 1220 m in Washington County; widespread in the northeastern U.S. and Canada, and southwestward to Arizona and New Mexico. Our material belongs to ssp. *bicrenata* (Woot. & Standl.) Welsh & Atwood; 3 (ii).

Aralia spinosa L. Hercules Club. Small trees, mainly 3–5 m tall; leaves commonly 5–10 dm long, 2- to 3-compound, the leaflets 4–10 cm long, acute to acuminate, serrate, acute to rounded basally; petioles and leaf rachis armed with stout prickles; inflorescence paniculate, with numerous umbels; fruit black (seldom produced). Cultivated botanical curiosity and ornamental of lower elevation cities and towns; introduced from the eastern U.S.; 1 (0).

Hedera L.

Evergreen woody climbers with adventitious holdfast roots along the stems; leaves simple, alternate, often with stellate hairs, estipulate; umbels paniculate; flowers perfect; calyx lobes 5, or lacking; petals 5; stamens 5; ovary usually 5-loculed; styles 5, connate; fruit berrylike.

Hedera helix L. English Ivy. Stems to 10 m long or more; leaves of various shapes and sizes, but usually 2–10 cm long, and often about as broad, ovate to elliptic, or lobed, the margins undulate to entire; flowers greenish yellow, 4–5 mm across; fruit globose, black, ca 6 mm wide; 2n = 48. Cultivated ornamental, growing on walls of houses and on utility poles, long persisting, in lower elevations of Utah; introduced from Europe; 2 (i).

ASCLEPIADACEAE R. Br.

Milkweed Family

Perennial herbs, vines, or shrubs with milky juice; leaves opposite, whorled, or sometimes alternate, without stipules; flowers perfect, regular, umbellate, 5-merous; calyx deeply lobed, the lobes mostly imbricate; corolla 5-lobed or -cleft, the lobes commonly valvate in bud, a 5-lobed crown (corona) usually present between the corolla and stamens and adnate to either or both; stamens 5, inserted on the corolla tube near its base, the filaments monadelphous or distinct, the anthers united and tipped with a scariosus membrane inflexed on the summit of the stylar disk; pollen grains united into waxlike or granular pollinia; carpels 2, with superior ovaries and styles but united above by the peltate discoid stigma; fruit of 2 follicles; seeds many, usually with a long coma; x = 9–12.

- 1. Stems not twining *Asclepias*
- Stems twining 2
- 2(1). Corona lacking; corolla lobes hoodlike *Cynanchum*
- Corona present; corolla rotate or open campanulate ..
..... *Sarcostemma*

Asclepias L.

Annual or perennial herbs, with milky juice; stems prostrate to erect; leaves usually opposite, infrequently whorled or irregularly approximate; inflorescence terminal or lateral, umbelliformly cymose; calyx lobes 5, equal, divided nearly to the receptacle; corolla rotate, 5-lobed, the lobes reflexed, spreading or rarely erect, the gynostegium stipitate to subsessile, the corona of 5 hoods at-

tached to the column and subtending the fused anthers, the hoods cucullate to clavate with various modifications, more or less stipitate to sessile and deeply saccate at the basal attachment to the column, usually bearing an internal horn or crest; anthers 2-locular, with more or less prominent corneous marginal wings enclosing the 5 stigmatic chambers and with membranous apical appendages; pollinia paired and pendulous from the translator arms, flat and uniformly fertile, enclosing granular pollen with thin hyaline intine; stigma head peltate, more or less pentagonal; fruit a follicle containing many compressed comose or rarely naked seeds.

Woodson, R. E. 1954. The North American species of *Asclepias*. *Annals Missouri Bot. Gard.* 41: 1–211.

- 1. Hoods sessile, the basal attachment deeply saccate, the adnate horn often absent or reduced to an inconspicuous and isolated crest or terminal appendage ... 2
- Hoods more or less stipitate or substipitate, cucullate, the basal attachment not deeply saccate; horn commonly present 6
- 2(1). Hoods sharply deflexed from the anther head; leaves lanceolate *A. asperula*
- Hoods not deflexed from the anther head; leaves variously shaped 3
- 3(2). Hoods with 2 conspicuous external laminate basal appendages; flowers greenish to cream; leaves linear *A. rusbyi*
- Hoods without external basal appendages or merely keeled laterally; flowers variously colored, but if greenish to cream, the leaves not linear 4
- 4(3). Hoods closed or nearly so by the involute margins, deeply bifid dorsally; horn absent; sepals and petals greenish to cream; leaves broadly ovate to elliptic, more or less glaucous *A. cryptoceras*
- Hoods freely open above; horn on crest present; sepals and petals pink to purple; leaves ovate or linear 5
- 5(4). Leaves broadly ovate, 1–3 cm broad; plants densely tomentulose; follicles erect *A. ruthiae*
- Leaves linear, 1–2 mm broad; plants inconspicuously puberulent; follicles pendulous or weakly ascending *A. cutleri*
- 6(1). Anther head about as long as broad; column cylindrical or conic; horns usually gradually tapered and arching over the anther head 7
- Anther head ca 3/4 as long as broad or somewhat shorter; column broadly obconic to essentially obsolete; horns usually abruptly beaked and sharply inflexed toward or over the anther head 11
- 7(6). Hoods with sharply incised marginal auricles; corolla orange or yellowish red; plants of southern Utah ...
..... *A. tuberosa*
- Hoods without sharply incised marginal auricles; plants variously distributed 8
- 8(7). Leaves opposite 9
- Leaves whorled or spirally approximate 10
- 9(8). Hoods subequal to the anther head; flowers bright pink; plants indigenous, growing in marshes or other wet sites *A. incarnata*
- Hoods 1/3–1/2 longer than the anther head; flowers bright red; plants cultivated *A. curassavica*
- 10(8). Inflorescence paired or clustered at the upper nodes; flowers grayish pink to white; leaves 10–25 mm broad
..... *A. fascicularis*

- Inflorescence usually solitary at the upper nodes; flowers white; leaves 1–5 mm broad . . . *A. subverticillata*
- 11(6). Hoods gradually rounded to acuminate; horns fused to about the middle of the hood or less 12
- Hoods truncate or very abruptly rounded apically . . . 15
- 12(11). Hoods usually broadly flattened dorsally, usually abruptly constricted to a short basal stipe; plants erect 13
- Hoods narrowly keeled dorsally, sessile or subsessile; plants prostrate to ascending 14
- 13(12). Hoods widely spreading, 3–4 times as long as the anther head, gradually acuminate *A. speciosa*
- Hoods erect or only slightly spreading 2–3 times as long as the anther head, abruptly acute to acuminate *A. hallii*
- 14(12). Hoods about twice as long as anther head; leaves lanceolate; plants inconspicuously puberulent *A. involucreta*
- Hoods barely longer than anther head; leaves broadly ovate to ovate-lanceolate; plants conspicuously tomentulose *A. macrosperma*
- 15(11). Inflorescence sessile or subsessile, the peduncles shorter than the subtending petioles or scarcely longer; leaves broadly oblong, tomentose, at least when young *A. latifolia*
- Inflorescence pedunculate, peduncles much longer than the subtending petioles; leaves variously shaped 16
- 16(15). Leaves narrowly lanceolate, cuneate, 0.6–2.5 cm broad; plants glabrous, occurring in eastern Utah *A. labriformis*
- Leaves broadly lanceolate to obovate or broadly elliptic, 2.5–14 cm broad; plants pubescent, of various distribution 17
- 17(16). Follicles erect on deflexed pedicels, smooth; sepals shorter than the corolla lobes; main leaves ovate, acute apically; plants of Washington County . . . *A. erosa*
- Follicles spreading to pendulous on spreading pedicels, with soft subulate processes; sepals subequal to corolla lobes; main leaves obovate to elliptic, truncate or rounded apically; endemic to Kane County *A. welschii*

Asclepias asperula (Decne.) Woodson Spider Milkweed. [*Acerates asperula* Decne. in A. DC; *A. decumbens* var. *erecta* Durand, type from vicinity of Great Salt Lake; *Asclepias capricornu* Woodson]. Low herbaceous perennials from stout rootstocks; stems usually clustered from the rootstock, simple, stout, ascending or decumbent, 2–4 (6) dm tall, minutely and roughly pilosulose; leaves 10–20 cm long, 1–3 cm broad, irregularly approximate, short petiolate, lanceolate to linear-lanceolate, acuminate, sparsely pilosulous; inflorescence terminal and solitary; peduncles 1–10 cm long, stout; flowers rather large; calyx lobes ovate to ovate-lanceolate, 4–5 mm long; corolla rotate, pale yellowish green, occasionally tinged with purple externally, the lobes 9–12 mm long; gynostegium sessile, the hoods broadly clavate-falciform, abruptly deflexed from the anther head, but with ascending bluntish apices, 8–10 mm long, greenish to purplish, the anther head depressed, ca 2 mm long and 5 mm broad; follicles erect on deflexed pedicels, fusiform, attenuate, 4–13 cm long, 1–25 mm broad, smooth. Warm desert shrub, sagebrush, pinyon-juniper, mountain brush and ponderosa pine communities at 1062 to 2700 m

in Beaver, Box Elder, Cache, Daggett, Davis, Garfield, Grand, Iron, Juab, Kane, Millard, Salt Lake, San Juan, Tooele, Uintah, Utah, Washington and Wayne counties; Colorado, Texas to Idaho, Nevada, California and Mexico; 64 (iv). Our plants belong to var. *asperula*.

Asclepias cryptoceras Wats. Pallid Milkweed. Herbaceous perennials; stems decumbent, clustered, stout, somewhat flattened, simple, glabrous, 1–3 dm tall; leaves 4–9 cm long, 4–8 cm broad, opposite, short-petiolate, broadly oval to suborbicular, glaucous, glabrous; inflorescence terminal or lateral; peduncles lacking or to 7 cm long; flowers large; calyx lobes narrowly lanceolate, 6–7 mm long, glabrous; corolla reflexed-rotate, greenish yellow, the lobes 10–15 mm long; gynostegium sessile, pale rose, the hoods deeply saccate and decurrent upon the column, conspicuously 2-apiculate, 6–9 mm long, subequal to anther head, the horn very inconspicuous and incurved or absent, the anther head 3–3.5 mm long and 4–5 mm broad; follicles erect on erect pedicels, broadly fusiform, 4–7 cm long, 1.5–2.5 cm broad, smooth and glabrous. Blackbrush, saltbush, sagebrush, grassland, and pinyon-juniper communities at 1130 to 2000 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, San Juan, Sanpete, Sevier, Uintah, and Wayne counties; California to Arizona, Colorado and Wyoming; 92 (iv). Our specimens belong to var. *cryptoceras*.

Asclepias curassavica L. Tropics Milkweed. Herbaceous perennials; stems 3–8 dm tall, somewhat woody below, glabrous or puberulent above; leaves 5–15 cm long, 1.5–4 cm broad, opposite or whorled, short petiolate, oblong to lance-oblong, glabrous, inflorescence axillary and terminal; peduncles 2–8 cm long, slender; flowers rather large; calyx lobes lanceolate, 2–2.5 mm long; corolla rotate, red purple, ca 3 mm long, the horns broad, curved; follicles erect, fusiform, 4–10 cm long, acuminate, pubescent or glabrous; $2n = 22$. A greenhouse and summer ornamental in Utah County; native to tropics; 3 (0).

Asclepias cutleri Woodson Cutler Milkweed. Small herbaceous perennials; stems slender, weak, simple or branching only from the base, 6–13 cm long, inconspicuously puberulent; leaves 3–8 cm long, 1–2 mm wide, irregularly approximate, sessile, filiform, minutely puberulent; inflorescence terminal or nearly so, usually solitary, sessile; flowers small; calyx lobes lanceolate, ca 3 mm long; corolla reflexed-rotate, pale greenish rose, the lobes ca 5 mm long; gynostegium subsessile, pale rose, the hoods shortly saccate, ca 1.5 mm long, truncate, but with prominent narrow marginal auricles, the horn tongue-like, slightly longer than the hood, the anther head ca 1 mm long and 1.5 mm broad; follicles pendulous to spreading on pendulous to weakly ascending pedicels, narrowly fusiform, 4–5 cm long, ca 8 mm broad, smooth, glabrous. Sand dunes and gravelly places in mixed desert shrub and pinyon-juniper communities at 1270 to 1420 m in Grand and San Juan counties; southeastern Utah and Arizona; a Colorado Plateau endemic; 7 (ii).

Asclepias erosa Torr. Desert Milkweed. [*A. leucophylla* Engelm. in Parry, type from near St. George]. Large herbaceous perennials; stems woody at the base, stout, simple, 10–20 dm tall, tomentose when young, glabrate with age; leaves 6–24 cm long, 2.5–11 cm broad, sessile, broadly ovate to elliptic-oblong, short acuminate apically, cordate basally, the margins minutely erose, white arachnoid-tomentulose when young, glabrate in

age, pale green; inflorescences solitary or rarely paired, several at the upper nodes; peduncles 2–12 cm long, tomentulose; flowers large; calyx lobes lanceolate, 4–6 mm long; corolla pale yellowish green, the lobes 9–10 mm long; gynostegium short-stipitate, greenish white to cream, the column obovate, ca 2 mm long and 3 mm broad, the hoods broadly oval, obtuse apically, ca 4 mm long, the horn strongly adnate, incurved, subequal to the hood, the anther head truncate-conic, ca 3 mm long and 4 mm broad; follicles erect on deflexed pedicels, broadly fusiform, 5–7 cm long, 2–3 cm broad, apiculate, apically smooth, glabrous; $n = 11$. Creosote bush, Joshua tree, and blackbrush communities below 1130 m in Washington County; Nevada to Arizona, California and Mexico; 4 (iii).

Asclepias fascicularis Deene. in DC. Mexican Milkweed. Herbaceous perennials from stout woody rootstocks; stems several, 4–10 dm tall, almost always with numerous microphyllous axillary branches, usually puberulent in decurrent lines from the nodes, or glabrous; leaves 3–12 cm long, 0.1–2.5 cm broad, opposite or whorled, oblong to linear-lanceolate, glabrous to minutely pilosulose beneath, short-petiolate; inflorescence paired or clustered at the upper nodes; peduncles slender 2–4 cm long; flowers small; calyx lobes narrowly triangular, 1–1.5 mm long; corolla reflexed-rotate, grayish pink or white, the lobes 3–4 mm long; gynostegium narrowly stipitate, grayish pink or white, the column cylindric, ca 1 mm long and broad, the hoods cucullate, oval, ca 1–1.5 mm long, the horn basal, narrowly acicular, ca half longer than the hood, gradually arching over the anther head, the anther head cylindric, ca 1.5 mm long and broad; follicles erect on erect pedicels, narrowly fusiform, ca 5–12 cm long, 0.7–1 cm broad, smooth, glabrous; $n = 11$. Sagebrush, mountain brush and pinyon-juniper communities at 1270 to 1600 m in Davis, Kane, and Utah counties; Idaho, Nevada, west to Washington, Oregon, and California; 6 (0).

Asclepias hallii Gray Hall Milkweed. Herbaceous perennials; stems mostly simple, 2–5 dm tall densely puberulent to glabrate; leaves 5–15 cm long 1.5–4 cm broad, irregularly approximate, ovate to broadly lanceolate, puberulent beneath, short-petiolate; inflorescences lateral and solitary at several of the upper nodes; peduncles 1–5 cm long; flowers rather large; calyx lobes lanceolate, ca 3 mm long; corolla reflexed-rotate, pale rose to purple, the lobes 6–8 mm long; gynostegium pale rose to cream, short-stipitate, the column obovate, ca 1 mm long and 1.5 mm broad, the hoods oblong-elliptic, acute, 4.5–5 mm long, the horn adnate about the middle, falciform, abruptly incurved, shorter than the hood, the anther head conic-truncate, ca 2 mm long and 3 mm broad; follicles erect on deflexed pedicels, broadly fusiform, short apiculate, 8–12 cm long, 1–3 cm broad, smooth, puberulent to glabrate. Rocky slopes in sagebrush, mountain brush, pinyon-juniper, ponderosa pine, and aspen communities at 1900 to 3070 m in Emery, Garfield, Grand, Kane, Morgan, Utah, and Washington counties and probably elsewhere in the state; Wyoming and Colorado to Nevada and Arizona; 5 (0). Most of the county records are reported by Woodson (1954).

Asclepias incarnata L. Swamp Milkweed. Herbaceous perennials from short rootstocks; stems stout, 4–15 dm tall, simple to much branched; leaves 7–18 cm long, 0.5–3 cm broad, linear-lanceolate, acute to acuminate apically, obtuse basally, short-petiolate; inflorescences

commonly paired at the upper nodes, solitary below; peduncles 1.5–7 cm long; flowers small; calyx lobes linear-oblong, ca 1–1.5 mm long, corolla pink or rarely white, reflexed-rotate, the lobes 3–4 mm long; gynostegium pinkish, the column cylindric 1–1.5 mm long, 1 mm broad; hoods cucullate, rounded apically, ca 1.5 mm long, the horn acicular, incurved over the stigmatic head, slightly longer than the hood, the anther head ca 1.5 mm long; follicles erect on erect pedicels, fusiform, long attenuate, 7–9 cm long, 8–12 mm broad, smooth, glabrous to puberulent. In riparian or palustrine sites at 1470 to 2030 m in Box Elder, Cache, Davis, Juab, Salt Lake, Utah, and Weber counties; Canada to Florida and west to Utah and New Mexico; 19 (0).

Asclepias involucrata Engelm. ex Torr. Dwarf Milkweed. Low herbaceous perennials from woody sub-fusiform rootstalks; stems clustered, ascending or decumbent, slender, branching repeatedly, 3–25 cm long, minutely puberulent; leaves 1–12 cm long, 3–10 mm broad, irregularly approximate, sessile or nearly so, narrowly lanceolate, somewhat folded, inconspicuously pilosulose; inflorescence terminal or from the uppermost nodes, sessile; flowers rather small; calyx lobes ovate-lanceolate, 3–4 mm long; corolla reflexed-rotate, pale green or pinkish, the lobes 5–7 mm long; gynostegium short-stipitate, white with purple keels, the column obovate, 1–1.5 mm long and 1.5–2.5 mm broad, the hoods ovate, acute, 3–4 mm long, the horns adnate toward the base, falciform, incurved or ascending, subequal to hood, the anther head truncate-conic, ca 2 mm long and 3 mm broad; follicles erect on deflexed pedicels, stoutly fusiform, short apiculate, 4–7 cm long, 1.5–2 cm broad, nearly glabrous. Dry flats and washes with mixed desert shrub, sagebrush and pinyon-juniper communities at 1470 to 2000 m in San Juan County; Texas and Kansas to Colorado, Arizona and Mexico; 1 (0).

Asclepias labriformis Jones Jones Milkweed. Herbaceous perennials; stems erect, mostly simple, 2–5 dm tall, puberulent to glabrous; leaves 5–15 cm long, 0.6–2.5 cm broad, irregularly approximate, subsessile, lanceolate to linear-lanceolate, pale green, glabrous; inflorescences lateral and solitary at several of the upper nodes; peduncles stout, 0.4–3 cm long; flowers medium sized; calyx lobes lanceolate 4–5 mm long; corolla pale yellowish green, the lobes ca 8 mm long; gynostegium short-stipitate, cream, the column narrowly cylindrical, ca 1.5 mm long, 2 mm broad, the hoods subquadrate, truncate, ca 3–4 mm long, the horn half adnate, falciform, incurved, somewhat longer than hood, the anther head truncate-conic, ca 2.5 mm long, 2 mm broad; follicles pendulous on spreading pedicels, ovoid to broadly fusiform, 4–7 cm long, 1.5–3 cm broad, smooth, glabrous. Sandy washes, canyons and flats with saltbush, Mormon tea, mixed desert shrub, and pinyon-juniper at 1533 to 2330 m in Duchesne, Emery, Garfield, San Juan, Uintah, and Wayne (type from Capitol Wash) counties; indigenous and endemic to Utah; 43 (x).

Asclepias latifolia (Torr.) Raf. Broadleaf Milkweed. [*A. obtusifolia* var. ? *latifolia* Torr.]. Herbaceous perennials; stems stout, usually simple, 2–6 dm tall, tomentulose when young, soon glabrate; leaves 4–16 cm long, 4–13 cm broad, opposite, very short-petiolate, broadly oval-obovate, retuse apically, glaucous; inflorescences lateral at several of the upper nodes; peduncles very short or subsessile; flowers rather large; calyx lobes ovate-lanceolate,

ca 4 mm long; corolla reflexed-rotate, pale green, the lobes 11–12 mm long; gynostegium short-stipitate, greenish white, the column broadly obconic, ca 2 mm long and 3 mm broad, the hoods subquadrate, truncate or retuse, ca 4 mm long, the horn wholly adnate, very broadly falciform, sharply incurved, somewhat longer than the hood, the anther head ca 3 mm long, 4 mm broad, truncately conic; follicles erect on deflexed pedicels, broadly fusiform, apiculate, 6–8 cm long, 1.5–4 cm broad, smooth and nearly glabrous. Disturbed sites, with mixed desert shrub, sagebrush, juniper, and hanging garden communities at 1130 to 1660 m in Garfield, Grand, Kane and San Juan counties; Nebraska to Texas and California; 17 (ix).

Asclepias macrosperma Eastw. Eastwood Milkweed. [*A. involucrata* var. *tomentosa* Eastw., type from Courthouse Wash, Grand County]. Low herbaceous perennials from woody rootstocks; stems clustered, ascending or decumbent, branching, 6–25 cm long, densely tomentose; leaves 2–6 cm long, 1–2 cm broad, irregularly approximate, very short petiolate, ovate to ovate-lanceolate, densely tomentulose; inflorescence solitary and terminal, sessile; flowers small; calyx lobes ovate, ca 3 mm long; corolla reflexed-rotate, pale green, purplish without, the lobes 5–6 mm long; gynostegium very short stipitate, greenish white or cream, the column broadly obconic, ca 0.7 mm long and 1.3–1.5 mm broad, the hoods broadly ovate, obtuse, 2.5–3 mm long, the horn adnate toward the base, falciform, incurved, somewhat shorter than hood, the anther head ca 2 mm long and 3 mm broad; follicles erect on deflexed pedicels, broadly fusiform, short apiculate, 4–6 cm long, 1.5–2 cm broad, sparsely pilose to glabrous. Sandy sites in mixed desert shrub, blackbrush, sagebrush, and pinyon-juniper communities at 1130 to 2000 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona; 68 (xx).

Asclepias rusbyi (Vail) Woodson Rusby Milkweed. [*Acerates rusbyi* Vail; *Asclepias engelmanniana* var. *rusbyi* (Vail) Kearney]. Herbaceous perennials; stems erect, simple or branching from the caudex, 6–12 dm tall, glabrous; leaves 12–18 cm long, 1–4 (6) mm broad, linear, sessile or nearly so, laxly spreading or reflexed, glabrous; inflorescences lateral, from several of the upper nodes, subsessile to short pedunculate; flowers rather small; calyx lobes ovate-lanceolate to lanceolate, 3–4 mm long, reflexed, pilose; corolla reflexed-rotate, pale green, purplish without, the lobes ca 5 mm long; gynostegium sessile, the hoods deeply saccate, truncate, white to yellow, auriculate at the base, with well-developed winglike basal auricles, these rounded, entire, pale green; horn present as a small indistinct crest within the hood, the anther head conical, ca 2.5–3 mm long and 3 mm broad; follicles erect on deflexed pedicels, narrowly fusiform, attenuate, 8–12 cm long, ca 1.5 cm broad. Sagebrush, oak brush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1270 to 2300 m in Grand, San Juan, and Washington counties; Nevada to Arizona; 7 (ii). Woodson reports a collection of *A. engelmanniana* from San Juan County, however the report of that Great Plains species requires substantiation.

Asclepias ruthiae Maguire Ruth Milkweed. Low, herbaceous perennials; stems ascending or decumbent, slender, simple or branched below ground, 6–9 cm long, minutely tomentulose; leaves 1–5 cm long, 1–3 cm broad, opposite, petiolate, broadly ovate, white-tomen-

tulose, particularly the margins; inflorescences terminal, or occasionally lateral at the uppermost nodes, sessile; flowers small; calyx lobes ovate-lanceolate, ca 3 mm long; corolla reflexed-rotate, pale violet, the lobes ca 6 mm long; gynostegium subsessile, pale rose purple, the hoods saccate, truncate, ca 1 mm long, the horn tongue-like, subequal to the hood, the anther head truncate conic, ca 1 mm long and 1.5 mm broad; follicles erect on deflexed pedicels, broadly fusiform, apiculate, 3–4 cm long, ca 1.5 cm broad, smooth, glabrous. Mixed desert shrub, saltbush and pinyon-juniper communities at 1400 to 1800 m in Emery (type from Calf Spring Canyon), San Juan, Sevier, and Wayne counties; a Navajo Basin endemic; 43 (iii).

Asclepias speciosa Torr. Showy Milkweed. Herbaceous perennials; stems usually very stout, simple, 6–10 dm tall, usually densely white-tomentose; leaves 6–20 cm long, 3–14 cm broad, opposite, short petiolate, broadly ovate to ovate-lanceolate, obtuse apically, rounded to cordate basally, densely white-tomentose beneath, nearly glabrous above; inflorescences lateral and solitary at several of the upper nodes; peduncles stout, 1–10 cm long; flowers large and showy; calyx lobes lanceolate, 5–6 mm long; corolla purplish rose, the lobes 10–15 mm long; gynostegium pale rose or pinkish cream, subsessile, the column broadly obconic, ca 1 mm long and 3 mm broad, the hoods narrowly ovate-lanceolate, attenuate, widely spreading, 10–14 mm long, the horn adnate toward the base, falciform-acicular, sharply incurved, much shorter than the hoods, the anther head broadly truncate-conic, ca 3 mm long, and 4.5 mm wide; follicles erect on deflexed pedicels, fusiform, 9–12 cm long, 2–3 cm broad, densely spiny to smooth, white-tomentose; n = 11. Weed of fields, roadsides, riparian, and palustrine sites at 830 to 2550 m in nearly all counties throughout Utah; Manitoba to Minnesota, Texas and westward to British Columbia and California; 71 (vi).

Asclepias subverticillata (Gray) Vail Whorled Milkweed. [*A. verticillata* var. *subverticillata* Gray; *A. galioides* H.B.K.]. Herbaceous perennials from stout woody rootstocks; stems 1.5–7 (12) dm tall, mostly with sterile dwarf branchlets, occasionally simple, glabrous or with puberulent lines from the nodes; leaves 2–13 cm long, 1–3 (4) mm broad, whorled or opposite, linear, glabrous to pilosulose; inflorescences usually solitary at the upper nodes; peduncle slender, 1.5–3 cm long; corolla reflexed rotate, white, rarely with a greenish purple tinge, the lobes 3–5 mm long; gynostegium narrowly stipitate, white, the column cylindrical, ca 1 mm long, slightly narrower, the hoods cucullate, oval, ca 1.5 mm long, the horn basal, acicular, somewhat longer than the hoods, gradually arching over the anther head; anther head cylindrical, ca 1.5 mm long and broad; follicles erect on erect pedicels, narrowly fusiform, ca 5–9 cm long, 6–8 mm broad, smooth, nearly glabrous. Roadsides and other disturbed sites in creosote bush, blackbrush, saltbush, sagebrush, rabbitbrush, pinyon-juniper and mountain brush communities at 830 to 2200 m in Emery, Garfield, Grand, Iron, Kane, Millard, San Juan, Sanpete, and Washington counties; Colorado, Texas, New Mexico, Arizona and Mexico; 32 (vi). Plants of this species are very poisonous to livestock.

Asclepias tuberosa L. Orange milkweed; Butterflyweed. Herbaceous perennials from deep woody rootstocks; stems stout, clustered, branching only at the inflo-

rescence, 2–9 dm tall, hirsutulose or hispid; leaves 3–11 cm long, 0.3–3 cm broad, irregularly approximate, crowded, short petiolate, narrowly lanceolate to broadly oblanceolate, acuminate to rounded apically, cuneate to cordate basally; inflorescences terminal or nearly so, 1–several at the nodes; flowers moderately large; calyx lobes lance-trigonal, 2–3 mm long; corolla reflexed-rotate, orange to reddish or yellowish red, the lobes 7–8 mm long; gynostegium orange, rarely yellow, the column narrowly obovate, ca 2 mm long, 1.5 mm broad, the hoods cucullate, lanceolate, 4–5 mm long, the horn basal, narrowly acicular, slightly longer than the hoods, gradually arching over the anther head, the anther head cylindrical, ca 2 mm long and broad; follicles erect on deflexed pedicels, narrowly fusiform, 8–15 cm long 1–1.5 cm broad, smooth pilosulose. Sagebrush, mountain brush, pinyon-juniper and ponderosa pine communities at 1333 to 2330 m in Garfield, Kane, San Juan, and Washington counties; Minnesota, Michigan, to Colorado, Arizona, Texas, and Mexico; 13 (iv). Our plants belong to *ssp. terminalis* Woodson, which have leaves typically obtuse to truncate, varying to slightly cordate.

Asclepias welshii N. & P. Holmgren. Welsh Milkweed. Perennial herbs from extensive underground rootstocks; stems 2.5–10 dm tall, erect, stout, simple from the base; leaves 6–9 (15) cm long, 3–6 (8) cm broad, opposite, coriaceous, broadly elliptic to ovate or obovate, rounded to truncate and mucronate apically, rounded to cordate basally, short-petiolate; inflorescence lateral at upper nodes, white-lanate; peduncles 2–7 cm long; flowers rather large; calyx reflexed at base, linear 5–7.5 mm long; corolla 5–8 mm long, reflexed rotate, ovate, cream with a rose tinged middle; gynostegium cream to pale green, the column ca 0.5 mm long, 1.5–2.5 mm broad, pale green, the hood 2.5–3.2 mm long, broadly truncate, cream, the horn exerted from and attached at middle of the hood, falcately curved over the anther head, the anther head 1.2–1.5 mm long, 1.5–3.4 mm broad; follicles spreading to pendulous on spreading pedicels, broadly fusiform; 4–7.5 cm long, lanate to glabrate, bearing soft subulate processes. Coral Pink sand dunes (type locality) in sagebrush, juniper, and ponderosa pine communities at 1700 to 1900 m in Kane County; endemic; 6 (i).

Cynanchum L.

Shrubs or suffrutescent perennials; stems twining, slender; leaves opposite, linear or reduced; flowers small, in axillary umbels or small cymes; calyx 5-lobed, the lobes acute; corolla campanulate to urn-shaped, 5-lobed, crown lacking; pollen-masses solitary in each pollen sack, pendulous; follicles long acuminate, smooth, terete.

Cynanchum utahense (Engelm.) Woodson Swallowwort. [*Astephanus utahense* Engelm., type from near St. George]. Plants perennial from a branched woody caudex; stems slender, glabrous, 2–5 dm tall; leaves linear, acuminate, 2–3 cm long, spreading or reflexed; umbels short-pedunculate, 3- to 10-flowered, with a few subulate bracts; corolla dull yellow, ca 2 mm wide, the lobes ovate, somewhat hooded, puberulent within; anthers unappendaged apically; follicles fusiform, long-acuminate, 4–6 cm long; seeds rough granulate. Creosote bush, blackbrush, mesquite, and sagebrush communities below 1065 m in Washington County; Nevada, Arizona and California; 14 (vii).

Sarcostemma R. Br

Suffrutescent twining or trailing vines; leaves opposite; flowers umbellate or cymose; calyx deeply 5-lobed; corolla rotate to campanulate or salverform, 5-lobed; stamens 5, the filaments fused into a column, each filament bearing an inflated vesicular segment (corona-vesicle) just below the anther; anthers 2-celled, the membranous dorsal appendage ovate to deltoid; pollinia solitary in each anther sac, pendulous; follicles fusiform to clavate.

Sarcostemma cynanchoides Decne. in DC. Climbing Milkweed. [*Funastrum heterophyllum* (Engelm.) Standley]. Stems twining or trailing, 1 m or more long, much branched, glabrous to puberulent; leaves to 6 cm long and 3.5 cm wide, broadly to narrowly ovate-lanceolate to triangular-lanceolate or linear-lanceolate, acute to acuminate apically, cordate to hastate or round-cuneate basally, sparsely puberulent on both surfaces, with one or more glands on the midrib near the base; inflorescence umbellate, to 20-flowered; peduncle slender to 60 cm long; bracts linear, minute; pedicels slender, to 17 mm long; calyx lobes ovate to narrowly ovate, 2–3 mm long, pilosulose without, glabrous within; corolla rotate-campanulate, greenish white to purple or pinkish, the tube 1–2 mm long, the lobes ovate, acute to acuminate, 5–7 mm long, glabrous within, fimbriate-ciliate, the ring of the crown thin, revolute, not adnate to the base of the crown-vesicles, these 1.5 mm long; follicles fusiform, to 7 cm long, attenuate apically, puberulent. Creosote bush, yucca, desert shrub, and hanging garden communities up to 1333 m in Garfield, Kane, San Juan, and Washington counties; Texas to California and Mexico; 10 (vi).

BERBERIDACEAE A. L. Juss.

Barberry Family

Shrubs with yellow wood and inner bark; leaves alternate, simple or compound; flowers perfect, regular, borne in racemes, umbels, or corymbs, hypogynous; sepals and petals usually similar and in 2 sets of 3; stamens as many as the petals and opposite them; anthers opening by 2 hinged valves; pistil 1, the ovary superior, 1-loculed, 1-carpelled; style short or lacking; fruit a berry; $x = 6, 7, 8, 10, 14$.

- 1. Primary leaves modified as spines; foliage leaves simple, aggregated on axillary spurs *Berberis*
- Primary leaves pinnately compound, the leaflets spinose-toothed *Mahonia*

Berberis L.

Deciduous or evergreen shrubs; leaves alternate, the primary ones modified as simple or 3-pronged spines; foliage leaves clustered on axillary spurs, simple; flowers yellow, borne in racemes, subumbellate corymbs, or umbels; sepals 6, or 3 and subtended by 3 bractlets; petals 6, bearing 2 glands near the base; stamens 6, irritable; fruit a berry.

- 1. Leaves persistent, evergreen, leathery; plants cultivated 2
- Leaves deciduous, thin; plants cultivated or indigenous . . . 4
- 2(1). Leaves glaucous or white beneath, ca twice longer than broad or less *B. verruculosa*

- Leaves green on both sides, or pale beneath, ca 4–10 times longer than broad 3
- 3(2). Veins of leaves prominent; flowers mainly 6–10 or more, umbellate from bud scales *B. julianae*
- Veins of leaves not prominent; flowers mainly 2–6, corymbose from spur apices *B. sargentiana*
- 4(1). Racemes 10– to 15–flowered; leaves spinulose-serrate *B. vulgaris*
- Racemes 2– to 10–flowered; leaves entire or spinulose-serrate 5
- 5(4). Spines simple; leaves broadly obovate to spatulate, entire; plants cultivated, common *B. thunbergii*
- Spines 3– to 5–parted; leaves oblanceolate to elliptic, serrate or entire; plants indigenous in southeastern Utah *B. fendleri*

***Berberis fendleri* Gray Fendler Barberry.** Shrubs, mainly 5–10 dm tall; branchlets purplish brown; spines 3 (5)-parted, 8–15 mm long; leaves 0.8–6 cm long, 4–14 mm wide, oblanceolate to spatulate, entire to spinulose-serrate; racemes terminating lateral branches, 5– to 10–flowered; pedicels 4–6 mm long; berries red, ovoid to ellipsoid, 5–7 mm long. Riparian, hanging garden, and pinyon-juniper communities at 1585 to 2290 m in Grand (?) and San Juan counties, Colorado and New Mexico; 4 (i). This is a handsome plant, with striking autumn foliage; it has horticultural potential.

***Berberis julianae* Schneider** Evergreen shrubs, mainly 0.8–1.5 m tall; spines 3–parted, 12–40 mm long, stout, present almost throughout; leaves 1.8–7 cm long, 0.7–2 cm wide, oblanceolate to elliptic, leathery, spinose-serrate; umbels 6– to 15–flowered, sessile from nodal buds of the previous season; pedicels 7–15 mm long; berries black, with a waxy bloom, 6–8 mm long, the style apparent. Commonly cultivated ornamental in lower elevation communities in Utah; introduced from China; 7 (i).

***Berberis sargentiana* Schneider** Evergreen shrubs, mainly 0.7–1.5 m tall; spines 3–parted, 6–22 mm long, slender; leaves 1.5–5 cm long, 3–8 mm wide, elliptic to narrowly lanceolate, leathery, revolute and more or less spinose-serrate; corymbs 2– to 6–flowered from apices of spur branches; pedicels 6–15 mm long; berries black, somewhat glaucous, 6–8 mm long, the stigma sessile. Commonly cultivated ornamentals of cities and towns at lower elevations in Utah; introduced from China; 3 (0).

***Berberis thunbergii* DC.** Thunberg Barberry. Shrubs, mainly 0.8–1.5 m tall; leaves deciduous; spines simple, 5–15 mm long; leaves 0.6–3.5 cm long, 3–12 mm wide, spatulate to obovate, entire; inflorescence 1– to 3–flowered, from apices of spur branches; pedicels 2–8 mm long; berries bright red, ellipsoid, the stigma sessile; 2n = 28. A very commonly cultivated ornamental in Utah; introduced from Japan; 9 (i). The purple-leaved cultivar is striking in autumn, when the branches are laden with scarlet berries.

***Berberis verruculosa* Hemsley & Wilson** Evergreen shrubs, mainly 0.5–1 m tall; spines 3–parted, 6–15 mm long, rather robust; leaves 8–20 mm long, 5–10 mm wide, obovate to elliptic, coriaceous, green above, whitish glaucous beneath, subtentire to spinose-serrate; flowers solitary; pedicels 4–12 mm long; fruit black, with a waxy bloom, 4–6 mm long. Cultivated ornamental in Utah; introduced from China; 2 (0).

***Berberis vulgaris* L.** Common Barberry. Shrubs, mainly 0.8–1.5 m tall; spines 3–parted, 4–7 mm long;

leaves 1.5–3.5 cm long, 5–16 mm wide, obovate to elliptic, spinulose-serrulate; flowers 10–15 or more in elongate racemes; pedicels 4–8 mm long; fruit scarlet to purplish, ovoid; 2n = 28. Sparingly cultivated ornamental plants in Utah; introduced from Eurasia; 1 (0). This is the infamous alternate host of stem rust of cereals.

Mahonia Nutt.

Evergreen shrubs; leaves alternate, not modified as spines, none in axillary fascicles, pinnately compound; leaflets spinose-toothed, leathery; flowers yellow, borne in racemes or subcorymbose racemes; sepals 3 and closely subtended by 3 bracts or 6; petals 6; stamens 6; fruit a berry. Note: This genus is often considered by botanists (but not by horticulturalists) as a subgenus of *Berberis*. The modified primary leaves of *Berberis* are interpreted as mere reductions of the pinnately compound leaves of *Mahonia*, and not as fundamental generic features. And species of *Mahonia* can be crossed with those of *Berberis*, yielding yet another horticultural curiosity, i.e., *Mahoberberis*. However, the species of *Mahonia* are decidedly an evolutionary grouping, and since taxonomy should be practical as well as represent relationships it seems best to regard *Mahonia* as distinct from *Berberis*. Alternative names are presented for those who wish not to follow this treatment.

- 1. Shrubs mainly 8–30 dm tall or more; leaflets with 5–7 broadly triangular lobes or teeth; plants indigenous in southeastern Utah *M. fremontii*
- Shrubs mainly 1–10 dm tall; leaflets with 12–40 teeth; plants of various distribution 2
- 2(1). Leaflets mainly less than twice longer than broad, dull on both surfaces; plants commonly less than 3 dm tall, indigenous *M. repens*
- Leaflets mainly twice or more longer than broad, glossy on at least the upper surface; plants commonly over 5 dm tall *M. aquifolium*

***Mahonia aquifolium* (Pursh) Nutt.** Shining Mahonia. [*Berberis aquifolium* Pursh]. Shrubs with erect stems, mainly 3–10 dm tall or more; leaves with 5–9 leaflets; leaflets 3–8 cm long, 2–6 cm wide, glossy above, glossy to dull beneath, with 12–40 spinose teeth; racemes several, 3–8 cm long; bractlets (outer sepals) 2–3 mm long; inner sepals 6–8 mm long, yellow; petals bilobed; staminal filaments commonly with 2 short teeth just below the anthers; berries blue, glaucous, 7–14 mm long; 2n = 28, 56. Cultivated ornamentals in Utah; indigenous from British Columbia to Idaho and Oregon; 2 (i).

***Mahonia fremontii* (Torr.) Fedde** Fremont Mahonia. [*Berberis fremontii* Torr.]. Shrubs with spreading branches, 15–30 dm tall and as broad; leaves with 3–9 leaflets; leaflets glaucous on both sides, 1–3 cm long, 0.6–3 cm broad, with 5–7 broad triangular spine-tipped lobes or teeth; bractlets (outer sepals) 3.5–4.5 mm long; inner sepals 5–8 mm long, yellow; petals broadly rounded; berries reddish or purplish, hollow, often open apically, the pericarp juicy and tart, 12–20 mm long. Warm, mixed, and salt desert shrub, pinyon-juniper, and mountain brush communities at 820 to 2380 m in Emery, Garfield, Grand, San Juan, Washington, and Wayne counties; Colorado, New Mexico, and Arizona; 71 (xii)

***Mahonia repens* (Lindl.) G. Don** Oregon Grape; Creeping Mahonia. [*Berberis repens* Lindl.]. Shrubs,

mainly 0.5–3 (5) dm tall; stems erect or more or less decumbent and often rooting (stoloniferous); leaflets 3–7 (9), 1.2–7 cm long, 1–5 cm wide, dull on both sides; bractlets (outer sepals) 2–3 mm long; inner sepals 5–8 mm long, yellow; petals bilobed; berries blue, glaucous, 6–10 mm long; 2n = 28. Riparian, sagebrush, pinyon-juniper, mountain brush, aspen, lodgepole pine, and mixed conifer communities at 1125 to 2980 m in all Utah counties; Washington and Alberta, south to California, Arizona, New Mexico, and Texas; 125 (x). This plant does well in cultivation, where it grows taller and simulates the closely related *M. aquifolium*, as do thick-leaved plants from Zion Canyon. Oregon grape is utilized in reclamation plantings.

BETULACEAE S. F. Gray

Birch Family

Monoecious, deciduous trees or shrubs; leaves alternate, simple, serrate to doubly serrate; stipules caducous; flowers imperfect; staminate flowers in spreading or pendulous catkins, subtended by scale bracts, with 2– to 4–parted perianth (or bracteoles) or the perianth lacking, and 2–many stamens; pistillate flowers in clusters, spikes, or scaly catkins, with perianth minute or lacking; ovary 2–loculed; styles 2; fruit a 1–loculed, 1–seeded nutlet or nut, with or without a foliaceous involucre; x = 8, 14.

- 1. Cultivated shrubs or small trees; scales of pistillate catkins deciduous, the involucre greatly enlarged, enclosing a single nutlet or nut 2
- Cultivated or indigenous shrubs or trees, or if as above (*Ostrya*) then indigenous in southeastern Utah 3
- 2(1). Involucres enclosing a nut 1–1.8 cm thick, lobed and the lobes laciniately fringed *Corylus*
- Involucres expanded, flat, subtending a nutlet to 5 mm thick, serrate *Carpinus*
- 3(1). Bracts of pistillate aments deciduous; nutlets wingless, enveloped by enlarged inflated involucres; plants of defiles, monolith bases, and alcoves in southeastern Utah *Ostrya*
- Bracts of pistillate aments persistent; nutlets often winged, lacking an involucre; plants of riparian areas, variously distributed 4
- 4(3). Pistillate aments 1–several, racemose, the bracts persistent, conelike; buds stalked; wood yellow orange. *Alnus*
- Pistillate aments solitary; bracts deciduous with the nutlets; buds sessile; wood whitish *Betula*

Alnus Miller

Trees or shrubs; leaves alternate, simple, doubly serrate to lobed; flowers in catkins, borne with or before the leaves; staminate catkins 1–3, the bracts peltate, subtending 3–6 flowers, each flower with 2–4 stamens; pistillate catkins conelike, 1–several, the persistent woody bracts subtending 2 flowers; fruit a nutlet. Note: Potentially there are several cultivated species in Utah, including almost certainly *A. serrulata* (Ait.) Willd., but they are not treated herein because of taxonomic considerations.

Alnus incana (L.) Moench Thinleaf Alder. [*Betula alnus* var. *incana* L.; *A. tenuifolia* Nutt.; *A. incana* ssp. *tenuifolia* (Nutt.) Breitung]. Shrubs or small trees; stems

commonly 1–4 (10) m tall, 0.2–2.5 dm thick; bark grayish to brownish; winter buds blunt; twigs puberulent and commonly glandular as well; leaf blades 2–9 (11) cm long, 1–6.5 (10) cm wide, ovate to elliptic, oblong, or oval, obtuse to rounded or less commonly acute or abruptly acuminate, obtuse to rounded or subcordate basally, doubly serrate with numerous teeth and shallowly lobed, the lower surface paler than the upper but not markedly so, hairy to glabrous above, usually hairy along the veins beneath; petioles 5–20 (30) mm long, puberulent; pistillate catkins arising from branches of the previous season, 3–9 per cluster, 9–15 mm long, 8–12 mm thick; wing of nutlet lacking; n = 14. Streambanks and terraces, and in seep and spring sites at 1250 to 2745 m in Box Elder, Cache, Daggett, Davis, Duchesne, Garfield, Morgan, Salt Lake, San Juan, Sevier, Summit, Tooele, Uintah, Wayne, and Weber counties; Alaska and Yukon, east to Nova Scotia, south to California, New Mexico, Arizona, and Pennsylvania; Eurasia; 37 (ii). Our material belongs to ssp. *rugosa* (Duroi) R.T. Clausen var. *occidentalis* (Dippel) C.L. Hitchc. [*A. occidentalis* Dippel]. The thinleaf alder is a portion of a huge circumboreal complex, with ssp. *incana* being the Old World portion and var. *rugosa* representing the eastern American plants.

Betula L.

Trees or shrubs; leaves alternate, simple, serrate to crenate, crenate-serrate, or doubly serrate; flowers in catkins, borne with or before the leaves; staminate catkins 1–4 per bud, pendulous or spreading in flower; pistillate catkins usually solitary, erect in flower; staminate flowers in clusters of 3, the stamens 2; bracts of pistillate catkins 3–lobed, deciduous; pistillate flowers 2–3 per bract; fruit a winged nutlet (samara).

Dugle, J. R. 1966. A taxonomic study of western Canadian species of the genus *Betula*. *Canad. J. Bot.* 44: 929–1007.

- 1. Plants low to moderately sized shrubs, 0.5–1.2 m tall; leaf blades 0.5–2.5 cm long, oval to orbicular, crenate to crenate-serrate, with usually 10 or fewer teeth per side *B. glandulosa*
- Plants tall shrubs or trees, mainly 4–8 m tall; leaf blades 1.5–8 cm long, ovate to deltoid, serrate to doubly serrate (or lobed), with usually 10–40 teeth per side 2
- 2(1). Bark shining, not exfoliating, brown to red brown or yellow brown; plants indigenous in riparian sites in Utah *B. occidentalis*
- Bark dull, white; plants cultivated in Utah 3
- 3(2). Bark exfoliating; leaves ovate, usually pubescent in vein axils beneath *B. papyrifera*
- Bark not exfoliating; leaves rhombic-ovate or laciniately lobed, glabrous beneath *B. pendula*

Betula glandulosa Michx. Glandular Birch; Swamp Birch. Shrubs, commonly 0.5–1.2 (2) m tall, with 1 to several main stems; bark not exfoliating, gray to brown or purplish, the lenticels not or seldom conspicuous; twigs puberulent, bearing yellowish crystalline resin glands; leaf blades 0.5–2.5 cm long, 0.5–2 cm broad, oval to orbicular, broadly elliptic, or obovate, or less commonly ovate, rounded to obtuse or rarely acute apically, cuneate to rounded basally, once crenate to crenate-serrate, mainly with 10 or fewer teeth per side, not hairy in lower vein axils, minutely hairy to glabrous on margins near the base; petioles 1–9 mm long, puberulent or glabrous;

pistillate catkins 7–20 mm long, 3–8 mm thick, the bracts commonly glabrous dorsally, ciliate; samara wings narrower than half the body width; $2n = 28$. Meadows and streamsides in lodgepole pine and spruce-fir communities at (2135?) 2745 to 3355 m in Cache (?), Daggett, Duchesne, Summit, Utah, and Wasatch counties; Alaska and Yukon, east to Newfoundland, south to California, Colorado, and New York; Greenland; Asia; 15 (iv).

Betula occidentalis Hook. Water Birch. [*B. fontinalis* Sarg.]. Shrubs or small trees, commonly 3–6 m tall, with several trunks to 2.5 dm thick or more; bark not or scarcely exfoliating, reddish or yellowish brown to brown, shining, marked with pale horizontal lenticels; twigs pubescent to glabrous, bearing yellowish to reddish crystalline resin glands; leaf blades 1–5 cm long, 0.7–4 cm broad, ovate, acute, or abruptly acuminate apically, obtuse to rounded or less commonly cuneate to truncate basally, sharply and often doubly serrate, with mostly 15–25 teeth per side, not hairy in lower vein axils, minutely hairy to glabrous on margins near the base; petioles 5–15 mm long, glabrous or puberulent; pistillate catkins 15–40 mm long, 4–10 mm thick, the bracts puberulent and ciliate; samara wing subequal to width of the nutlet. Riparian communities and near seeps and springs at 1220 to 2685 m in all Utah counties; Alaska and Yukon, east to Mackenzie, south to California, Colorado, and South Dakota; 134 (xiv). This birch forms hybrids with *B. papyrifera*. Presumably the material constituting the type of *B. utahensis* Britt., from City Creek Canyon, was derived in that manner and has either persisted from a time when *B. papyrifera* was sympatric, or has been derived more recently through long-distance pollination.

Betula papyrifera Marshall Paper Birch. Trees, commonly 5–8 m tall or more, with 1 main trunk to 5 dm thick or more; bark exfoliating, creamy white, marked with pale elongate horizontal lenticels; twigs puberulent to glabrous, bearing yellowish to white crystalline resin glands, or these poorly developed or lacking; leaf blades 2.5–8 cm long, 1.3–7 cm broad, ovate to lance-ovate, acuminate to acute, rounded to truncate or subcordate basally, sharply and often doubly serrate and sometimes lobed as well, with usually 15–20 teeth per side, usually hairy in lower vein axils, hairy to glabrous on margins near the base and often over the upper surface; petioles 8–40 mm long, glabrous or puberulent; pistillate catkins 15–40 mm long, 5–15 mm thick; bracts glabrous or puberulent dorsally; samara wings broader than the body; $2n = 56, 70, 84$. Cultivated ornamental in Utah; introduced from elsewhere in North America; 2 (0).

Betula pendula Roth European White Birch. Trees, commonly 5–10 m tall or more, with 1 main trunk to 5 dm thick or more; bark flaking off in layers, but not especially exfoliating, marked with elongate horizontal lenticels; twigs glabrous, with yellowish crystalline resin glands or these lacking, often pendulous; leaf blades 1.5–7 cm long, 1.2–5 cm wide, rhombic-ovate, acuminate apically, truncate to obtuse basally, sharply doubly serrate with 15–30 teeth per side or more, or laciniately lobed, not hairy in the vein axils below, hairy to glabrous on margins near the base; petioles 10–40 mm long; bracts puberulent or glabrous dorsally; pistillate catkins 20–50 mm long, 8–12 mm thick; samara wing broader than the body; $2n = 28$. Cultivated ornamental in Utah; introduced from Eurasia; 7 (0).

Carpinus L.

Shrubs or small trees; leaves alternate, simple; staminate aments pendulous; bracts ovate, each with a single naked flower with several stamens; filaments short, divided apically and bearing 2 apically pilose half-anthers; pistillate aments slender, with ovate deciduous bracts, the flowers in pairs, with calyx much reduced; bracts accrescent in fruit; fruit a ribbed nutlet.

Carpinus caroliniana Walter Hornbeam. Plants mainly 3–8 m tall, with flattened trunk and smooth or gray striated bark (musclelike); leaves 2.5–12 cm long, ovate or lance-oblong to ovate or obovate, sharply doubly serrate, acuminate or acute; fruiting catkins 2–7 cm long, the bracts oblong-lanceolate, 1.2–3 cm long, often lobed at the base, entire or few-toothed. Cultivated ornamental plants in Utah; introduced from the eastern U. S.; 1 (0).

Corylus L.

Deciduous shrubs or small trees; leaves alternate, simple, doubly serrate; staminate catkins pendulous at anthesis, each scale subtending a pair of bractlets and a single naked flower with 4 stamens; filaments divided apically, each bearing 2 half-anthers; pistillate catkins small, ovoid, the flowers concealed by bud scales except for the elongate reddish stigmas, each flower subtended by a tiny bract and 2 bractlets, these greatly accrescent at maturity, finally enclosing the nut.

Corylus avellana L. European Filbert; Hazelnut. Shrubs, mainly 2–6 m tall; leaves 1.5–10 cm long, 1.2–8.5 cm broad, suborbicular to broadly obovate, abruptly acuminate apically, subcordate basally, hairy along the veins beneath, puberulent above; petioles 4–14 mm long, long-hairy; mature involucre densely hairy, subequal to or somewhat exceeding the nut, laciniately lobed; nuts 1–2 cm wide; $2n = 22$. Cultivated nut plant, widely but not commonly grown in warmer portions of Utah; 6 (0). Other species, native elsewhere in North America are probably present.

Ostrya L.

Small trees; leaves alternate, simple, doubly serrate; staminate catkins pendulous, the scales abruptly acuminate, the flowers consisting of several stamens, each in a bract axil, the filaments short, each forked apically and the branches bearing pilose half-anthers; pistillate catkins slender, loosely flowered, the ovate hairy bracts caducous, subtending 2 flowers each enclosed within an ovoid pouch composed of united bract and bractlets; calyx minute; bracts accrescent and inflated in fruit, hoplike; fruit a compressed ovoid nutlet.

Ostrya knowltonii Cov. Western Hophornbeam. Small trees, mainly 2–6 m tall; trunks 3–18 cm thick; branchlets spreading-hairy and more or less stipitate-glandular, becoming glabrous; leaf blades 0.8–8 cm long, 0.8–5 cm wide, ovate to lance-ovate or elliptic, doubly serrate, acute apically, rounded to obtuse basally; fruiting aments 2–5 cm long, the individual sacs 10–25 mm long, greenish white to brownish. Bases of monoliths, defiles, and hanging gardens in sandstone areas at 1225 to 1710 m in Garfield, Grand, Kane, and San Juan counties; New Mexico, Arizona, and Texas; 17 (x).

BIGNONIACEAE A. L. Juss.

Catalpa Family

Shrubs or trees; leaves mostly opposite, simple or compound; flowers large and showy, perfect, irregular, in

terminal panicles or spicate racemes; calyx short, bilabiate or unequally 4- to 5-toothed; corolla sympetalous, bilabiate, 5-lobed; stamens 2 or 4; pistil 1, the ovary superior, 2-carpelled; style 1; stigma bilobed; fruit an elongate 2-valved capsule; seeds many, large, flat, winged or comose; x = 20 (7).

- 1. Plants climbing or clambering woody vines; leaves compound *Campsis*
- Plants trees or shrubs; leaves simple 2
- 2(1). Leaves ovate, petioled; fertile stamens 2; plants cultivated, less commonly escaping and established .. *Catalpa*
- Leaves linear to lance-linear; fertile stamens 4; plants indigenous in Washington County, seldom cultivated *Chilopsis*

Campsis Lour.

Woody vines; leaves opposite, odd-pinnately compound, with toothed leaflets; flowers orange, in compact terminal panicles; calyx 5-lobed, suffused with red, leathery; corolla funnelform, expanded above the narrow tube, the 5 lobes spreading; stamens 4, in 2 pairs; ovary 2-loculed, surrounded at base by a large disk; fruit a fusiform capsule, the 2 valves separating from the septum; seeds numerous, compressed, with 2 large translucent wings.

Campsis radicans (L.) Seemann Trumpet-vine. [*Bignonia radicans* L.]. Stems mainly 1.5-10 m long, climbing by means of aerial rootlets or merely clambering over other plants or structures; leaves pinnately compound with 7-11 leaflets, these 2-8 cm long, oval to ovate or oblong, long-acuminate, serrate, dark green above, pale and hairy beneath (at least on the midrib); corolla tube orange, mainly 6-8 cm long; capsules commonly 7-16 cm long, sharply margined at maturity, tapering at both ends. Cultivated ornamental, persisting and spreading, at elevations below 1525 m in Grand, Utah, and Washington counties; widely cultivated in the U. S., indigenous in eastern U. S.; 4 (iii).

Catalpa Scop.

Trees; leaves opposite or sometimes whorled, long petioled, large, simple, entire or coarsely lobed, often with a pungent odor when crushed; flowers white, pinkish, or yellowish, in large showy terminal panicles; calyx splitting irregularly or 2-lipped; corolla campanulate, 2-lipped, with 2 smaller upper lobes and 3 larger lower lobes; fertile stamens 2, curved, the anther sacs divergent, included; style 2-lobed; fruit a cylindrical capsule, dehiscent by 2 valves at maturity; seeds small, compressed, with a tuft of white hairs at each end.

- 1. Leaves glabrous or soon glabrate beneath; corolla 1-2 cm broad, yellow, marked with orange and spotted with violet; capsules less than 8 mm thick *C. ovata*
- Leaves with persistent soft pubescence beneath; corolla 2-4 cm broad, white marked with yellow and brown purple; capsules mainly over 8 mm thick 2
- 2(1). Leaves long-acuminate apically; corolla ca 3-4 cm broad, the lower lobe notched *C. speciosa*
- Leaves abruptly short-acuminate; corolla 2-3 cm broad, the lower lobe not notched *C. bignonioides*

Catalpa bignonioides Walter Common Catalpa. Trees, 6-20 m tall, with rounded spreading canopy; leaves odor-

iferous, often whorled, the blades broadly cordate-ovate, 10-20 cm long, abruptly acuminate, sometimes with 2 small lateral lobes, pubescent on lower surface; panicles broadly pyramidal, 15-25 cm long, many-flowered; corollas 2-3 cm broad, white, with 2 yellow stripes inside and spotted with brown purple, the lower lobe not notched; capsules 12-37 cm long; n = 20. Cultivated ornamentals, escaping and established locally at or below 1750 m in Grand, Utah, and Wasatch counties; widely cultivated in the U. S.; 10 (ii).

Catalpa ovata G. Don Chinese Catalpa. Small trees or large shrubs; leaves abruptly acuminate, glabrous or soon glabrate beneath, often with sharp lateral lobes; corollas 1-2 cm broad, yellow, marked with orange and spotted with violet; capsules mainly less than 8 mm thick. Cultivated ornamental in Utah County; widely cultivated in the U. S., introduced from eastern Asia; 1 (0).

Catalpa speciosa Warder Showy Catalpa; Cigartree. Trees to 25 m tall or more; leaves nonodorous, cordate-ovate, 15-30 cm long, long acuminate, pubescent beneath; panicles rather few-flowered, ca 15 cm long and broader than long; flowers white, 3-4 cm broad, inconspicuously spotted on the throat, the lower lobe notched; capsules 20-50 cm long. Cultivated ornamentals, persisting and occasionally escaping, mainly below 1525 m in Davis, Grand, Utah, and Wayne counties; Illinois and Arkansas; widely cultivated in the U. S.; 14 (iii).

Chilopsis D. Don

Small trees or large shrubs to 10 m tall; leaves alternate or the lower opposite, simple, linear or lance-linear, entire; corolla white, often tinged, streaked, or spotted with purple; capsule cylindrical, 2-valved; seeds long-hairy.

Chilopsis linearis (Cav.) Sweet Desert Willow. [*Bignonia linearis* Cav.]. Branches laxly ascending or spreading; sterile branches glabrous or somewhat woolly, without terminal buds; leaves sessile or short-petioled, 4-15 cm long, 0.3-1 cm wide, glabrous or often viscid; flowers fragrant; pedicels stout, pubescent, ca 2-5 mm long; calyx pubescent, bilabiate, 1-1.5 cm long; corolla broadly funnelform, 2-3.5 cm long; stamens 4, included; staminodia 1; capsule slender, mainly 15-30 cm long, ca 7 mm thick; seeds ca 6 mm long, with a fringe of hairs. Along stream courses below 1500 m in Washington County; Texas to Nevada, California, and Mexico; 20 (x). This plant has horticultural potential and phases with brightly colored flowers are being selected for introduction.

BORAGINACEAE A. L. Juss.

Borage Family

Plants herbaceous or shrubby; leaves simple, alternate, opposite, or whorled, entire and pubescent, hispid or setose; flowers perfect, regular, solitary or cymose; cymes glomerate-racemose or spicate, frequently unilateral and coiled (scorpioid), usually with bracts between, to one side of, or opposite the flowers; calyx usually 5-lobed or 5-parted, usually persistent, the lobes valvate; corolla 5-lobed, sometimes crested or appendaged in the throat; stamens 5, borne on the corolla tube alternate with the lobes; ovary superior, bicarpellate, usually 4-ovulate, entire or lobed, becoming tough or bony at maturity; fruit commonly breaking up into 4 single-seeded lobes (nut-

lets); style simple or 2-cleft, seated in the pericarp at the apex of the fruit or borne between the nutlets on the receptacle, or on an upward prolongation (gynobase); endosperm absent or scarce; embryo straight or curved; $x = 4-12$. Note: The classification of this family is based primarily upon the structure of the fruit. In many cases it is difficult to recognize the genus and almost impossible to obtain a precise identification of the species if the specimens lack mature fruiting structures.

1. Style 2-cleft; stigmas 2, distinct; flowers solitary or clustered in the stem forks *Tiquilia*
- Style simple; stigmas united 2
- 2(1). Style arising from the pericarp at the apex of the fruit, falling away with the nutlets; stigma annular-peltate, surmounted by a conical or cylindrical, simple or lobed appendage *Heliotropium*
- Style borne between the lobes of the nutlets, and attached to the receptacle or gynobase; stigma capitate, unappendaged 3
- 3(2). Nutlets with uncinat, glochidiate, or barbed prickles on the back, margins, or the apex 4
- Nutlets without hooked or barbed prickles 7
- 4(3). Nutlets subglobose, with dorsal surface rather uniformly covered with barbed prickles, no definite margins *Cynoglossum*
- Nutlets with a definite margin, the prickles confined to this (back may be muricate or tuberculate) 5
- 5(4). Nutlets stellately spreading, attached at the apical (radicle) end, armed with hooked appendages; plants small slender annuals *Pectocarya*
- Nutlets erect, incurved or weakly divergent, attached at or below the middle, i.e., toward the cotyledon end 6
- 6(5). Plants annual; pedicels erect or nearly so; styles surpassing the nutlets; subulate gynobase about as long as the nutlets *Lappula*
- Plants perennial or biennial; pedicels reflexed in fruit; styles usually shorter than the nutlets; pyramidal gynobase about half as long as the nutlets *Hackelia*
- 7(3). Corolla irregular, the upper lobes usually longer than the lower ones; stamens not all equal in length *Echium*
- Corolla regular or nearly so 8
- 8(7). Calyx in fruit much enlarged, becoming conspicuously veiny, folded and flattened; stems procumbent, angled, with stiff retrorse bristles on the angles *Asperugo*
- Calyx in fruit little if any enlarged, not becoming veiny, folded, and flattened; stems various but not as above 9
- 9(8). Nutlet attachment surrounded by a swollen ring, leaving a distinct pit on the gynobase; plants of fields and waste places 10
- Nutlet attachment neither surrounded by a rim nor leaving a pit 11
- 10(9). Stamens appendaged dorsally, closely crowded around the style; corolla rotate *Borago*
- Stamens unappendaged, included within the tubular corolla *Anchusa*
- 11(9). Corolla normally blue (aberrant white-flowered plants occasionally are found), or reddish in the bud stage 12
- Corolla white, greenish white, yellow or orange 14
- 12(11). Nutlets with an oblique dorsal face encircled by an upturned flange or rim, this often irregularly toothed; plants depressed-pulvinate, seldom over 7 cm tall, of alpine areas in Utah *Eritrichium*
- Dorsal face of nutlet (if present) not encircled by an upturned flange or rim; plants not depressed-pulvinate, usually over 7 cm tall, most species growing below alpine areas in Utah 13
- 13(12). Corolla salverform, the lobes convolute in the bud; nutlets basally attached to a flat gynobase *Myosotis*
- Corolla with a tube and usually a campanulate throat, not salverform, the lobes imbricate in the bud; nutlets obliquely attached to a convex gynobase *Mertensia*
- 14(11). Nutlets attached above the base along a usually open and generally basally forked central groove or slit, or by a triangular opening in the pericarp *Cryptantha*
- Nutlets lacking a distinct ventral groove or opening in the pericarp, this usually replaced by an elevated ventral keel 15
- 15(14). Plants perennial; nutlets attached by a broad, rounded, quite basal noncircular attachment, ovoid, smooth and shiny; corolla usually yellow or orange *Lithospermum*
- Plants annual; nutlets attached by a caruncular scar borne upon or at the basal end of the ventral keel, the attachment usually lateral or suprabasal, usually rough 16
- 16(15). Corolla white; cotyledons entire *Plagiobothrys*
- Corolla orange or yellow, the tube definitely longer than the calyx; cotyledons 2-lobed *Amsinckia*

Amsinckia Lehm.

Annual, pungent-bristly, herbaceous plants; stems erect or with spreading branches, leafy; leaves alternate, linear to ovate, usually veinless; racemes usually bractless; calyx cut to base into erect lanceolate or oblong lobes; corolla tubular or salverform, heterostyled, yellow or orange, tube cylindrical, glabrous, unappendaged; lobes spreading, rounded, imbricate; stamens included, affixed in the tube; filaments very short; anthers oblong; style obtuse, filiform, included; stigma capitate, emarginate; ovules 4; cotyledons 2-parted; nutlets 4, erect, angulate-ovoid, smooth or rough, unmarginated, strongly keeled ventrally; gynobase pyramidal, ca half the height of the nutlet.

1. Corolla tube 20-nerved below attachment of stamens; calyx lobes unequal in width and reduced in numbers (2, 3, or 4) by fusion; nutlets tessellate *A. tessellata*
- Corolla tube 10-nerved below insertion of stamens; calyx lobes 5, distinct 2
- 2(1). Corolla orange yellow, 7-20 mm long, well exerted beyond the calyx; plants usually green; stems hirsute-bristly, but with few or no fine appressed hairs *A. intermedia*
- Corolla pale yellow, 4-7 mm long, little or not at all exerted beyond the calyx lobe; leaves pubescent with appressed or ascending hairs *A. menziesii*

Amsinckia intermedia Fisch. & Mey. Medium Fiddle-neck. [*A. campestris* Greene; *A. velens* Macbr.; *A. intac-tilis* Macbr.; *A. arvensis* Suksd.]. Stems simple or much branched, erect to widely spreading, 3-9 dm tall, sparsely bristly otherwise usually glabrous except for a tomentose pubescence near the base of the spikes; basal and lower cauline leaves linear or linear-lanceolate to nearly

ovate, usually clasping at base and acute at apex, thinly hirsute on both sides with spreading, often pustulate hairs; spikes short or usually elongating in fruit, usually leafy-bracted at base; calyx lobes linear attenuate, about half as long as the corolla, rufous-hispid on the back, densely white-hirsute on the margins; corolla orange yellow 8–10 mm long, the limb 3–6 mm wide; nutlets 2.5–3 mm long, incurved, grayish, narrowly keeled on the back and sharply rugose with the surface between papillate or muricate. Creosote bush, Joshua tree, and other warm desert shrub communities below 1200 m in Washington County; Washington, south to Baja California and eastward to Arizona, New Mexico, and west Texas; 15 (iii).

Amsickia menziesii (Lehm.) Nels. & Macbr. Menzies Fiddleneck. [*A. retrorsa* Suksd.; *A. parviflora* Heller; *A. rugosa* Rydb.; *A. helleri* Brand; *A. eatonii* Suksd., type from Utah]. Stems strictly erect, 3–8 dm tall, usually simple below the inflorescence, bristly-hirsute and often more or less cinereous with fine appressed hairs; leaves linear or the upper linear-lanceolate, hirsute on both sides with ascending or appressed hairs; inflorescence of 1 or few, strict, erect or ascending racemes, bractless; calyx lobes 5, distinct, 7–13 mm long, linear or linear-lanceolate; corolla light yellow, 5–7 mm long, the tube included or only slightly exerted beyond the calyx lobes; style 2.5–3 mm long; nutlets 2–3 mm long, broadly ovoid, densely tuberculate all over, with scattered larger tubercles intermixed, the latter on the central and lateral ridges when these are present. Mixed desert shrub, pinyon-juniper, sagebrush, mountain brush, and aspenfir communities at 1400 to 2850 m in Beaver, Box Elder, Cache, Davis, Millard, Morgan, Rich, Salt Lake, Tooele, Utah, Wasatch, and Weber counties; Alaska, Yukon, south to California and Nevada; 20 (ii).

Amsinckia tessellata Gray Rough Fiddleneck. [*A. colina* Greene; *A. pustulata* Heller; *A. conica* Suksd.; *A. utahensis* Suksd., type from Salt Lake City]. Stems stout, branched throughout or sometimes simple below, 3–6 dm high, hispid with spreading bristles; leaves linear-lanceolate, 2–7 cm long, rather thinly hispid, the hairs pustulate at base, sessile except the narrowly oblanceolate basal ones; spikes elongating with age, often 5–12 cm long; calyx lobes (2) 3 or 4, when 4 with 1 broader and notched or 2-lobed at apex, when 3 a little broader and notched at apex, hispid and on the margins densely white-hirsute, 8–13 mm long; corolla orange, the tube 5–10 mm long, the limb 2.5–5 mm wide; nutlets 3–3.5 mm long, ovoid, the back low usually with a median line, densely tessellate or papillate, and often transversely rugose. Creosote bush, Joshua tree, mixed warm desert shrub, sagebrush, oak, and pinyon-juniper communities at 750 to 1900 m in Box Elder, Davis, Juab, Millard, Salt Lake, Sevier, Tooele, Utah, and Washington counties; Washington to Idaho, Arizona, and Baja California; 29 (iii).

Anchusa L.

Annual, biennial or perennial herbs with blue or purple flowers in panicked, scorpioid racemes; calyx divided into narrow lobes; corolla trumpet-shaped, the tube straight, the throat closed by scales, the limb with widely spreading lobes; stamens included; style slender; ovary 4-parted; nutlets 4, their attachment surrounded by an annular ring leaving a pit on the low gynobase.

1. Calyx lobes linear; flowers more than 12 mm wide
 *A. azurea*
 — Calyx lobes triangular to lanceolate; flowers less than 8
 mm wide *A. officinalis*

Anchusa azurea Miller Alkanet. Plants perennial, from a taproot; stems erect, branched from near the base, 3–10 dm tall or more, coarsely hirsute, the hairs often pustulate basally; basal leaves 6–20 cm long, oblong or lanceolate; calyx 8–12 mm long, the lobes linear, much longer than the tube; corolla ca 10–15 mm long, dark blue; nutlets oblong, erect; $2n = 32$. Cultivated ornamental, escaping and persisting in Box Elder, Salt Lake, and Utah counties; introduced from the Mediterranean region of the Old World; 3 (i).

Anchusa officinalis L. Bugloss. Plants perennial, from a taproot; stems erect, branched from near the base, 3–10 dm high, coarsely hirsute, the hairs often pustulate at base; basal leaves 8–20 cm long, oblanceolate, the stem leaves lanceolate; calyx 5–8 mm long, the lobes lanceolate to narrowly triangular, about as long as the tube; corolla about 10 mm long, dark blue; nutlets 2–3 mm long, rugose or granulate, inserted by their bases on a flat gynobase; $2n = 16, 32$. Disturbed hills, river bottoms, and ditch banks in sagebrush, cottonwood, maple, and oak communities at 1430 to 2500 m in Summit and Utah counties; introduced from Eurasia; 18 (ii).

Asperugo L.

Rough-hispid, annual, procumbent plants, with stiff bristly hairs; leaves alternate, or the upper sometimes opposite, entire; calyx campanulate, unequally 5-cleft, much enlarged and reticulate-veiny in fruit, lobes incised-dentate, the teeth often appearing as extra lobes in the sinuses; corolla tubular-campanulate, 5-lobed, 1 to 3 together on short, recurved pedicels in the upper leaf axils; stamens 5, inserted on the corolla tube, included; filaments very short; ovary 4-lobed; style short; stigma capitate; nutlets 4, ovoid, erect, granular-tuberculate, attached laterally above the middle to the elongate-conic receptacle, the scar not leaving a pit.

Asperugo procumbens L. Catchweed. Stems 2–6 dm long; diffusely branched, slender and procumbent or ascending, retrorsely short-hispid; leaves 1–4 cm long, obovate to oblanceolate, scabrous, obtuse to acutish at apex; fruiting calyx 8–15 mm wide; corolla small, 2–3 mm long, blue, purple or purplish red; nutlets obliquely ovoid, about 4 mm long, granulate-tuberculate; $2n = 24, 48$. Roadsides, ditch banks, and other waste places at 1400 to 2450 m in Cache, Daggett, Davis, Salt Lake, Summit, Tooele, Utah, and Weber counties; native of Eurasia now widely scattered over the northern U. S.; 27 (ii).

Borago L.

Hirsute or hispid annual or biennial herbs with alternate, entire leaves and blue flowers in terminal leafy racemes; calyx deeply 5-cleft or 5-parted; corolla rotate, the tube very short, throat closed by scales, the limb 5-lobed, the lobes imbricated, acute; stamens 5, inserted on the corolla tube; filaments dilated below, narrowed above to a slender appendage; anthers linear, erect and connivent with a beaklike cone; ovary 4-divided; style filiform; nutlets 4, ovoid, erect, attached by their bases to the flat receptacle; scar of attachment large, concave.

Borago officinalis L. Common Borage. Stems erect, 5–8 dm tall, with ascending or spreading branches; leaves oblong to obovate, 5–11 cm long, rounded to acute at apex, the upper ones clasping, lower narrowed to a winged petiole; pedicels spreading or recurving, 2–5 cm long; calyx lobes linear-lanceolate, 7–10 mm long; corolla 15–20 mm broad, bright blue; anther-beak dark purple, ca 6–7 mm long; nutlets 4 mm long. Cultivated and escaping from gardens in Cache and Salt Lake counties; sparingly naturalized in the western U. S.; a native of Europe; 2 (0).

***Cryptantha* Lehm.**

Annual or perennial, herbaceous or fruticulose; leaves opposite at base, or alternate throughout, firm, veinless; flowers white or rarely yellow, in bractless or bracted spikes or racemes; calyx divided to the base, the lobes erect or connivent, linear or oblong; mature calyx investing the nutlets and falling away entire, or the calyx persistent and the nutlets falling away separately; corolla with a short to somewhat elongate cylindrical tube with or without scales at the base of the tube, the throat with intruded appendages; corolla lobes imbricate, rounded spreading; style slender, short or long, included; stigma capitate; ovules 2–4; nutlets 1–4, erect, ovate to triangular, roughened or smooth, winged, margined or marginless, affixed laterally through a medial ventral and commonly basally forked groove to a usually columnar, subulate or pyramidal gynobase. Note: This is one of the most perplexing genera in the family. It is exclusively American, mostly in the western U. S., but common in the deserts of South America as well. Several species are reported to have some value as a forage for sheep.

- 1. Plants annual; stems slender (subgenus *Krynitzkia*) . . . Key 1
- Plants biennial or perennial; stems coarse, usually with a basal tuft of leaves (subgenus *Oreocarya*) Key 2

Key 1.

Plants annual.

- 1. Nutlets with the margins decidedly winged or knife-like 2
- Nutlets with the margins rounded or angled, never with a marginal wing or knifelike edge 5
- 2(1). Pedicels usually evident, slender, 1–4 mm long, nutlets heteromorphic *C. racemosa*
- Pedicels obscure or none, less than 1 mm long 3
- 3(2). Nutlets heteromorphic, the odd nutlet abaxial *C. inaequata*
- Nutlets homomorphic, or if slightly heteromorphic the odd nutlet axial 4
- 4(3). Nutlets solitary or rarely 2; calyx obliquely conical at the base; corolla conspicuous; plants of Washington County *C. utahensis*
- Nutlets 4; calyx symmetrical; corolla inconspicuous; widespread species *C. pterocarya*
- 5(1). Nutlets all smooth 6
- Nutlets all rough or at least some of them so 10
- 6(5). Nutlets with an excentric groove; flowers in biserial naked spikes *C. affinis*
- Nutlets with a centrally placed groove 7

- 7(6). Nutlets broadly ovate; spikes usually geminate, the inflorescence projected above the leafy mass of the plant *C. torreyana*
- Nutlets oblong-ovate to narrowly-lanceolate 8
- 8(7). Style reaching 1/4–3/4 the height of the nutlets; calyx densely appressed hispid-villous, commonly lacking conspicuous spreading bristles *C. gracilis*
- Styles almost reaching the nutlet-tips or surpassing them 9
- 9(8). Margin of the nutlet acute, at least above the middle *C. watsonii*
- Margin of the nutlets rounded or obtuse *C. fendleri*
- 10(5). Nutlets not all alike, heteromorphic 11
- Nutlets all alike, homomorphic 16
- 11(10). Mature calyx strongly appressed to the flattened rachis, decidedly gibbous, persistent; plants limited to Washington County *C. dumetorum*
- Mature calyx somewhat spreading, not at all gibbous . 12
- 12(11). Odd nutlet abaxial, surpassed by the style 13
- Odd nutlet axial, surpassing the style 15
- 13(12). Spikes bracteate throughout; calyx persistent *C. micrantha*
- Spikes naked or nearly so; calyx deciduous 14
- 14(13). Pedicels slender, 1–4 mm long; plants rare in Washington County *C. racemosa*
- Pedicels stout and obscure *C. angustifolia*
- 15(12). Odd nutlet spinular-muricate; consimilar nutlets with a deeply impressed scar; calyx lobes conspicuously thickened *C. crassisejala*
- Odd nutlet more or less granulate to nearly smooth, consimilar nutlets with a shallowly impressed scar; calyx lobes moderately thickened *C. kelseyana*
- 16(10). Calyx circumscissile *C. circumscissa*
- Calyx not circumscissile 17
- 17(16). Style surpassing the nutlets *C. micrantha*
- Style equal to or shorter than the nutlets 18
- 18(17). Nutlets and calyx recurved *C. recurvata*
- Nutlets and calyx straight 19
- 19(18). Nutlet usually solitary, abaxial; gynobase reaching 1/3 to 1/2 the height of the nutlet *C. decipiens*
- Nutlets usually 4 20
- 20(19). Nutlets decidedly ovate, with low inconspicuous rounded tuberculations *C. ambigua*
- Nutlets lanceolate to narrowly lanceolate, the tuberculations very prominent 21
- 21(20). Stems spreading hirsute; calyx densely and conspicuously long hairy; plants limited to Washington County *C. barbigerata*
- Stems strigose or mostly so 22
- 22(21). Nutlets spinular-muricate; fruiting calyx 4–6 mm long; plants of Box Elder County *C. scoparia*
- Nutlets verrucose or verrucose-muricate; fruiting calyx 6–11 mm long; southern Utah *C. nevadensis*

Key 2.

Plants biennial or perennial.

- 1. Corolla tube elongate, distinctly surpassing the calyx; flowers usually heterostyled 2
- Corolla tube short, scarcely if at all surpassing the calyx; flowers not heterostyled 17

- 2(1). Nutlets smooth and shining 3
- Nutlets more or less roughened 8
- 3(2). Corolla yellow 4
- Corolla white 5
- 4(3). Inflorescence an elongate, cylindrical thyrse; nutlets lanceolate with acute margins, usually only 1 maturing *C. flava*
- Inflorescence consisting of a large terminal cluster with 1 or more branches remote, at maturity frequently stalked, in much smaller lateral clusters; nutlets broadly ovate, with winged margins, all 4 usually maturing *C. confertiflora*
- 5(3). Inflorescence capitate, 0.1–0.4 dm long; corolla limb 6–8 mm broad, the tube little surpassing the calyx; nutlets lanceolate *C. capitata*
- Inflorescence elongate, 0.4–4.4 dm long; corolla limb 8–17 mm broad, the tube distinctly surpassing the calyx, except only slightly so in *C. barnebyi*; nutlets ovate 6
- 6(5). Upper surface of the leaves glabrous *C. semiglabra*
- Upper surface of the leaves pubescent 7
- 7(6). Corolla limb 13–17 mm broad, the tube salverform; crests at base of tube absent; nutlets 3–3.5 mm long; plants of the north end of the San Rafael Swell, Emery County *C. johnstonii*
- Corolla limb 8–11 mm broad, the tube funnelform; crests at base of tube conspicuous; nutlets 3.5–4.5 mm long; plants of Uintah County *C. barnebyi*
- 8(2). Nutlets uniformly muricate or papillose, or occasionally with some inconspicuous ridges 9
- Nutlets more or less rugose or tuberculate, or with a few inconspicuous murications 11
- 9(8). Leaves oblanceolate, silvery strigose, the hairs only inconspicuously pustulate; corolla 7–10 mm long, the fornicies much longer than wide *C. fulvocanescens*
- Leaves spatulate-oblanceolate to spatulate, green, the surface exposed between the hairs (or the upper surface glabrous), evidently pustulate at least on the lower surface; corolla 10–15 mm long, the fornicies low and broad 10
- 10(9). Upper surface of the leaves glabrous *C. creutzfeldtii*
- Upper surface of the leaves hairy *C. jonesiana*
- 11(8). Ventral surface of the nutlets smooth or nearly so; leaves strongly pustulate hairy on both surfaces; plants of the Uinta Basin and San Rafael Swell *C. rollinsii*
- Ventral surface of the nutlets distinctly roughened . . 12
- 12(11). Leaves conspicuously pustulate on both surfaces; corolla tube 12–16 mm long; calyx-lobes 7–10 mm long at anthesis *C. longiflora*
- Leaves sparsely if at all pustulate on the upper surface; corolla tube 6–12 mm long; calyx-lobes 3.5–7 mm long in anthesis 13
- 13(12). Inflorescence subcapitate, less than 5 cm long; corolla tube 10–12 mm long; margins of nutlets not in contact; plants less than 1.5 dm tall, of Duchesne, Emery, and Uintah counties *C. paradoxa*
- Inflorescence more elongate, 0.5–3 dm long; corolla tube 5–10 mm long; margins of nutlets in contact or nearly so; plants usually over 1.5 dm tall 14
- 14(13). Scar of nutlets surrounded by an elevated margin but tightly closed; style exceeding nutlets 1–2 mm; calyx 3.5–4 mm long in anthesis *C. bakeri*
- Scar of nutlets conspicuously open; style exceeding nutlets 3–8 mm; calyx 4.5–7 mm long in anthesis ... 15
- 15(14). Scar of nutlets conspicuously open and surrounded by a definite elevated margin *C. flavoculata*
- Scar of nutlets slightly open and with only a inconspicuous elevated margin if any 16
- 16(15). Leaves linear-spatulate; nutlets sharply and deeply rugose; corolla tube 5.5–7 mm long, the limb funnelform and with low, broad fornicies *C. tenuis*
- Leaves obovate to broadly oblanceolate; nutlets with rounded ridges and tubercles; corolla tube 7–10 mm long; limb more spreading and with fornicies long-papillose *C. wetherillii*
- 17(1). Nutlets smooth on their dorsal surface 18
- Nutlets more or less roughened, muricate, rugose or tuberculate at least dorsally 19
- 18(17). Fruit depressed-globular, the nutlets not in contact by their margins; style exceeding mature fruit 1–3 mm; corolla tube 2.5–3 mm long *C. cinerea*
- Fruit conical, ovoid or lanceolate, the nutlets in contact by their margins or nearly so; style exceeding mature fruit 5–6 mm; corolla tube 5–7 mm long; plants of Uintah County *C. barnebyi*
- 19(17). Ventral surface of the nutlets smooth or nearly so ... 20
- Ventral surface of nutlets roughened 23
- 20(19). Nutlets bordered by a conspicuous wing; robust plants, 5–10 dm tall, with long, ebracteate spikes *C. setosissima*
- Nutlets never conspicuously winged, sometimes with an acute margin; plants shorter 21
- 21(20). Corolla tube 7–9 mm long; calyx 6–9 mm long in anthesis; plants of the Uinta Basin and San Rafael Swell *C. rollinsii*
- Corolla tube 2–6 mm long; calyx 2.5–6 mm long in anthesis 22
- 22(21). Nutlets scarcely or not at all muricate between the rugae; strictly erect, conspicuously hispid perennials from northeastern Utah *C. stricta*
- Nutlets distinctly muricate or tuberculate between the rugae and near the margins; plants of western Utah *C. rugulosa*
- 23(19). Nutlets conspicuously muricate or, in *C. humilis*, also with a few irregular low ridges 24
- Nutlets not exclusively muricate, but rugose or tuberculate 26
- 24(23). Pubescence of the leaves silky-strigose or strigillose but not subtomentose or tomentose; plants of the Uinta Basin *C. breviflora*
- Pubescence of the leaves subtomentose or tomentose, also setose or strigose 25
- 25(24). Plants 0.3–1 dm tall; leaves 0.5–2.5 cm long; calyx 2–2.5 mm long in anthesis; corolla tube 1.8–2.2 mm long; plants of Millard County *C. compacta*
- Plants 0.4–2.5 dm tall; leaves 2.5 cm long or longer; calyx 3–5 mm long in anthesis; corolla tube 3–5 mm long; widespread *C. humilis*
- 26(23). Scar of nutlets open some distance above the base ... 27
- Scar of nutlets closed or nearly so, without a conspicuous triangular opening near the base 34
- 27(26). Scar somewhat constricted some distance below the middle of the open portion 28
- Scar triangular and not constricted below the middle 29

- 28(27). Hairs with pustulate bases present on both leaf surfaces; elevated margin of nutlet scar very prominent *C. mensana*
- Hairs with pustulate bases present only on the lower leaf surface; elevated margin evident but not very prominent *C. osterhoutii*
- 29(27). Elevated margin evident around the nutlet scar 30
- Elevated margin not evident around the nutlet scar 31
- 30(29). Cymules elongating and so the inflorescence broad; biennial or short-lived perennials; nutlets with an evident dorsal ridge; plants of Washington County *C. virginensis*
- Cymules short and the inflorescence narrow; long-lived caespitose perennials; nutlets with only a slight dorsal ridge, if any *C. abata*
- 31(29). Style exceeding mature fruit 1.6 mm or more; plants usually taller than 1.3 dm; widespread *C. humilis*
- Style not exceeding the mature fruit by more than 0.5 mm; plants usually less than 1.3 dm tall 32
- 32(31). Corolla tube 2–2.6 mm long; nutlets 2.3–3 mm long; plants of the Pink Limestone member of the Wasatch Formation in Garfield County *C. ochroleuca*
- Corolla tube 3–4 mm long; nutlets 3–3.5 mm long 33
- 33(32). Ventral surface of nutlets deeply rugose and tuberculate; plants of southern Utah *C. abata*
- Ventral surface of nutlets indefinitely muricate; plants of Daggett and Rich counties *C. caespitosa*
- 34(26). Upper surface of the leaves uniformly appressed strigose and without pustulate hairs 35
- Upper surface of the leaves with 2 distinct kinds of hairs, some pustulate at the base 37
- 35(34). Nutlets sharply rugose and tuberculate; scar tightly closed and surrounded by an elevated margin *C. bakeri*
- Nutlets not so sharply rugose or tuberculate; scar not surrounded by an elevated margin 36
- 36(35). Corolla tube 2–2.5 mm long; style exceeding mature fruit by 1 mm or less; plants of the Pink Limestone member of the Wasatch Formation, Garfield County *C. ochroleuca*
- Corolla tube 3.5 mm long or longer; style exceeding fruit by more than 1 mm; plants of northeastern Utah *C. sericea*
- 37(34). Mature calyx exceeding the nutlets by 2–4 mm; stem usually solitary; plants of Grand County *C. elata*
- Mature calyx exceeding the nutlets by 4–8 mm 38
- 38(37). Nutlets muricate and rugulose; plants widespread in western Utah *C. humilis*
- Nutlets tuberculate, scarcely if at all rugulose; plants of Box Elder County and the Uinta Basin 39
- 39(38). Plants 1–2 dm tall; calyx 5–7 mm long in anthesis; corolla tube 3.5–5 mm long; style exceeding mature fruit by 2 mm; plant a Uinta Basin endemic *C. grahamii*
- Plants mostly over 2 dm tall; calyx 2–3 mm long in anthesis; corolla tube 2–2.5 mm long; style exceeding mature fruit by less than 1 mm; plants of Box Elder County *C. interrupta*

Cryptantha abata Johnston Low Cryptanth. [*Krynitzkia depressa* Jones, not *C. depressa* A. Nels.]. Plants perennial, arising from a strong, woody taproot, 5–18 cm high; stems many, 2–15 cm long, strigose and weakly setose; leaves oblanceolate to spatulate, obtuse, strigose,

setose and subtomentose, the petioles ciliate; inflorescence narrow, 2–8 cm long; calyx segments lanceolate to ovate, 2.5–4 mm long in anthesis, in fruit becoming 5–8 mm long, setose; corolla white, the tube 3–4 mm long, with crests at base of tube conspicuous, the fornicies yellow, rounded, papillose, ca 0.5 mm long; limb 7–8 mm wide; style exceeding mature fruit 0.5–1 mm; nutlets ovate, 3–3.5 mm long, 2–2.5 mm wide, usually all 4 maturing, margins in contact, obtuse to acute, dorsal surface carinate, tuberculate, muricate and sometimes with low inconspicuous ridges, ventral surface deeply and irregularly rugose; scar open, triangular, surrounded by a slightly elevated margin. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, and spruce communities at 2500 to 3000 m in Beaver, Garfield, Iron, Kane, Millard, Piute, Sevier, and Wayne counties; Arizona and western Nevada; 25 (vi).

Cryptantha affinis (Gray) Greene Ally Cryptanth. [*Krynitzkia affinis* Gray; *C. geminata* Greene; *C. confusa* Rydb.; *C. eastwoodiae* St. John]. Usually sparsely branched herb 1–2 (4) dm tall; branches commonly few and ascending but occasionally many from the base, hispid or short-hirsute throughout; leaves narrowly to broadly oblanceolate, 1–4 (5) cm long, 2.5–6 (8) mm broad, few, short-hirsute, usually minutely pustulate, obtuse or rounded at tip, lowest pair clearly opposite; spikes geminate or solitary, usually 2 to 8, becoming 15 mm long, slender, remotely flowered, commonly with a few large leafy bracts below; corolla inconspicuous, 1–2 mm long; limb ca 1.5 mm broad; fruiting calyx 2.5–4 mm long, usually about as broad as long, laterally compressed, ascending; pedicels 0.5–1 mm long; mature calyx lobes lanceolate, somewhat connivent, not greatly surpassing the nutlets, midrib weakly thickened on the abaxial lobe, sparsely hirsute, the margins appressed hispid; nutlets 4, homomorphic, smooth or very finely granulate, shiny, brownish to greenish, frequently mottled, 1.8–2.5 mm long, ovate, obliquely compressed, back low-convex, margins rounded; groove evidently excentric, closed, simple or shortly and unequally forked at the base; gynobase short, stout, ca 1/2 the height of the nutlets; style evidently surpassed by nutlets or rarely equaling them. Sagebrush, mountain brush, pinyon-juniper, and aspen communities at 2050 to 2800 m in Cache, Daggett, Juab, Salt Lake, Sevier, Uintah, and Utah counties; Washington and western Montana, south to Wyoming and California; 8 (i). The most obvious characteristics of this species are the obliquely compressed nutlets which result in the excentric position of the groove.

Cryptantha ambigua (Gray) Greene Wilkes Cryptanth. [*Eritrichium muriculatum* var. *ambiguum* Gray; *Krynitzkia ambigua* Gray; *C. polycarpa* Greene; *C. multicaulis* A. Nels.; *C. ambigua* var. *robustior* Brand]. Stems usually loosely branched from the base, ascending, 1–2.5 dm tall, hirsute and somewhat strigose; leaves linear to narrowly lanceolate, 2–3 (5) cm long, 1–4 (5) mm broad, obtuse to acutish, usually somewhat appressed hispid-hirsute, the hairs commonly pustulate at base; spikes often solitary, 5–15 cm long, bractless, or with the lowermost flowers bracteate, commonly not projecting clear of the leafy mass of the plant and not clearly differentiated from the leafy branches; corolla 1–2 mm broad, inconspicuous; fruiting calyces ovate-oblong, 4–7 mm long, crowded or distant, the tube rounded-obconic at base, lobes linear or linear-lanceolate more or less

connivent, midrib thickened, tawny hirsute, margins strigose-hirsute; pedicels 0.5–0.9 mm long; nutlets 4, broadly ovoid, 1.6–2 mm long, granulate and coarsely tuberculate or rarely tending to be smooth toward the base, back low-convex, sides obtuse and rounded, groove closed or somewhat open at the always broadly forked base; gynobase narrow, 1–1.2 mm long, 2/3 the height of the nutlets; style reaching 4/5 to equaling the of nutlets. Dry slopes and ridges, sagebrush, mountain brush, pinyon-juniper, and aspen communities at 2100 to 2900 m in Beaver, Box Elder, Daggett, Duchesne, Grand, Juab, Sevier, Uintah, and Wasatch counties; Washington and Montana, south to northern Colorado, Nevada, and California; 8 (0).

Cryptantha angustifolia (Torr.) Greene Narrowleaf Cryptanth. [*Eritrichium angustifolium* Torr.; *Krynitzkia angustifolia* Gray]. Stems diffusely branched from the base, 0.5–3 dm tall, canescent, villous-hirsute, with light ashy gray hairs, the lowest branches decumbent or ascending; leaves narrowly linear, 1.5–4 cm long, 1–2 mm wide, hispid or strigose, somewhat pustulate; spikes usually geminate, ca 5 cm long, rather dense, bractless or with 1–2 bracts near the base; corolla minute, the tube 1–2 mm long, the limb 1–2.5 mm broad; fruiting calyces ovate-oblong, 3–4 mm long, stiffly ascending, strongly bisectate, slightly asymmetrical; pedicels less than 0.5 mm long; mature calyx-lobes linear-lanceolate, slightly connivent, hispid on the thickened midrib, short villous on the margins, abaxial lobe longest and most hirsute; nutlets usually 4, heteromorphous, ovate-oblong, brown or plumbeous with pale tuberculations or rarely murications, the back convex, the face flattish, the margins round or somewhat angular; odd nutlet next to the abaxial calyx lobe, a little larger and more persistent than the similarly colored and shaped consimilar nutlets, these ca 1 mm long; groove slightly open above, broadening at the base; gynobase columnar, equaled by consimilar nutlets but shorter than odd nutlet. Creosote, Joshua tree, and other warm desert communities below 930 m in Washington County; Nevada and Arizona to Baja California, Sonora and western Texas; 1 (i).

Cryptantha bakeri (Greene) Payson Baker Cryptanth. [*Oreocarya bakeri* Greene]. Biennial or short-lived perennials, 1–4 dm tall; stems 1–4 (6), 0.5–1.5 dm long, spreading setose-hirsute; leaves oblanceolate, obtuse, mostly basal, 3–6 (8) cm long, 0.5–1.2 (2) cm wide, strigose and spreading setose dorsally, pustulate, the ventral surface uniformly strigose and with few or no pustulate hairs; inflorescence narrow, 0.6–2.5 (3) dm long, setose-hirsute, the foliar bracts evident, slightly surpassing the individual cymes; calyx segments broadly lanceolate or ovoid, in anthesis 3.5–4 mm long, in fruit becoming 6–8 mm broad; nutlets ovate-lanceolate, 2.5–3 mm long, 1.5–2 mm wide, 3 to 4 usually maturing, margins obtuse, nearly in contact, the dorsal surface deeply and sharply rugose; scar closed, surrounded by a definitely elevated margin; style exceeding mature fruit 1–2 mm; $n = 12$. Sagebrush, oak brush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce fir communities at 1650 to 2700 m in Carbon, Duchesne, Garfield, Grand, Kane, San Juan, and Sevier counties; Colorado, New Mexico and Arizona; 35 (viii).

Cryptantha barbiger (Gray) Greene Bearded Cryptanth. [*Eritrichium barbigerum* Gray, type from St. George; *Krynitzkia barbiger* Gray; *K. mixta* Jones].

Stems erect, 1–4 dm high, solitary or several from the base, with branches strictly ascending or spreading, very bristly and sparsely if at all strigose, except in the inflorescence; leaves oblong to lance-linear, obtuse, 1–5 (7) cm long, 3–7 (13) mm broad, hirsute, more or less pustulate; spikes geminate or rarely solitary or ternate, naked, as much as 15 cm long; corolla inconspicuous, the limb 1–2 mm broad; fruiting calyx ascending, 5–10 mm long, narrowly ovoid-oblong to oblong-lanceolate, symmetrical, deciduous; pedicels 0.3–0.7 mm long, villous; mature calyx lobes lanceolate to linear-lanceolate, connivent above with recurving tips, the margin conspicuously long white-villous, midrib thickened and hirsute, abaxial lobe slightly the longest; nutlets 1–4 homomorphous, lance-ovoid, 1.5–2.5 mm long, strongly verrucose, usually brownish, the back convex, the edges obscurely angled or rounded, groove opened or closed but base gradually dilated to form a triangular areola; gynobase narrow, 2/3 to 3/4 the height of the nutlets; style reaching to or slightly beyond the nutlet tips. Joshua tree, blackbrush, and pinyon-juniper communities below 1500 m in Washington County; southern Nevada, California, Baja California, Arizona, New Mexico, Texas, and northern Sonora; 20 (vii).

Cryptantha barnebyi Johnston Barneby Cryptanth. Perennial, 1.5–3.5 dm tall; stems stout, erect, several, 0.8–1.2 dm long, conspicuously yellow-hispid; leaves oblanceolate, thick, acute, 5–9 cm long, 0.5–1.4 cm wide, coarsely appressed hispid-pustulate on both sides, and with some finer hairs beneath, the petioles conspicuously ciliate; inflorescence narrow, 1–1.5 dm long, densely yellowish hispid, foliar bracts evident to conspicuous; calyx segments lanceolate, in anthesis 5–7 mm long, in fruit becoming 8–13 mm long, yellowish hirsute; corolla white or light yellow, the tube 5–7 mm long, the crests at base of tube very conspicuous, the fornicies yellow, emarginate, distinctly papillose, 0.5 mm long, the limb 8–11 mm wide; style exceeding mature fruit 5–6.5 mm; nutlets ovate, 3.5–4 mm long, 2.5–3 mm wide, all 4 usually maturing, the margins in contact, acute, smooth and glossy on both surfaces; scar closed, straight, and without an elevated margin. On white barren shale knolls of the Green River Formation in shadscale, rabbitbrush, sagebrush, and pinyon-juniper communities at 1850 to 2400 m in Uintah (type 30 mi S of Ouray) County; endemic; 45 (viii).

Cryptantha breviflora (Osterh.) Payson Short-flower Cryptanth. [*Oreocarya breviflora* Osterh., type N of Jensen]. Long-lived perennials, 1.6–3 dm tall; stems several, slender, 0.7–1.7 dm long, densely white setose at the base, strigose above; leaves oblanceolate to spatulate, 2.5–9 cm long, 0.4–1.4 cm wide, clustered at the ends of the branched caudices, the apices obtuse, the dorsal surface densely and uniformly silky-strigose with many very small pustules, ventral surface similar but with fewer pustules; inflorescence in flower narrow but becoming broad and open at maturity, 0.6–2.7 dm long, setose; calyx segments linear-lanceolate, 4.5–6 mm long in anthesis, in fruit becoming 7–9 mm long, setose; corolla white, 3.5–4.5 mm long, the crests at base of tube evident, the fornicies yellow, rounded, ca 0.5 mm long, the limb 8–12 mm wide; nutlets lanceolate, 3.4–4 mm long, 2–2.5 mm wide, fewer than 4 nutlets maturing, the margins in contact, knifelike, the dorsal surface uniformly muricate or tuberculate, the ventral surface similar; scar

open, narrowly triangular, margin not elevated; style exceeding mature fruit by 2 mm or less. Mostly heavy clay soils of the Morrison and Duchesne River formations in salt desert shrub, sagebrush, rabbitbrush, pinyon-juniper and mountain brush communities at 1600 to 2450 m in Duchesne, Uintah, and Wasatch counties; Colorado (?); a Uinta Basin endemic; 70 (vi).

Cryptantha caespitosa (A. Nels.) Payson Tufted Cryptanth. [*Oreocarya caespitosa* A. Nels.]. Densely caespitose or mat-forming perennials, 0.5–1.5 dm tall; stems 1 to many, arising from a much-branched woody caudex, 0.2–0.9 dm long, weakly setose and appressed strigose; leaves oblanceolate to spatulate, 1–3 cm long, 0.3–0.7 cm wide, pubescence of two kinds, strigose and appressed setose, becoming tomentulose toward the petiole; inflorescence narrow, 0.3–1 dm long; foliar bracts inconspicuous; calyx segments lanceolate, in anthesis 3–4 mm long, in fruit becoming 5–8 mm long, strigose and weakly setose, also somewhat tomentulose; corolla white, the tube 3–4 mm long, the crests at base of tube conspicuous, the fornicies yellow, rounded, ca 0.5 mm long, the limb 4–7 mm wide, the margins acute, in contact, the dorsal surface with low rounded rugae, also tuberculate, and with numerous murications between the ridges, the ventral surface muricate; scar open, narrowly triangular, the margin not elevated; style equaling or 0.5 mm longer than mature fruit. Forb-grass, pinyon-juniper, mountain brush, limber pine, and spruce-fir forests at 1950 to 3120 m in Daggett and Rich counties; southern Wyoming; 5 (0).

Cryptantha capitata (Eastw.) Johnston Head Cryptanth. [*Oreocarya capitata* Eastw.]. Perennial, 1.5–2.7 dm tall; stems weak, 1–several, 12–24 cm long, appressed setose; leaves linear or very narrowly oblanceolate, 3–8 cm long, 3–5 (8) mm wide, dorsal surface appressed setose-pustulate, ventral surface uniformly strigose and without pustules; inflorescence capitate, or with 1 or 2 glomerules below the terminal cluster, 1–4 cm long, spreading white setose; calyx segments linear-lanceolate, 7–9 mm long in anthesis, in fruit becoming 11–16 mm long, conspicuously setose-pustulate; corolla white, the tube 9–12 mm long, the crests at base of tube conspicuous, the fornicies yellow, emarginate, ca 1 mm long, papillose, the limb 6–8 mm wide; nutlets lanceolate, 4–5 mm long, 2–3 mm wide, 2–4 usually maturing, the margins in contact, knifelike, both surfaces glossy-smooth; scar closed, straight, and without an elevated margin; style exceeding mature fruit 4–5 mm. Sandy to loamy soils in pinyon-juniper, sagebrush, and mountain brush communities at 1700 to 2520 m in Garfield, Kane, San Juan, and Wayne counties; northern Arizona; 6 (0).

Cryptantha cinerea (Torr.) Cronq. James Cryptanth. [*C. jamesii* (Torr.) Payson]. Perennials, 1–6 dm tall; stems 1 to many, 4–40 cm long, glabrous to conspicuously hirsute; leaves linear to broadly oblanceolate, obtuse to acute, 2–15 cm long, 0.2–1.5 cm wide, glabrous to hirsute, usually pustulate dorsally, the ventral surface lacking pustules or the pustules very inconspicuous; inflorescence open, the cymules usually elongating, tomentose to setose-hirsute; floral bracts inconspicuous to very conspicuous; calyx segments ovate-lanceolate, acute, in anthesis 3–4 mm long, in fruit 5–7 mm long, subtomentose to setose-hirsute; pedicels 1–3 mm long; corolla white, the tube 2.5–3 mm long, the crests at base of tube conspicuous, the fornicies light yellow, emarginate, 0.5–1

mm long, the limb 5–8 mm broad; fruit oblate-ovoid, 1–4 nutlets maturing, ovate-lanceolate, 2–2.5 mm long, 1.5–2 mm wide, the acute margins not in contact, both surfaces smooth and glossy; scar straight, closed, extending from the base to near the apex; style exceeding mature fruit 1–3 mm.

1. Upper surface of the leaves glabrous, the petioles not ciliate-margined or the leaves tufted at the base *C. cinerea* var. *pustulosa*
- Upper surface of the leaves pubescent; the petioles ciliate-margined; leaves tufted at the base 2
- 2(1). Stems simple; inflorescence capitate or nearly so; plants in our flora mostly limited to Navajo blow sand in Garfield, Kane, and Washington counties *C. cinerea* var. *arenicola*
- Stems branched from the base and above; inflorescence otherwise 3
- 3(2). Stems prostrate or weakly ascending, to 2 dm long; inflorescence conspicuously leafy-bracteate; plants of western Beaver, Iron, and Washington counties *C. cinerea* var. *abortiva*
- Stems erect or ascending; inflorescence only weakly leafy bracteate 4
- 4(3). Stems freely branched at the base and upwards, leafy, often somewhat decumbent, sparsely appressed-hairy; cymules usually notably elongating *C. cinerea* var. *jamesii*
- Stems branched only near the base, pubescence mostly of dense cinereous and spreading setose hairs; leaves mostly in a dense basal tuft; cymules usually more congested *C. cinerea* var. *cinerea*

Var. *abortiva* (Greene) Cronq. [*Oreocarya abortiva* Greene; *C. jamesii* var. *abortiva* Payson]. Rocky or gravelly slopes and ridges in sagebrush, and pinyon-juniper communities at 1650 to 2600 m in Beaver, Iron, and Washington counties; Nevada and California; 3 (ii).

Var. *arenicola* Higgins & Welsh [*C. jamesii* var. *multicaulis* authors, not (Greene) Payson]. Usually on Navajo blow sands in sagebrush, pinyon-juniper, oak, mountain brush, and ponderosa pine communities at 1650 to 2600 m in Garfield, Kane, and Washington counties; Arizona; 20 (iii).

Var. *cinerea* [Oreocarya cinerea Greene; *C. jamesii* var. *cinerea* Payson; *C. jamesii* var. *setosa* (Jones) Johnston ex Tidestr.; *C. jamesii* var. *multicaulis* (Greene) Payson; *Krynitzkia multicaulis* var. *setosa* Jones, type from near Cove Fort, Millard County]. Sandy to clayey soils in sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1650 to 2450 m in Beaver, Emery, Garfield, Iron, Kane, Piute, Sanpete, Sevier, Washington and Wayne counties; Arizona and Nevada; 60 (xii).

Var. *jamesii* (Payson) Cronq. [*Oreocarya disticha* Eastw., type from San Juan County; *C. jamesii* var. *disticha* Payson; *C. jamesii* Payson]. Mostly sandy or gravelly soils in mixed desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 1720 to 2550 m in Emery, Garfield, Kane, San Juan, and Wayne counties; Utah to Colorado, Arizona, New Mexico, South Dakota, Wyoming, Kansas, Oklahoma, Texas, and Mexico; 95 (xiii). At one time I thought var. *disticha* was distinct, but additional evidence indicates that var. *disticha* and var. *jamesii* are the same. Var. *jamesii* also introgresses with var. *pustulosa* especially in Garfield and Wayne counties.

Var. *pustulosa* (Rydb.) Higgins [*Oreocarya pustulosa* Rydb., type from Elk Mts., San Juan County; *C. jamesii* var. *pustulosa* (Rydb.) Harrington]. Sandy soils in mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1350 to 2300 m in Garfield, Kane, San Juan, and Wayne counties; Utah to southwestern Colorado, northwestern New Mexico and northeastern Arizona; 28(ii). Because var. *pustulosa* introgresses with var. *jamesii*, I cannot accept it at specific rank.

***Cryptantha circumscissa* (H. & A.) Johnston** Opening Cryptanth. [*Lithospermum circumscissum* H. & A.; *C. depressa* A. Nels.]. Stems few to many from the base, strigose, more or less branched above, often forming a dense hemispherical mass 2–10 cm high, the outer ones often decumbent; leaves oblanceolate, 3–15 mm long, 1–2 mm broad, obtuse, the surface siliceous especially toward the pale base, strigose or short-hispid, obscurely pustulate; flowers in axils of foliaceous bracts in short somewhat indefinite racemelike clusters; corolla inconspicuous, 1–2 (3) mm broad; fruiting calyx 2.5–4 mm long, oblong-ovoid, united to near the middle, at maturity the upper half falling away by a circumscission just below the sinuses, basal part persistent, cupulate, appressed-hispid; mature calyx lobes narrowly linear-lanceolate, firm-herbaceous, scarcely ribbed, more or less hispid; pedicels obscure, ca 0.5 mm long; nutlets 4, homomorphous, or with the abaxial one slightly longer, smooth or inconspicuously muricate, triangular-ovoid or oblong-lanceolate, 1.2–1.7 mm long, back flattened, especially near the apex, margins angled, groove closed and forked at base; gynobase ca 2/3 height of nutlets; style equalling or barely exceeded by nutlets. Warm desert shrub, blackbrush, salt desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 900 to 2500 m in Beaver, Box Elder, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, San Juan, Sevier, Tooele, Uintah, and Washington counties; Washington to Idaho, Wyoming, Colorado, Arizona, and Baja California; South America; 67(vii).

***Cryptantha compacta* Higgins** Mound Cryptanth. Densely caespitose perennials, 0.3–1 dm tall; stems numerous, arising from a woody root, 1–4 cm long, tomentose below, weakly strigose above; leaves oblanceolate to spatulate, obtuse, 5–15 (20) mm long, 2–4 mm wide, the dorsal surface with appressed setose-pustulate bristles, also densely strigose or subtomentose, the ventral surface similar but with fewer pustulate hairs, the petioles tomentose; inflorescence narrow, nearly capitate, 1–5 cm long; foliar bracts evident but not conspicuous; calyx segments lanceolate, 2–2.5 mm long in anthesis, in fruit becoming 3.5–4.5 mm long, densely white setose and tomentose; corolla white, the tube 1.8–2.2 mm long, the crests at base of tube evident, the fornices yellow, rounded, papillose, about 0.5 mm long, limb 4.5–5.5 mm wide; nutlets lance-ovate, acute, 2.5–3 mm long, 1.5–1.8 mm wide, only 1 or 2 maturing, the dorsal surface muricate or weakly tuberculate-rugulose, the ventral surface muricate, scar open, subulate to narrowly triangular, an elevated margin lacking; style equalling or shorter than mature fruit. Salt desert shrub and mixed desert shrub communities at 1900 to 2250 m in Beaver, Millard (type from 8 mi W of Desert Experimental Range), and Tooele counties; endemic; 6 (ii).

***Cryptantha confertiflora* (Greene) Payson** Golden Cryptanth. [*Oreocarya confertiflora* Greene; *Krynitzkia*

leucophaea var. *alata* Jones, type from Johnson, Kane County]. Perennial herbs, 1.7–4.3 dm tall; stems 1–7, slender, 1.5–2.5 dm long, tomentose at the base, strigose and setose upward; leaves linear to oblanceolate, 3–12 cm long, 2–16 mm wide, acute, the dorsal surface densely strigose and appressed setose with pustulate bases, the ventral surface uniformly strigose and with few or no pustules; inflorescence subcapitate, 3–20 cm long, strigose and with twisted setose hairs, bracts inconspicuous; calyx segments linear-lanceolate, in anthesis 6–8 mm long, in fruit becoming 10–14 mm long, strigose and spreading setose; corolla yellow, the tube 9–13 mm long, the fornices broad, emarginate, ca 1 mm long, the crests at base of tube evident or sometimes lacking, the limb 8–10 mm wide; nutlets triangular or ovate, 3.5–4 mm long, 2.5–3 mm wide, usually all 4 maturing, the margins narrowly winged, in contact, surfaces smooth and glossy; scar straight, closed, and lacking an elevated margin; plants distinctly heterostyled. Warm desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and bristlecone pine communities at 900 to 2850 m in Emery, Garfield, Iron, Juab, Kane, Millard, San Juan, Sanpete, Sevier, Washington, and Wayne counties; Arizona, Nevada, and California; 110 (xii).

***Cryptantha crassisepala* (T. & G.) Greene** Plains Cryptanth. [*Eritrichium crassisepalum* T. & G.]. Erect or widely spreading herb 5–15 cm high, stems normally numerous, loosely ascending, branched, hirsute to hispid; leaves oblanceolate, 2–3 (6) cm long, 3–4 (6) mm wide, rounded or obtuse, thickish, hirsute, pustulate, the upper scarcely reduced; spikes solitary or rarely geminate, naked or few bracted below, 5–8 (15) cm long, frequently produced from the lowest axils; corolla inconspicuous, 1–1.5 mm wide; fruiting calyces 6–7 (10) mm long, oblong-ovoid, somewhat asymmetrical, becoming distant below; mature calyx lobes linear-lanceolate, connivent above, midrib strongly thickened and indurate, hispid, the margins short-hispid; pedicels short, 0.5–1.2 mm long; nutlets 4 (1 or 2 rarely aborted), distinctly heteromorphous; odd nutlet next to the axial calyx lobe, persistent, 2–2.5 (3) mm long, brownish, ovoid, acute, finely granulate and spinular-muricate; consimilar nutlets readily deciduous, 1.2–1.5 (2) mm long, oblong-ovoid, thickish coarsely tuberculate, very obscurely if at all granulate, groove usually dilated and commonly excavated to form an areola occupying much of the ventral face of the nutlet; gynobase narrowly oblong, usually ca 2/3 height of consimilar nutlets; style equalling or a trifle exceeding the consimilar nutlets, surpassed by odd nutlet. Mixed desert shrub, blackbrush, sagebrush, and pinyon-juniper communities at 1200 to 1820 m in Carbon, Emery, Garfield, Grand, Kane, Millard, San Juan, Sevier, Washington, and Wayne counties; Colorado, Arizona, Texas, and Mexico; 94 (x). Our plants, which have a very narrow corolla limb, belong to var. *elachantha* Johnston.

***Cryptantha creutzfeldtii* Welsh** Creutzfeldt-flower. Perennial herbs, 7–23 cm tall; stems many, arising from a multicapital caudex and stout black-barked taproot, the caudex branches 2–12 cm long clothed by marcescent leaf bases; leaves narrowly spatulate to oblanceolate, acute to obtuse, 2–8 cm long, 2–9 mm wide, coarsely appressed setose-pustulate (appearing ashy gray on leaves of previous years) below, the petioles long-setose; inflorescence an interrupted thyse, with few to several clusters below the terminal subcapitate one; calyx segments lance-linear

in anthesis, 6–8 mm long, in fruit 9–13 mm long, densely long-setose with yellowish, ascending bristles; corolla white, the tube 8–11 mm long, campanulate in the throat, the fornicies low and broad, the crests at base of tube lacking, the limb 10–13 mm wide; nutlets lanceolate, 4–5 mm long, muciculate; scar narrow, open, without an elevated margin. Mancos Shale in shadscale and mat-triplex communities at 1600 to 1950 m in western Carbon and Emery (type from N of Emery) counties; endemic; 10 (0).

Cryptantha decipiens (Jones) Heller Beguiling Cryptanth. [*Krynitzkia decipiens* Jones]. Stems 1–4 dm high, slender, loosely branched, strigose and frequently short-hispid; leaves few, linear, obtuse, 1–3 cm long, 1–3 (4) mm wide, strigose and sometimes hispid, minutely pustulate; spikes slender, geminate or rarely solitary or ternate, bractless, usually becoming loosely flowered, 4–10 cm long; corolla inconspicuous in ours, 0.8–1 mm broad; fruiting calyx ovoid to ovoid-oblong, strictly ascending, asymmetrical, 2.5–7 (9) mm long, deciduous, sessile; mature calyx lobes lance-linear, decidedly connivent above with the tips frequently spreading or even recurving, midrib thickened and usually evidently hirsute, the margins strigose, abaxial lobe evidently the longest and most hirsute; nutlets 1 or rarely 2, next the abaxial calyx lobe, ovoid-lanceolate, 1.5–2.4 mm long, muciculate-granulate to tuberculate, usually brownish, the back convex, the sides rounded; groove open or closed but always dilated below to form a definite areola; gynobase 1/2–1/3 as high as nutlet; style much surpassed by nutlet, 1/2–2/3 the height of nutlet. Creosote, Joshua tree, blackbrush, and pinyon-juniper communities below 1500 m in Washington County; Nevada, Arizona, and California; 15 (viii).

Cryptantha dumetorum Greene Greene Cryptanth. [*Krynitzkia dumetorum* Greene]. Laxly branched closely strigose herb; stems at first erect but later commonly much elongated and sprawling or climbing among bushes; leaves lanceolate, thickish, 2–4 cm long, 2–4 (8) mm wide, sparsely appressed hirsute-villous, closely pustulate below and finely so above; spikes solitary or geminate, usually remotely flowered, 5–15 cm long, occasionally with foliaceous bracts toward base, the rachis brittle and tortuously flattened; corolla inconspicuous, ca 1 mm broad; fruiting calyx closely appressed to rachis, 2–3 mm long, very asymmetrical, not deciduous, the base very oblique and downwardly gibbous on axial side; mature calyx lobes connivent and subequal, the 3 abaxial lobes lanceolate, somewhat strigose, with the thickened midribs deflexed hirsute, the 2 axial lobes partly united, hirsute only on outer margins; nutlets 4, heteromorphic, granulate and muciculate, odd nutlet persistent, axial, broadly lanceolate, 2–3 mm long, the base much developed and distorting the calyx, the groove open and broad; consimilar nutlets 1.5–2 mm long, deciduous, lanceolate, the groove closed or very narrow; gynobase narrow; style shortly surpassed by nutlets or reaching to their tips. Creosote bush, Joshua tree, and blackbrush communities below 1250 m in Washington County; Arizona, Nevada, and California; 2 (ii).

Cryptantha elata (Eastw.) Payson Tall Cryptanth. [*Oreocarya elata* Eastw.]. Biennial or short-lived perennials, 3–5 dm tall; stems 1–6, erect, stout, weakly setose with spreading white hairs, 9–15 cm long; leaves oblanceolate to spatulate, 2–5 cm long, 4–13 mm wide, the

apices acute to obtuse, the blade abruptly tapering to the narrow petiole, the dorsal surface strigose and appressed setose, the ventral surface strigose, both surfaces pustulate; inflorescence spreading or open in age, 1.5–3.5 dm long, setose; foliar bracts inconspicuous; calyx segments lanceolate, in anthesis 3–4.5 mm long, in fruit becoming 7–8 mm long, hirsute; corolla white, the tube 3.5–5 mm long, the fornicies yellow, rounded, papillose, ca 1 mm long, the crests at base of tube well developed, the limb 6–8 mm wide; nutlets lance-ovate, 4–4.5 mm long, 2–2.5 mm wide, usually all 4 maturing, the margins in contact, the dorsal surface densely tuberculate and somewhat rugulose, also covered with dense minute papillae, the ventral surface similar but the roughenings less prominent; scar closed, or narrowly open at the base, without an elevated margin; style exceeding mature fruit 0.5–2 mm. Mancos Shale in salt desert shrub communities at 1550 to 1700 m in Grand County; Colorado; 8 (ii).

Cryptantha fendleri (Gray) Greene [*Krynitzkia fendleri* Gray; *Eritrichium hispidum* var. *leiocarpum* Kuntze; *C. ramulosissima* A. Nels.; *C. wyomingensis* Gand.]. Stems erect, usually evident throughout and bearing lateral branches mostly above the middle, sometimes rather bushy-branched from near the base, 1–5 dm tall, more or less densely hispid and frequently appressedly so; leaves narrowly oblanceolate to linear, 2–5 cm long, 2–4 mm broad, appressed-hirsute, often pustulate on the lower surface; spikes solitary or geminate, 2–12 cm long, loosely flowered, bractless or rarely bracted below; corolla inconspicuous, ca 1 mm broad; fruiting calyxes ovate-oblong, 4–5 (7) mm long, ascending, slightly asymmetrical, obscurely biserial; pedicels ca 0.5 mm long; mature calyx lobes linear to lance-linear, usually loosely connivent with the tips somewhat spreading, the midrib hirsute, thickened, the margins strigose; nutlets 4, homomorphic, or sometimes reduced to 1–3, smooth, somewhat shiny, lanceolate, acuminate, 1.5–2 mm long, convex on dorsal face, rounded or somewhat obtuse on the sides; groove closed above, but opening into a definite deltoid areola at the base; gynobase subulate, twice the length of the style, at least 2/3 the height of the nutlets; style equaling or barely surpassing the nutlets. Sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1850 to 2800 m in Daggett, Duchesne, Emery, Garfield, Iron, Kane, Sevier, Tooele, Uintah, Wasatch, Washington, and Wayne counties; Alberta and Saskatchewan south to Nebraska, New Mexico, Arizona to Oregon and Washington; 38 (viii).

Cryptantha flava (A. Nels.) Payson Yellow Cryptanth. [*Oreocarya flava* A. Nels.; *O. torva* A. Nels., type from Price]. Perennial, 1.3–4 dm tall; stems many from a multiple caudex, 8–26 cm long, densely setose, white-hairy at the base, becoming setose and strigose upward; leaves narrowly oblanceolate to nearly linear, acute, 2–9 cm long, 3–8 mm wide, the dorsal surface strigose and appressed setose with pustulate hairs, the ventral surface almost uniformly strigose and with the pustules less conspicuous; inflorescence narrow to somewhat open, 0.5–2.5 dm long, conspicuously yellow-setose, the floral bracts inconspicuous; calyx segments linear, in anthesis 8–10 mm long, in fruit becoming 9–12 mm long, densely setose, with yellowish hairs; pedicels 3–5 mm long in fruit; corolla yellow, the tube 9–12 mm long, the crests at the base of the tube absent or nearly so, the fornicies yellow, truncate, emarginate, 1–1.5 mm long, the limb

8–10 mm wide; nutlets lanceolate, 3.4–4 mm long, 1.9–2.2 mm wide, 1 or 2 usually maturing, margins acute, in contact when more than 1 nutlet matures, both surfaces of nutlet smooth and glossy; scar straight, closed, elevated margin lacking; style exceeding mature fruit 3–7 mm (heterostyled); $n = 12$. Mixed desert shrub, salt desert shrub, sagebrush, Mormon tea, and pinyon-juniper communities at 1280 to 2600 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Uintah, and Wayne counties; Wyoming, Colorado, New Mexico, and Arizona; 250 (xxi).

Cryptantha flavoculata (A. Nels.) Payson Yellow-eye Cryptanth. [*Oreocarya flavoculata* A. Nels.]. Caespitose perennials, 10–37 cm tall; stems 1 to several, slender, 5–20 cm long, strigose and spreading setose with slender bristles; leaves linear-oblong to spatulate, obtuse or sometimes acute, 3–11 cm long, 3–15 mm wide, densely strigose and weakly setose, the dorsal surface conspicuously pustulate, the ventral surface with a few pustules or sometimes silky-strigose; inflorescence narrow or sometimes slightly open and lax, 5–30 cm long; foliar bracts evident but not conspicuous; calyx segments in anthesis linear-lanceolate, 5–6 mm long, in fruit becoming 8–10 mm long and becoming broadly lanceolate to ovate; corolla white or pale-yellow, the tube 7–10 mm long, the crests at base of tube lacking, the fornicies yellow, minutely papillose, 1–2 mm long, the limb 8–12 mm wide; nutlets lanceolate to lance-ovate, 2.5–3.5 mm long, 1.8–2 mm wide, usually all 4 maturing, with margins obtuse, in contact or slightly separated, the dorsal surface muricate, tuberculate, and with conspicuous ridges, sometimes nearly foveolate, the ventral surface tuberculate, rarely with ridges; scar open, constricted near the middle and surrounded by a highly elevated margin; style exceeding mature fruit 4–8 mm (heterostyled). Sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1650 to 3160 m in all counties except Cache, Davis, Morgan, Piute, Rich, Salt Lake, and Weber counties; Wyoming and Colorado to New Mexico, Arizona, Nevada, and California; 315 (xxv).

Cryptantha fulvocanescens (Wats.) Payson Yellow-hair Cryptanth. [*Krynitzkia echinoides* Jones, type from Paria Canyon; *C. fulvocanescens* var. *echinoides* (Jones) Higgins]. Densely caespitose perennials from a strongly lignified taproot, 8–30 cm tall; stems many from a multiple caudex, 5–13 cm long, white-hairy at the base, setose-hispid upward; leaves oblanceolate to spatulate, acute to obtuse, 1.5–7 cm long, 4–12 mm wide, uniformly strigose, with pustules mainly confined to the dorsal surface; inflorescence narrow or somewhat open at maturity, 3–19 cm long, white or yellowish setose; foliar bracts inconspicuous; calyx segments linear, 4–6 mm long in anthesis, in fruit becoming 9–13 mm long, densely white or yellowish setose; pedicels 2–10 mm long; corolla white, the tube 7–11 mm long, the crests at base of tube evident or lacking, the fornicies yellow, emarginate or rounded, 0.7–1.3 mm long, the limb 7–9 mm broad, nutlets lance-ovate, 3.5–4.5 mm long, 2–3 mm broad, 1 or 2 usually maturing, margins acute to obtuse, in contact when more than 1 nutlet matures, with both surfaces densely and uniformly muricate; scar open or nearly closed, an elevated margin lacking; style exceeding mature fruit 3–7 mm. Mancos Shale in salt desert shrub, blackbrush, sagebrush, and pinyon-juniper communities at 1500 to 2150 m in Carbon, Emery, Garfield, Grand,

Kane, San Juan, and Wayne counties; Colorado, New Mexico and Arizona; 78 (ix).

Cryptantha gracilis Osterh. Slender Cryptanth. [*C. hillmannii* Nels. & Kennedy; *C. gracilis* var. *hillmannii* Munz & Johnston]. Stems slender, 10–20 cm high, erectly branched, usually solitary, densely spreading short-hirsute; leaves linear or narrowly oblanceolate, the lower 1.5–3 cm long, 1–3 mm broad, the upper usually much reduced, obtuse or rounded, ascending short-hirsute, minutely pustulate; spikes solitary or geminate, usually dense, 1–2 mm broad; fruiting calyx ovate, divaricate, 2–2.8 mm long, early deciduous, the base evidently conical, sessile; mature calyx lobes lanceolate, densely appressed tawny hispid-villous, with tips erect and midrib slightly thickened and inconspicuously short-hispid; nutlets 1 or rarely 2–3 and unequally developed, lanceolate, 1.5–2 mm long, 0.8–1 mm broad, smooth and shiny, acute, with back nearly flat and sides rounded at least near the apex; groove mostly opened to above the middle and scarcely forked below; style reaching to 2/3–3/4 height of nutlet. Mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1200 to 2800 m in Beaver, Box Elder, Carbon, Daggett, Emery, Garfield, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Uintah, Utah, and Washington counties; Idaho and Colorado to Arizona and California; 45 (vii).

Cryptantha grahamii Johnston Graham Cryptanth. Long-lived perennial from a thick woody taproot, 15–25 cm tall; stems several, 4–12 cm long, weakly spreading setose; leaves spatulate to oblanceolate, 2–4.5 cm long, 4–10 mm wide, conspicuously setose pustulate on both surfaces, with some finer pubescence beneath; inflorescence narrow, 0.4–1 dm long setose; foliar bracts evident but not conspicuous; calyx segments lanceolate, in anthesis 5–7 mm long, in fruit becoming 7–9 mm long, very setose; corolla white, the tube 3.5–5 mm long, constricted at the middle, the crests at base of tube evident, the fornicies yellow, emarginate, papillose, 0.5–1 mm long, the limb 11–15 mm wide; nutlets lanceolate, 3–3.8 mm long, 1.7–2 mm wide, 2–4 maturing, the margins in contact, acute, both surfaces with inconspicuous, small, low-rounded tubercles or some of these confluent into short irregular ridges; scar straight, open, narrowly linear, the margin not elevated; style coarse, exceeding mature fruit 1.8–2.2 mm. Green River Shale in mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1520 to 2250 m in Duchesne and Uintah (type from mouth of Sand Wash) counties; endemic; 49 (ix).

Cryptantha humilis (Greene) Payson Dwarf Cryptanth. [*Oreocarya humilis* Greene; *O. shantzii* Tidestr., type from Great Salt Lake; *C. humilis* var. *shantzii* (Tidestr.) Higgins; *O. commixta* Macbr., type from Juab, Juab County; *C. humilis* var. *commixta* (Macbr.) Higgins; *C. nana* var. *ovina* Payson; *C. humilis* var. *ovina* (Payson) Higgins; *O. dolosa* Macbr., type from Logan]. Perennials, more or less densely caespitose, 5–30 cm tall; stems many, arising from the ends of the branched caudex, 2–15 cm long, strigose to spreading setose; leaves oblanceolate to spatulate, 1–6 cm long, 2–12 mm wide, strigose, setose or subtomentose, pustulate on both surfaces; inflorescence narrowly cylindrical to open and lax, 2–18 dm long, tomentose to conspicuously setose; calyx segments linear-lanceolate, in anthesis 2.5–4.5 mm long, in fruit becom-

ing 6–13 mm long, setose or tomentose; corolla white, the tube 2.5–4.5 mm long, the crests at base of tube conspicuous to nearly obsolete; fornicies yellow, more or less papillose, rounded, ca 0.5 mm long; limb 7–10 mm wide; nutlets lanceolate to ovate-lanceolate, 3–4.5 mm long, 1.8–3.2 mm wide, 1 to 4 of them maturing, the margins in contact, acute to somewhat obtuse, the dorsal surface muricate, tuberculate, or somewhat rugulose, the ventral surface indistinctly muricate or tuberculate; scar open, triangular, margin not elevated; style from shorter than to longer than the mature fruit by 2.5 mm. Salt desert shrub, mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1500 to 2540 m in all counties except Daggett, Rich, Summit, and Wasatch; Montana to Idaho, Colorado, Arizona, and California; 226 (xx). This is the most variable of all Utah cryptanthas. In a previous treatment of the Utah borages I recognized four varieties, but additional evidence does not support segregation of infraspecific taxa. Pubescence throughout the range is quite constant, however, some plants in the Uinta Basin are more hispid than otherwise. The style length varies from slightly shorter than to 2 mm longer than the mature nutlets. The nutlets can be densely and uniformly muricate to muricate-rugose. These characters exist in varying degree, but lack geographical correlation, except those plants in the Uinta Basin that tend to be shorter, more hispid, with short styles and quite rugulose nutlets. These might best be designated *C. humilis* var. *nana* (Eastw.) Higgins [*O. nana* Eastw.; *C. nana* (Eastw.) Payson].

Cryptantha inaequata Johnston Unequal Cryptanth. Stems erect or ascending, 3–4 dm high, branched throughout or sometimes the basal branches elongated and simple or nearly so, hispid and strigose or hirsute toward the base; leaves linear to narrowly-oblancoelate, 2–4 cm long, acute, often becoming more or less convolute, more or less hispid, pustulate, especially beneath; spikes geminate or solitary, 4–12 cm long, at times few bracted below; corolla inconspicuous, the tube shorter than the calyx, the limb 1–2.5 mm broad; fruiting calyx ovoid-oblong, 2.5–3 mm long, ascending; pedicels less than 0.5 mm long; mature calyx lobes lanceolate, midrib thickened and hirsute, villous-ciliate on the margins; nutlets 4, heteromorphous, triangular-ovate, dark with small pale tuberculations, the margins acute, the groove closed above but below gradually enlarging into a shallow triangular areola; odd nutlet ca 1.7 mm long, somewhat persistent, slightly paler than the others, next to the abaxial calyx lobe; consimilar nutlets ca 1.3 mm long; gynobase equaling consimilar nutlets but surpassed by odd nutlet; style much surpassing the nutlets. Warm desert shrub, blackbrush, and mixed desert shrub communities below 1250 m in Kane, San Juan, and Washington counties; Utah to northern Arizona, and Nevada; 5 (i). This species is closely allied with *C. angustifolia* and has been placed in synonymy by Cronquist. However, *C. angustifolia* has smaller nutlets with the margins rounded and never knifelike or with a narrow winged-margin as in *C. inaequata*. *C. inaequata* is also a more robust plant. I find no basis on which to combine them.

Cryptantha interrupta (Greene) Payson Basin Cryptanth. [*Oreocarya interrupta* Greene]. Long lived perennial, 1.7–6 dm tall; stems few to several, slender, 1–3.5 dm long, strigose and weakly setose with slender white hairs; leaves oblanceolate to spatulate, obtuse,

1.5–7 cm long, 4–12 mm wide, lower surface densely strigose and appressed setose-pustulate, the upper surface more finely strigose, the setose hairs less conspicuous and, pustules fewer; inflorescence narrow, interrupted, 1–2.5 dm long, densely setose, the cymes somewhat elongating at the top, the foliar bracts evident on lower part of stem; calyx segments lanceolate, 2–3 mm long in anthesis, in fruit becoming 5–8 mm long, setose; corolla white, the tube 2–2.5 mm long, the crests at base of tube conspicuous, the fornicies light yellow, slightly emarginate, ca 0.5 mm long, the limb 5–6 mm wide; style exceeding mature fruit by less than 1 mm; nutlets lanceolate, 3.3–3.6 mm long, 1.7–2 mm wide, all four usually maturing, the margins in contact, acute and both surfaces tuberculate with scattered rounded tubercles, or sometimes nearly smooth; scar slightly open, linear, margin not elevated. On white tuffaceous slopes in rabbitbrush, salt desert shrub, sagebrush, and pinyon-juniper communities at 1720 to 2150 m in Box Elder County; Idaho, and Nevada; 6 (0).

Cryptantha johnstonii Higgins Johnston Cryptanth. Caespitose perennial 1–2.5 dm tall; stems several, arising from the branched caudex, 6–13 cm long, very weakly strigose; leaves oblanceolate, the apices obtuse to acute, 2–6.5 cm long, 4–10 mm wide, the dorsal surface strigose with conspicuous pustulate hairs; inflorescence somewhat open, 5–20 cm long; floral bracts evident but not conspicuous, 1–2 cm long; calyx segments linear-lanceolate, in anthesis 5–6 mm long, in fruit becoming 8–10 mm long, strigose and spreading white-setose; pedicels 0.5–1 mm long; corolla white, the tube 12–15 mm long, flaring in the throat, the crests at base of tube lacking, the fornicies yellow, 1–1.5 mm long, emarginate, papillose, the limb 13–17 mm broad; nutlets ovate, 3–3.5 mm long, 2.3–2.7 mm wide, usually all 4 maturing, the margins acute and knifelike, in contact, both surfaces smooth and glossy; scar straight, closed, an elevated margin lacking; style exceeding mature fruit 3–8 mm (heterostyled). Mixed desert shrub and pinyon-juniper communities at 1800 to 1950 m in Emery (type from Huntington road, ca 15 mi W. of US 50–6) County; endemic; 12 (iv).

Cryptantha jonesiana (Payson) Payson Jones Cryptanth. [*Oreocarya jonesiana* Payson, type from San Rafael Swell]. Coarse caespitose perennials, 5–15 cm tall; stems many, arising from a thick-woody multiple caudex, 2–7 cm long, setose; leaves spatulate, 1–4 cm long, 4–13 mm wide, coarsely appressed setose-pustulate; leaf bases also setose with dense white hairs; inflorescence narrow, somewhat capitate, with 1–3 flowers in the axils of the bracts below the terminal cluster; calyx lobes lanceolate to nearly linear, in anthesis 5–7 mm long, in fruit becoming 7–10 mm long, densely setose, with ascending yellowish bristles; corolla white, the tube 10–15 mm long, campanulate in the throat, the fornicies low and broad, papillose, the crests at base of tube lacking, the limb 9–13 mm wide; nutlets lanceolate, 3.5–4.5 mm long, densely and uniformly muricate, or with a few short low ridges; scar narrow, open, and without an elevated margin; style exceeding mature fruit 4–6 mm. Mixed desert shrub and pinyon-juniper communities at 1700 to 2280 m in Emery County; endemic; 25 (vi).

Cryptantha kelseyana Greene Kelsey Cryptanth. [*C. pattersonii* authors, not (Gray) Greene]. Spreading or ascending hirsute herb 5–25 cm high; stems 1 to several, hirsute and also hispid-strigose; leaves linear or narrowly

oblanceolate, 1.5–3 (4) cm long, 2–4 mm wide, rounded or obtuse, thickish, hirsute, pustulate, the upper ones scarcely reduced; spikes usually solitary, 4–9 cm long, naked or with a few bracts near the base; corolla minute, 1–2 mm broad; fruiting calyces 4–6 mm long, ovate-oblong, spreading, loose or dense, somewhat asymmetrical; pedicels short but definite, ca 0.8 mm long; mature calyx lobes linear, weakly connivent above, midrib thickened, hirsute to hispid, margins inconspicuously villous-strigose; nutlets 4, heteromorphous; odd nutlet next to the axial calyx lobe, broadly lance-ovoid, 2–2.6 mm long, smoothish or granulate or muriculate-granulate or rarely somewhat tuberculate, standing off slightly from the gynobase; consimilar nutlets lance- or oblong-ovoid, 1.8–2.3 mm long, coarsely tuberculate and usually granulate, darker than the odd nutlet, the sides rounded; groove narrow or closed, near base abruptly dilated to form a small triangular areola; gynobase subulate, a little longer than the style, 1/2 to 2/3 height of consimilar nutlets; style surpassed by odd nutlet and just surpassing or even exceeded by consimilar ones. Salt desert shrub, mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1580 to 2500 m in Carbon; Daggett, Duchesne, Grand, Millard, San Juan, Sevier, Tooele, Wasatch, and Weber counties; Saskatchewan and Montana south to Wyoming and Colorado; 40 (ii).

Cryptantha longiflora (A. Nels.) Payson Long-flower Cryptanth. [*Oreocarya longiflora* A. Nels.]. Short-lived perennial or possible biennials, 0.8–3 (5) dm tall; stems 1 to several, 5–10 cm long, setose and spreading hirsute; leaves spatulate, obovate or oblanceolate, 2–7 cm long, 5–15 mm wide, both surfaces strigose and strongly hirsute, pustulate; inflorescence broad and open, 7–25 cm long, setose; foliar bracts inconspicuous; calyx segments linear-lanceolate, in anthesis 7–10 mm long, in fruit becoming 10–16 mm long, setose; corolla white, the tube 12–14 mm long, lacking crests at base of tube, the fornicies yellow, emarginate, broad, rounded, papillose, 0.5–1 mm long, the limb 9–11 mm wide; style exceeding mature fruit 4–9 mm (heterostyled); nutlets lanceolate-ovate 3–4 mm long, 2.2–2.6 mm wide, 2–4 maturing, both surfaces with tubercles and low rounded ridges; scar straight, closed or very narrowly open, with a slightly elevated margin. Salt desert shrub and pinyon-juniper communities at 1450 to 1830 m in Emery and Grand counties; Colorado; a Navajo Basin endemic; 15 (iii).

Cryptantha mensana (Jones) Payson Carbon Cryptanth. [*Krynitzkia mensana* Jones, type from Emery]. Short-lived perennials, 10–15 (20) cm tall; stems 1 to several, 5–12 cm long, setose-hirsute, with some finer strigose hairs beneath; leaves oblanceolate to spatulate, obtuse, 3–8 cm long, 5–14 mm wide, lower surface setose with pustulate hairs, also finely strigose, ventral surface strigose, less setose and with fewer pustules; inflorescence broad, open, 4–12 cm long, setose; foliar bracts well developed; calyx segments lanceolate, in anthesis 4–5 mm long, in fruit becoming 7–8 mm long, setose-hirsute; corolla white, the tube 3–4 mm long, the crests at base of tube lacking or nearly so, the fornicies yellow, rounded, slightly papillose, ca 0.5 mm long, the limb 5–8 mm wide; nutlets ovoid, 3–3.5 mm long, 1.6–1.9 mm wide, the margins obtuse, not in contact, the dorsal surface rugose, tuberculate and somewhat muricate, the ventral surface conspicuously tuberculate; scar open,

constricted at the middle and surrounded by a high elevated margin; style exceeding mature fruit 1.5–2 mm. Salt desert shrub, mixed desert shrub, sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1750 to 2790 m in Carbon, Duchesne, Emery, Garfield, Grand, Sevier, Utah, and Wayne counties; endemic; 72 (viii).

Cryptantha micrantha (Torr.) Johnston Dye Cryptanth. [*Eritrichium micranthum* Torr.; *Eremocarya muricata* Rydb., type from southern Utah]. Slender, dichotomously branched herb 5–15 cm high, drying brownish; root and lower parts of the stem stained with a purple dye; leaves oblong-oblanceolate, 3–7 mm long, 0.8–1.4 mm wide, whitish strigose or short-hirsute, rounded at apex, uppermost scarcely reduced and extending through the inflorescence; spikes numerous, solitary or geminate, densely flowered and strongly unilateral, leafy-bracted throughout, 1–4 cm long; corolla inconspicuous to medium-sized, the limb 0.5–2.5 mm broad; fruiting calyx ovoid-oblong, 1.8–2.5 mm long, slightly asymmetrical, decidedly biserial, the base broadly conical; pedicels 0.5–0.8 mm long; mature calyx lobes oblong-lanceolate, broad, erect, hirsute, the midrib not evidently thickened; nutlets 4, 1–1.3 mm long, smooth or tuberculate, with 1 sometimes a little longer and more persistent than the others, the groove extending full length of nutlet, narrow, scarcely broadened at base; gynobase subulate, nearly as long as the calyx, much surpassing the nutlets and bearing at its summit the sessile stigma. Creosote bush, warm desert shrub, blackbrush, saltbush, sagebrush, and pinyon-juniper communities below 1850 m in Garfield, Kane, Millard, San Juan, Tooele, and Washington counties; Texas and New Mexico to Oregon, California, and Baja California; 65 (xiv).

Cryptantha nevadensis Nels. & Kennedy Nevada Cryptanth. [*C. leptophylla* Rydb., type from St. George]. Stems slender, 1–5 dm high, 1 to several, erect or usually flexuous, appressed short-strigose, mostly laxly branched; leaves linear-oblanceolate to linear, acute or obtuse, 1–4 cm long, 1–5 (7) mm broad, not numerous, appressed short-hispid, more or less pustulate; spikes geminate or ternate, terminal, also scattered along the stem on short, slender, axillary branches, occasionally bracted toward the base, congested and somewhat glomerate or elongate and to 15 cm long; corolla inconspicuous, the limb 1–2 mm broad; fruiting calyx oblong-ovoid to lanceolate, 5–12 mm long, ascending, slightly asymmetrical; pedicels ca 0.5 mm long; mature calyx lobes lanceolate or linear, connivent above with the slender tips usually recurving, margins more or less villous and hispid on the somewhat thickened midrib; nutlets 4, homomorphous, verrucose or muriculate toward the tip, lanceolate to lance-ovoid, 2–2.9 mm long, back convex, the margins somewhat angled, groove open or closed, dilated below into a small areola; gynobase narrow; style reaching to or almost to the tips of the nutlets. Creosote bush, other warm desert shrub, sagebrush, and pinyon-juniper communities below 2130 m in Kane, San Juan, and Washington counties; Nevada and Arizona to California and Baja California; 16 (viii).

Cryptantha ochroleuca Higgins Yellowish Cryptanth. Low caespitose perennial, 2–13 cm tall; stems several, 1–4 cm long, strigose and weakly setose; leaves linear-oblanceolate to oblanceolate, the apices acute or sometimes obtuse, 1–2.5 cm long, 1–3 mm wide; basal leaves

slightly outcurved; groove open or closed above but below broadening into a shallow broadly triangular areola; odd nutlet next to the abaxial calyx lobe, 1–2 mm long, somewhat persistent, finely mucronate or tuberculate, light or dark, consimilar nutlets 0.8–1.5 mm long, acute, tending to be very narrowly wing-margined, dark with pallid tuberculations; gynobase subulate, $3/4$ the length of odd nutlet and subequal to the consimilar nutlets; style much surpassing the nutlets. Creosote bush, Joshua tree, and other warm desert shrub communities below 950 m in Washington County; Nevada, Arizona, and southwestward to Baja California; 3 (0).

Cryptantha recurvata Cov. Recurved Cryptanth. Stems branched from the base, slender, ascending or decumbent at base, 1–3 dm high, strigose; root often dye-stained; basal leaves oblanceolate or spatulate, 1.5–2 cm long, the cauline ones remote, linear or lanceolate, 5–10 mm long, rounded or obtuse, rather finely appressed-hispid and minutely pustulate; spikes bractless, slender, loose, 2–10 cm long, solitary or geminate; corolla inconspicuous, ca 2 mm long, subtubular, not exerted, lobes short; fruiting calyx slender, asymmetrical, bent and recurved, 3–4 mm long, tardily deciduous, sessile; mature calyx lobes linear, the midrib somewhat thickened and hirsute, rarely merely strigose, the axial lobe longest, thickest, and most hirsute; ovules 2; nutlet 1, subsistent, oblong-lanceolate, curved inwardly, dull brownish, granulate-mucronate, next to the axial calyx lobe, the edges obtusish; groove somewhat oblique, narrow or closed, opening into a small basal areola; gynobase slender, ca $1/2$ the length of the matured nutlet and subequal to the abortive ones; style commonly much surpassed by nutlet. Creosote bush, blackbrush, yucca, mixed desert shrub, sagebrush, and pinyon-juniper communities at 800 to 1500 m in Beaver, Box Elder, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, and Washington counties; Oregon to Arizona, Nevada, and southern California; 35 (v).

Cryptantha rollinsii Johnston Rollins Cryptanth. Biennial herbs, 1–3.5 dm tall; stems 1 to several, 2–15 cm long, setose; leaves clustered at the base, gradually reduced upward, oblanceolate to spatulate, obtuse to acute, 2–5 cm long, 5–15 mm wide, setose and hispid, pustulate on both surfaces; inflorescence narrow to somewhat open at maturity, cylindrical or obovoid, racemes in dense glomerules, 3- to 6-flowered, hispid, 5–20 cm long; calyx segments linear, in anthesis 7–8 mm long, in fruit becoming 8–10 mm long, hispid; corolla white, campanulate, the tube 7–9 mm long, the crests at base of tube evident, the fornicies yellow, papillose, ca 0.5–1 mm long, the limb 7–8 mm wide; plants slightly heterostyled; nutlets lanceolate, 3–4 mm long, 1–1.5 mm wide, obscurely rugulose and tuberculate on the dorsal surface, smooth ventrally; scar closed and without an elevated margin. Salt and mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1650 to 2250 m in Carbon, Duchesne, Emery, Uintah (type from 22 mi S of Ouray), and Wayne counties; Wyoming and Colorado; 89 (xiv).

Cryptantha rugulosa (Payson) Payson Tubercle Cryptanth. [*Oreocarya rugulosa* Payson, type from Fish Springs, Tooele County]. Biennial or short-lived perennial, 12–30 cm tall; stems slender, 1 to several, 8–16 cm long, spreading setose-hispid; leaves oblanceolate to spatulate, obtuse to acute, strigose and conspicuously setose-

hispid, pustulate on both surfaces; inflorescence 2–20 cm long, hispid; foliar bracts inconspicuous; calyx segments linear-lanceolate, in anthesis 4–5 mm long, in fruit becoming 7–9 mm long, strigose and spreading hirsute; corolla white, the tube 3–4 mm long, with conspicuous crests at base of tube, the fornicies rounded, distinctly papillose, ca 0.5 mm long, the limb 5–7 mm broad; nutlets lanceolate, 2.8–3.2 mm long, 1.3–1.7 mm wide, all 4 usually maturing, the margins in contact, acute, the dorsal surface with short low ridges, also somewhat tuberculate, the ventral surface smooth or nearly so; scar open, subulate, without an elevated margin; style exceeding mature fruit 1–1.5 mm. Salt desert shrub, rabbitbrush, horsebrush, mixed desert shrub, sagebrush, and pinyon-juniper communities at 1460 to 2620 m in Beaver, Box Elder, Juab, Millard, Piute, Sanpete, Sevier, and Tooele counties; eastern Nevada; a Great Basin endemic; 59 (viii).

Cryptantha scoparia A. Nels. Desert Cryptanth. Stems with several to many stiffly erect branches 10–35 cm tall, closely strigose and frequently also sparsely hispid; leaves linear to lance-linear, 2–4 cm long, obtuse, 1–3 mm broad, strictly ascending, strigose or appressed hirsute, finely pustulate; spikes stiff, bractless, solitary or geminate, 2–10 cm long; corolla inconspicuous, ca 1 mm wide, the tube subequal to the calyx; fruiting calyx ovate-oblong, 5–6 mm long, strictly ascending, subsessile, subsymmetrical, becoming rather obscurely biserial at maturity, 5–10 mm distant; mature calyx lobes linear-lanceolate, rather stiff, somewhat connivent above the tips, slightly spreading, midrib thickened and hirsute, the margins ascending-hispidulous, the axial lobe slightly longer; nutlets 4, homomorphous, lanceolate to broadly so, 1.8–2.2 mm long, antorsely spinulose-mucronate, especially near the apex, the margins and base rounded, the groove narrow and forked below where occasionally open to a small triangular areole; gynobase subulate, ca $3/4$ height of nutlets; style reaching to tip of nutlets. Mixed desert shrub, sagebrush, and pinyon-juniper communities at 1450 to 1900 m in Box Elder and Weber counties; Washington, Oregon, Idaho, Wyoming, and Nevada; 2 (0).

Cryptantha semiglabra Barneby Pipe Springs Cryptanth. Erect perennials, 2–3 (4) dm tall; stems 1 to several, 9–18 (20) cm long, retrorsely strigose and weakly spreading setose; leaves oblanceolate, acute, 3–7 cm long, 3–6 cm wide, dorsal surface appressed setose-pustulate, the ventral glabrous, the old leaf bases long white-hairy; inflorescence narrow to somewhat open, 4–13 dm long; foliar bracts slightly surpassing the cymes, 1.5–2 cm long; calyx segments lanceolate, in anthesis 5–8 mm long, in fruit becoming 10–13 mm long, setose; pedicels 1–2 mm long; corolla white, the tube 10–12 mm long, the crests at base of tube conspicuous; fornicies yellow, rounded, 1–1.2 mm long, obscurely papillose; limb 8–10 mm wide; nutlets ovate, 3.5–4 mm, 2–2.5 mm wide, usually all 4 maturing, the margins acute, in contact, both surfaces smooth and glossy; scar closed, elevated margin lacking, style surpassing the mature fruit 5–7 mm. Clay soils in mixed desert shrub, sagebrush, and pinyon-juniper communities at 1500 to 1730 m in Washington County; Arizona; 1 (0).

Cryptantha sericea (Gray) Payson Silky Cryptanth. [*Krynitzkia sericea* Gray]. Perennials, 1.5–4.3 (5) dm tall; stems 1 to several, branched from near the base, 5–12 (30)

cm long, setose with spreading hairs; leaves oblanceolate to spatulate, obtuse, 2.5–10 (15) cm long, 0.5–2 cm wide, the dorsal surface strigose and weakly appressed to spreading setose, pustulate, the ventral silky-strigose, lacking pustules or these very inconspicuous; inflorescence narrow to somewhat open, 5–32 cm long, setose-hispid, foliar bracts 2–5 cm long; calyx segments lanceolate, 2.5–4 mm long in anthesis, in fruit becoming 6–8 mm long; pedicels 0.5–1 mm long; corolla white, the tube 2.5–3.5 mm long, the crests at base of tube conspicuous; fornices yellow, broad, depressed, 0.5–0.6 mm long; limb 7–9 mm wide; nutlets lanceolate, 2.5–3.5 mm long, 1.5–2 mm wide, usually all 4 maturing, the margins acute or narrowly winged, in contact, dorsal surface with low rounded tuberculations, also somewhat rugulose and muriculate, the ventral similar but the markings less evident; scar straight, closed and without an elevated margin; style exceeding mature fruit 0.5–1.3 mm. Salt desert shrub, sagebrush, pinyon-juniper, mountain brush, aspen, and spruce-fir communities at 1700 to 2950 m in Carbon, Daggett, Duchesne, Grand, Rich, Summit, and Uintah counties; Wyoming and Colorado; 125 (x).

Cryptantha setosissima (Gray) Payson Fish Lake Cryptanth. [*Eritrichium setosissimum* Gray, type from Fish Lake]. Biennial or short-lived perennial, 3–10 dm tall; stems usually 1–3, erect, 1.7–5 (10) dm long, hirsute; leaves clustered at the base, reduced upward, oblanceolate, the apices obtuse to acute, 3–13 cm long, 0.5–1.5 cm wide, setose and with some finer twisted pubescence beneath, with pustulate hairs numerous on both surfaces; inflorescence broad-topped due to the elongation of the scorpioid racemes, 1–5 dm long; calyx segments broadly lanceolate, 4–6 mm long in anthesis, in fruit becoming 9–11 mm long, setose, and strigose; corolla white, the tube 3–5 mm long, constricted above the ovary by the conspicuous ring of crests, the fornices yellow, emarginate, 0.5 mm long, the limb 7–9 mm broad; nutlets ovate, 5–6 mm long, 3.5–4.5 mm wide, papery, with a broad, winged margin, the dorsal surface muricate, and inconspicuously rugulose or tuberculate, the ventral smooth or nearly so; scar straight, narrow, slightly open, elevated margin lacking; style exceeding mature fruit 1–2 mm. Sagebrush, pinyon-juniper, oakbrush, mountain brush, aspen, and spruce-fir communities at 1950 to 3250 m in Garfield, Piute, Sevier, and Washington counties; Arizona and Nevada; 36 (xiii).

Cryptantha stricta (Osterh.) Payson Erect Cryptanth. [*Oreocarya stricta* Osterh.; *O. williamsii* A. Nels., type from Flaming Gorge, Daggett County]. Strict perennial, 10–39 cm tall; stems 1 to several, 4–20 cm long, strigose and conspicuously setose-hispid; leaves mostly basal, reduced upward, oblanceolate, acute, 2–7 cm long, 4–9 cm wide, retrorsely strigose and spreading setose-hispid, pustulate; inflorescence narrow, interrupted below the terminal cluster, 0.5–2 dm long, setose-hispid; foliar bracts conspicuous, especially near the base; calyx segments lanceolate, 4–6 mm long in anthesis, in fruit becoming 7–9 mm long, setose-hispid; corolla white, the tube 3–4 mm long, with conspicuous crests at base of tube, the fornices yellow, rounded, papillose, the limb 7–10 mm wide; nutlets lanceolate to elliptic, 3–3.5 mm long, 1.5–2 mm wide, usually all 4 maturing, the margins in contact, knifelike, with definite transverse ridges and also somewhat tuberculate or nearly smooth dorsally, ventrally smooth or nearly so; scar open, very narrowly

linear, an elevated margin lacking; style exceeding mature fruit 1–1.5 mm. Sagebrush, pinyon-juniper, mountain brush, aspen, and spruce-fir communities at 1780 to 3100 m in Daggett, Summit, and Uintah counties; Wyoming and Colorado; 25 (iii).

Cryptantha tenuis (Eastw.) Payson Slender Cryptanth. [*Oreocarya tenuis* Eastw., type from Courthouse Wash, Grand County]. Caespitose perennials, 13–25 cm tall; stems slender, 1 to many, 8–12 cm long, strigose and weakly spreading setose; leaves linear-spatulate, mostly basal, obtuse, 2–5 cm long, 3–6 mm wide, dorsally strigose, weakly spreading setose, and conspicuously pustulate, ventrally uniformly strigose and without pustules; inflorescence narrow, interrupted, 6–14 cm long, weakly setose; foliar bracts inconspicuous; calyx segments linear-lanceolate, in anthesis 4.5–6 mm long, in fruit becoming 7–9 mm long, white-setose; corolla white, the tube 5.5–7 mm long, the crests at base of tube lacking or sometimes evident, the fornices yellow, broad, emarginate, papillose ca 0.5 mm long, the limb campanulate, 5–8 mm wide; nutlets lanceolate, 3–4 mm long, 1.8–2 mm wide, all 4 nutlets usually maturing, the margin acute to somewhat obtuse, nearly in contact, the dorsal surface carinate, sharply and deeply rugose, the ventral rugose; scar open, constricted above the base, and with an elevated margin; style exceeding mature fruit 3–4 mm. Blackbrush, salt desert shrub, mixed warm desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1300 to 2280 m in Emery, Garfield, Grand, San Juan, and Wayne counties; endemic; 76 (xi).

Cryptantha torreyana (Gray) Greene Torrey Cryptanth. [*Krynitzkia torreyana* Gray]. Stems erect, 1–4 dm high, solitary or several with erect or more often spreading branches, finely strigose and sparsely hirsutulous; leaves oblanceolate to linear, strict or ascending, 2–5 (7) cm long, 3–6 (8) mm wide, obtuse or rounded, hispid, inconspicuously if at all pustulate; spikes commonly geminate, bractless, 4–8 (15) cm long, more or less projected from the leafy mass of the plant, very elongate and loosely flowered or congested and glomerate; corolla inconspicuous, ca 1 mm broad; fruiting calyx ovoid or oblong-ovoid, 2–7 mm long, ascending asymmetrical, base rounded or broadly conic; pedicels ca 0.5 mm long; mature calyx lobes lanceolate to linear-lanceolate, connivent above with tips usually spreading, midrib slightly thickened and hispid-hirsute, margins hispid-strigose; nutlets 4, occasionally 1 or more aborted, usually broadly ovate, 1.5–2.2 (2.5) mm long, 0.8–1.3 mm broad, smooth and polished, usually mottled, rarely finely granulate, back low and convex, the sides rounded or obtuse; groove broadly forked below and closed throughout; gynobase ca 1/2 height of nutlets, ca 1 mm long; style reaching to 2/3 height of nutlets or rarely even to their tips. Sagebrush, mountain brush, oak, maple, aspen, and spruce-fir communities at 1900 to 2930 m in Beaver, Cache, Carbon, Davis, Duchesne, Juab, Millard, Morgan, Rich, Salt Lake, Sanpete, Sevier, Utah, Wasatch, Washington, and Weber counties; Wyoming to California, north to Alaska; 35 (ii).

Cryptantha utahensis (Gray) Greene Utah Cryptanth. [*Krynitzkia utahensis* Gray, type from near St. George; *Eritrichium holopterum* var. *submolle* Gray, type from near St. George]. Plant usually with a main erect stem with a few scattered ascending or erect branches, 1–3 dm high, strigose or appressed short-hispid; leaves not nu-

merous, strongly reduced above, linear to oblanceolate-linear, 1–5 (7) cm long, 1–4 mm wide, rounded at apex, commonly pustulate and short-hirsute especially beneath; spikes usually geminate, commonly 1–2.5 (5) cm long, dense, bractless; corolla rather conspicuous, 2–3 mm broad; fruiting calyx ovoid or ovoid-oblong, 2–3 (4) mm long, subsessile, spreading or somewhat recurved, deciduous, usually densely appressed hirsute and silky; mature calyx lobes lanceolate, connivent, midrib thick and usually brownish, and frequently bearing spreading or recurved hairs; corolla rotate, (2.5) 3–5 mm wide, white, with yellow or yellowish fornicies more or less well developed; ovules 4, nutlets 1 or rarely 2, next to the abaxial calyx lobe, 1.7–2.5 mm long, 1–1.5 mm broad, pale, broadly lanceolate, granulate, muciculate-papillate or rarely spinulose, back low-convex or flat, the margins sharply angled or with a very narrow knife-like margin; groove open, narrow, opening into a small areola below; gynobase subulate, ca 2/3 height of nutlet, not markedly differentiated from style; style usually slightly shorter than the nutlet. Gravelly to sandy washes in creosote, Joshua tree, blackbrush, warm desert shrub, and pinyon-juniper communities at or below 1200 m in Kane and Washington counties; Arizona, Nevada, and southern California; 12 (v).

Cryptantha virginensis (Jones) Payson Virgin Cryptanth. [*Krynitzkia glomerata* var. *virginensis* Jones, type from La Verkin]. Biennials, 1.5–3.5 (4) dm tall; stems 1 to several, arising from a stout taproot, 0.3–0.6 dm long, setose-hirsute; leaves oblanceolate to spatulate, obtuse, 3–10 (12) cm long, 0.5–1.5 cm wide, dorsal surface sparsely setose, pustulate, also with some fine tangled hair beneath, the ventral surface subtomentose and weakly appressed setose, with only a few pustulate hairs; inflorescence a broad thyrus with the individual cymes much elongating, 0.5–3 dm long; foliar bracts conspicuous, 2–4 cm long; calyx segments linear-lanceolate, in anthesis 3–4 mm long, in fruit becoming 7–11 mm long, hirsute; corolla white, the tube 3–4 mm long, with conspicuous crests at base of tube, the fornicies yellow, emarginate, papillose, ca 1 mm long, the limb 7–9 mm broad; nutlets ovate, 3.3–4.5 mm long, 2.4–2.6 mm wide, usually only 1–2 maturing, the margins in contact, acute, the dorsal surface with a distinct ridge, tuberculate and usually rugulose, ventrally very uneven with indeterminate rugae and tubercles; scar open and triangular with an elevated margin; style exceeding mature fruit 1–1.5 mm. Creosote, Joshua tree, mixed warm desert shrub, sagebrush, and pinyon-juniper communities below 1350 m in Washington County; Arizona, Nevada, and California; 23 (v).

Cryptantha watsoni (Gray) Greene Watson Cryptanth. [*Krynitzkia watsoni* Gray, type from the Wasatch Mts.]. Slender strictly branched hispid herb 1–3 dm high; stems solitary, sparsely or loosely branched, spreading short-hispid; leaves linear to oblanceolate, 1–4 (5) cm long, 1–4 (5) mm broad, obtuse or rounded, ascending hispid and merely pustulate; spikes solitary or in pairs, 1–4 (6) cm long, bractless or rarely bracted below; corolla inconspicuous, ca 1 mm broad; fruiting calyx ovoid to oblong-ovoid, 2–3.5 (4) mm long, subsessile, rounded at base, early deciduous, oldest ones becoming distant; mature calyx lobes lanceolate, the tips usually connivent, hirsute with ascending hairs, the midrib also with a few spreading bristles and scarcely thickened; nutlets 4, ho-

momorphous or practically so, lanceolate, 1.5–2 mm long, about 0.8 mm broad, smooth, shiny or at times dulled by minute granulations, the back nearly flat, the margins definitely angled; groove closed or nearly so and forked at base; gynobase subulate, subequal to the nutlets; style equaling nutlets or a trifle surpassed by them. Sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 2200 to 2650 m in Beaver, Daggett, Duchesne, Juab, Salt Lake, Tooele, Uintah, Utah, and Wasatch counties; Washington and Montana, south to Colorado, Nevada, and California; 11 (i).

Cryptantha wetherillii (Eastw.) Payson [*Oreocarya wetherillii* Eastw., type from Courthouse Wash, Grand County; *Krynitzkia glomerata* var. *acuta* Jones, type from near Cisco, Grand County]. Biennial or short-lived perennials, 1–3.5 (4) dm tall; stems 1–6, 0.5–0.8 dm long, branched from the base with 1 stout and usually several low slender ascending stems; leaves clustered at the base, gradually reduced upward, spatulate to broadly oblanceolate, the apices obtuse to rounded, 2.5–5 cm long, 0.7–1.6 cm wide, strigose and appressed setose, the dorsal surface conspicuously pustulate, the ventral with few or no pustules; inflorescence becoming broad in age due to the elongation of the cymes, 0.6–3 dm long; calyx segments lanceolate, in anthesis 5–7 mm long, in fruit becoming 7–13 mm long, white-setose; corolla white, the tube 7–10 mm long, a crest at base of tube lacking; fornicies light yellow, emarginate, papillose, ca 1 mm long; limb 6–13 mm wide; nutlets lanceolate, or ovate-lanceolate, 3.5–4 mm long, 2–2.5 mm wide, usually all 4 maturing, the margins acute, in contact, the dorsal surface distinctly tuberculate and often rugulose as well; scar open, linear, surrounded by a slightly elevated margin; style exceeding mature fruit 3–5 mm. Mixed salt desert shrub and pinyon-juniper communities at 1400 to 2100 m in Carbon, Emery, Garfield, Grand, and Wayne counties; endemic; 38 (vi).

Cynoglossum L.

Biennial or perennial or rarely annuals; leaves alternate, the basal ones long petioled; racemes elongating, usually without bracts, or rarely bracted at base; calyx cut to beyond the middle, somewhat accrescent, the lobes often spreading or reflexed in fruit; corolla cylindrical or funnelliform, the tube short, the lobes broad, spreading, imbricate, throat with trapeziform oblong or subulate appendages; stamens included; filaments short; anthers oblong or elliptic; ovules 4; nutlets 4, equally divergent, depressed ovoid or orbicular, glochidiate, back flat or convex, frequently with an elevated margin, attached by a small or large medial to apical scar to a convex or pyramidal gynobase and frequently with a free subulate prolongation decurrent on the short entire style.

Cynoglossum officinale L. Houndstongue. Biennial, villous-tomentose throughout; stems stout, erect, leafy to the top, 4–5 dm high; lower leaves oblong to oblong-lanceolate, slender petiolate, 15–30 cm long, 2–7 cm wide; upper leaves lanceolate, acute or acuminate, sessile or the upper mostly clasping; racemes several to many simple or branched, sparingly bracted or bractless; much elongating in fruit; pedicels 5–12 mm long; calyx segments ovate-lanceolate, obtuse to acutish, 5–7 mm long in fruit, corolla reddish purple, the broad tube 3–5 mm long, the limb 6–8 mm broad; nutlets ascending on the pyramidal gynobases, ca 6 mm high, flattish on the upper

surface and margined, splitting away from the gynobase at maturity but hanging attached to the subulate style; $2n = 24, 48$. Sagebrush, pinyon-juniper, cottonwood, mountain brush, aspen, ponderosa pine, and spruce-fir communities at 1480 to 3000 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Emery, Juab, Millard, Morgan, Rich, Salt Lake, Sanpete, Tooele, Utah, Wasatch, Washington, and Weber counties; native to Europe and Asia but widely distributed over North America; 136 (viii).

Echium L.

Biennial or possibly perennial, hispid, herbaceous plants; leaves alternate, entire; flowers blue to violet purple, in leafy bracted scorpioid, spikelike racemes; calyx 5-parted; corolla tubular-funnelform, irregular, usually 5-lobed, the throat not appendaged; stamens unequal, at least the longer ones exerted on long filaments; ovary 4-lobed, these separating in fruit; style 2-cleft at apex; nutlets erect, rugose, attached by their bases to a flat gynobase, the scar flat or somewhat concave, not leaving a pit.

Echium vulgare L. Stems 3–9 dm tall, erect, solitary or occasionally several, finely hispid-villous as well as shaggy coarsely hirsute; leaves appressed-hispid and the margin and midrib somewhat hirsute, with a strong midrib but very obscure or absent veins; lower leaves 8–16 cm long, oblanceolate, broadly stalked, forming a rosette that withers at anthesis; cauline leaves reduced upward, the middle ones linear-lanceolate, 3–9 cm long, contracted to a rounded sessile base; racemes short, lateral, disposed in a long narrow thyrse or open panicle; corolla bright blue, rarely rose or white, pubescent and sparsely setose, rather firm in texture, 10–15 mm long, the tube subequal to the calyx; stamens very unequal, the 2 pair slightly unequal but both surpassing the lower corolla lobe, the odd stamen included; nutlets ca 2 mm long, erect, rugose; $2n = 16, 32$. Roadsides, fields, and waste places in mountain brush communities at 1820 to 1960 m in Echo Canyon, Summit County; widely distributed in North America; adventive from Europe; 3 (0).

Eritrichium Schrader

Low depressed cushionlike perennials, with the short stems densely clothed with small often imbricate leaves; flowers few in a racemelike cluster terminating the slender flowering stem; calyx lobes ascending, linear; corolla blue, funnelform, with a short tube; nutlets obliquely attached to the conical gynobase, smooth, the apex obliquely truncate, with a distinct, entire or toothed margin.

Eritrichium nanum (Vill.) Schrader Low Blue-eyes. [*Myosotis nana* Vill.]. Plants villous often silvery, forming a tuft ca 2–4 cm tall (not counting the flowering branches); leaves closely overlapping, 5–10 mm long, narrowly ovate to oblong or oblanceolate, 1.5–2 mm broad, acute or obtuse, pilose, with long white hairs, especially on the margins and tips; flower cluster compact when sessile among the leaves, or sometimes racemelike when borne on a leafy flowering branch up to 7 cm long; calyx lobes linear, 1.5–3 mm long; corolla tube equaling the calyx lobes, the limb variable in size (1) 4–5 (7) mm broad, bright blue (rarely white), the crests in the throat puberulent; nutlets smooth, with an entire margin to the truncated oblique portion, rarely with a few obscured teeth.

Alpine tundra and krumholtz communities at 3330 to 4350 m in Box Elder, Daggett, Duchesne, Summit, and Uintah counties; Alps of Europe, Asia, Alaska, Yukon, and in the Rocky Mountains from Montana to New Mexico and west to Oregon; 16 (i). Our plants belong to var. *elongatum* (Rydb.) Cronq. [*E. aretioides* var. *elongatum* Rydb.; *E. elongatum* var. *paysonii* Johnst., type from the Uinta Mts., Summit County].

Hackelia Opiz in Bercht.

Coarse biennial or perennial (rarely annual) herbs; leaves alternate, broad and veiny; flowers in naked or inconspicuous bracted racemes paniculately disposed; pedicels slender, recurving in fruit; calyx cut to the base into spreading ovate to oblong or lanceolate lobes; corolla white or blue, with a short or elongate tube, lobes rounded, imbricate; throat with trapeziform intruded appendages; stamens included, affixed at middle of tube; filaments slender, short; anthers oblong to elliptic; style slender, scarcely if at all surpassing the nutlets; stigma capitate; ovules 4; nutlets 4, erect, ovate, affixed ventrally to the pyramidal gynobase by a broad medial or submedial areola, the margin with subulate glochidiate appendages, these frequently confluent at the base, the back smooth or with glochidiate appendages.

1. Corolla white marked with blue *H. patens*
- Corolla blue, (rarely pinkish) with a white or yellow
fornices 2
- 2(1). Cymes 1–3, mostly terminal; plants mostly alpine and
subalpine, small, to 1.5 dm tall, of Juab County
..... *H. ibapensis*
- Cymes more abundant; plants of lower elevations and
over 3 dm tall 3
- 3(2). Stems several to many from a caudex; plants perennial;
surface of the nutlet with (1) 3–8 intramarginal prickles
..... *H. micrantha*
- Stems 1–3 (5) from the base; plants biennial or peren-
nial; surface of the nutlet lacking intramarginal prickles
or rarely with 1 or 2 *H. floribunda*

Hackelia floribunda (Lehm.) Johnston Showy Stickseed. [*Echinosperrnum floribundum* Lehm.]. Stem erect, stout, from a short-lived perennial root, 5–12 dm high, the rough pubescence deflexed, mixed with some spreading hairs; leaves oblanceolate to linear to oblong, appressed hirsutulous, the basal leaves petiolate, with spreading hairs, the stem leaves sessile above; racemes of the inflorescence many, rather strict, densely flowered; pedicels short, 5–7 mm long in fruit; corolla blue, 4–7 mm broad, appendages small, obscurely papillate, not closing the throat; nutlets 3–5 mm long, the face with a medial ridge, muriculate, hirsutulous, without short glochidiate prickles, the marginal spines much flattened at base, distinct or somewhat confluent, 4 to 6 on each side, mostly exceeding in width the face of the nutlet. Sagebrush, willow, mountain brush, aspen, lodgepole pine, Douglas fir, and spruce-fir communities at 1833 to 3470 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, Rich, Salt Lake, Sanpete, Sevier, Summitt, Tooele, Uintah, Utah, Wasatch and Weber counties; British Columbia to Ontario, south to North Dakota, New Mexico, Arizona, and California; 86 (iii).

Hackelia ibapensis L. & J. Shultz Deep Creek Stickseed. Stems slender, clothed with the old leaf bases, up to 1.5 dm tall, strigose; basal leaves well developed, lance-elliptic, 1.5–8 (12) cm long, 6–11 (17) mm broad, the cauline reduced and narrowly lanceolate, thinly to densely strigose on both surfaces; inflorescence of a solitary terminal cyme, rarely with 2, laxly flowered; corolla blue; nutlets 2–3 mm long, the marginal prickles connate at base forming a distinct rim; intramarginal prickles several. Exposed granite outcrops in mountain brush and Douglas fir communities at 2500 m in Juab (type from Deep Creek Range) County; endemic; 3 (0).

Hackelia micrantha (Eastw.) J. Gentry Small-flower Stickseed. [*Lappula micrantha* Eastw.; *L. jessica* McGregor]. Stems erect or ascending from a stout root, sparsely to rather densely villous-hirsute; basal leaves 8–15 cm long, the blades oblanceolate, 15–20 mm wide, narrowed to a winged petiole of about equal length; upper stem leaves sessile, lanceolate, acute, the reduced ones subtending the lower racemes often ovate-lanceolate; racemes several in an open panicle; pedicels slender, at length recurved, reflexed, 5–10 mm long; calyx lobes oblong to oblong-lanceolate, 2–3 mm long; corolla small, pale blue, 3.5–5 mm broad, the tube often whitish, 1.5–2 mm long, the lobes oblong-ovate, the crests yellowish, rounded, puberulent; nutlets 4–6 mm long, with ca 10 marginal prickles broadly dilated at base, distinct, often with a shorter one in between; dorsal face broadly ovate, usually flattened with a distinct median ridge, puberulent and in age more or less muriculate, usually with 1 or more short barbed prickles near the center; n = 12. Sagebrush, juniper, aspen, Douglas fir, and spruce-fir communities at 2540 to 3320 m in Box Elder, Cache, Carbon, Davis, Duchesne, Emery, Garfield, Juab, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties; British Columbia and Alberta, south to California, Nevada, and Colorado; 48 (ii). Immature specimens without fruit are difficult to distinguish from *H. floribunda*. However, in the field it is easily separated on the basis of perennial habit and numerous stems.

Hackelia patens (Nutt.) Johnston Pale Stickseed. [*Rochelia patens* Nutt.]. Stems 2 or 3, short, deflexed hirsute, with some hairs spreading, arising from a woody caudex covered with old leaf bases; basal leaves many, oblanceolate to lanceolate, the cauline leaves reduced upward, the pubescence rather dense, short, appressed; branches of the inflorescence 5- to 10-flowered; pedicels short, elongating somewhat in fruit; corolla whitish or light blue, usually quite large, the appendages somewhat broader than long, obscurely papillose; nutlets small, with marginal glochidiate prickles 3–5 on each side, a few short prickles interspersed, the longest prickles surpassing the body of the nutlet; face of nutlet with a faint median ridge, muricate and occasionally bearing 1 or 2 prickles; n = 12.

- 1. Hairs of the leaves and lower stem hirsute-spreading, with pustulate bases *H. patens* var. *harrisonii*
- Hairs of the leaves and lower stem strigose, and without pustulate bases *H. patens* var. *patens*

Var. *harrisonii* J. Gentry Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, Douglas fir, and aspen communities at 1780 to 2800 m in Beaver, Utah, and Washington (type from Pine Valley) counties; endemic; 8

(ii). This variety intergrades with var. *patens* except in Washington County where it alone occurs.

Var. *patens* Sagebrush, pinyon-juniper, mountain brush, birch, aspen, and spruce-fir communities at 1500 to 3050 m in Beaver, Box Elder, Cache, Davis, Duchesne, Garfield, Iron, Kane, Juab, Millard, Morgan, Rich, Salt Lake, Sanpete, Summit, Tooele, Utah, Wasatch, and Weber counties; Montana to Wyoming, Idaho, and Nevada; 120 (iii).

Heliotropium L.

Annual or perennial, herbaceous or more or less shrubby plants; leaves small to large, sessile or petiolate; cymes unilateral and usually distinctly scorpioid, with or without bracts; corolla white, yellow or purple, variable in form, throat frequently pubescent inside; anthers included; filaments extremely short; style present or absent; stigma usually conic, mostly sterile, receptive only in a band around the base; fruit dry, at maturity breaking up into 4 single-seeded or 2 2-seeded nutlets; seeds with a thin endosperm.

- 1. Plant not succulent, hairy, never glaucous; fruit 2-lobed, each lobe splitting into 2 nutlets; stigma capped by a tuft of bristles; annuals *H. convolvulaceum*
- Plants very succulent, glabrous, usually glaucous; fruit not lobed; stigma discoid, naked; perennials *H. curassavicum*

Heliotropium convolvulaceum (Nutt.) Gray Showy Heliotrope. [*Euploca convolvulacea* Nutt.]. Annual, 1–4 dm tall; stems at first simple, but later developing elongate branches, that ascend or sprawl, strigose and cinereous; leaves numerous, strigose, pustulate, lanceolate to ovate, 10–14 mm long, 4–15 mm broad, acute apically, basally acute to rounded; petioles slender, 3–8 mm long, the midrib evident; flowers extra axillary, appearing to be borne along the elongating leafy branches; bracts foliose, numerous; calyx 5-lobed, at anthesis 4–6 mm long, becoming 6–9 mm long at maturity; lobes linear-lanceolate or linear, unequal; pedicels at anthesis 1–3 mm long, in fruit 3–5 mm long; corolla white with a yellow throat, fragrant, opening during the morning and evening, the limb widely funnellform, expanded, 15–22 mm broad, not lobed pentagonal, plicate in the bud with the sinus inflexed; tubular portion of corolla 8–10 mm long, strigose on the outside; anthers lanceolate, basifixed, 2–2.5 mm long; filaments ca 1 mm long; ovary globose, glabrous; style slender, 3–4 mm long; stigmatic head with a prominent stigmatic band 0.5 mm in diameter at the base, this surmounted by a truncate appendage bearing a cluster of hairs; fruit laterally compressed, hairy, 2-lobed, 3–4 mm long, 2–2.5 mm thick, 2–2.5 mm high; at maturity first dividing transversely and the lobes separating, forming halves, each with a broad flat commissural face; each half next dividing on the narrow longitudinal axis to form the asymmetrical single seeded nutlets. Sandy dunes in creosote, blackbrush, mesquite, mixed desert shrub, salt-bush, rabbitbrush, and sagebrush communities at 950 to 1690 m in Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Washington, and Wayne counties; Nebraska and Wyoming, south to northern Chihuahua and Texas, west to Arizona and Nevada; 43 (v).

Heliotropium curassavicum L. Salt Heliotrope. Annual or short-lived perennial, fleshy, glaucous and glabrous

throughout; stems diffusely branched, 1-6 dm long; leaves succulent, varying from linear to obovate, but commonly spatulate, 1-4 cm long, obtuse, narrowed to a thick petiole; spike mostly in pairs, sometimes 3-5, often 6-12 cm long; calyx-segments ovate-lanceolate, acute, 2-3 mm long; corolla 3-5 mm long, white with a violet purple eye on the throat; stigma glabrous; stamens included, the anthers subsessile; fruit subglobose, at length separating into 4 nutlets; $2n = 26$.

- 1. Corolla limb 5-16 mm wide, white or at most only purplish tinged or yellow at the throat; leaves 10-18 mm broad, spatulate to obovate *H. curassavicum* var. *obovatum*
- Corolla limb 3-5 (7) mm wide, with a conspicuous purple eye and throat; leaves usually less than 9 mm wide, oblanceolate to slightly spatulate *H. curassavicum* var. *oculatum*

Var. obovatum DC. Saline seeps and roadsides in saltgrass, greasewood, saltbush, and other mixed salt desert shrub communities at 1125 to 1710 m in Box Elder, Cache, Garfield, Iron, Juab, Kane, Millard, Salt Lake, Uintah, and Utah counties; Washington, Oregon, and Nevada, east to Wyoming, Colorado, and New Mexico; 25 (ii).

Var. oculatum (Heller) Johnston [*Heliotropium oculatum* Heller]. Saline seeps, sidewalks, ditch banks in creosote, mesquite, saltbush, saltgrass, and other warm salt desert shrub communities below 1200 m in Kane? and Washington counties; Nevada, south to Baja California, and east to New Mexico and Texas; 18 (vi).

Lappula Gilib.

Annual herbs; leaves alternate, usually narrow, firm and veinless; flowers small, blue or white, on usually erect pedicels or rarely subsessile, in bracted racemes; calyx 5-parted into spreading lanceolate lobes; corolla with a rather short tube; lobes rounded, ascending imbricate; throat closed by intruded appendages; stamens affixed in the tube, included; filaments slender, short; anthers oblong, obtuse; style short, surmounting the subulate-columnar gynobase, commonly surpassing the mature nutlets; stigma subcapitate; ovules 4; nutlets 4, erect, smooth or verrucose, narrowly but firmly attached to the gynobase along the length of the well developed ventral keel, back angulate or margined by a single or double row of prickles which by confluence frequently form a winglike or cupulate border.

- 1. Nutlets with marginal prickles in at least 2 rows *L. squarrosa*
- Nutlets with the marginal prickles definitely in a single row *L. occidentalis*

Lappula occidentalis (Wats.) Greene Western Stickseed. [*Echinosperrum redowskii* var. *occidentalis* Wats.; *L. texana* (Scheele) Britt.; *L. collina* Greene, type from Kingston; *E. collinum* (Greene) K. Schum.]. Annual, the stems simple or few branched at base and erect or sometimes diffuse, 15-35 cm tall, herbage more or less canescent with a strigose and villous pubescence; leaves narrowly linear to narrowly lanceolate or the lower narrowly oblanceolate, 1-3 cm long; flowers in the axils of the small foliaceous bracts forming open and at length elongated terminal racemes; pedicels 1-2 mm long; calyx-segments narrowly lanceolate, erect, or but little spreading in fruit, a little shorter than the corolla tube, corolla blue, 3-4 mm

long, conspicuously crested on the throat; nutlets 2-2.5 mm long, bordered by a single row of barbed prickles, the prickles distinct at base or joined to form a cupulate margin, the dorsal area of nutlets distinctly tuberculate. Mixed warm desert shrub, sagebrush, pinyon-juniper, rabbitbrush, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 830 to 3000 m in all Utah counties, except Davis and Morgan; throughout western North America; 240 (xiv). Our plants belong to var. *cupulata* (Gray) Higgins [*Echinosperrum redowskii* var. *cupulatum* Gray].

Lappula squarrosa (Retz.) Dumort. European Stickseed. [*Myosotis squarrosa* Retz.; *L. echinata* Gilib.]. Annual, with erect, simple to freely branched stems 1.5-8 dm tall, villous-hirsute with upwardly more or less appressed hairs; lower leaves linear to linear-lanceolate or oblong, acute to obtuse, narrowed to a sessile base, closely ascending, 2-5 cm long, roughly pubescent like the stem, passing above into linear or lanceolate bracts of the usually numerous racemes; pedicels 1-3 mm long; calyx-lobes broadly linear, appressed bristly, in fruit spreading, 2.5-3 mm long; corolla bright blue, the limb 2-4 mm broad, the tube surpassing the calyx; nutlets 3-4 mm long, sharply verrucose or muricate dorsally, with 2 marginal rows of long slender bristles not confluent at the base, these sometimes irregularly distributed over the back; $2n = 48$. Roadsides and disturbed sites in sagebrush, pinyon-juniper, mountain brush, aspen, sedge meadows, lodgepole pine, Douglas fir, and spruce-fir communities at 2050 to 2875 m in Cache, Daggett, Emery, Garfield, Grand, Morgan, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, and Utah counties; adventive from Eurasia, now widely distributed in Canada and northern parts of the U. S., especially the Rocky Mountains; 19 (iii).

Lithosperrum L.

Annual or perennial, herbaceous or fruticose plants with alternate leaves; flowers white, yellow, or violet, in bracted racemes; calyx usually undivided; corolla tubular or salverform, the tube cylindrical, lobes spreading and imbricate, the throat with intruded appendages or with pubescent or glandular areas; stamens inserted in the tube, included; filaments short, anthers oblong, usually with apiculate connectives; style filiform; stigmas geminate; ovules 4; nutlets 4 or rarely fewer, erect, ovoid or angular, smooth or verrucose, inserted by a broad horizontal or slightly oblique basal areola; gynobase flat or very broadly pyramidal.

- 1. Flowers white; nutlets densely tuberculate and dull; plants annual *L. arcense*
- Flowers greenish to bright yellow; nutlets smooth; plants perennial 2
- 2(1). Corolla tube (in chasmogamous flowers) 15-35 mm long, the lobes erose *L. incisum*
- Corolla tube less than 13 mm long, the lobes entire or nearly so 3
- 3(2). Corolla greenish yellow to light yellow; flowers homostylic *L. ruderale*
- Corolla bright yellow or orange yellow; flowers heterostylic *L. multiflorum*

Lithosperrum arcense L. Gromwell. Annual; stems erect, 2-7 dm tall, 1 to several, simple or sparsely

branched above, hoary strigose; leaves 2–5 cm long, 2–8 mm broad, closely appressed-hispid, firm, veinless, with prominent midrib, pale beneath; basal leaves rosulate, oblanceolate, or spatulate; cauline leaves acute and lanceolate or linear; racemes bracteate, becoming loosely flowered; calyx parted into linear-subulate lobes, hispid, mature calyx with the erect or ascending lobes becoming 8–13 mm long, the very short tube oblique, pale and chartaceous; pedicels short and stout, ca 1 mm long; corolla white or yellowish or even purplish, 5–7 mm long, tubular-funnelform, the tube glabrous within and scarcely if at all surpassing the calyx; corolla throat gradually expanded, without protuberances, merely pubescent; corolla lobes ascending ovate, obtuse; nutlets brown, dull, roughened, tuberculate, or rough-wrinkled or pitted, ca 3 mm long, ovate; $2n = 14, 28, 42$. Wet meadows, cottonwood, grassland, pinyon-juniper, mountain brush, aspen, and spruce-fir communities at 1420 to 3250 m in Cache, Davis, Salt Lake, Tooele, and Weber counties; native of Eurasia, now established as a weed over most of the U. S.; 9 (i).

***Lithospermum incisum* Lehm.** Showy Stoneseed. Perennial plants from a thick woody root; stems 1–5 dm tall, usually several, erect or ascending, strigose to somewhat hirsute; leaves 10–50 mm long, linear to linear-oblong, strigose; inflorescence of terminal leafy racemes; calyx 6–10 mm long; corolla 10–30 mm long, yellow, the tube seldom over 2.5 mm wide when pressed, salverform, the limb 9–18 mm wide, the lobes fimbriate to toothed; nutlets 3–4 mm long, white and shining; cleistogamous flowers present, in fruit usually with recurved pedicels; flowers monomorphic. Sagebrush, pinyon-juniper, ephedra, mixed desert shrub, bitterbrush, mountain brush, ponderosa pine, and mountain mahogany communities at 1350 to 2870 m in all except Morgan, Piute, Rich, Summit, Tooele, and Wasatch counties; central U. S., Canada, and Mexico westward to British Columbia, Nevada, Arizona, New Mexico, and Texas; 136 (vi).

***Lithospermum multiflorum* Torr.** Pretty Stoneseed. Perennial plants from a thick woody root containing a purple dye; stem 3–6 dm tall, more or less tufted, often virgately branched above, strigose-hispid; leaves 2–6 cm long, linear or linear-lanceolate, appressed-strigose above, hirsute beneath, becoming smaller and bractlike near the flowers, scarcely if at all longer than the calyx lobes and simulating them; flowers racemose, short-pedicled, often on several ascending corymblike branches; calyx lobes 4–6 mm long; corolla yellow or orange yellow, tubular funnelform, the tube 8–13 mm long, the lobes short, ca 2 mm long, rounded, not fimbriate; nutlets ca 3 mm long, white and shining; cleistogamous flowers lacking; flowers heterostyled and dimorphic. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities at 1850 to 2930 m in Beaver, Emery, Garfield, Iron, Kane, Piute, San Juan, Sevier, and Wayne counties; Colorado, south to Texas, Arizona, and northern Mexico; 29 (ii).

***Lithospermum ruderale* Dougl. ex Lehm.** Contra Stoneseed. Stems usually several from a large root, erect or decumbent, rather stout, 2–5 dm high, simple or branched, hirsute and somewhat hispid to densely villous; leaves numerous, usually crowded above, mostly ascending or some reflexed, linear-lanceolate to lanceolate, 3–8 cm long, 2–12 mm wide, softly to rather

harshly pubescent on both sides, scabrous on the margins, flowers in the axils of the upper leaves; pedicels stout, 1–3 mm long; calyx lobes in fruit subulate, 7–10 mm long; corolla pale, often greenish-yellow, 9–12 mm long, the tube broad, scarcely dilated at the throat, the lobes ca 3 mm long; nutlets broadly ovoid, 5–6 mm long, usually abruptly attenuate at the apex into a stout beak, whitish, smooth and highly polished. Sagebrush, pinyon-juniper, mountain brush, aspen, and Douglas fir communities at 1720 to 2800 m in all except Carbon, Garfield, Kane, Morgan, Piute, and Wayne counties; British Columbia and Alberta to California, Nevada, and Colorado; 80 (iv).

***Mertensia* Roth**

Glabrous or pubescent caulescent perennial herbs with fleshy, fusiform, rhizomelike roots; leaves entire, linear to cordate, sessile or petiolate, alternate; stems 1 to many from each root, decumbent to erect, usually branched below the inflorescence, this a lax or congested ebracteate unilateral modified scorpioid cyme, or with the lowest flowers often single and subtended by leaves, often becoming paniced in age; calyx 5-parted, occasionally campanulate, the expanded limb shorter or longer than the tube, with or without fornicies in the throat, blue, occasionally white or pink; filaments attached below the throat, the anthers exerted or included; style shorter or longer than the corolla, in some di- or trimorphic; stigma entire or slightly lobed; ovary 2-loculed, each locule 2-lobed; nutlets 4, attached laterally to the gynobase, usually rugose or pectinately rugose, coriaceous or smooth and shining, utriclike.

1. Plants relatively tall and robust (4–15 dm tall when fully developed) with evident lateral veins in the cauline leaves; flowering in late spring and summer 2
- Plants smaller, seldom as much as 4 dm tall, usually without evident lateral veins in the cauline leaves, blooming as soon as snow and temperature permits 4
- 2(1). Leaves strigose at least on the upper surface; calyx lobes acute, often hairy on the back and ciliate-margined *M. franciscana*
- Leaves glabrous on both surfaces, or pustulate on the upper surface, but lacking hairs; calyx lobes ciliate but usually not hairy on the back 3
- 3(2). Calyx mostly 1.5–3(4) mm long at anthesis, cleft to the base or nearly so; limb of the corolla shorter than the tube, or subequal; leaves usually not acuminate. *M. ciliata*
- Calyx mostly longer than 5 mm and not cleft to the base; limb of the corolla longer than the tube; leaves usually acuminate *M. arizonica*
- 4(1). Style short, 1–2.5 mm long; anthers nearly sessile, attached in the corolla tube, not projecting beyond the throat *M. brevistyla*
- Style longer, 4 mm long or more; anthers with evident filaments, attached near the throat, the anther projecting beyond the throat 5
- 5(4). Corolla tube glabrous within, and usually much longer than the limb *M. oblongifolia*
- Corolla tube with a ring of hairs within, the tube shorter than to slightly longer than the limb 6
- 6(5). Upper surface of the leaves with loosely appressed hairs directed towards the margins of the leaves; stems 1–3 (5); plants of middle to lower elevations *M. fusiformis*

- Upper surface of the leaves glabrous or with strigose forward pointing hairs; stems few to many; plants of middle and upper elevations *M. lanceolata*

***Mertensia arizonica* Greene Tall Bluebell.** [*M. leonardii* Rydb., type from Mill Creek Canyon, Salt Lake County; *M. arizonica* var. *leonardii* (Rydb.) Johnston; *M. sampsonii* Tidestr., type from east of Ephraim; *M. toyabensis* var. *subnuda* Macbr.; *M. arizonica* var. *subnuda* (Macbr.) L. O. Williams]. Plants erect or ascending, 3–8 dm tall or more; stems 1 to several from each root stock; basal leaves narrowly to broadly ovate or oblong-lanceolate, 7.5–15 cm long, 2–6 cm broad, slightly decurrent on the petiole, this as long as the blade, glabrous but slightly papillate, the margin ciliate; lower cauline leaves spatulate to elliptical, usually petiolate, the petiole winged; upper cauline leaves usually sessile, elliptical to narrowly ovate, acute, 3–12 cm long, 1–5 cm broad, the base attenuate, acute apically; inflorescence of axillary peduncles with branches elongating in age; calyx 4–8 mm long, campanulate, glabrous on the back, hairy within, the lobes 1/2 or less the entire length of the calyx or cut nearly to the base, acute or obtuse, ciliate; pedicels 2–30 mm long, glabrous papillose or sometimes the papillae developing short hairs; corolla tube 6–9 mm long, with a definite ring of hairs at the base within; corolla limb 7–11 mm long, always longer than tube, moderately expanded; anthers 2.5–3.5 mm long, as long as or shorter and narrower than the filaments, these 3–4 mm long; fornicis conspicuous, pubescent; style 10–15 mm long, usually shorter than the corolla; nutlets rugose, shorter than the calyx. Usually in moist canyons, stream-sides, or moist meadows in pinyon-juniper, mountain brush, ponderosa pine, aspen, spruce-fir communities at 1920 to 3400 m in all except Daggett, Rich, Uintah, and Wayne counties; Wyoming, Colorado, and Utah; 136 (x).

***Mertensia brevistyla* Wats. Wasatch Bluebell.** Plants with erect or ascending stems, 1–4 dm tall; 1 to many from each fusiform rootstock, more or less pubescent; basal leaves broadly lanceolate to oblong, acute or obtuse, strigillose above, glabrous below, 5–13 cm long, 2–4 cm broad; petioles longer than the blade; cauline leaves obovate-oblong to narrowly elliptic, obtuse to acute, densely strigillose above, glabrous below, 2–6 cm long 0.5–3 cm broad; inflorescence congested at first, becoming paniculate in age; pedicels strigose, 1–14 mm long; calyx 2–5 mm long divided almost to the base, strigose, the lobes narrowly triangular to linear, acute, 1.5–4 mm long, 0.5–1 mm broad at the base; corolla tube 2–4 mm long, slightly shorter to a little longer than the calyx lobes, with or without a ring of scattered hair; corolla limb rotate, 4–6 mm long; anthers 1–1.3 mm long, longer than the filaments, inserted on the tube and not exceeding the throat; fornicis more or less prominent; style shorter than the calyx lobes; nutlets rugose, 2–3.5 mm long. Sagebrush, mountain brush, aspen, and spruce-fir communities at 2000 to 3320 m in Box Elder, Cache, Davis, Duchesne, Juab, Salt Lake, San Juan (?), Sanpete, Summit (? type from the Wasatch Mts.), Tooele, Utah, Wasatch, and Weber counties; Wyoming and Colorado to Idaho and Nevada; 95 (i).

***Mertensia ciliata* (James) G. Don Mountain Bluebell.** [*Pulmonaria ciliata* James]. Plants erect or ascending, 1–12 dm tall, usually with many stems from each rootstock; basal leaves variable, oblong to ovate, or lanceolate, subcordate, 4–15 cm long, 3–10 cm broad, ciliate

on the margins, often papillate on the upper surface; petioles longer or shorter than the blades; cauline leaves lanceolate to ovate, acute, acuminate or obtuse at apex, attenuate to subcordate at the base, the lowermost short-petiolate, the uppermost sessile, ciliate on the margins, often papillate on the upper surface, often quite glaucous, thin in texture; pedicels 1–10 mm long, glabrous, papillose or rarely with a few hairs; inflorescence from the axils of leaves, the peduncles elongated in mature or well developed plants, in young plants the flowers aggregated at the top of the plant, each peduncle terminated in a modified ebracteate scorpioid cyme, or occasionally subumbellate; calyx lobes 1.5–3 mm long, glabrous on the back, ciliate to papillate on the margins, more or less strigose within, obtuse or rarely somewhat acute, divided almost or quite to the base, rarely enlarged in fruit; corolla tube 6–8 mm long, glabrous or with crisped hairs within; corolla limb 4–10 mm long, sometimes longer than the tube, moderately expanded; anthers 1–2.5 mm long, as long as or shorter and narrower than the expanded part of the filament; fornicis prominent, glabrous, papillate or pubescent; style about as long as the corolla or exceeding it; nutlets rugose or mammillate. Mountain brush, aspen, Douglas fir, limber pine, ponderosa pine, lodgepole pine, spruce-fir, and alpine tundra communities at 2025 to 4050 m in Box Elder, Cache, Daggett, Davis, Duchesne, Grand, Salt Lake, San Juan, Summit, Utah, Uintah, and Wasatch counties; Montana to Colorado, New Mexico, and west to Oregon and California; 30 (v).

***Mertensia franciscana* Heller Flagstaff Bluebell.** [*M. arizonica* var. *subnuda* L. O. Williams, type from Fish Lake, Sevier County]. Plants with erect or ascending stems, 1–10 (17) dm tall, usually several from each rootstock; basal leaves oblong-elliptic to elliptic, 6–20 cm long, 5–9 cm broad, the base subcordate to obtuse, the apex acuminate, acute or obtuse, short-strigillose above, glabrous or with spreading pubescence beneath; petioles longer or shorter than the blade; cauline leaves elliptical to narrowly ovate, 4–14 cm long, 1–5 cm broad, obtuse to acuminate, the lowermost petiolate, becoming sessile toward the inflorescence, strigillose on the upper surface, glabrous to densely pubescent with spreading hairs below; flowers of the inflorescence paniculately disposed in a bracteate modified scorpioid cyme, the branches of the inflorescence elongating in age; pedicels strigose, 1–20 mm long; calyx 2.5–5 mm long, divided almost to the base, the lobes linear to lanceolate, 1–2 mm wide at the base, acute, rarely obtuse, glabrous or pubescent on the back, strongly ciliate; corolla tube 5–9 mm long, glabrous or pubescent within; corolla limb 4–6 (9) mm long, subequal to or slightly shorter or longer than the corolla tube, moderately expanded; anthers 2.5–3 mm long, longer than the filaments; filaments 2–2.5 mm long, glabrous or with spreading hairs; fornicis prominent, usually pubescent; style 9–20 mm long, usually shorter than the corolla, sometimes exceeding it; nutlets rugose and papilliferous. Moist canyons and stream-sides or wet meadows in mountain brush, ponderosa pine, aspen, Douglas fir, willow, and spruce-fir communities at 2000 to 3520 m in Grand, San Juan, Sanpete, and Sevier counties; Colorado, New Mexico, and Arizona; 13 (0).

***Mertensia fusiformis* Greene Spindle Bluebell.** Plants with erect stems or nearly so, 1–3 dm tall, glabrous or sparingly pubescent, 1 to few from each rootstock, this typically rather large and fusiform; basal leaves elliptic to

oblong-ovate, 4–12 cm long, 1.5–3 cm broad, usually densely strigose above, glabrous below, petiole 7–12 cm long, cauline leaves linear-oblong to ovate-oblong, 1.5–10 cm long, 0.4–3 cm broad, sessile or the lowermost short-petiolate, more or less densely strigose above, glabrous below, usually quite obtuse, rarely somewhat acute; inflorescence usually congested, sometimes paniculate; pedicels 1–15 mm long, densely strigose; calyx 3–6 mm long, slightly accrescent, the lobes lanceolate to lance-ovate, 2–5 mm long, acute, ciliate, usually pubescent on the backs, occasionally nearly glabrous, not divided to the base; corolla tube 4–7 mm long, with a ring of crisp hairs within at the base; corolla limb 5–7 mm long, moderately expanded, usually subequal to or shorter than the limb, but sometimes longer; anthers 1.5–2.5 mm long; filaments 1–3 mm long; fornicies present but usually not conspicuous, glabrous or nearly so; style usually surpassing the anthers, sometimes shorter; nutlets rugose, ca 3 mm long. Sagebrush, pinyon-juniper, mixed mountain brush, aspen, ponderosa pine, Douglas fir, and spruce communities at 2000 to 3500 m in Daggett, Duchesne, Grand, Iron, Kane, Salt Lake, San Juan, Sanpete, Summit, Uintah, Wasatch, and Washington counties; Colorado and Wyoming; 67 (ii).

***Mertensia lanceolata* (Pursh) DC.** Lanceleaf Bluebell. [*Pulmonaria lanceolata* Pursh]. Stems 1 to many, 1–4.5 dm tall, erect or ascending, canescent to glabrous; leaves at base 1.5–14 cm long, 0.3–3.5 cm broad, glabrous to densely canescent on both surfaces, sessile or with the petioles longer than the blade; cauline leaves only moderately reduced toward the inflorescence, mostly sessile; inflorescence congested to loosely paniculate, especially in age; bracts only near the base; calyx 2–5 (8) mm long in fruit, divided to below the middle and mostly to near the base, the segments lanceolate to ovate-triangular, glabrous to strigose; pedicels 1–15 mm long, strigose to glabrous; corolla tube 3–7 mm long, with a ring of dense hairs near the base, the limb 3–9 mm broad, moderately expanded; fornicies conspicuous, glabrous to pubescent; anthers 1–2 mm long, well exerted from the tube; style shorter or longer than the corolla tube; nutlets 2–3 mm long, rugose.

1. Leaves pubescent at least on one surface; plants usually occurring above 3000 m *M. lanceolata* var. *lanceolata*

— Leaves glabrous on both surfaces; plants mostly well below 2800 m *M. lanceolata* var. *nivalis*

Var. *lanceolata* Fell fields, talus and open rocky slopes in mountain meadows, spruce-fir, krummholz, and alpine tundra communities at 3100 to 4110 m in Cache, Carbon, Daggett, Duchesne, Garfield, Grand, Salt Lake, San Juan, and Summit counties; Saskatchewan, Montana, and North Dakota, south through Idaho, Colorado, Wyoming, and Utah into northern New Mexico; 49 (i).

Var. *nivalis* (Wats.) Higgins [*M. paniculata* var. *nivalis* Wats., type from the Uinta Mts.; *M. lanceolata* var. *viridis* A. Nels.; *M. viridis* (A. Nels.) A. Nels.; ; *M. coriacea* var. *dilatata* A. Nels.; *M. viridis* var. *dilatata* (A. Nels.) L. O. Williams; *M. canescens* Rydb., not Kaulf.; *M. cana* Rydb.; *M. viridis* var. *cana* (Rydb.) L. O. Williams; *M. amoena* A. Nels.]. In open sites in sagebrush, pinyon-juniper, mountain mahogany, mountain shrub, and ponderosa pine communities at 1950 to 2800 m in Daggett and Uintah counties; Wyoming and Colorado; 15 (0). Attempts at further segregation of plants

included within this variety are fraught with difficulties; specimens separated by use of pubescence position on the leaves apparently do not represent taxa. Hence, a conservative approach is indicated.

***Mertensia oblongifolia* (Nutt.) G. Don** Western Bluebell. [*Pulmonaria oblongifolia* Nutt.; *M. o.* var. *amoena* (A. Nels.) L. O. Williams; *M. o.* var. *nevadensis* (A. Nels.) L. O. Williams; *M. praecox* Smiley in Macbr., type from Logan]. Plants with erect or ascending stems, 1–3 dm tall, 1 to many from each elongated rootstock; blade of basal leaves 3–8 cm long, 0.5–2 cm broad, oblong or spatulate to narrowly oblong-ovate, usually obtuse, strigose above, glabrous below; petiole longer or shorter than the blade; cauline leaves sessile or the lowermost short-petiolate, linear-elliptical, 2–8 cm long, 3–15 mm broad, pubescent as on basal leaves; inflorescence congested, becoming paniced with age; pedicels strigose to essentially glabrous, 1–10 mm long; calyx 3–7 mm long, divided to within ca 1 mm of the base, the lobes linear to lanceolate-triangular, acute, ciliate, glabrous dorsally or rarely with a few hairs; corolla tube 5–12 mm long, usually quite glabrous within, occasionally with a few scattered hairs; corolla limb 4–7 mm broad; anthers 1.2–2 mm long, oblong and straight, filaments 2–4 mm long, usually longer and broader than the anthers; style exceeding the anthers; fornicies prominent, glabrous or occasionally sparsely hairy; immature nutlets 3–4 mm long, rugose; $2n = 24$. Sagebrush, pinyon-juniper, mountain brush, aspen, and Douglas fir communities at 1600 to 3300 m in Box Elder, Cache, Juab, Millard, Morgan, Rich, Salt Lake, Summit, Tooele, Utah, and Weber counties; Washington and Montana, south to Idaho, Wyoming, Nevada, and California; 78 (ii).

Myosotis L.

Annual or perennial herbs; stems slender, usually erect; leaves alternate, entire; inflorescence racemose, bracted or bractless; calyx 5-parted, cut to beyond the middle into lanceolate or triangular lobes; corolla blue, white, or rarely pink, the tube short, salverform, the throat with prominent fornicies; stamens adnate to the corolla tube, included or exerted; nutlets 4, small, ovoid, smooth and shiny, sharply margined, the attachment scar flat; gynobase short and depressed.

1. Calyx strigose; inflorescence terminal; corolla limb 5–10 mm wide, showy; plants known from Cache and Tooele counties *M. scorpioides*

— Calyx uncinately hairy; plants floriferous nearly to the base; corolla small, the limb 1–2 mm wide; plants known from Daggett County *M. micrantha*

***Myosotis micrantha* Pallas** Annuals; stems to 2 dm tall, erect, simple or branched near the base, hirsute; leaves oblanceolate to oblong or elliptic, sessile or nearly so, 0.5–2 cm long, 3–7 mm wide, acute, plants floriferous to near the base, leafy-bracteate below, racemose above and without bracts; calyx in anthesis 3–5 mm long, the tube uncinately-hispid, the lobes strigose; pedicels spreading, 1–2 mm long; corolla blue, the tube short, the limb 1–2 mm wide; nutlets brown, distinctly surpassing the style. Our one record is from a ponderosa pine forest at 2150 m in Daggett County; introduced from Eurasia, now established in Canada and the northern U. S.; 1 (0).

***Myosotis scorpioides* L.** Forget-me-not. Fibrous rooted perennial herbs; stems 2–6 dm tall, often branch-

ing at the base, commonly stoloniferous as well, strigose; leaves oblong to oblanceolate, sessile, 2–8 cm long, 7–15 (20) mm broad, obtuse; inflorescence terminal, the racemes usually in pairs, becoming loose and open; bracts lacking; calyx in anthesis 1.5–2.5 mm long, in fruit becoming 3–5 mm long, the segments triangular, short, strigose, equaling or shorter than the tube; pedicels in fruit spreading, 4–7 mm long; corolla blue with a yellow eye, the tube short, ca 2 mm long, the limb 5–8 (10) mm broad; nutlets angled, keeled on the inside, smooth; $2n = 63, 64, 66$. Moist places, our few records from along ditch banks and in sloughs at ca 1550 m in Cache and Tooele counties; introduced from Europe, now widely distributed in North America; 7 (0).

***Pectocarya* DC. ex Meissner**

Low, often spreading annual herbs, with slender stems and narrowly linear leaves, canescent with appressed hairs; flowers scattered along the stems or branches, on short pedicels, solitary in the axils; calyx 5-parted, the lobes narrow, spreading or reflexed in fruit; corolla white, the tube shorter than the calyx, the lobes broadly oval, the throat nearly closed by prominent crests; stamens included; style very short; nutlets flattened, thin, widely divergent either radiately or in pairs, their margins with a row of hooked bristles, at least toward the apex.

1. Nutlets orbicular or nearly so, both the body and the very thin conspicuous wing beset with slender uncinat bristles *P. setosa*
— Nutlets oblong or linear, the body without uncinat bristles 2
- 2(1). Nutlets heteromorphic, 1 of each divergent pair wingless, or merely margined, the other with a broad somewhat incurved uncinat-toothed wing *P. heterocarpa*
— Nutlets not heteromorphic, all 4 wing-margined or toothed 3
- 3(2). Margin of nutlet conspicuous, the teeth confluent at base *P. platycarpa*
— Margin of the nutlet very narrow or wanting, the teeth nearly or quite distinct, subulate; nutlets strongly recurved *P. recurvata*

***Pectocarya heterocarpa* Johnston** Unequal Combseed. [*P. penicillata* var. *heterocarpa* Johnston]. Diffusely branched from the base; stems slender, ascending or spreading, 3–15 cm long, strigose and canescent throughout; leaves narrowly linear, 1–3 cm long, 1–2 mm wide, the hairs on the basal ones often pustulate at base; corolla minute, its limb ca 1.5 mm broad; fruiting nutlets widely divergent, dissimilar, 2 narrower and with or without a narrow margin, and 2 prominently winged-margined, the wings pectinately bristly at the apex, irregular, few toothed and with or without scattered bristles on the sides. Creosote bush, Joshua tree, blackbrush, and other warm desert shrub communities at 730 to 1200 m in San Juan and Washington counties; Arizona, Nevada, California, Baja California, and Sonora Mexico; 16 (vii).

***Pectocarya platycarpa* Munz & Johnston** Flattened Combseed. [*P. gracilis* var. *platycarpa* Munz & Johnston]. Stems slender, diffusely branched from the base, prostrate or widely ascending, 5–20 cm long, cinereous-strigillose throughout; leaves narrowly linear to linear-oblanecolate, 0.5–1.5 mm wide, 1–3.5 cm long; calyx lobes nearly as long as the nutlets; corolla 2 mm long; nutlets divergent in pairs, sometimes heteromorphous,

linear-oblong or spatulate-oblong, 2.5–3 mm long, with a wide conspicuous stramineous margin bearing irregular uncinat-tipped teeth, the odd nutlet when differentiated, with more deeply dissected wing and with more pubescent body. Creosote bush, Joshua tree and other warm desert shrub communities at 730 to 900 m in Washington County; Arizona, Nevada, California and Baja; 6 (i).

***Pectocarya recurvata* Johnston** Bent Combseed. Stems slender, simple below, with 2 to several erect or ascending branches above, or sometimes diffusely branched throughout and more spreading, 5–25 cm long; herbage cinereous-strigose; leaves narrowly linear, acute, 1–3.5 cm long, 0.5–2 mm broad; calyx lobes ca 2 mm long in fruit, acute; nutlets divergent in pairs, linear, strongly recurved, the wing divided to or almost to the body into prominent subulate straw colored uncinat bristles, the wing prolonged into a short scarios tip, the margin uncinat bristly. Creosote bush, Joshua tree, and other warm desert shrub communities at 730 to 900 m in Washington County; California, Nevada, Arizona, New Mexico, and Baja; 1(0). The species has been taken in Utah by Neese (12952 BRY).

***Pectocarya setosa* Gray** Saucer Combseed. [*P. setosa* var. *aperta* Johnston; *P. setosa* var. *holoptera* Johnston; *Gravelia setosa* (Gray) Rydb.]. Stems usually diffusely branched from the base, ascending, slender to rather stout, 5–20 cm tall, herbage rather thinly strigose and setose with spreading bristlelike hairs; leaves linear to linear-oblanecolate, 5–20 mm long; calyx lobes narrowly linear, 3–4 mm long in fruit, armed with 3–6 straight divergent bristles; nutlets divergent in pairs, broadly obovate to orbicular, two of them bordered with a thin scarios wing, the other two wingless, the body of the nutlets and usually the wing bearing slender uncinat bristles, the wing usually undulate and saucerlike. Desert almond, blackbrush, other warm and cool desert shrub, mountain brush, and pinyon-juniper communities at 800 to 1700 m in Washington County; Washington and Idaho, south to Nevada, Arizona, New Mexico, and Baja; 11 (iii).

***Plagiobothrys* Fisch. & Mey.**

Slender, glabrate or mostly softly pubescent, annual or perennial herbs; leaves mostly linear or linear-lanceolate, alternate above and either opposite at base or forming a rosette; flowers in bractless or bracteate spikelike racemes, the racemes more or less scorpioid and usually elongated in fruit; corolla white, small, salveriform, with crests at the mouth of the throat; nutlets rugose, erect or incurved, attached at or below the middle of a depressed gynobase through a earuneular scar, this decurrent on the lower part of the ventral keel or situated at the lower end of the keel and sunken below its crest.

1. Leaves opposite, at least below; scar of nutlet lateral, oblique or basal 2
— Leaves alternate; scar of nutlet lateral, near middle of nutlet 3
- 2(1). Scar of nutlet nearly basal; calyx lobes becoming elongate and thickened, all tending to be directed toward the same side of the fruit; plants mostly prostrate
..... *P. leptocladus*
— Scar lateral or basi-lateral; calyx lobes neither elongate or much thickened, semibasally disposed; plants prostrate to ascending or erect *P. scouleri*

- 3(2). Scar of nutlet elongate, extending along crest of the ventral keel; nutlets trigonous 4
 — Scar round or nearly so, at or below end of ventral keel 5
 4(3). Corolla 4–10 mm broad; nutlets irregularly rugose; reported for Utah, but no specimens have been seen by me *P. kingii* (Wats.) Gray
 — Corolla 1–2.5 mm broad; nutlets conspicuously tessellate *P. jonesii*
 5(3). Nutlets 4, cruciform; calyx not circumscissile *P. tenellus*
 — Nutlets 1–4, not cruciform; calyx circumscissile *P. arizonicus*

Plagiobothrys arizonicus (Gray) Greene Stainplant. [*Eritrichium canescens* var. *arizonicum* Gray]. Stems slender, several from the base, ascending, simple or few branched, 1–4 dm high, hirsute-hispid with spreading hairs and also rather sparingly villous pubescent; leaves hirsute-hispid with more or less appressed hairs, pustulate at base, without shorter pubescence, the lower linear-lanceolate, 1.5–5 cm long, upper linear-oblong to lanceolate; roots, lower parts of stems and veins of the leaves, or sometimes the whole plant purplish and staining the pressing paper or mounting sheets; spikes at length elongated, remotely flowered and bractless or with a few foliaceous bracts; calyx ca 3 mm long, cleft to near the middle, the lobes narrow-attenuate, connivent, hirsute-hispid, the tube at length usually circumscissile near the base; corolla 2–2.5 mm broad; nutlets 1–4 commonly 2, ovoid and abruptly acute at apex, with median and lateral keels often tuberculate, and with connecting transverse rugae, the areolae between smooth or minutely papillate; scar median, seated in a sunken area at the base of the keel. Creosote bush, Joshua tree, blackbrush, other warm desert shrub, and pinyon-juniper communities at 830 to 1620 m in Davis and Washington counties; Nevada, Arizona, and California; 23 (iii).

Plagiobothrys jonesii Gray Jones Popcornflower. [*Sonchena jonesii* (Gray) Greene]. Stems erect, 1 to several from the base, divergently branched, 1–3 dm high, hispid with spreading bristly hairs pustulate at base and also retrorsely hairy; basal leaves linear or narrowly oblanceolate; cauline leaves mostly lanceolate with pubescence similar to the stem but thinner; racemes terminating the branches, mostly conspicuously leafy-bracted at base, 1.5–3 cm long, the lower leaves of the branches often bearing one or few axillary flowers; calyx lobes subulate-linear, 6–8 mm long, corolla 1–2 mm broad; nutlets 3 mm long, incurved and 4–angled by the dorsal and ventral keels and the 2 lateral ridges, abruptly pointed at apex, the keel and lateral angles tuberculate, the concave surface densely tessellate; scar narrow or medial-narrow merging into the keel above and with a diverging lateral ridge extending to either side. Creosote bush, Joshua tree, blackbrush, other warm desert shrub, and sagebrush communities at 830 to 1330 m in San Juan and Washington counties; California to Arizona and Nevada; 6 (i).

Plagiobothrys leptocladus (Greene) Johnston Hairy Popcornflower. [*Eritrichium californicum* var. *subglochidiatum* Gray; *Allocarya orthocarpa* Greene, type from Cache County; *A. versicolor* Brand]. Stems branched from the base, the branches prostrate, 1–3 dm long, straight, slender, and somewhat wiry, thinly strigose or glabrate, often floriferous nearly to the base; leaves narrowly linear, the lower 3–10 cm long, glabrous

or nearly so above, thinly strigose beneath, the hairs mostly pustulate at base; racemes simple, becoming loosely flowered; mature calyx lobes usually accrescent, 3–8 mm long, ca 1 mm wide, connivent or sometimes spreading, more or less definitely curved toward one side; corolla 1–2 mm broad; nutlets narrowly to broadly lanceolate, acute; dorsal side keeled only above the middle, more or less obliquely or transversely rugose, smooth, granulate or penicillate-hairy; ventral side keeled down to the basal scar, this horizontal or slightly oblique, not surrounded by a ridge, but frequently with a downwardly directed dorsal flange. Wet, saline meadows and ditch banks, in greasewood, pickleweed, saltgrass, and other salt desert shrub communities at 1420 to 2500 m in Box Elder, Cache, Davis, Salt Lake Counties; Oregon to the Dakotas, south to Baja; 15 (0).

Plagiobothrys scouleri (H. & A.) Johnston Scouler Popcornflower. [*Myosotis scouleri* H. & A.; *Allocarya scouleri* (H. & A.) Greene; *A. cusickii* Greene; *A. hispidula* Greene; *A. nitens* Greene; *A. cognata* Greene, type from Cache County; *P. scopulorum* Johnston; *P. nelsonii* Johnston; *P. nitens* (Greene) Johnston; *P. hispidulus* Johnston; *P. cusickii* Johnston; *P. cognatus* Johnston]. Plants more or less densely branched from the base; stems 5–25 cm tall, ascending or spreading, with stiff appressed hairs; leaves 1–8 cm long, linear to oblanceolate, strigose to somewhat setose; racemes rather lax, the bracts resembling the leaves; calyx 1–1.5 (2) mm long in flower, in fruit becoming 1.5–2.5 mm long; corolla ca 1.5 mm long, inconspicuous; nutlets 1.5–2 mm long, variously roughened, with or without setose projections. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, and spruce-fir communities at 1850 to 3500 m in Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Garfield, Juab, Morgan, Rich, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington and Weber counties; Alaska to Manitoba, south to California, Nevada, and New Mexico; 60 (v). Our plant belongs to var. *penicillatus* (Greene) Cronq. [*Allocarya penicillata* Greene].

Plagiobothrys tenellus (Nutt.) Gray Slender Popcornflower. [*Myosotis tenella* Nutt.; *P. parvulus* Greene; *P. asper* Greene; *P. humifusus* Jones; *P. tenellus* var. *parvulus* subvar. *humifusus* (Jones) Brand]. Stems slender, erect, freely branched from the base or sometimes simple, 5–25 cm high, softly villous with spreading and reflexed hairs; leaves of the basal rosette oblong-lanceolate or oblanceolate, obtuse or acutish, villous, 1–2.5 cm long; cauline leaves distinct, the lower ones linear-oblong, the upper becoming lanceolate or ovate-lanceolate, gradually reduced in size; spikes elongated in age and loosely flowered, only the lowest flowers bracteate; calyx densely short-villous with whitish or more often rufous hairs, ca 3 mm long in age; corolla limb 2–3 mm broad; nutlets 1.5–2 mm long, thick cruciform, pale colored, sharply ridged dorsally and on the margins, the ridges commonly tuberculate. Sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1525 to 2600 m in Salt Lake and Washington counties; British Columbia, south to California, Nevada, and Arizona; 3 (i).

Tiquilia Pers.

Herbaceous or suffruticose plants with slender, forking, usually prostrate or widely spreading stems; leaves

small, entire, usually strongly veined, subsessile or petio- late; flowers small, typically white, commonly extra-axil- ary, along leafy twigs or at the forks of the branches, sometimes glomerate, opening in late afternoon; corolla with a short, cylindrical or ampliate tube and spreading lobes, the throat naked or sometimes appendaged; stamens 4-5, included, the filaments adnate to the corolla tube; style terminal on the ovary, short to long, bilobed; stigmas 2; ovary 2-loculed or sometimes 4-loculed by the septumlike placenta, entire or 4-lobed; fruit dry, pyramidal or hemispheric, divided into usually 4 1-seeded nutlets; nutlets more or less broadly united ventrally or joined to a central prolongation of the recep- tacle.

1. Fruit nearly globose, unlobed, breaking at maturity into quarter sections, each quarter forming a nutlet; leaves ovate to elliptic, white-tomentose, obscurely veined *T. canescens*
- Fruit deeply 4-lobed, the lobes joined only by their inner angle and each forming a nutlet; leaves not tomen- tose 2
- 2(1). Plants perennial; leaves not evidently nerved, lance- olate to linear, usually very pungently setose; petiole base expanded, indurate, usually villous; flowers solitary in the leaf axils; nutlets finely warty, ovate *T. hispidissima*
- Plants annual; leaves with evident impressed nerves, ovate or obovate to nearly orbicular; petiole base not expanded, or indurate or villous; flowers in dense clus- ters at the forks of the stem; nutlets smooth or granulate *T. nuttallii*

Tiquilia canescens (DC.) A. Richards. Hairy Tiquilia. [*Coldenia canescens* DC.; *Stegnocarpus canescens* (DC.) Torr.; *S. leiocarya* Torr.; *C. canescens* var. *subnuda* Johnston]. Plant suffrutescent, perennial, forming mats 2-6 dm in diameter; stems several to numerous, mostly prostrate; leaves numerous, white-tomentose; petiole slender, 2-7 mm long; leaf blade ovate to elliptic-lance- olate, obtuse to broadly acute at the ends, 7-10 (15) mm long, 2-7 (9) mm wide, thickish, the margins somewhat revolute, tomentose; flowers usually solitary in the axils of the leaves; calyx sessile, persistent, at anthesis 3-4 mm long, the lobes subequal to the corolla tube, unequal, finally lanceolate, usually long-attenuate, 4-7 mm long; corolla 5-6 (8) mm long, pink, rose, or rarely white, the lobes broad and rounded, 1.8-3 (4.5) mm wide, 1.5-2 (3.5) mm long, usually villous in the buds, the margins frequently erose; filaments all differing slightly in length and height of attachment; ovary 4-ovulate, at anthesis subglobose, ca 0.8 mm high, marked with 4 longitudinal grooves; fruit at maturity glabrous or hairy, ovoid-glo- bose, 2.5-3 mm in diameter, 2-2.5 mm high, not lobed; nutlets bony, the back convex, densely and minutely tuberculate; style seated in the pericarp, persistent until the fruit fractures into 4 nutlets 1.5-2.5 mm long. Creosote bush, Joshua tree, and other warm desert shrub communities, on limestone, at ca 900 to 1200 m in Wash- ington County; California, Nevada, Arizona, New Mex- ico, Texas, and Mexico; 5 (ii).

Tiquilia latior (Johnston) A. Richards. [*Coldenia his- pidissima* var. *latior* Johnston; *Ehretia hispida* Torr.]. Plants prostrate, forming mats 2-6 dm in diameter; stems several to numerous, dichotomously branched, spreading from a woody taproot; leaves clustered, borne mostly on

very short branchlets; petioles 1-2 mm long, broadest (1-1.5) mm at the base, becoming indurate, usually pal- lid, the margin hispid-ciliate and the back usually glabrous or nearly so; leaf blades linear, (rarely ovate or elliptic), revolute, 4-10 mm long, 0.6-1 mm wide, usu- ally narrower than the indurate petiole-base; flowers borne among the leaves; calyx sessile, broadly and perma- nently attached in the leaf axil, at anthesis ca 3 mm long, lanceolate, united at the base, ciliate below the middle, frequently terminated with a stiff bristle; corolla usually pink, ca 7.5 mm long; corolla lobes rounded, spreading, ca 2 mm long and 3 mm broad; stamens 5, unequal in length and position within the corolla tube; style 1.5-2.2 mm long, somewhat flattened, the apex bilobed; nutlets ovoid, usually only 1 or 2 maturing, 1.1-1.4 mm long, 0.8-1 mm broad, papillate, the back convex and the ventral side rounded or somewhat flattened; scar open, 1.5-2 mm wide at base, nearly as long as the nutlet, surrounded by a narrow band of smooth nonpapillate pericarp, traversed down the center by a lineate ridge; n = 9. Salt and cool desert shrub and pinyon-juniper com- munities at 900 to 2100 m in Beaver, Emery, Garfield, Grand, Kane, Millard, San Juan, Washington, and Wayne counties; Arizona; a Colorado Plateau endemic; 41 (vi). *Tiquilia latior* is closely allied to *T. hispidissima* (T. & G.) A. Richards. of Texas, New Mexico, and Mexico, but has broader leaves, with densely ciliate petioles and larger papillate nutlets 1.5-2 mm long.

Tiquilia nuttallii (Hook.) A. Richards. [*Coldenia nut- tallii* Hook.; *T. parviflora* Nutt. ex Hook.; *T. brevifolia* Nutt. ex Torr.]. Prostrate annual with slender, somewhat brittle, dichotomously branched stems forming mats 1-3.5 dm broad, finely strigose; leaves ovate to suborbic- ular, 4-8 mm long, narrowly revolute, often hispid on the margins, with 2-3 pairs of distinct veins dorsally, thinly strigose on the upper surface with somewhat stiff hairs, hirsute on the lower surface; petioles slender, usually as long or longer than the blade; flowers in compact clusters in the forks and at the ends of the branches; calyx lobes linear-subulate, 4-5 mm long, villous or setulose on the back, sparsely but conspicuously hispid on the margins; corolla pink or nearly white, little exceeding the calyx, the limb 2-2.5 mm broad, the tube with 5 triangular scales near the base; nutlets oblong-ovoid, smooth and shining. Salt desert shrub, creosote bush, mixed desert shrub, and pinyon-juniper communities at 900 to 1830 m in Beaver, Box Elder, Duchesne, Iron, Juab, Millard, Tooele, Uintah, and Washington counties; Washington to Idaho and Wyoming, south to California, and Arizona; 19 (i).

BUDDLEJACEAE Wilhelm

Logania Family

Shrubs or trees; leaves opposite, entire or crenate, stipulate; flowers regular, perfect, 4- or 5-merous, sym- petalous, variously arranged; calyx deeply lobed or with separate sepals; corolla salverform to tubular or campanu- late; stamens perigynous, as many as corolla lobes and alternate with them; pistil 1, the ovary 2-loculed, supe- rior; style 1; fruit a capsule; x = 19.

Buddleja L.

Shrubs or small trees; leaves opposite, simple, entire to dentate; flowers mostly 4-merous; calyx campanulate;

corolla salverform or rotate-campanulate, the lobes ovate or rounded; anthers subsessile on throat or tube of corolla; capsule globose to ellipsoid, bivalved, septicial; seeds many.

- 1. Leaves 5–25 cm long, lance-ovate to lanceolate; flowers lilac with an orange yellow center; plants cultivated *B. davidii*
- Leaves 1–3 cm long, linear, with revolute margins; flowers creamy yellow to purplish; plants indigenous in Washington County *B. utahensis*

***Buddleja davidii* Franchet** Shrubs or small trees to 5 m tall; leaves 5–25 cm long, lance-ovate to lanceolate, acuminate, rounded to acute basally, shortly petiolate, serrate to doubly so, dark green above, densely white-tomentose below; flowers fragrant, lilac, with an orange yellow throat, in slender panicles 12–40 cm long; 2n = 76. Cultivated ornamental in Cache, Salt Lake, Utah, and Weber counties; widely grown in the U. S.; introduced from China; 6 (0).

***Buddleja utahensis* Cov.** Low much-branched shrubs, 2–3 (5) dm tall, pubescent with densely lanate-tomentose stellate hairs; leaves 1–3 cm long, linear, with revolute margins, subsessile; axils often bearing fascicles of smaller leaves; flowers in glomerules, forming heads in an interrupted spike ca 10–15 mm thick; corolla creamy yellow to purplish, 4–5 mm long, the lobes ca 1 mm long, rounded, the tube tomentulose. Blackbrush, Joshua tree, and other warm desert shrub communities, mainly on limestone outcrops, at 800 to 1100 m in Washington (type from near St. George) County; Arizona, Nevada, and California; 8 (ii).

- 3(2). Stems with tubercles spirally arranged; tubercles distinctly grooved on upper side; flowers pink or yellow *Coryphantha*
- Stems ribbed; tubercles not grooved; flowers variously colored 4
- 4(3). Flowers borne laterally below the stem apex; hypanthium spiny *Echinocereus*
- Flowers terminal on the stems; hypanthium devoid of spines 5
- 5(4). Stems 20–50 cm in diameter or more, mainly 2–10 dm tall; upper axils and ovaries not woolly; plants of Washington County *Ferocactus*
- Stems usually much smaller, or if, as rarely, approaching the lower limits as described above, the ovaries and upper axils woolly 6
- 6(5). Stems mainly 12–25 cm in diameter; spines flattened, annular; ovaries and upper axils woolly; plants reported for Kane and Washington counties *Echinocactus*
- Stems mainly 3–10 cm in diameter; spines variously terete, subterete, or flattened, but not annular; ovaries and upper axils not or rarely woolly 7
- 7(6). Spines straight, purplish or reddish, 2–5 cm long or more; flowers rose pink; plants of the Beaver Dam Mountains, Washington County *Neolloydia*
- Spines hooked or some or all of them straight; flowers variously colored; plants not of western Washington County or, if so, the flowers yellow 8
- 8(7). Stems with spines all straight, depressed-hemispheric; flowers white to yellow or pale pinkish, mainly 1–2 cm long *Pediocactus*
- Stems with at least some spines hooked or, if straight, the flowers rose pink to violet or more than 2 cm long *Sclerocactus*

CACTACEAE A. L. Juss.

Cactus Family

Perennial succulent woody or herbaceous plants, with spiny, glochidiate, or rarely unarmed, globose, cylindrical, columnar, or flattened stems; stems ribbed, smooth, or tuberculate; leaves lacking, or green, terete, and caducous (*Opuntia*); areoles axillary (regardless of apparent position), bearing wool, glochids, spines, branches, or flowers; perianth of numerous segments grading from sepals to petals, imbricate, the bases more or less united, inserted on a hypanthium; stamens numerous, variously inserted within the hypanthium tube; style 1; stigmatic lobes several; ovary inferior; fruit a dry or fleshy many-seeded berry; x = 11.

Benson, L. 1982. The cacti of the United States and Canada. Stanford University Press, California. 1044 pp.

- 1. Stems jointed, the joints flattened, clavate, or cylindrical; areoles with glochids and/or spines (or spineless), subtended by caducous terete green leaves when young *Opuntia*
- Stems hemispheric or cylindroid, not jointed; areoles with hair or spines but no glochids 2
- 2(1). Flowers borne in axils of tubercles or at bases of grooves, removed from the spiniferous areoles; central spine hooked, dark purple; small hemispheric or cylindrical plants of Washington County *Mammillaria*
- Flowers borne variously, seldom as above; central spines hooked or straight but, if hooked, the plants not of Washington County 3

Coryphantha (Engelm.) Lem.

Plants depressed-hemispheric to hemispheric or shortly cylindrical, solitary or colonial; tubercles separate; areoles circular; spines smooth; central spines 0 or 3–12 per areole, transitional to radials, straight, elliptic in cross-section; radial spines 12–40 per areole, straight, subterete; flowers axillary at tubercle base, at end of a felty persistent groove connected to the areole, borne near the summit of the stem, funnelliform, the perianth pink purple to rose or yellow; fruit fleshy, green or red, indehiscent; seeds black or brown.

- 1. Flowers yellow; fruit red at maturity, globular; plants rare in Garfield and Kane counties *C. missouriensis*
- Flowers pink purple to rose; fruit green at maturity, ellipsoid; plants widely distributed *C. vivipara*

***Coryphantha missouriensis* (Sweet) Britt. & Rose** [*Mammillaria missouriensis* Sweet]. Stems commonly solitary, depressed hemispheric, 2–5 cm tall, 3–8 cm wide; tubercles 6–9 mm long; areoles few; radial spines 10–19, spreading; flowers 3.8–5 cm wide and long; sepals greenish, the margins yellowish or whitish; petals yellow; filaments yellow; anthers yellow; style green, 12–25 mm long; fruit red, ca 1 cm thick; seeds black, 2–2.5 mm wide.; 2n = 44. Cool desert shrub, juniper, and ponderosa pine communities in Garfield (type from Hells Backbone) and Kane (lectotype from Buckskin Mts.) counties; Arizona. Our material belongs to var. *marstonii* (Clover) Benson [*C. marstonii* Clover]; 1 (0). The species is distributed from Montana east to North Dakota, south to Arizona, New Mexico, and Texas.

Coryphantha vivipara (Nutt.) Britt. & Rose [*Cactus viviparus* Nutt.; *Mammillaria vivipara* (Nutt.) Haw.]. Stems solitary or colonial, depressed hemispheric to short-cylindric, mainly 2–15 cm tall, 2–10 cm wide; tubercles 6–15 (23) mm long; areoles 1.5–3 mm wide; central spines 3–12, whitish basally, dark apically, mainly 12–20 mm long; radial spines 12–20, spreading, obscuring the stem; flowers 2.5–5 cm wide and long; sepals greenish, the margins variously colored; petals pink purple or rose; anthers yellow; fruit green, ellipsoid, 12–25 mm long; seeds brown, reticulate, 1.5–2 mm wide; n = 11. Like other of our depressed-hemispheric cacti, the plants of this species expand as they take up water in springtime. Following flowering the plants dry and shrink downward into the substrate surface. Plants conspicuous at flowering become difficult to observe when dormant. The juice of *C. vivipara* is apparently unique among our species in being non-mucilaginous. Three more or less distinctive varieties are present in Utah.

- 1. Central spines 4; flowers ca 3.8 cm wide; plants of Carbon and Uintah counties . . . *C. vivipara* var. *vivipara*
- Central spines 4–7; flowers wider or, if narrower, the plants not of northeastern Utah 2
- 2(1). Flowers ca 2.5–3 cm wide; radial spines 12–20, 9–12 mm long, petaloids yellowish, greenish, or pinkish; plants of Washington County *C. vivipara* var. *deserti*
- Flowers mainly 3.8–5 cm wide; radial spines 20–30; petaloids pink purple to rose; plants rather broadly distributed *C. vivipara* var. *arizonica*

Var. *arizonica* (Engelm.) W. T. Marshall [*Mammillaria arizonica* Engelm.]. Desert shrub and pinyon-juniper communities at 1586 to 2440 m in Beaver, Garfield, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Tooele, Washington, and Wayne counties; Nevada to Colorado, south to Arizona and New Mexico; 33 (xiii). This variety is locally common on limestone and dolomite outcrops and on gravels degraded from them. It is a beautiful plant when in flower, the violet flowers contrasting with the thatch of whitish spines.

Var. *deserti* (Engelm.) W. T. Marshall [*Mammillaria deserti* Engelm.; *M. chlorantha* Engelm., type from St. George]. The small yellowish to pinkish flowers are apparently diagnostic. Warm desert shrub communities at 760 to 980 m in Washington County; Arizona, Nevada, and California; 2 (i).

Var. *vivipara* Desert shrub and pinyon juniper communities in Carbon and Duchesne counties; Alberta to Manitoba, south to Oregon, New Mexico, and Texas; 1 (0).

***Echinocactus* Link & Otto**

Stems solitary or few to many, subglobose to cylindric, woolly at the apex, few- to many-ribbed; areoles large; spines broad, flattened-triangular, with transverse annular rings; flowers borne subapically, yellow; floral tube bearing spiny persistent scales; ovary clothed with narrow scales having mats of wool; fruit densely white-woolly, dry at maturity; seeds black, shining.

***Echinocactus polycephalus* Engelm. & Bigel.** Stems mostly 2–3 dm tall and 1–2 dm thick (or more); ribs 10–21; areoles 10–12 mm long; radial spines 8–10, 2.5–5 cm long, often reddish when young, subulate, triangular-flattened; central spines 3–5, stouter than the radial, annulate, curved but not hooked, 3–8 cm long; flowers

5–6 cm long, yellow; perianth segments narrowly oblong; fruits 15–25 mm long, dehiscent by a basal pore; seeds angular, black. Two varieties are potentially present in Utah.

- 1. Spines felty, at least when young; seeds papillate, dull or shining from the papillae; plants reported for Washington County *E. polycephalus* var. *polycephalus*
- Spines smooth or with scattered hairs; seeds smooth and shining; plants potentially of Kane County *E. polycephalus* var. *xeranthemoides*

Var. *polycephalus* Warm desert shrubland on the Beaver Dam slope, Washington County (reported by Meyer); Nevada, California, and Arizona; 0 (0).

Var. *xeranthemoides* Coult. Pinyon-juniper and desert shrub communities near Kanab, Kane County; Arizona; a Plateau endemic; 0 (0). This report is based on two collections by pioneer collectors, one by A. L. Siler (in "Kanab Mts.") in 1881 and the other by Dr. E. Palmer in 1877 (in "S. Utah"). Since it is probable that neither knew where the Utah-Arizona boundary was situated (it was surveyed in 1879), the collections noted could have been taken from nearby Arizona. However, the plants should be sought near Kanab.

***Echinocereus* Engelm. in Wisliz.**

Stems erect or ascending, solitary or more usually colonial, cylindric or subcylindric; areole small; central spines 1–6; radial spines 5–12, acicular to subulate, flattened or subterete; flowers borne laterally, below the stem apex, the bud breaking through the epidermis above the areole, large and showy, pink purple to scarlet; stigmas green; fruit fleshy, spiny, not regularly dehiscent, the spine clusters deciduous as fruit matures.

- 1. Flowers pink purple to rose; stems solitary or few, often over 10 cm tall *E. engelmannii*
- Flowers scarlet; stems often 10 cm long or less, few to numerous in compact hemispheric clusters *E. triglochidiatus*

***Echinocereus engelmannii* (Parry) Lem.** Engelmann Hedgehog-cactus. [*Cereus engelmannii* Parry]. Stems solitary or 2 to several (or rarely many) and loosely clustered, mainly 10–30 cm tall, 5–9 cm thick; ribs 10–13; tubercles not prominent; areoles small, subcircular; central spines 2–6, stout, more or less curved or twisted, 2–5 cm long; radial spines 6–12, 7–15 mm long, appressed and spreading; flowers 5–9 cm long, pink purple to rose; perianth segments oblong; fruit ovoid to oblong, green or turning red, the spine clusters deciduous; seeds black, globose, pitted, 1–1.5 mm long. This widely ranging southwestern species consists of a series of morphologically differing but intergrading segregates, which largely lack geographical integrity. Utah material is assigned to two of named segregates.

- 1. Lowermost central spines mainly 3.5–6 cm long, not markedly differing in color from the other spines; plants of canyons of the Colorado *E. engelmannii* var. *variegatus*
- Lowermost central spines mainly 2.8–4.5 cm long, often markedly differing in color from other spines; plants mainly not of the Colorado canyons *E. engelmannii* var. *chrysocentrus*

Var. *chrysocentrus* (Engelm. & Bigel.) Engelm. ex Rumpfer [*Cereus engelmannii* var. *chrysocentrus* En-

gelm. & Bigel.; *E. engelmannii* var. *purpureus* L. Benson, type from near St. George]. Larrea, Joshua tree, shadscale, and mountain brush communities at 760 to 1865 m in Beaver, Juab, Kane (inter var. *variegatus*), Millard, and Washington counties; Nevada, California, and Arizona; 28 (iv). Maintenance of plants passing under the name of var. *purpureus* is only arbitrarily possible. They grade continuously in all known populations with var. *chrysocentrus*, and purple spined phases occur sporadically throughout the range of the species in Utah.

Var. *variegatus* (Engelm. & Bigel.) Engelm. ex Rumpel [*Cereus engelmannii* var. *variegatus* Engelm. & Bigel.]. Blackbrush, shadscale, and pinyon-juniper communities at 1125 to 1895 m in Garfield, Kane, and San Juan counties; Arizona; 6 (ii). Purported differences between this phase of the species complex and those noted for var. *chrysocentrus* are tenuous, and the two phases could be combined without doing serious injustice to their taxonomy.

***Echinocereus triglochidiatus* Engelm.** Claretcup. [*E. coccineus* Engelm.]. Stems few to several hundred in compact hemispheric clumps or mounds, mainly 8–15 cm long, 3–6 cm thick; ribs 9 or 10, the tubercles not prominent; areoles circular, bearing a white felty mat when young; central spines 1–3, 8–40 mm long or more, stout, straight or curved to twisted; radial spines 5–8, 4–35 mm long, not appressed, spreading; flowers 5–7.5 mm long, scarlet; perianth segments euneate-obovate; fruit red at maturity, obovoid to cylindroid; seeds papillate, 1.5–2 mm long; $n = 22$. Two rather weakly separable varieties are present in Utah.

1. Central spines twisting or curved; flowers often over 4 cm wide; plants of Millard, Beaver and Washington counties *E. triglochidiatus* var. *mojavensis*
- Central spines straight; flowers often less than 4 cm wide; plants of broad distribution *E. triglochidiatus* var. *melanacanthus*

Var. *melanacanthus* (Engelm.) L. Benson [*Cereus coccineus* var. *melanacanthus* Engelm.; *E. triglochidiatus* var. *inermis* (K. Schum.) Rowley; *E. phoeniceus* var. *inermis* K. Schum., neotype from San Juan County]. Blackbrush, ephedra, sagebrush, pinyon-juniper, mountain brush, and aspen communities at 975 to 2562 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Nevada to Colorado, south to California, Arizona, New Mexico, Texas, and Mexico; 86 (xvi). There is a cline within the specimens from eastern Utah and western Colorado from densely spiny to no spines at all. The spineless plants have passed under the name of var. *inermis*, but they do not seem to represent a taxon.

Var. *mojavensis* (Engelm. & Bigel.) L. Benson [*Cereus mojavensis* Engelm. & Bigel.]. Mixed desert shrub, pinyon-juniper, and ponderosa pine communities at 1550 to 2257 m in Beaver, Millard, and Washington counties; 4 (i).

***Ferocactus* Britt. & Rose**

Plants hemispheric to cylindrical, massive; ribs thick, prominent, somewhat spirally arranged; spines coarse, the central ones flattened and transversely annulate, not hooked; areoles large, more or less woolly when young; flowers subterminal, yellow, funnelliform; stamens nu-

merous; ovary and floral tube scaly, not woolly; fruit oblong in outline, dry at maturity, dehiscent by a basal pore.

***Ferocactus acanthodes* (Lem.) Britt. & Rose** Barrel Cactus. [*Echinocactus acanthodes* Lem.]. Plants mainly 2–15 dm tall and 2–5 dm thick or more; ribs 20–30; areole 1–1.5 cm long, brown-woolly when young; spines pink, red, or yellow, the central ones 1–4, subulate, flattened, annulate, curved, 4–8 cm long or more; radial spines with mixed coarse and slender ones; flowers 4–6 cm long, the scales of the tube and ovary overlapping when young, ovate; perianth segments oblong to spatulate; filaments yellow; fruit 3–3.5 cm long; seeds 2–3 mm long, reticulate; $n = 11$. Limestone and dolomite outcrops and gravels at 760 to 1375 m in Washington County; Nevada, California, and Arizona; 2 (i). Our material belongs to var. *lecontei* (Engelm.) Lindsay [*Echinocactus lecontei* Engelm.]. This is the largest cactus native to Utah; it is distinguished from *Echinocactus polycephalus* by the large size, glabrous ovaries, and merely short-woolly areoles.

***Mammillaria* Haw.**

Subglobose to shortly cylindrical plants, stems solitary or few; tubercles many, elongate, in spiral rows; areoles spiniferous; spines smooth, the central 1–4 straight or 1 or more hooked; flowers borne between tubercles, diurnal; fruit fleshy, red, lacking appendages, elongate.

***Mammillaria tetrancistra* Engelm.** [*Phellosperma tetrancistra* (Engelm.) Britt. & Rose]. Stems 4–10 cm tall or more, 4–6 cm wide; tubercles 4–10 mm long, more or less woolly in the axils when young; central spines 1–4, dark, 1 or more hooked, 10–15 mm long; radial spines 30–45, mostly whitish; flowers 25–30 mm long; sepals green with pink margins; petals rose to pink purple; fruit initially green and included below the spines, some finally scarlet and 12–20 mm long, often protruding beyond the spines. Warm desert shrub communities at 760 to 1300 m in Washington County; Nevada, California, Arizona; 6 (iii). The seeds evidently mature while the fruit is still green and included below the spines. Ultimately, at least some of the fruit ripens to scarlet and typically protrudes beyond the spines. Several stages of fruit development—from green (included) to red (included to exerted)—have been observed on a single plant.

***Neolloydia* Britt. & Rose**

Subglobose to shortly cylindrical plants, mostly solitary; ribbed and more or less tuberculate; areoles small; central spines 1 to several or lacking, straight (or curved), not hooked; radial spines 9–10; flowers borne subapically at the base of a woolly groove, purple or pink purple; fruit green, drying tan, dehiscent by a basal pore, the scales and their axils glabrous.

***Neolloydia johnsonii* (Parry) L. Benson** [*Echinocactus johnsonii* Parry in Engelm., type from near St. George; *Echinomastus johnsonii* (Parry) Baxter; *Ferocactus johnsonii* (Parry) Britt. & Rose]. Stems solitary, seldom branched, 8–20 cm tall, 5–10 cm thick, the ribs 17–21, obscured by interlocking spines; areoles with a short narrow woolly groove running to the axil; central spines pink to reddish or purplish, 3–4 cm long, terete; radial spines paler in color; flowers 5–6 cm long, purple or pink purple; fruit green, drying tan, oblong, 10–15 mm long, nearly naked, splitting dorsally; seeds ca 2.5 mm long,

papillate; n = 11. Warm desert shrub community at 760 to 1250 m in Washington County; Nevada, Arizona, and California; 5 (ii).

Opuntia Miller

Stems jointed, the joints flattened, cylindric, or clavate; areoles with glochids (i.e., detachable barbed spinules), and commonly with 1 or more stout spines (less commonly spineless); spines naked or sheathed; leaves terete, fleshy, caducous; flowers borne in areoles of previous years growth, variously colored; floral tube cup-shaped; ovary with areoles; stamens numerous; stigmas short; fruit fleshy or dry, armed or unarmed; seeds with a bony aril, flattened.

- 1. Stem joints cylindric or clavate; spines with detachable epidermal sheaths, at least apically (subgenus *Cylindropuntia*) 2
- Stem joints flattened; spines not sheathed (subgenus *Opuntia*) 5
- 2(1). Stem joints clavate, 1 or few above ground, mainly 3–10 cm tall, arising from a tuberous subterranean joint; plants of Millard, Juab, and Tooele counties *O. pulchella*
- Stem joints cylindric, several to numerous above ground, mainly 3–20 dm tall, not arising from a tuberous joint; plants of various distribution 3
- 3(2). Joints mainly less than 2 cm thick; fruits fleshy at maturity; plants of rather broad distribution in Utah *O. whipplei*
- Joints mainly over 2.5 cm thick; fruits dry at maturity; plants mainly of Washington County 4
- 4(3). Ridge of tubercle on mature joints mainly 18–22 mm long, more than 3 times longer than broad; longer terminal joints mainly more than 15 cm long *O. acanthocarpa*
- Ridge of tubercle on mature joints mainly 10–15 mm long, only 1–2 times longer than broad; longer terminal joints mainly shorter than 15 cm long *O. echinocarpa*
- 5(1). Areoles with glochids only; spines not developed (except in hybrids with other taxa) or if present the glochids very numerous and 4–10 mm long; plants of Washington, Kane, and San Juan, and less commonly of Emery, Garfield and Wayne counties 6
- Areoles with glochids and spines, at least some, or if lacking (a condition probable in all species), of different distribution 8
- 6(5). Plants with pyriform, erect, usually bluish or purplish tinged joints, these erect, forming vase-shaped clusters; fruit dry at maturity *O. basilaris*
- Plants with ovate to elliptic, sprawling to decumbent, usually green joints, these often rooting in contact with the soil; fruit dry or not 7
- 7(6). Fruit fleshy; joints often wrinkled; plants sporadic in Utah except in Washington County, where locally abundant *O. macrorhiza*
- Fruit dry; joints seldom if ever wrinkled; plants mainly of Kane County . . spineless phase of *O. erinacea*
- 8(5). Fruit dry at maturity, finally tan, green or reddish when young; seeds mainly 4–8 mm long, rough and irregular in outline (key non-fruitlet specimens both ways) 9
- Fruit fleshy at maturity, red or reddish purple to purple; seeds mainly 2.5–4.5 mm long, smooth and regular in outline 12

- 9(8). Largest joints 2–8 cm long, 1.5–3.5 cm wide, readily detachable (carried burlike by animals) *O. fragilis*
- Largest joints mainly 7–15 cm long or more, 4–12 cm broad or more, not readily detachable 10
- 10(9). Spines not especially flattened, even basally, terete or nearly so, or rarely lacking; plants transitional to the next *O. polyacantha*
- Spines at least somewhat flattened, at least basally, usually elliptic in cross-section 11
- 11(10). Spines less than 1 mm thick, more or less flexible; joints mainly 5–15 cm long and 3–10 cm wide; plants rather widespread, transitional to the next *O. erinacea*
- Spines over 1 mm thick (at least some), not especially flexible; joints often over 15 cm long and 10 cm wide; plants of the Glen Canyon vicinity (transitional to *O. phaeacantha*) *O. nicholii*
- 12(8). Spines terete to subterete, not flattened (except when hybridizing with *O. phaeacantha*), commonly 1–6 per areole 13
- Spines at least basally flattened, narrowly elliptic in cross-section, commonly 3 per areole 14
- 13(12). Spines gray or brownish, or more commonly lacking; plants usually prostrate, rooting along the joint in contact with the soil, not forming upright clumps; largest joints mainly less than 12 cm long; plants scattered in Utah *O. macrorhiza*
- Spines tan or variously colored; plants usually upright and with several joints standing above the ground; largest joints mainly more than 15 cm long; plants of San Juan and Washington counties *O. littoralis*
- 14(12). Joints subcircular in outline; spines all deflexed, yellow; plants of Washington County *O. chlorotica*
- Joints mainly obovate in outline; spines spreading in various directions, brown to tan or gray; plants of rather broad distribution *O. phaeacantha*

Opuntia acanthocarpa Engelm. & Bigel. Buckhorn Cholla. Shrubs, mainly 8–15 dm tall or more; trunk short; larger terminal joints mostly 12–50 cm long, 2–3 cm thick; tubercles decurrent along the joint, mostly 15–50 mm long and 4–6 mm wide; leaves caducous; areoles circular; spines 6–20 or more per areole, 1–4 cm long, variously colored, the sheaths straw colored; glochids minute; flowers 4–6 cm long; sepals greenish yellow to brownish; petals typically yellow orange to bronze; ovary shiny; anthers yellow, the filaments wine colored; fruit dry, tan or brown, spiny, 2–4 cm long; seeds 5–8 mm long, tan or whitish; 2n = 22. Creosote bush-Joshua tree, and other warm desert shrub communities at 760 to 1220 m in Washington County; Nevada, California, Arizona, and Mexico; 4 (i). Two varieties are reported from Utah by Benson (1982); var. *acanthocarpa*, with tubercular ridges 30–50 mm long and longer joints 25–50 cm long; and var. *coloradoensis* L. Benson, with tubercular ridges 15–22 mm long and larger joints 12–30 cm long. More specimens are necessary to determine the nature of the Utah materials.

Opuntia basilaris Engelm. & Bigel. Plants mainly 10–30 cm high and to 3 broad or more; joints typically blue, blue green or violet green, obpyriform, obovate, or spatulate, 5–30 cm long, 2.5–12 cm broad; areoles circular, 9–17 mm apart; spines lacking; glochids brown to tan; flowers 5–8 cm long; sepals greenish, edged with violet; petals violet; fruit 2.6–3.3 cm long, dry at maturity, green, becoming tan or gray; seeds ca 6–8 mm long, white or grayish; n = 11. Two more or less distinctive and geographically correlated varieties are present.

- 1. Joints obpyriform, seldom otherwise, suffused with violet or blue; glochids brown; plants of Washington and San Juan counties *O. basilaris* var. *basilaris*
- Joints mainly obovate to spatulate, suffused with blue or purple; glochids tan to yellowish; plants of Emery, Garfield, and Wayne counties *O. basilaris* var. *heilii*

Var. *basilaris* Warm desert shrub community at 760 to 1770 m in San Juan (Cataract Canyon) and Washington counties; Nevada, California, Arizona, and Mexico; 9 (ii). The materials from Cataract Canyon differ in tenuous ways from the typical material in Washington County; they do not seem worthy of taxonomic recognition.

Var. *heilii* Welsh & Neese Salt desert shrub communities at 1460 to 1680 m in Emery, Garfield, and Wayne (type from SW of Hanksville) counties; endemic; 3 (0).

***Opuntia chlorotica* Engelm. & Bigel.** Pancake Pricklypear. Shrubby plants, mainly 6–15 dm tall; trunk to 30 cm long; larger joints 15–20 cm long and about as broad, orbicular to suborbicular, blue green; areoles elliptic, ca 20 mm apart; spines present in all but basal areoles, yellowish, 1–6, all deflexed, straight or curved at the base, 2.5–4 cm long; glochids yellow; flowers 5–8 mm long; sepals and petals yellow, or suffused with red; ovary with glochids and some spinules; fruit fleshy, grayish, tinged with purple, lacking spines; seeds 2.2–3 mm long, tan, smooth. Creosote bush, blackbrush, and other warm desert shrub communities at 1400 m in Washington County (Beaver Dam Wash, Pine Valley Mts., and Zion Canyon); Nevada, California, Arizona, New Mexico, and Mexico; 3 (ii).

***Opuntia echinocarpa* Engelm. & Bigel.** Pale Cholla. Shrubs, mainly 8–15 dm tall; trunk to 1/2 of plant height; larger terminal joints mainly less than 15 cm long (5–15), 2–4 cm thick; tubercles decurrent along the joint, mostly 6–15 mm long and 4–5 mm wide; leaves caducous; areoles circular; spines 3–12 per areole, 1–3 cm long, straw colored or silvery or yellow; sheaths colored like the spines; glochids minute; flowers 3–4.5 cm long; sepals and petals greenish-yellow, the outer sometimes suffused reddish; fruit dry, green, turning tan; n = 11. Creosote bush, Joshua tree, blackbrush, and shadscale communities at 760 to 1376 m in Beaver (?) and Washington counties; Nevada, California, Arizona, and Mexico; 3 (ii).

***Opuntia erinacea* Engelm.** Plants mainly 10–30 cm tall and to 1 m in diameter or more; larger joints obovate to spatulate, glaucous, 5–19 cm long, 3–11 cm wide; areoles small, 4–18 mm apart; spines at all or most areoles or only in the upper ones (or lacking?); 4–9 per areole, deflexed, flexible, straight or irregularly curved, 0.5–10 cm long, less than 1 mm thick, at least some clearly flattened (at least basally); glochids yellow to tan or brown; flowers 4.5–7.5 cm long; sepals commonly greenish; petals yellow, bronze, pink, or violet; ovary usually spiny; fruit dry, tan to brown, spiny, 2.5–3 cm long, deciduous; seeds 4–6 mm long, whitish. Plants of this complex of morphologically differing forms intergrade freely among themselves, and they hybridize with the dry fruited *O. fragilis*, *O. nicholii*, and the varieties of *O. polyacantha*. Further, they hybridize with the fleshy fruited *O. phaeacantha*, *O. littoralis*, and likely with *O. macrorhiza*. Intergradation with *O. polyacantha* is sufficiently complete as to pose the question of whether maintenance of the proposed segregates within separate species is reasonable. I follow tradition in maintaining them thusly,

because, if a case is made for combining these two species then a similar case must be considered for union of all platyopuntias with which they intergrade into a single polymorphic species. The variants could then be recognized as belonging to numerous infraspecific taxa, approximately equal to the number of taxa recognized currently. Such a proposal would solve none of the basic problems resulting from intergradation of taxa, despite the convenience of having only one name at the specific level for all of the prickly pears. Four varieties are recognized.

- 1. Areoles with glochids only, lacking spines or essentially spineless; flowers ordinarily yellow; joints typically turgid; plants mainly of Kane County *O. erinacea* var. *aurea*
- Areoles with glochids and spines; flowers rose to orange or yellow; plants of broad distribution 2
- 2(1). Spines lacking in much of the joint, mainly confined to the upper half or along the upper edge; plants widespread *O. erinacea* var. *utahensis*
- Spines present in much or all of the joint; plants of the southern half of Utah 3
- 3(2). Spines stiff, rigid, the longest mainly 1–4 cm long; plants widespread in southern Utah *O. erinacea* var. *erinacea*
- Spines slender and more or less flexible, the longest 3–10 cm long; plants of Washington County *O. erinacea* var. *ursina*

Var. *aurea* (Baxter) Welsh [*O. aurea* Baxter, type from Pipe Springs, Arizona; *O. basilaris* var. *aurea* (Baxter) W. T. Marshall, n = 33. Sagebrush, pinyon-juniper, and ponderosa pine communities at ca 1220 to 2075 m in Kane and Washington counties; Arizona; a Plateau endemic; 6 (iii). Intermediates occur between this taxon and adjacent phases of *O. erinacea* and *O. polyacantha*. Previous inclusion with *O. basilaris* was evidently erroneous. Lack of spines was the main criterion for inclusion within that entity, but the relationship clearly lies with *O. erinacea* var. *utahensis*.

Var. *erinacea* [*O. hystricina* sensu Utah authors]. Warm and mixed desert shrub communities at 885 to 1285 m in Beaver, Emery, Grand, Kane, Millard, San Juan, Washington, and Wayne counties; Nevada to Colorado, California, Arizona, and New Mexico; 20 (ix). It has been postulated (Benson 1982) that this phase of *O. erinacea* is one of the putative parents of *O. nicholii*, the other being *O. phaeacantha*. Along Glen Canyon there are many specimens that bridge this variety with *O. nicholii*.

Var. *ursina* (Weber) Parish in Jepson [*O. ursina* Weber in Boiss.; *O. rubrifolia* Engelm. ex Coult., type from St. George]. Warm desert shrub community at 760 to 900 m in Washington County; Nevada, California, and Arizona; 4 (ii). Our material shows evidence of mixing with var. *erinacea*.

Var. *utahensis* (Engelm.) L. Benson [*O. sphaerocarpa* var. *utahensis* Engelm.; *O. rhodantha* K. Schum.; *O. xanthostemma* K. Schum.; *O. erinacea* var. *xanthostemma* (K. Schum.) L. Benson]. Blackbrush, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, and aspen communities at 1220 to 2810 m in most if not all Utah counties; Idaho to California, Arizona, New Mexico, and Wyoming; 24 (xiii). This variety is the counterpart of *O. polyacantha* var. *polyacantha*, with which it hybridizes wherever they meet.

Opuntia fragilis (Nutt.) Haw. Brittle Pricklypear. [*Cactus fragilis* Nutt.; *O. fragilis* var. *denudata* Wiegand & Backeberg; *O. brachyarthra* Engelm. & Bigel.; *O. fragilis* var. *brachyarthra* (Engelm. & Bigel.) Coult.]. Plants mat-forming, mainly 5–10 cm tall and to 5 dm wide; larger joints 2.5–7 cm long, 1–4 cm wide, obovate to ovate or orbicular to elliptic in outline, blue green, often to half as thick as wide or more, readily detached and transported by animals; leaves caducous; areoles 3–12 mm apart; spines in most areoles or only in the upper ones or sometimes lacking, 1–9 per areole, disoriented, 4–25 mm long or more, terete to somewhat flattened; glochids tan to brown; flowers 3.5–6 cm long; sepals greenish; petals yellowish, greenish, bronze, or violet; fruit dry, tan, spiny or spineless, 1.2–2.5 cm long; $n = 33$. This is a taxon of unusually great latitude of habitat types ranging from low elevation marshlands and riparian sites upwards to pinyon-juniper, ponderosa pine, sagebrush, mountain brush, and aspen communities at 1370 to 2565 m in Box Elder, Carbon, Duchesne, Emery, Garfield, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Uintah, Utah, Wayne, and Weber counties; British Columbia to Ontario, south to California, Nevada, Arizona, New Mexico, Texas, and Iowa; 13 (iii). Morphological amplitude of our specimens is greater than that reported for the species as a whole (Benson 1982), excluding hybrids presumably intermediate with both *O. erinacea* and *O. polyacantha*. Recognition of proposed infraspecific taxa seems moot.

Opuntia littoralis (Engelm.) Britt. & Rose [*Opuntia engelmannii* var. *littoralis* Engelm.]. Plants mainly 30–50 cm high and 0.5–1.2 m wide, erect or more or less sprawling; larger joints 10–18 cm long, 7–14 cm wide, obovate to orbicular, green or glaucous; areoles mainly 15–30 mm apart; spines in all, or only in the upper, areoles, 1–6 per areole, mainly 2–7 cm long, spreading to deflexed, straight or curved, terete to somewhat flattened; glochids yellowish to brown; flowers 5–7.5 cm long; sepals greenish; petals yellow, the bases sometimes violet or rose purple; fruit fleshy, reddish or purplish red, armed with glochids, 3–6 cm long; seeds 3–6 mm long, tan or gray. Pinyon-juniper community (?) in Washington and San Juan counties (reported by Benson 1982); Nevada, California, and Arizona; 1 (0). This plant can be mistaken for *O. phaeacantha*, with which it is at least partially sympatric. Our material is assigned to var. *martiniana* (L. Benson) L. Benson [*O. eriocentra* var. *martiniana* L. Benson].

Opuntia macrorrhiza Engelm. Plains Pricklypear. [*O. utahensis* Purpus, type from the Pine Valley Mts. *O. compressa* Macbr.; *O. basilaris* var. *woodburyi* Earle, type from Fort Pierce Wash, Washington County, pro max. parte]. Plants mainly 7–15 cm high and 2–15 dm wide or more; larger joints 5–15 cm long, 5–7.5 cm wide, obovate to orbicular, glaucous; leaves caducous; spines mainly in upper areoles, 1–6 per areole, commonly deflexed, straight or slightly curved, 1.5–5 cm long, terete or somewhat flattened; glochids yellow to brown; flowers 5–6.5 cm long; sepals greenish or reddish; petals yellow or tinged reddish basally; ovary smooth at anthesis, with few areoles; fruit fleshy, purple or purplish, with some glochids, 2.5–5 cm long; seeds 4–5 mm long, tan or gray; $n = 22$. Mixed desert shrub, pinyon-juniper, and mountain brush communities in Garfield, Iron, Kane, Piute, Salt Lake, San Juan, and Washington counties, the

reports mainly by Benson (1982); Idaho to Wisconsin, south to Mexico, Texas, and Louisiana; 14 (vii). This is mainly a Great Plains species, with extensions into Utah where some of the reports might represent recent introductions. However, the principal population in Utah is in eastern Washington and western Kane counties. The plants from there have long been mistaken for *O. basilaris*, but the stems sprawl and root along the points of contact. They form numerous hybrids with the similarly fleshy fruited *O. phaeacantha* var. *discata*. One of these hybrids is the basis of *O. basilaris* var. *woodburyi*. The similar *O. humifusa* (Raf.) Raf. is reported for Utah on the basis of a collection from Utah County (Mason 6570 US), which was taken from along a railroad right-of-way. It is distinguished by having green joints and 1 spine per areole.

Opuntia nicholii L. Benson Plants mainly 15–25 cm high and 0.5–2 m wide or more; larger joints 10–20 cm long and 5–12 cm wide, narrowly obovate to obovate, bluish green; areoles 10–20 mm apart; spines usually in all areoles, 4–7 per areole, deflexed, often twisted and curving, mainly 5–12 cm long, flattened, some more than 1 mm thick; glochids yellow or tan; flowers 6–7 (8) cm long; sepals green, edged with purple or yellow; petals violet or yellow; fruit dry, tan to brown, 2.5–3.5 cm long, more or less spiny; seeds 7–8 mm long, whitish. Salt desert shrub and warm desert shrub communities at 1200 to 1500 m in Garfield, Kane, and San Juan counties (where it grows along Glen Canyon); Arizona; a Plateau endemic; 3 (i). Evident intermediates between *O. nicholii* and both *O. erinacea* var. *erinacea* and *O. phaeacantha* are known. Benson (1982) postulates a hybrid origin for this entity, and states that it should probably best be treated at varietal rank, but with which species?

Opuntia phaeacantha Engelm. Berry Pricklypear. Plants 30–90 cm high and 3–15 dm wide or more; larger joints 10–40 cm long, 7–25 cm wide, obovate to suborbicular, bluish green; areoles mainly 20–34 mm apart; spines in most areoles or restricted to upper ones or along the margin, 1–9 per areole, or none, spreading or deflexed, 2–8 cm long, flattened at least basally in some; glochids brown, reddish, or tan; flowers 6–9 (10.5) cm long; sepals greenish, edged yellow or red; petals yellow, or suffused with red below; ovary spineless, but with glochids; fruit fleshy, purple to red purple, 3.5–8 cm long; seeds 4–5 mm long, tan to gray; $n = 22, 33$. Three intergrading varieties have been identified from Utah (Benson 1982); their recognition at taxonomic rank is questionable, at least as far as our specimens are concerned.

1. Larger joints 10–15 cm long and 7–10 cm wide; plants of Washington and San Juan counties *O. phaeacantha* var. *phaeacantha*
- Larger joints 12–40 cm long and 9–25 cm wide; plants of various distribution 2
- 2(1). Joints mainly 12–20 cm long and 9–15 cm wide; plants rather broadly distributed in southern Utah *O. phaeacantha* var. *major*
- Joints mainly 20–40 cm long and 15–25 cm wide; plants of San Juan and Washington counties *O. phaeacantha* var. *discata*

Var. *discata* (Griffiths) Benson & Walkington [*O. discata* Griffiths *O. palmeri* Engelm., type from near St. George]. $n = 33$. Warm desert shrub, pinyon-juniper,

and sagebrush communities at 905 to 1800 m in San Juan (White Canyon, associated with prehistoric Indian dwellings) and Washington counties; California to Texas and Mexico; 8 (v). Some plants presumed to belong to this variety from along Beaverdam Wash have very long flowers and ovaries. They do not differ otherwise from the remainder of the variety.

Var. *major* Engelm. 2n = 44, 66. Warm desert shrub, pinyon-juniper, and mountain brush communities in Garfield, Kane, San Juan, and Washington counties; Nevada to Kansas, south to California, Mexico, and Texas; 8 (iii). This is the common phase of the species in Utah; plants north of the southern tier of counties having fleshy fruit probably belong to *O. macrorhiza*, with which transitional forms are known.

Var. *phaeacantha* This variety is reported by Benson (1982) from Washington County; Arizona, Colorado, New Mexico, Texas, and Mexico; 0 (0).

Opuntia polyacantha Haw. Central Pricklypear. [*O. barbata* K. Schum., type from the La Sal Mts.; *O. barbata* var. *gracillima* M. Brandegees ex Purpus, type from the La Sal Mts.]. Plants mainly 5–20 cm high and 3–30 dm wide or more; larger joints 5–15 (20) cm long (rarely longer) and 4–12 cm wide, obovate to orbicular, bluish green, not readily detached; areoles mainly 5–15 mm apart; spines variously borne in some or all areoles or lacking, often 6–10 per areole, variously oriented (all erect or spreading or some or all deflexed), straight or curved, terete (or somewhat flattened); glochids yellowish or tan; flowers 5–8 cm long; sepals green, margined with yellow or red; petals yellow, bronze, or pink to violet; ovary with glochids and often spines; fruit dry, 2–4 cm long, spiny, tan or brownish, deciduous; seeds 3–6 mm long, tan to white. This species, along with *O. erinacea*, forms a complex around which revolve all other species of subgenus *Opuntia* (the platyopuntias) in Utah. Members of this complex form hybrids with *O. fragilis*, *O. erinacea*, and *O. phaeacantha*. Those, in turn, are transitional to all other species. Diversity of form and joint size; spine length, number, size, cross-sectional shape, and color; flower size and color; and other features give indications of genetic variability, differential response to ecological situations, and of problems of interpretation. Three varieties from Utah are treated by Benson (1982); they are more or less sympatric and intergrading.

1. Spines slender, flexible and curving, often whitish; plants of Grand and San Juan counties *O. polyacantha* var. *trichophora*
- Spines slender to coarse, not flexible (penetrating the skin before collapsing), mostly straight, or sometimes lacking; plants of various distribution 2
- 2(1). Spines in lower areoles mainly less than 12 mm long, those of upper areoles mainly less than 4 cm long, or spines lacking *O. polyacantha* var. *polyacantha*
- Spines in lower areoles mainly over 12 mm long, those of upper areoles often over 4 cm long *O. polyacantha* var. *rufispina*

Var. *polyacantha* [*O. polyacantha* var. *watsonii* Coult., type presumably from Summit County; *O. juniperina* Britt. & Rose; *O. polyacantha* var. *juniperina* (Britt. & Rose) L. Benson]. 2n = 44. Salt Desert shrub, mixed desert shrub, pinyon-juniper, sagebrush, mountain brush, mixed conifer, and aspen communities at 1370

to 2565 m in probably all Utah counties; British Columbia to Saskatchewan, south to Nevada, New Mexico, and Oklahoma; 39 (v). This variety is transitional with the next.

Var. *rufispina* (Engelm. & Bigel.) L. Benson [*O. missouriensis* var. *rufispina* Engelm. & Bigel.]. 2n = 22, 66. Blackbrush, mixed desert shrub, and pinyon-juniper communities at 1370 to 2200 m in Carbon, Emery, Garfield, Grand, Kane, Millard, San Juan, Washington, and Wayne counties; Wyoming to Nevada and California, south to Arizona and Texas; 21 (iii). This assemblage seems not to represent plants with genetic affinities. Rather the specimens appear to be artificial aggregations of phenotypically similar individuals. The use of spine characteristics as diagnostic results in a dilemma; the assemblage thus defined should be allied genetically to be recognized at a taxonomic level, but the definition is faulty. Thus, those plants of the Colorado drainage system show evidence of derivation from hybridization with *O. erinacea*, the plants of the Great Basin do not.

Var. *trichophora* (Engelm. & Bigel.) Coult. [*O. missouriensis* var. *trichophora* Engelm. & Bigel.]. 2n = 22, 44. Desert shrub and pinyon-juniper communities at 1125 to 1250 m in Grand, Kane, and San Juan counties; Colorado, Arizona, and New Mexico, Oklahoma, and Texas; 6 (iv).

Opuntia pulchella Engelm. Sand Cholla. Plants mainly 3–10 cm tall and about as broad, arising from an areolate glochid-armed tuberous joint 2–7 cm thick or more; joints mainly 1–5 cm long and 0.6–1.5 (2) cm thick, clavate to cylindrical, green or blue green; tubercles 5–9 mm long and 4–5 mm wide; areoles spineless or with the upper mainly spiniferous, 8–15 per areole, straight or curved, 1–3.5 cm long or more, strongly flattened, the epidermal sheath not at all or poorly developed; glochids yellow to brown; flowers 3–4.5 cm long; sepals green, margined with pink purple; petals purple to violet; fruit 2–3 cm long, fleshy, red, prominently areolate and spiny; seeds 3–4.5 mm long, whitish; 2n = 22. Salt and mixed desert shrub communities at 1430 to 1770 m in Juab, Millard, Tooele, and Washington (?) counties; Nevada; a Great Basin endemic; 8 (iv). This taxon was named three times from Utah, all of the names based on types taken from the Desert Experimental Range in western Millard County, i.e., *Micropuntia brachyropalia* Daston, *M. barkleyana* Daston, and *M. spectatissima* Daston. All are characteristic of the species as it occurs in Utah, and none are worthy of taxonomic consideration.

Opuntia whipplei Engelm. & Bigel. Whipple Cholla. Plants low shrubs or less commonly mat-forming, mainly 10–60 cm tall or more; larger joints 2–15 cm long and 1–2 (2.5) cm thick; tubercles 8–9 mm long, 3–5 mm wide; leaves caducous; spines 4–10 or more per areole, straight, mainly 0.6–3 cm long, subulate to flattened; glochids yellow to tan or whitish; flowers 2–4 cm long; sepals and petals yellowish or yellowish green; fruit fleshy, 2–3 cm long, yellow, glochidiate; seeds 2.5–3 mm long, tan; n = 11. Desert shrub-grass and pinyon-juniper communities at 1340 to 1895 m in Beaver, Grand (?), Iron, Kane, Millard, San Juan, and Washington counties; Nevada, Colorado, Arizona, and New Mexico; 19 (xi). Our material belongs to var. *whipplei*. Specimens with short terminal joints have been regarded tentatively as var. *multigeniculata*, but they fit in a graded series with *O. whipplei* in a strict sense. Dwarf plants at the limits of

their ecological tolerance seem to represent a "cactus-line," corresponding to the dwarf conifers at "timberline." This seems to be the case with *O. whipplei* at the northern margin of its distribution in southwestern Millard County. A taxon represents the sum of its characteristics, not merely those considered to be diagnostic. *O. multigeniculata* is evidently restricted to the Spring (Charleston) Mountains and vicinity in southern Nevada.

Pediocactus Britt. & Rose

Plants globose to depressed-hemispheric, solitary; tubercles spirally arranged; areoles woolly, at least when young, with spines various but not hooked; flowers subterminal, borne at one side of the areole at the tubercle apex, small; sepaloids shorter than the petaloids; fruit dry, green, becoming tan to brownish or yellowish, naked or scaly, dehiscing by a vertical slit; seeds black tuberculate.

Heil, K., B. Armstrong, and D. Schleser. 1981. A review of the genus *Pediocactus*. *Cactus & Succ. J. (U.S.)* 53: 17-39.

- 1. Central spines 1-7, 6-30 mm long or more 2
- Central spines lacking, the longest lateral spines mainly less than 6 mm long 3
- 2(1). Longest spines mainly 12-25 mm long; sepaloids long-fimbriate; plants known only from gypsiferous substrates in Washington and Kane counties *P. sileri*
- Longest spines mainly 6-12 mm long; sepaloids subentire or shortly fimbriate; plants broadly distributed, seldom as above *P. simpsonii*
- 3(1). Longest spines 4 mm long or less, white, or lacking, often obscured by a dense mat of persistent white hairs; flowers peach to pink; plants of western Wayne County *P. winkleri*
- Longest spines more than 4 mm long, pale yellowish, not obscured by hairs, the woolly hairs pale yellowish and caducous; flowers yellow to peach; plants of north-central Emery County *P. despainii*

Pediocactus despainii Welsh & Goodrich Despain Footcactus. Plants solitary or less commonly colonial, subglobose to depressed-hemispheric, 3.8-6 cm tall, 3-9.5 cm wide; tubercles 6-10 mm long, 5-11 mm wide; areoles elliptic, persistently white-woolly, the central spines lacking; radial spines 9-13, 1.7-6 mm long, pale yellowish; flowers 1.5-2.5 cm long, 1.8-2.5 cm wide; petaloids yellow bronze to bronze or pinkish; fruit green, drying reddish brown, smooth, obovoid, 9-11 mm long, 10-12 mm wide; seeds shiny black, papillate to ridged, 3-3.5 mm long. Open pinyon-juniper community on limestone gravels at ca 1830 m in Emery (type from San Rafael Swell) County; endemic; 5 (0).

Pediocactus sileri (Engelm.) L. Benson Gypsum Cactus. [*Echinocactus sileri* Engelm. in Coult.; *Utahia sileri* (Engelm.) Britt. & Rose]. Plants solitary (less commonly colonial), depressed-hemispheric to cylindrical, 5-25 cm high, 6-12 cm wide; tubercles 9-15 mm long, 6-11 mm wide; areoles circular, persistently white-woolly; central spines 3-7, 13-30 mm long, blackish brown when young, straight; radial spines 11-15, 11-21 mm long, white; flowers 18-22 mm long, 20-30 mm wide; petaloids yellow or yellowish with purple veins; sepaloids conspicuously fringed; fruit dry, greenish yellow, 1.2-1.5 cm long; seeds gray to black, 3.5-5 mm long; n = 11. Salt desert shrub community at ca 900 to 1590 m in Kane and Wash-

ington counties; Arizona; a Plateau endemic; 3 (i). The type locality for this remarkable species is Pipe Springs, Arizona, but those springs were thought by early collectors to be in Utah, hence the name *Utahia*, which commemorates an Arizona type.

Pediocactus simpsonii (Engelm.) Britt. & Rose Simpson Footcactus. [*Echinocactus simpsonii* Engelm.; *P. hermannii* W. T. Marshall, type from near Hatch; *E. simpsonii* var. *minor* Engelm.; *P. simpsonii* var. *minor* (Engelm.) Cockerell]. Stems solitary or colonial, depressed-hemispheric to subglobose, 2-15 cm high, 3-20 cm wide (or more); tubercles 5-25 mm long, 4-7 mm wide; areoles elliptic to subcircular; central spines (1-3) 4-10, mainly 5-25 mm long, brownish or blackish; radial spines mainly 10-25, white; flowers 1.2-3 cm long; petaloids whitish, pinkish, yellowish or greenish; sepaloids shortly fimbriate; fruit green, often turning reddish brown, with few scales, 6-11 mm long, 5-10 mm wide; seeds gray to black, tuberculate, 2-3 mm long. Shadscale, mixed desert shrub, pinyon-juniper, sagebrush, and Douglas fir communities at 1460 to 2830 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, San Juan, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Washington to Wyoming, south to Nevada, Arizona, and New Mexico; 41 (xiii). Segregation of this common species of cactus into varieties seems not to be practical or even possible for Utah materials. Ridgetops in some south-central mountain and plateaus support one to several plants per square foot, mainly flush with the ground surface.

Pediocactus winkleri Heil Winkler Footcactus. Plants solitary or sometimes colonial, 3.9-6.8 cm tall, 2.7-5 cm wide; tubercles 4-7 mm long, 5-7 mm wide; areoles elliptic, persistently white-woolly; central spines lacking; radial spines 8-14, 1.5-4 mm long, white; flowers 1.7-2.2 cm long, 1.7-3 cm wide; petaloids peach to pink; sepaloids like the petaloids, except the outer darker; fruit green, drying reddish brown, smooth, obovoid, 7-10 mm long, 8-11 mm wide; seeds shiny black, papillate to ribbed, 2.5-3 mm long. Salt desert shrub communities at 1460 to 1590 m in Wayne (type from east of Capitol Reef) County; endemic; 5 (0). This is a remarkable tiny plant of poor quality saline fine-textured substrates.

Sclerocactus Britt. & Rose

Plants subglobose, depressed-hemispheric, ovoid, obovoid, or cylindrical; ribs 8-17; tubercles coalescent; areoles circular to elliptic; central spines 0 or 1-10, usually 1 or more hooked, or all straight; radial spines 2-15, straight; flowers subterminal, borne on upper side of tubercle adjacent to the areole, the sear persisting; floral tube short; petaloids pink to violet, white, or yellow; fruit dry, green turning reddish to tan, naked or with scales, debiscent by basal and horizontal or lateral and vertical slits; seeds black, papillate-reticulate. Note: The taxonomy of this genus is subject to interpretation because of the remarkable diversity of form present in each of the species complexes.

- 1. Plants depressed-hemispheric to subglobose; areoles retaining juvenile pubescent radial spines for some years, finally with 1 or 2 hooked central spines; plants of the Great Basin *S. pubispinus*
- Plants variously shaped, but if as above and with areoles retaining juvenile radial spines for several years, the spines glabrous and plants not of the Great Basin 2

- 2(1). Flowers mostly 2–3 cm long and broad; yellowish, pink, or white with pale pink midrib dorsally; juvenile condition retained for several years; plants of Emery and Wayne counties *S. wrightiae*
- Flowers mostly 3.5–5 cm long and broad, rose pink to violet, white, or yellow; plants of broad distribution in eastern Utah *S. whipplei*

Scleroactis pubispinus (Engelm.) L. Benson Basin Fishhook. [*Echinocactus pubispinus* Engelm.]. Plants solitary or sometimes colonial, depressed-hemispheric to ovoid, 1–10 cm high, 2–15 cm wide; ribs 6–13; tubercles more or less developed; areoles circular to elliptic; juvenile spines and often the others (in part) densely or sparingly white-pubescent, finally glabrate; central spines lacking or 1–5, the lower 1 often hooked, 1–3 cm long, the upper 1 flattened, 5–35 mm long, 0.7–2.2 mm wide; radial spines 5–12, spreading; flowers 2.5–3.5 cm long; sepals bronze to brownish; petals yellow, bronze, pink, or violet to rose purple; fruit dry, green or pink becoming tan to brownish, ellipsoid to obovoid, opening by vertical slits; seeds 2.8–3.4 mm long, papillate, black. This species was named simultaneously in 1863 as *Echinocactus pubispinus* and as *E. whipplei* var. *spiniosior*. The type of the former was taken in Pleasant Valley, Juab County, Utah or in adjacent White Pine County, Nevada (the boundary bisects the valley), and that of the latter was taken in the Dugway or Thomas ranges in central northern Juab County. Both remained obscure for almost a century, with *S. pubispinus* being ignored and var. *spiniosior* being placed with *S. whipplei* and interpreted as including what now belongs in var. *intermedius* of that species (sensu stricto, which it resembles in its broad upper central spines). The type of *S. pubispinus* is a juvenile plant lacking both flowers and fruit; that of var. *spiniosior* consists of flowers and seeds. Modern interpretations are based on interpolations of presumed collection localities with known modern occurrences of these dwarf cacti. In a way these peculiar cacti share characteristics of *S. blainei* Welsh of southern Nevada (pubescent spines and the tendency to flattened upper central spine) and with *S. whipplei* (the flattened upper central spine). The smaller flowers and depressed growth form are diagnostic from both. There are two intergrading and partially sympatric varieties present.

- 1. Flowers rose to violet; widest upper central spines 1–2.2 mm wide *S. pubispinus* var. *spiniosior*
- Flowers bronze to yellow; widest upper central spines 0.7–1 mm wide *S. pubispinus* var. *pubispinus*

Var. *pubispinus* Shadscale, sagebrush, winterfat, rabbitbrush, and pinyon-juniper communities on calcareous and dolomitic gravels and outcrops at 1800 to 1955 m in Beaver, Box Elder, Iron, Juab, Millard, and Tooele counties; Nevada; a Great Basin endemic; 13 (vi).

Var. *spiniosior* (Engelm.) Welsh [*Echinocactus whipplei* var. *spiniosior* Engelm.; *S. spiniosior* (Engelm.) Woodruff & L. Benson]. Shadscale, rabbitbrush, sagebrush, and pinyon-juniper communities on calcareous and igneous gravels and clay silts at 1525 to 1985 m in Beaver, Juab, Millard, and Sevier counties; Arizona (?); 15 (x). The range of this variety is partially sympatric with var. *pubispinus* in western Beaver County and intermediates are known. The population from Sevier County dif-

fers in subtle ways (i.e., more like *S. whipplei*) from the remainder of the taxon, but does not seem to be worthy of taxonomic rank.

Scleroactis whipplei (Engelm.) Britt. & Rose Whipple Fishhook. [*Echinocactus whipplei* Engelm. & Bigel.]. Plants solitary or in small colonies, depressed-hemispheric, obovoid, ovoid, or cylindrical, 5–45 cm tall or more, 5–15 cm thick; ribs mainly 8–15, tuberculate; central spines 1–4, the lower 1 (sometimes 2–4) hooked or all straight, mainly 1–7.5 cm long, curved or some or all of them straight, the upper central spine (at least) usually pale and flattened to flat and ribbonlike, 1–5 cm long or more, 0.7–3.5 mm wide, erect; radial spines 7–12 or more; flowers 3.5–5 cm long; sepals greenish, margined with rose purple, pink, white, or yellow; petals pink, violet, white, or yellow; fruit dry, green, becoming tan, sparingly scaly, 1.2–2.5 cm long; seeds 2–3.4 mm long, black, papillate. Salt and mixed desert shrub, pinyon-juniper, sagebrush, and ponderosa pine communities at 1125 to 2440 m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Uintah, and Wayne counties; Colorado, New Mexico, Arizona, and Nevada; 134 (xxxi). Our materials belong to var. *roseus* (Clover) L. Benson [*S. havasupaiensis* var. *roseus* Clover; *S. intermedius* Peebles, type from Pipe Springs, Arizona; *S. whipplei* var. *intermedius* (Peebles) L. Benson; *S. parviflorus* var. *intermedius* (Peebles) Woodruff & Benson; *S. parviflorus* Clover & Jotter, type from Forbidding Canyon, San Juan County; *S. contortus* Heil, type from eastern Wayne County; *S. terrae-canyonae* Heil, type from Trachyte Wash, Garfield County; *E. glaucus* Purpus ex K. Schum.; *Scleroactis glaucus* (K. Schum.) L. Benson; *S. whipplei* var. *glaucus* (Purpus) Welsh]. Spine characteristics are notoriously variable in this genus. Specimens of *Scleroactis* with straight spines have long been known and they have been recognized as belonging to this genus. Their status has been open to question, because they differ in no other discernible way from the body of the species. Specimens with straight spines occur here and there through much of the range of *S. whipplei*, even though they are more common at the margin of the distribution in the Uinta Basin and in west-central Colorado. They are considered herein to be taxonomically negligible. A peculiar phase of var. *roseus* from the Pariette Draw region of southeastern Duchesne County has a long juvenile stage, with the initial central spines very short (to 2 mm long) and hooked or straight. It does not seem to warrant taxonomic recognition. Some tiny juvenile plants have pubescent spines, but the juvenile stage is apparently arrested in most portions of this variety. The var. *roseus* is almost as variable as the species itself. It has been treated previously at specific rank (as three separate species) and as consisting of three varieties. With the degree of variability exhibited it is not surprising that so many divergent views should have developed; it is surprising that even more segregation was not attempted. *S. contortus* is a slender-spined phase in which the spines are contorted, a condition that seems to be unworthy of consideration from a taxonomic standpoint. *S. terrae-canyonae* appears to be more substantially based, with its long slender spines and yellow flowers. There is little correlation, however, between flower color and spine length. Long-spined phases are more common in the southeastern portion of Utah, but the flowers of the long-spined phases are mainly pink to

violet. Spine length forms a cline from long in the south-east to short in the northwestern and northern portions of the range. The var. *intermedius* is more difficult to discount. In the extreme situations that variety has the uppermost central spine flattened and ribbonlike, commonly 1–3.5 mm wide at the base, and with var. *roseus* (or *S. parviflorus* per se) having the uppermost spine merely flattened and mainly 0.7–1 mm wide. There are as many intermediates as there are extremes, and until other diagnostic criteria are identified, it seems best to include all of the tremendous range of variation within an expanded var. *roseus* of *S. whipplei*.

***Sclerocactus wrightiae* L. Benson** Wright Fishhook. Plants depressed-hemispheric to obovoid or short-cylindric, mainly 6–12 cm long and 4–8 cm thick; ribs mostly 8–13; tubercles more or less developed; areoles circular to elliptic; juvenile spines glabrous; central spines 1–4, the lower one often hooked on at least the upper tubercles, mostly 10–20 mm long, the uppermost 1–2.5 cm long, flattened, 0.8–1.5 mm wide; radial spines 8–11, spreading; flowers 2–3.5 cm long; sepals green or variously tinged with red or brown; petals yellowish to white or pink; fruit ellipsoid, 9–12 mm long; seeds black, tuberculate, 3–3.5 mm long. Salt desert shrub and shrub-grass to juniper communities at 1460 to 1865 m on Mancos Shale (Bluegate, Tununk, Emery, and Ferron members), Dakota, Morrison, Summerville, and Entrada formations in Emery and Wayne counties; endemic; 14 (iii). The small flowers and short spines are evidently diagnostic. Occasional intermediates with *S. whipplei* var. *roseus* occur in Emery County near the Sevier County line—at edaphic ecotones marking the boundary between shale and sandstone members of the Mancos Shale Formation.

CALLITRICHACEAE Link

Water-starwort Family

Slender, annual, monoecious, aquatic (terrestrial) herbs; leaves simple, opposite, entire, floating or submerged; flowers imperfect, solitary in leaf axils; calyx and corolla lacking; staminate flower of a single stamen; pistillate flowers of a single pistil, the ovary superior, 2-loculed (or 4-loculed by intrusion of false septae); styles 2, slender; fruit a schizocarp; x = 3, 5+.

Callitriche L.

Aquatic herbs, floating or submerged; flowers inconspicuous, much reduced; ovary superior; fruit a schizocarp.

Fassel, N. C. 1951. *Callitriche* in the New World. *Rhodora* 53: 137–55, 161–82, 185–94, 209–22.

- 1. Leaves uniformly linear-lanceolate to oblong, 3–13 mm long, the bases not connected by a ridge or wing *C. hermaphroditica*
- Leaves not uniformly linear-lanceolate, some or all of them broader or, if all linear, more than 13 mm long and bases connected by a ridge or wing 2
- 2(1). Fruit definitely obovoid, longer than broad, broadest about the middle, usually narrowly winged apically; plants common *C. verna*
- Fruit suborbicular in outline, about as broad as long, broadest near the middle, inconspicuously if at all winged apically *C. heterophylla*

***Callitriche hermaphroditica* L.** Plants slender, mainly 5–30 cm long; leaves mainly 3–13 mm long, all linear-lanceolate to narrowly oblong, 1-veined and bidentate apically; flowers not subtended by bracts; fruits grayish, 1–2 mm long, narrowly winged apically, the pitlike depressions not in definite rows; 2n = 6. Reservoirs, stock ponds, lakes, and sluggish streams at 2150 to 3205 m in Cache, Daggett, Salt Lake, Sevier, Summit, Uintah, and Utah counties; Alaska east to Newfoundland, south to California, New Mexico, and New York; 7 (ii).

***Callitriche heterophylla* Pursh** Plants aquatic or growing on mud, mainly 5–25 cm long; leaves with small membranous ridges connecting across the nodes, the emerged ones 1-nerved, 5–25 mm long, the vein not projecting into an apical notch, the floating and emergent ones broadly obovate to elliptic, mainly 1.5–5 mm wide (or more) and 3-nerved; floral bracts present; fruit more or less orbicular in outline, 0.6–1.2 mm long and about as broad, widest at or near the middle, wingless or rarely narrowly winged apically; 2n = 20. Beaver ponds, marshes, lakes, and reservoirs at 2285 to 3175 m in Daggett (?), Duchesne, Grand, Piute, Summit, Uintah, and Wasatch counties; widely distributed in North America; South America; 6 (i). Note: Reported for Utah (Flora Pacific N. W. 3:403. 1961) is *C. anceps* Fern. It differs in minor technical characteristics from *C. heterophylla*, i.e. the fruits are essentially orbicular, and the midnerve of the leaf projects beyond the leaf tip. The extent of plants with these features in Utah, if any, is unknown.

***Callitriche verna* L.** Vernal Water-starwort. [*C. palustris* L.]. Plants slender, 5–30 cm long; leaves mainly 3–15 mm long, linear, 1-veined, and shallowly bidentate apically, the upper ones often enlarged and the terminal ones petioid and narrowly obovate to spatulate, 3-veined, and often floating; flowers subtended by bracts; fruit tan to pale reddish brown, 1–2 mm long, more or less winged apically, the pitlike depressions arranged in rows; 2n = 20. Ponds, beaver ponds, sluggish streams, bogs, and muddy banks at 2400 to 3390 m in Cache, Daggett, Duchesne, Garfield, Rich, Salt Lake, Sevier, Summit, Uintah, Utah, and Washington counties; widespread in North America; Eurasia; 17 (i).

CAMPANULACEAE A. L. Juss.

Bellflower Family

Herbs, usually with milky juice; leaves simple, alternate, stipulate; flowers usually perfect; sepals 5, persistent; corolla 5-lobed, regular or irregular; stamens 5, distinct or connate; pistils 1; ovary inferior, 2- to 5-loculed; style 1; fruit a capsule, opening by pores, slits, or valves; x = 6–17. *Heterocodon rariflorum* Nutt. was discovered in Washington County too late for formal treatment.

- 1. Corolla regular; anthers and filaments distinct 2
- Corolla irregular, bilabiate; anthers distinct or connate . . . 3
- 2(1). Flowers pedicellate or pedunculate, borne in racemes or solitary; plants perennial *Campanula*
- Flowers sessile, borne in spikes; plants annual *Triodanum*
- 3(1). Flowers minute, 2–3 mm broad; anthers alike, distinct; plants diminutive annuals with capillary branches *Nemacladus*
- Flowers larger, more than 5 mm broad; anthers united into a tube, with 2 shorter ones; plants annual or perennial, not with capillary branches 4

- 4(3). Flowers sessile, axillary; ovary linear, simulating a pedicel; capsule dehiscent by longitudinal slits *Downingia*
- Flowers pedicellate; ovary obconic, opening by valves . . . 5
- 5(4). Plants palustrine annuals; corolla 6–10 mm long *Porterella*
- Plants perennial or annual; corolla 12–25 mm long or more *Lobelia*

Campanula L.

Perennial herbs; leaves often dimorphic, the lower ones petiolate and with obovate to lanceolate or elliptic blades and the upper ones linear and sessile, or all petiolate and broader; flowers solitary or racemose, blue to violet or white, regular, campanulate; calyx 5-lobed; corolla 5-lobed; stigmas 3–5; ovary 3-loculed; fruit a capsule, opening subbasally or apically.

- 1. Cauline leaves lanceolate to lance-ovate, serrate, petiolate to stem middle or above; flowers several to numerous, borne in axils of foliose bracts; plants adventive *C. rapunculoides*
- Cauline leaves linear to narrowly oblong, entire, sessile or subsessile; flowers solitary or several; bracts much reduced; plants indigenous 2
- 2(1). Flowers solitary, 4–10 mm long; anthers 1.5–2.5 mm long; calyx lobes 3–4 mm long; plants of the Uinta and La Sal mts. *C. uniflora*
- Flowers solitary or 2–several, 10–20 mm long; anthers 4–6 mm long; calyx lobes 5–10 mm long or more 3
- 3(2). Sepals 5–7 (8) mm long, entire; leaf bases and petioles glabrous or merely hispidulous; flowers nodding or erect; plants of the Uinta Mts. *C. rotundifolia*
- Sepals 7–12 mm long or more, often callous-toothed; leaf bases and petioles ciliate (at least the lowermost); flowers erect; plants of central and southern Utah *C. parryi*

Campanula parryi Gray Parry Bellflower. Perennial herbs; stems 5–30 cm tall, pubescent at the base or glabrous throughout; lower leaves 1.5–6 cm long, spatulate to oblanceolate, entire or denticulate, ciliate on petiole at least, becoming sessile and linear upwards; flowers solitary (rarely 2), erect; sepals 7–12 mm long or more; corolla 10–20 mm long, campanulate, blue to purple or white; anthers 4–6.5 mm long; capsules opening by valves or pores near the summit. Ponderosa pine, aspen, and spruce-fir communities, often where wet, at 1920 to 3205 m in Beaver, Garfield, Iron, Kane, Piute, San Juan, Sanpete, Sevier, and Wayne counties; Colorado, Arizona, and New Mexico; 37 (iii).

Campanula rapunculoides L. Rover Bellflower. Perennial herbs from taproots and rootstocks; stems 2.5–14 dm tall, glabrous or pubescent; lower leaves long-petiolate, cordate-ovate; cauline leaves lance-ovate to lanceolate, the blades 2.5–10 cm long, 0.6–4.5 cm wide, short-petiolate, becoming sessile upwards, irregularly serrate to doubly serrate; flowers blue, the corollas 15–30 mm long, the lobes 5–12 mm long, nodding, shortly pedicellate, secund; calyx lobes reflexed, 4–8 mm long; capsule opening basally; 2n = 68, 102. Cultivated ornamental, persisting and escaping, at 1370 to 2505 m in Cache, Duchesne, Emery, Tooele, Uintah, and Utah counties; introduced from Eurasia; 7 (0).

Campanula rotundifolia L. Bluebells of Scotland. Perennial herbs from a slender rhizome or from a caudex,

with 1 to several decumbent to ascending or erect stems 1–5 dm tall or more, glabrous and smooth or minutely scabrous in some; leaves mainly cauline, commonly 10–22, 0.7–8 cm long, 0.1–1.5 cm wide, more or less dimorphic, the lower ones often with broad, cordate-ovate, lanceolate, or elliptic blades and distinctive petioles, the upper ones reduced and linear to lance-linear to oblong, serrulate to entire, the margins scabrous; flowers solitary or 2–15; pedicels glabrous; calyx and ovary glabrous; calyx sinuses lacking appendages; corolla blue (rarely white), 15–30 mm long, the lobes ovate or broader, erect or ascending, much shorter than the tube; styles shorter than the corolla, but usually exceeding the tube; anthers 5–7 mm long; capsules obconic, nodding, opening at the base; 2n = 34, 66, 102. Ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 2285 to 3480 m in Daggett, Duchesne, Summit, Uintah, and Wasatch (?) counties; Alaska and Yukon, east to Newfoundland, south to California and Mexico; Eurasia; 38 (vi).

Campanula uniflora L. Arctic Harebell. Perennials, from elongate rhizomes; stems 1 to several, decumbent to erect, 3–20 (28) cm tall, glabrous, or more or less hairy in decurrent lines; leaves mainly cauline, usually 4–10, 0.5–4 (4.5) cm long, 1–5 (7) mm wide, elliptic to oblanceolate or linear, entire to crenulate, glabrous or nearly so, or the upper ones hairy, scabrous marginally; flowers solitary; pedicels glabrous or nearly so; calyx lobes lance-attenuate, entire; calyx and ovary hairy; corolla blue to purplish, 4–10 mm long, the lobes ovate, erect, about as long as the tube; styles shorter than the corolla, not exerted; anthers 1–2 mm long; capsules subcylindric, opening subapically; 2n = 34. Alpine tundra, often in talus or rock stripes, at 3355 to 3965 m in Daggett, Duchesne, Grand, San Juan, Summit, and Uintah counties; Alaska and Yukon, south to Colorado; Eurasia; 8 (iii).

Downingia Torr.

Low, soft annual herbs; leaves sessile, simple, entire; flowers perfect, 5-merous, sessile in bract axils; sepals 5, more or less unequal; corolla bilabiate, blue, the lower lip maculate, the upper lobes smaller; stamens 5, unequal, the 2 smaller anthers each with a terminal tuft of bristles and often with a hornlike process also; capsule linear to fusiform, many times longer than thick, twisted (inverting the flowers), opening by slits.

Downingia laeta (Greene) Greene [*Bolelia laeta* Greene]. Plants 3–15 cm tall or more; leaves 3–20 mm long, 0.5–2 mm wide; corollas 4–6 mm long, pale blue or purplish, the lower lip marked with white or yellow, often with a purple stripe; filaments connate, the tube 1.5–2.5 mm long; anthers ciliate or glabrous; capsules 2–4 cm long, appearing like pedicels. Drying mud on reservoir and pond margins at 1525 to 1710 m in Cache, Rich, Salt Lake, and Utah counties; Montana and Saskatchewan, south to California, Nevada, and Wyoming; 8 (0).

Lobelia L.

Perennial or annual herbs; leaves sessile, alternate, simple, entire or toothed; flowers perfect, 5-merous, inverted at anthesis, pedicellate, borne in racemes; sepals 5, subequal; corolla irregular, bilabiate, blue or scarlet, the tube often split to the base on one side, the limb 5-lobed, the upper 3 lobes forming the apparent upper lip, the other 2 (on each side of the split) erect or re-

curved; anthers united into a tube around the style; ovary 2-loculed; fruit dehiscent near the apex.

- 1. Corollas scarlet, 22-40 mm long; plants of moist sites and hanging gardens in southern Utah *L. cardinalis*
- Corollas blue, violet, or white, 12-14 mm long; plants cultivated and escaping *L. erinus*

Lobelia cardinalis L. Scarlet Lobelia; Cardinal-flower. [*L. splendens* L.]. Perennial herbs; stems simple, 3-10 dm tall or more, glabrous or pubescent, erect; leaves 3-15 cm long, 2-16 mm wide, narrowly elliptic to linear-lanceolate, irregularly denticulate to entire; racemes 7-36 cm long; pedicels 5-15 mm long; sepals 5-10 mm long; anthers bluish gray, 3-4 mm long, long-pilose on one side; capsule 4-5 mm long, 5-8 mm wide, 10-ribbed, papery. Drainages, seeps, springs, and hanging gardens at 900 to 1405 m in Kane, San Juan, and Washington counties; widely distributed in North America, Mexico, and Central America; 15 (vii). Our material belongs to ssp. *graminea* (Lam.) McVaugh [*L. graminea* Lam.]. This is a strikingly beautiful plant that flowers late in the summer and into the autumn.

Lobelia erinus L. Annuals; stems diffusely branched, mainly 10-30 cm tall, glabrous or sparingly hairy, clump-forming; leaves 1-3 cm long, 2-12 mm wide, oblanceolate to elliptic, irregularly serrate to entire; racemes 2-5 cm long (mainly 1- to 5-flowered); pedicels 12-25 mm long, capillary; sepals 3-5 mm long; anthers bluish gray, 1-2 mm long, short-hairy on one side; capsules 4-5 mm long, 3-4 mm wide, ca 10-ribbed, papery. Cultivated ornamental "edging" plants, commonly grown and rarely escaping in low elevation communities in Utah; introduced from Africa; 3 (0).

Nemacladus Nutt.

Annuals with capillary, flexuous stems and branches; leaves basal, rosetiform, the cauline ones bracteate; flowers inverted, minute, borne in a panicle comprising most of plant height; sepals 5, triangular; corolla irregular, more or less bilabiate, the lower lip 3-lobed, the upper 2-lobed; staminal filaments connate, the anthers spreading, distinct; capsules bilocular, dehiscent by valves.

McVaugh, R. 1939. Some realignments of the genus *Nemacladus*. Amer. Midl. Naturalist 22: 521-550.

- 1. Stems purplish to dark brown; bracts mainly 2-7 mm long, linear to narrowly lanceolate; plants locally common in Washington County *N. glanduliferus*
- Stems silvery to gray; bracts mainly 0.5-2 mm long, lanceolate to lance-ovate; plants not definitely known from Utah, but possible in Beaver Dam Wash *N. rubescens* Greene

Nemacladus glanduliferus Jepson Diminutive puberulent or glabrous annuals; stems diffusely branched, 5-15 cm tall; pedicels spreading-ascending, 3-10 mm long, capillary; bracts 2-7 mm long; corolla 1.5-2.5 mm long, white, with lobes purple apically; sepals 0.8-1.2 mm long; anthers 0.2-0.3 mm long; capsule 1.5-3 mm long, half-inferior; n = 9. Warm desert shrub and mixed desert shrub communities at 750 to 1070 m in Washington County; Nevada, Arizona, California, and Mexico; 14 (0). Our material belongs to var. *orientalis* McVaugh.

Porterella Torr.

Annuals with thickish soft stems; leaves cauline, alternate, sessile; flowers inverted, solitary or few, pedicel-

late; sepals 5, subulate; corolla irregular, bilabiate, the lower lip 3-lobed, the upper 2-lobed; stamens connate; capsule bilocular, dehiscent by apical valves.

McVaugh, R. 1940. A revision of "Laurentia" and allied genera in North America. Bull. Torrey Bot. Club 67: 778-798.

Porterella carnulosa (H. & A.) Torr. [*Lobelia carnulosa* H. & A.]. Plants erect or spreading; stems mainly 3-15 cm long, glabrous; leaves sessile, 4-20 mm long, 1-3 mm wide, linear-subulate to elliptic; bracts 4-15 mm long; sepals 2-6 (9) mm long; corolla showy, blue, with white or yellow center, 6-10 mm long, the upper 2 lobes erect; anthers bluish gray, 1.5-2.6 mm long; capsules 7-10 mm long, inferior. Pond and pool margins and streamsides at 2745 to 3205 m in Sevier and Summit counties; Oregon to Wyoming, south to California and Arizona; 5 (ii).

Triodanis Raf.

Annuals; stems simple or branched; leaves alternate, simple, transitional to foliose bracts; flowers solitary, axillary, sessile, the lowermost usually cleistogamous, at least some upper ones chasmogamous, with well-developed corollas; corollas regular; staminal filaments ciliate basally; capsules dehiscent by small valvlike openings.

Triodanis perfoliata (L.) Nieuwl. Venus Looking-glass. [*Campanula perfoliata* L.; *Specularia perfoliata* (L.) DC.]. Plants erect, 1-6 dm tall; stems simple or with ascending branches, 0.8-3 cm long, rounded-cordate, clasping, crenate, the lowermost shortly petiolate; calyx lobes 5-8 mm long, or smaller in cleistogamous flowers; corollas of upper flowers 8-13 mm long; capsules oblong to obovoid, 2- or 3-locular. Rare adventive weedy species of disturbed sites, known from Kane and Washington counties; throughout the U. S.; adventive from Europe; 2 (i).

CANNABACEAE Endl.

Hemp family

Plants herbaceous, with watery juice; leaves alternate opposite, palmately veined and lobed or divided to essentially compound; stipules persistent; flowers imperfect, the plants dioecious, regular, the staminate in open racemes or panicles, the pistillate in dense clusters; sepals 5, connate in pistillate flowers and enclosing the ovary; petals lacking; stamens 5; pistil 1, the ovary superior, 2-carpelled, the styles 2; fruit an achene; x = 8, 10.

- 1. Plants strong-smelling, stout, erect herbs; leaves palmately 5- to 9-parted *Cannabis*
- Plants rough-stemmed clampering vines; leaves coarsely 3- to 7-lobed *Humulus*

Cannabis L.

Plants dioecious or rarely some monoecious; leaves palmately lobed to parted and apparently compound, alternate or the lower opposite; flowers small, inconspicuous, the staminate in leafy panicles in upper axils; sepals 5, oblong; stamens 5; pistillate flowers in small clusters on leafy branches from upper axils, each flower subtended and enclosed by an acuminate bract, the calyx barely lobed, surrounding only the base of the ovary; stigmas 2, elongate; fruit a lenticular achene, enclosed within the accrescent bract; x = 10.

Small, E. and A. Cronquist. 1976. A practical and natural taxonomy for *Cannabis*. Taxon 5: 405-435.

Cannabis sativa L. Hemp, Marijuana, Hashish, Pot, Grass. Plants 6-20 dm tall or more, the stems simple or much branched; leaves long petioled, the blades 3- to 7-parted, the segments oblanceolate to elliptic, attenuate to acuminate apically, sharply serrate, mostly 4-12 cm long and 4-18 mm wide, scabrous and more or less glandular and pubescent; achenes mostly 3.5-4.5 mm long. Weedy species of roadsides and other disturbed sites in Cache, Grand, Salt Lake, Utah, Washington, and Weber counties; introduced from Eurasia; 8 (i). Cultivated historically in Utah for fiber produced from the stems, this is the commercial source of hemp; currently sporadic, or else grown illegally for its intoxicant properties. Utah materials are sufficiently rare as to give only hints as to the classification below the species level. It seems likely, however, that, at least historically, two phases have been grown in the state (for a complete review see Small and Cronquist l.c.). Nineteenth century plantings for hemp likely belonged to *ssp. sativa*, demonstrated to have only limited intoxicant properties. At least some of the recent introductions clearly belong to *ssp. indica* (Lam.) Small & Cronq. (*Cannabis indica* Lam.), which has demonstrated high intoxicant levels.

***Humulus* L.**

Plants herbaceous, twining, perennial vines; stems scabrous; leaves opposite, broadly 3- to 5-lobed; flowers small, inconspicuous, the staminate in axillary panicles; sepals 5, distinct; stamens 5; pistillate flowers in short spikes, in pairs, with each pair subtended by a foliaceous bract; calyx membranous, unlobed, closely covering the ovary; stigmas 2, elongate; fruit an achene enclosed by the persistent calyx and accrescent bracts; x = 8.

Humulus americanus Nutt. American Hop. Plants twining, the stems to 20 dm long or longer; leaves ovate to orbicular in outline, deeply cordate basally, mostly 3-15 cm long and 2.8-16 cm wide, the lobes serrate to doubly so, attenuate to acuminate apically, rough-hairy above, glandular-dotted beneath; fruiting spikes usually 2-3.5 (4) cm long at maturity. Twining over shrubs and other vegetation at lower and middle elevations in Cache, Duchesne, Garfield, Grand, Millard, Piute, Salt Lake, Summit, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties, and probably throughout Utah; widespread in North America; 37 (vi). The hop of commerce, *H. lupulus* L., or European hop, is grown in the U. S., where it has escaped and persists. Though not definitely known for Utah, the European hop might occur here. It can be distinguished by its unlobed leaves, or when lobed, the terminal lobe is less than twice longer than broad.

CAPPARACEAE A. L. Juss.

Caper Family

Annual herbs; leaves alternate, palmately 3- to 7-foliolate, rarely simple above; flowers in racemes, regular or irregular, perfect; sepals 4; petals 4, distinct; stamens 6 to many; pistil 1, the ovary superior, sessile or stipitate, 1-loculed, with 2 parietal placentae; pistil 1, the ovary superior, 2-carpellate; style 1, the stigma 2-lobed; fruit a 2-valved capsule; x = 8-17.

- 1. Stamens 8-16, unequal in length; herbage stipitate-glandular; petals white; staminal filaments purple *Polanisia*
- Stamens 6, equal in length; herbage glabrous or merely hairy, not glandular; petals yellow, yellow orange, or pink purple, rarely white; staminal filaments yellow or purple 2
- 2(1). Fruits about as broad as long or broader, few- to several-seeded; plants mainly 0.4-3 dm tall *Cleomella*
- Fruits several to many times longer than broad, many-seeded; plants 2-20 dm tall *Cleome*

***Cleome* L.**

Annual herbs; leaves 3- to 7-foliolate; flowers in bracteate racemes, regular; sepals 4; petals 4, yellow or pink to pink purple (rarely white); stamens commonly 6; ovary stipitate, with a gland at the base; capsules linear to oblong, spreading or pendulous.

- 1. Petals pink or purplish to white; leaflets 3 *C. serrulata*
- Petals yellow; leaflets 5-7 *C. lutea*

Cleome lutea Hook. Yellow Beeplant. Plants erect; stems mainly 3-15 dm tall, branched or simple; herbage glabrous or sparingly hairy; leaflets 3-5 (or 7), oblong to lanceolate or elliptic, 0.8-5 cm long, 2-10 mm wide, entire; racemes 2-10 cm long; pedicels 3-10 mm long; pods 1-3 (4) cm long, spreading, on stipes 6-12 mm long; 2n = 32. Warm, salt, and mixed desert shrub, pinyon-juniper, and ponderosa pine communities at 915 to 2380 m in all Utah counties, except Box Elder, Cache, Daggett, Davis, Morgan, Rich, Sanpete, and Summit; Washington to Nebraska, south to California, and New Mexico; 131 (xxiv).

Cleome serrulata Pursh Rocky Mountain Beeplant. Plants erect; stems mainly 3-20 dm tall or more, simple or branched above; herbage glabrous or sparingly hairy; leaflets 3, lanceolate, elliptic, or oblanceolate, 1.5-7 cm long, 4-14 mm wide, entire; racemes 5-25 cm long or more; pedicels 12-23 mm long; pods 2.5-7 cm long, descending to pendulous, on stipes 10-25 mm long; 2n = 32. Disturbed sites along roadsides, on stream traces and other pioneer situations at 900 to 2745 m in probably all Utah counties; Washington to Saskatchewan, south to California and Arizona; 92 (xvi). Two morphologically intergrading phases have been recognized in Utah: *var. serrulata*, with fruit 2-6 mm long and 2.5-6 cm wide, and seeds 3-4 mm long; and *var. angusta* (Jones) Tidestr. [*C. integrifolia* *var. angusta* Jones, type from Marysvale], with fruit 5-7 cm long and 3.5-5.5 mm wide, and seeds 4-4.5 mm long. The former is widespread and the latter is restricted to southern counties in Utah.

***Cleomella* DC.**

Annual herbs; leaves alternate, 3-foliolate; racemes bracteate, many-flowered; flowers regular; sepals 4, tardily deciduous; petals 4, yellow, closed in bud; stamens 6, the anthers coiled when dry; capsules stipitate, obdeltoid, rhomboidal, deltoid, or ovoid, usually wider than long; seeds 2-12.

- 1. Leaflets 2-7 mm wide, ca 3.5 times longer than wide; petioles of lower leaves 6-27 mm long; plants of the Colorado Drainage system *C. palmeriana*
- Leaflets 1-3 mm wide, ca 5.5 times longer than wide; petioles of lower leaves 2-12 mm long; plants of the Great Basin *C. plocasperma*

Cleomella palmeriana Jones [*C. nana* Eastw., type from near Thompson Springs; *C. cornuta* Rydb., type from Cainville; *C. montrosae* Payson]. Plants glabrous; stems widely branching from the base, 6–30 cm tall; leaflets 9–20 mm long, 2–9 mm wide, elliptic to oblong or lance-oblong; petioles of lower leaves 6–27 mm long; bracts, except the lowermost, reduced to setae; pedicels 5–6 mm long; sepals entire, acute; petals 3–4 mm long, yellow or yellow orange, tipped with red in bud; filaments to ca twice as long as the petals; anthers 1.2–2 mm long; style ca 1 mm long; capsules obtuse apically, the base triangular-acute, 2–5 mm long, 5–9 mm wide, the valves acute; stipe 3–7 mm long, often recurved; seeds few to several. Salt desert shrub community, on Mancos Shale, Tropic Shale, and Morrison formations, at 1220 to 1830 m in Emery (type from Green River), Garfield, Grand, Kane, Uintah, and Wayne counties; Colorado; a Plateau endemic; 43 (iii). The material from Uintah County, disjunct considerably from the remainder of the species, has conspicuously horned fruit 8–9 mm wide. In specimens from the Navajo Basin the fruit is not especially horned and mostly 3–5 mm wide. The Uinta Basin specimens are designated as var. *goodrichii* Welsh.

Cleomella plocasperma Wats. Plants usually with several diffuse, strongly ascending branches; stems 15–40 cm tall; leaflets 7–18 mm long, 1–3 mm wide, linear to narrowly oblong; petioles 5–12 mm long; bracts unifoliate and linear or the lowermost 3-foliate; pedicels 9–15 mm long; petals 3–5 mm long; stamens 6–9 mm long; capsules ovoid, rhomboidal, or obovoid, 1.5–3 mm long, 3–6 mm wide, the valves hemispheric, deltoid, or conical; stipes 2–7 mm long; seeds several. Saline soils with saltgrass, greasewood and other halophytes at 1370 to 1680 m in Beaver, Iron, and Millard counties; Oregon and Idaho, south to California; 5 (ii).

Polanisia Raf.

Viscid-puberulent annuals with a rank odor; leaves petiolate, palmately 3-foliate; racemes bracteate, many-flowered; sepals 4, free nearly to the base; petals 4, white, open in bud, irregular; stamens 6–20, of unequal length; anthers short; capsules elongate, erect, subsessile, glandular, the persistent valves dehiscent apically; seeds many.

Iltis, H. H. 1958. Studies in the Capparidaceae - IV. Brittonia 10, 33–58.

Polanisia dodecandra (L.) DC. Clammy-weed. [*Cleome docecandra* L.]. Plants 1.5–8 dm tall; petioles 0.5–5 cm long; leaflets 0.8–4.5 cm long, 3–18 mm wide, obovate to oblanceolate or elliptic; pedicels 10–21 mm long; sepals 4–5 mm long, purplish; petals white to cream, 8–12 mm long, emarginate, clawed; staminal filaments purple, long exerted; style 4–6 mm long; sepals subsessile, 3–5.5 cm long, 5–9 mm broad; $2n = 20$. Warm, mixed, and salt desert shrub and juniper communities, often in wash bottoms, at 1065 to 1985 m in Box Elder, Carbon, Daggett, Duchesne, Salt Lake, Sevier, Tooele, Uintah, Utah, Washington, and Weber counties; British Columbia to North Dakota, south to California, Arizona, and Mexico; 27 (vi). Our material is assignable to var. *trachysperma* (T. & G.) Iltis [*P. trachysperma* T. & G.].

CAPRIFOLIACEAE A. L. Juss.

Honeysuckle Family

Subshrubs, shrubs, woody vines, or small trees; leaves opposite, (rarely some of them whorled, simple or compound, lacking stipules or rarely with them; flowers regular or irregular, perfect, arranged in cymes, or in axillary, pedunculate pairs, or in head- or spikelike clusters; calyx (3) 4- to 5-lobed; corolla of connate petals, typically 4- or 5-lobed; stamens 4 or 5; pistil 1; ovary inferior, 1- to 5-loculed; fruit a berry, drupe, or bristly achene; $x = 8-12+$.

1. Corolla rotate, regular or nearly so 2
- Corolla tubular, typically irregular 3
- 2(1). Leaves pinnately compound *Sambucus*
- Leaves simple, though often lobed *Viburnum*
- 3(1). Plants trailing, low subshrubs; flower pairs on long peduncles *Linnaea*
- Plants erect shrubs; flower pairs typically axillary and on moderately long peduncles, or sometimes clustered at stem ends 4
- 4(3). Stamens 5; locules all fertile, 2- to many-ovuled; flowers yellow, white, or pink, the lobes (or some of them) flaring; plants indigenous, cultivated or escaping and established *Lonicera*
- Stamens 4 or 5; locules 1-ovuled or infertile; flowers typically pink, the lobes flaring or not; plants indigenous or cultivated 5
- 5(4). Stamens 4, in 2 pairs; flowers pink, very showy, with flaring limb; pedicels, calyx, and fruit bristly with long, yellowish trichomes; plants cultivated and persisting *Kolkwitzia*
- Stamens 4 or 5, not paired; flowers pink to almost white, not very showy, the limb not especially flaring; pedicels, calyx, and fruit glabrous; plants indigenous, rarely cultivated *Symphoricarpos*

Kolkwitzia Grabner

Deciduous shrubs; branches with conspicuously exfoliating bark; leaves opposite, petiolate, serrate, lacking stipules; flowers showy, borne in axillary pairs forming terminal corymbs; calyx 5-lobed; corolla 5-lobed; campanulate; stamens 4; ovaries 2, each 3-loculed, but only 1 locule fertile and 1-ovuled; fruit a bristly achene.

Kolkwitzia amabilis Graebn. Beauty-bush. Shrubs to 3 m tall; leaves lanceolate, 2–8 cm long, 0.8–3 cm wide, acuminate apically, obtuse basally, entire or sparingly serrate, ciliate, sparingly yellowish hairy on the lower surface and sometimes also on the veins above; corymbs 3–8 cm long; flowers pink, the throat yellow, 17–22 mm long, with a short basal tube and a flaring limb, the upper pair of lobes erect, the lower 3 spreading; pedicels, sepals, and fruit bristly with long yellowish trichomes. Commonly cultivated ornamental, in lower elevation portions of Utah, long persisting but not escaping; introduced from China; 9 (i).

Linnaea L.

Subshrubs, the stems prostrate, rooting at the nodes; leaves opposite, simple; flowers borne in pairs on elongate, axillary peduncles; calyx 5-lobed; corolla 5-lobed, regular or nearly so, funnellform, regular or nearly so, pink or pinkish; stamens 4, in 2 pairs, attached near the

corolla base; ovary 3-loculed, with only 1 functional; style elongate; fruit dry, 1-seeded.

Linnaea borealis L. Twin-flower. Stems mostly 1-12 dm long, trailing, moderately to sparingly hairy, becoming glabrous in age; flowering stems erect or ascending, commonly 1-15 cm long; leaves 0.5-2 cm long, 3-15 mm wide, elliptic to obovate or orbicular, or sometimes ovate, entire or few-toothed, rounded to obtuse apically, shortly petiolate, long-hairy to glabrous; peduncles axillary, 1.5-6 cm long, stipitate-glandular and often villous, bearing a pair of small bracts at the apex; flowers paired (rarely more); pedicels mostly 0.5-2 cm long, hairy like the peduncles; ovary glandular hairy; calyx 2-5 mm long; corolla 6-12 mm long, pink or pinkish, hairy within; fruit 1.5-3 mm long, hairy; 2n = 32. Douglas fir, aspen, lodgepole pine, and spruce-fir communities at 1830 to 2930 m in Beaver, Daggett, Duchesne, Emery, Salt Lake, Sanpete, Summit, and Uintah counties; Alaska and Yukon, east to the Atlantic, south to California, Arizona, New Mexico, South Dakota, Indiana, and West Virginia; circumpolar; 12 (i). Our material is assignable to var. *longiflora* Torr. [*L. americana* Forbes; *L. borealis* var. *americana* (Forbes) Rehder; *L. borealis* ssp. *americana* (Forbes) Hulten; *L. longiflora* (Torr.) Howell; *L. borealis* ssp. *longiflora* (Torr.) Hulten].

Lonicera L.

Shrubs, the stems erect, or vines with twining stems; leaves opposite, simple; flowers borne in axillary, pedunculate pairs or in terminal head- or spikelike clusters; calyx 5-lobed; corolla 5-lobed, 2-lined, irregular, funnelform, swollen near the base, white, pink, orange, or yellowish; stamens 5, attached near the corolla base; ovary 2- or 3-loculed, each locule functional; style elongate; fruit a berry, several-seeded.

- 1. Plants trailing vines, cultivated *L. japonica*
- Plants erect shrubs, indigenous or cultivated 2
- 2(1). Flowers typically bright pink, fading yellow or brownish; branchlets hollow, plants cultivated, escaping, and established *L. tatarica*
- Flowers ochroleucous, whitish, or yellow; branchlets solid; plants cultivated or indigenous 3
- 3(2). Corollas yellow, often tinged purplish, glandular-hairy; flowers subtended by large foliose bracts; fruit black; plants indigenous *L. involcrata*
- Corollas pale yellowish to ochroleucous, glabrous; flowers not subtended by large bracts; fruit red; plants indigenous or cultivated 4
- 4(3). Leaves ciliate; petioles to 6 mm long; shrubs 1.5-2.5 m tall; flowers appearing before the leaves of the season; plants semi-evergreen, cultivated *L. fragrantissima*
- Leaves typically not ciliate; petioles over 6 mm long; shrubs mainly less than 1.5 m tall; plants deciduous, indigenous *L. utahensis*

Lonicera fragrantissima Lindl. & Paxt. Fragrant Honeysuckle. Shrubs, mainly 1.5-2.5 m tall, semievergreen; leaves oval, 1.5-5 cm long or more, mainly 12-40 mm wide, glabrous except along the vines, ciliate, short-petiolate, apiculate, bicolored, green above, glaucous beneath; flowers creamy white, 10-12 mm long, the lobes widely flaring or reflexed, fragrant, borne in pairs on short peduncles, glabrous without; fruit red, seldom formed. Cultivated early-flowering ornamental with very fragrant

flowers, long persisting in lower elevation portions of Utah; introduced from China; 4 (i).

Lonicera involcrata (Richards.) Banks ex Sprengel Black Twinberry. [*Xylosteum involcratum* Richards.; *L. ledebourii* Eschsch.]. Shrubs 0.5-2 m tall, the young stems glabrous, quadrangular; leaves 2.5-16 cm long, 1.5-7.5 cm broad, elliptic to oblanceolate or broadly lanceolate, entire, acuminate apically, acute to rounded basally, green and glabrous above or hairy along the midvein, pale and more or less hairy beneath, short-petiolate; peduncles 0.5-4 cm long; flowers borne in sessile pairs, subtended by broad, greenish or purplish black, foliose, glandular-hairy bracts commonly 1 cm long or more, these becoming black and fleshy at maturity; ovary glandular-hairy; calyx less than 1 mm long; corollas 12-18 mm long, yellow (sometimes tinged purplish), pubescent externally; fruit 8-12 mm long, black; 2n = 18. Stream banks and other moist sites in riparian, aspen, Douglas fir, and spruce-fir communities at 1370 to 3235 m in Beaver, Cache, Carbon, Davis, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Wasatch, and Weber counties; Alaska east to Quebec, south to California, New Mexico, and Mexico; 75 (xiii).

Lonicera japonica Thunb. Japanese Honeysuckle. Plants clambering or twining woody vines with hollow stems, semievergreen, mainly 1-3 m long or more; leaves 2-8 cm long or more, ovate to oblong, pubescent beneath, becoming glabrous above, apiculate; flowers white, often suffused with purple without, aging yellow, borne in axillary pairs on lateral branchlets, often crowded apically, fragrant; peduncles short, bracteate; corolla mainly 30-40 mm long, pubescent, the tube slender, the limb 2-lipped; fruit black, seldom produced. Cultivated ornamental and reclamation plant in lower elevation portions of Utah, persisting; introduced from Asia; 3 (0).

Lonicera tatarica L. Tatarian Honeysuckle. Shrubs 1-3 m tall or more, the young stems glabrous, more or less terete; leaves 1.5-6 cm long, 0.5-3 cm broad, lanceolate to oblong, entire, attenuate to acuminate or acute apically, obtuse to rounded or subcordate basally, green and glabrous above, pale and glabrous beneath, short petiolate; peduncles 3-15 mm long; flowers borne in sessile pairs, subtended by narrow, scarious bracts; ovary glabrous; calyx less than 1 mm long; corollas 7-15 mm long, white to pink, glabrous; fruit 4-6 mm long, orange or red; 2n = 18. Cultivated ornamental, escaping and established, in Carbon, Juab, Salt Lake, Summit, Uintah, and Utah counties; introduced from Eurasia; 10 (i).

Lonicera utahensis Wats. Utah Honeysuckle. Shrubs 1-2 m tall; leaves 1-8 cm long, 0.5-4 cm wide, elliptic to ovate or oblong, rounded to subcordate basally, rounded to obtuse apically, glabrous above, often pubescent beneath, short-petiolate; peduncles axillary, 5-35 mm long, with a pair of bracts apically; flowers paired; corolla ochroleucous or yellowish, 10-20 mm long, somewhat bilabiate, the lobes shorter than the tube, spurred basally; fruit 8-10 mm long, red. Mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1500 to 3145 m in Cache, Carbon, Duchesne, Grand, Juab, Salt Lake (type from Cottonwood Canyon), San Juan, Sanpete, Sevier, Summit, Utah, and Wasatch counties; British Columbia and Alberta, south to California and Wyoming; 21 (i).

Sambucus L.

Shrubs, with coarse, erect or ascending stems; leaves opposite, pinnately compound, sometimes stipulate; flowers numerous, borne in terminal, compound, paniculate cymes; calyx 5-toothed; corolla 5-lobed, rotate, regular, white to cream; stamens 5, attached to the corolla tube; ovary 3- to 5-loculed, each locule functional; style very short or lacking; fruit a 3- to 5-seeded berry.

- 1. Cymes flat-topped, mainly 7-30 cm wide; flowers mainly cream colored; fruit black, with a glaucous, waxy bloom; plants typically below 2600 m elevation *S. caerulea*
- Cymes obconic to rounded, mainly less than 8 cm wide; flowers white to cream; fruit red (or rarely black?); plants typically above 2500 m elevation *S. racemosa*

Sambucus caerulea Raf. Blue Elderberry. [*S. glauca* Nutt. ex T. & G.]. Shrubs, mainly 2-4 dm tall, with soft branches, the pith brown, very thick; stipules linear, caducous or lacking; leaves typically 5- to 9-foliolate, the leaflets 3-15 cm long, 1-6 cm wide, lanceolate to lance-ovate or elliptic, often strongly oblique at the base, glabrous or hairy beneath; inflorescence pedunculate or sessile, corymbose (when alive), commonly 7-30 cm wide at anthesis, with mostly 4 or 5 rays, occasionally with subsidiary lateral inflorescences from the uppermost leaf axils; flowers cream to whitish, 4-7 mm wide, the corolla lobes longer than the tube; fruit 4-6 mm thick, subglobose, bluish black, glaucous and appearing powdery blue; 2n = 38. Riparian, sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, and spruce-fir communities at 1370 to 2810 m in probably all Utah counties; British Columbia to Montana, south to California, Arizona, and New Mexico; 130 (xxv). Two other elderberry species are known in cultivation in Utah. They are *S. canadensis* L. and *S. nigra* L. They resemble *S. caerulea* in general habit, but have black, not glaucous fruit. Additionally, *S. nigra* has mainly 5 leaflets per leaf, these again divided in some ornamental specimens.

Sambucus racemosa L. Red Elderberry. Shrubs, mainly 1-2 m tall, with subherbaceous pithy twigs; leaves 5-35 cm long, the leaflets (3) 5-7, 2.5-15 cm long, 1-6 cm broad, lanceolate to elliptical, oblanceolate, or oblong, acuminate apically, unequally obtuse to acute basally, serrate, petiolulate, green and glabrous or hairy only along the midvein beneath; flowers numerous, borne in terminal, paniculate cymes with a distinct central rachis extending beyond the lowermost branches, borne on leafy lateral shoots; calyx lobes less than 1 mm long; corollas white to cream, 4-6 mm wide, the lobes much longer than the tube; fruit 4-6 mm long, red (or black?); 2n = 36, 38. Aspen, lodgepole pine, and spruce-fir communities at 1860 to 3355 m in Beaver, Cache, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; Alaska east to the Atlantic, south to California, Arizona, and New Mexico; 78 (xvii). Our material, or most of it, is assignable to var. *microbotrys* (Rydb.) Kearney & Peckles [*S. microbotrys* Rydb.], the typical red-fruited plants from the Rocky Mountains. However, the var. *melanocarpa* (Gray) McMinn [*S. melanocarpa* Gray], a black-fruited phase might be present in Utah.

Symphoricarpos DuRoi

Shrubs, with slender, erect, ascending, or less commonly prostrate stems; leaves opposite, simple; flowers

solitary in leaf axils, or 2 to several borne in short, terminal or axillary spikes; calyx 5-lobed; corolla 5-lobed, more or less irregular, funnelform, white to pink; ovary 4-loculed, with only 2 functional; style elongate; fruit a 2-seeded berry.

Jones, G. N. 1940. Monograph of *Symphoricarpos*. J. Arnold Arb. 21: 201-253.
 Wood, B. W. 1965. Revision of *Symphoricarpos* (Caprifoliaceae) in Utah. Proc. Utah Acad. 42: 203-213.

- 1. Corolla 10-18 mm long, salverform; plants typically of semi-arid sites *S. longiflorus*
- Corolla typically less than 10 mm long, or sometimes longer, campanulate to tubular-funnelform; plants typically of mesic sites or in cultivation 2
- 2(1). Flowers typically in terminal or axillary spikes; plants cultivated 3
- Flowers typically solitary in leaf axils, though sometimes in spikes; plants indigenous, rarely cultivated 4
- 3(2). Stamens included; berries white *S. albus*
- Stamens exerted; berries red *S. orbiculatus*
- 4(3). Corolla short-campanulate, about as broad as long (when pressed), the lobes subequal to the tube; staminal filaments longer than the anthers; plants of northeastern Utah *S. occidentalis*
- Corolla campanulate to tubular-funnelform, the lobes much shorter than the tube; staminal filaments shorter than the anthers; plants widespread and common *S. oreophilus*

Symphoricarpos albus (L.) Blake White Snowberry [*Viburnum album* L.; *S. racemosus* var. *laevigatus* Fern.]. Shrubs, mostly 0.5-1.5 m tall, the young stems glabrous, terete or nearly so; leaves 1.5-7 cm long, 0.8-4 cm broad, ovate to elliptic, entire or coarsely toothed, rounded to obtuse apically, rounded to obtuse basally, green and glabrous above, pale and sparingly hairy to glabrous beneath, short-petiolate; peduncles 3-30 mm long; flowers solitary, or more commonly 2 to several in axillary or terminal spikes, each closely subtended by a pair of minute bracts; ovary glabrous; corollas 5-7 mm long, white to pink, densely hairy within; fruit 6-12 mm long, white; 2n = 54, 72. Cultivated ornamental shrub, persisting in Salt Lake and Utah counties; introduced from elsewhere in North America; 3 (0).

Symphoricarpos longiflorus Gray Long-flower Snowberry. Shrubs, mostly 0.5-1 m tall, the young stems glabrous or pubescent, typically spreading at right-angles to the stem axis; leaves 6-15 (20) mm long, 2-7 (9) mm wide, oval to lanceolate or oblanceolate; flowers very fragrant, solitary or paired in leaf axils, or in small, terminal, few-flowered racemes; corollas 10-18 mm long, salverform, glabrous within and without, pale to deep pink, regular, the lobes much shorter than the tube; fruit white. Mixed desert shrub, pinyon-juniper, sagebrush, mountain brush, and ponderosa pine, grass, and hanging garden communities at 915 to 2900 m in Beaver, Daggett, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, Washington, and Wayne counties; Oregon to Colorado, south to California, Arizona, New Mexico, Texas, and Mexico; 55 (xv).

Symphoricarpos occidentalis Hook. Wolfberry. Shrubs, mainly 0.4-1 m tall, spreading below ground, forming colonies, the young stems puberulent or glabrous; leaves 2-8 cm long, 1-5 cm wide, or larger on

twigs of the season, elliptic to ovate, entire or coarsely toothed or lobed, glabrous above, puberulent beneath, at least on the main veins; flowers borne in axillary or terminal spikelike racemes; corollas 5–8 mm long, often wider than long (when pressed), hairy within, the lobes subequal to the tube; anthers shorter than the filaments; berries white. Riparian communities, mainly with cottonwood and willow species at 1525 to 1895 m in Daggett, Duchesne, and Uintah counties; British Columbia to Manitoba, south to Washington, Idaho, and Colorado; 9(0).

Symphoricarpos orbiculatus Moench Coralberry. Shrubs, mainly 0.5–2 m tall; leaves 1–3.5 cm long, elliptical to oval, typically glabrous above, softly puberulent below; flowers borne in dense axillary or terminal spike-like racemes; corolla short-campanulate, pink, villous within, slightly ventricose on the lower sides, the lobes subequal to the tube; fruit coral red, ellipsoid. Cultivated ornamental in Utah County, persisting and escaping; introduced from the eastern U. S.; 1(0).

Symphoricarpos oreophilus Gray Mountain Snowberry. Shrubs, mainly 0.5–1.5 m tall, the young stems puberulent to glabrous; leaves typically 1–5 cm long and 3–25 mm wide, elliptic to ovate, entire or few-toothed; flowers solitary or paired in leaf axils, and sometimes also in terminal, few-flowered racemes; corolla tubular-funneliform to campanulate, mostly 5–13 mm long, the lobes much shorter than the tube, hairy or glabrous; anthers longer than the filaments; fruit white. Sagebrush, ponderosa pine, Douglas fir, aspen, lodgepole pine, and spruce fir communities at 1370 to 3295 m in all Utah counties (except Davis and Morgan); British Columbia to Montana, south to California, Arizona, New Mexico, and Mexico; 219 (xxv). This common and widespread snowberry species is recognized as having three confluent and insubstantial varieties. The phase with decumbent, intricately branched stems from the western border counties is regarded as var. *parishii* (Rydb.) Cronq. [*S. parishii* Rydb.]. That with corollas 6–10 mm long and nutlets blunt to acutish at the base are assignable to var. *utahensis* (Rydb.) A. Nels. [*S. utahensis* Rydb., type from Logan; *S. vaccinoides* Rydb.; *S. rotundifolius* var. *vaccinoides* (Rydb.) A. Nels.; *S. tetonensis* A. Nels.], with most of the plants occurring in southern Utah. The final phase consists of plants with corollas mostly more than 10 mm long and with often acutish nutlets. It is the var. *oreophilus*.

Viburnum L.

Shrubs or small trees with simple, opposite, deciduous or evergreen leaves; flowers borne in corymbose clusters, radially symmetric, or some of the marginal flowers of an inflorescence enlarged and slightly irregular; calyx 5-lobed; corolla 5-lobed, rotate to campanulate; stamens 5; ovary 3-loculed, with 1 fertile locule and a single ovule; style, short; stigma 3-lobed; fruit a drupe. Note: The genus is not well represented in herbaria, but the plants long persist following cultivation. They are included in the key but not described.

- 1. Leaves lobed, reddish in the fall; shrubs to 4 m tall (snowball bush) *V. opulus* L.
- Leaves not lobed 2
- 2(1). Leaves evergreen, entire or obscurely denticulate; petiole 12–25 mm long; shrubs to 3 m tall (wayfaring bush) *V. rhytidophyllum* Hemsl.

- Leaves typically deciduous; petiole more than 25 mm long; shrubs usually less than 2 m tall 3
- 3(2). Leaves 2.5–10 cm long, winter buds scaly *V. plicatum* Thunb.
- Leaves 10–20 cm long; winter buds naked *V. alnifolium* Marshall

CARYOPHYLLACEAE A. L. Juss.

Pink Family

Annual or perennial herbs; leaves opposite, entire, simple, with or without stipules; flowers usually perfect, regular; sepals 4 or 5, connate or persistent; petals 4 or 5 or lacking; stamens 4–10, distinct; anthers 2-loculed; pistil 1, the ovary superior, 1-loculed, with free-central placentation, or incompletely 3- to 5-loculed; styles 2–5 (rarely connate into 1); fruit a capsule or a utricle; x = 5–19.

- 1. Fruit a utricle, 1-seeded, indehiscent, petals lacking; flowers minute, whitish, greenish, or yellowish 2
- Fruit a capsule, many-seeded, dehiscent; petals usually present; flowers various 4
- 2(1). Plants pulvinate-caespitose perennials, usually montane or alpine *Paronychia*
- Plants annual, prostrate or ascending, not montane or alpine 3
- 3(2). Sepals united basally into a tube, the lobes white-hyaline, surpassing the ovary *Achyronychia*
- Sepals distinct or nearly so, the lobes green with hyaline margins, shorter than or subequal to the ovary *Herniaria*
- 4(1). Sepals connate into a tubular calyx; petals clawed 5
- Sepals distinct or nearly so; petals without claws 10
- 5(4). Ribs of calyx twice as many as the calyx teeth, ending both in apices and in sinuses 6
- Ribs of calyx as many as calyx teeth, the calyx 5-ribbed, 5-nerved, nerveless, or striate-nerved ... 7
- 6(5). Styles 3 (4); capsule opening by 6 (3, 4, or 8) teeth ... *Silene*
- Styles 5 (4); capsules opening by 10 (8) teeth ... *Lychnis*
- 7(5). Calyx scarious between green midveins ending in teeth 8
- Calyx not at all scarious, green overall 9
- 8(7). Calyx urn-shaped, constricted apically; petals pink *Vaccaria*
- Calyx campanulate, not constricted apically; petals white or pink *Gypsophila*
- 9(7). Calyx closely subtended by and basally invested by long-aristate bractlets *Dianthus*
- Calyx not immediately subtended by bractlets, these, when present, not investing the base *Saponaria*
- 10(4). Leaves with scarious or setaceous, persistent stipules 11
- Leaves lacking stipules 12
- 11(10). Plants erect-ascending; leaves rigid, with setaceous stipules *Loeflingia*
- Plants usually mat-forming; leaves not rigid, with scarious broad stipules *Spergularia*
- 12(10). Petals 2-cleft, -parted, or -lobed, or lacking (key both ways) 13
- Petals rounded, emarginate, irregularly toothed, or bilobed (see *Stellaria jamesiana* and *Arenaria fendleri*), or lacking 14

- 13(12). Styles usually 5; capsule cylindrical, membranous, often 1 or 2 times longer than the calyx, dehiscent by 10 teeth *Cerastium*
- Styles usually 3; capsule ovoid to short-cylindric, seldom equaling the calyx, dehiscent by 6 or 8 teeth *Stellaria*
- 14(12). Plants annual, flowering at middle elevations in springtime; petals irregularly toothed *Holosteum*
- Plants perennial or annual; flowering in spring and summer at low to high elevations; petals not toothed 15
- 15(14). Styles usually 3, or if more, opposite the sepals; valves of capsule alternate with sepals; plants common *Arenaria*
- Styles usually 5, alternate with the sepals; valves of capsule opposite the sepals; plants uncommon .. *Sagina*

Achyronychia T. & G.

Glabrous annual herbs; leaves opposite, but unequal at each node, spatulate; stipules hyaline, conspicuous; flowers in axillary, cymose clusters; calyx 5-lobed, united at the base, the lobes white-scarious; petals lacking; stamens 10-15, with 1-5 fertile ones; styles 2-cleft; fruit a utricle, enclosed by the calyx; seeds minute, black.

Achyronychia cooperi T. & G. Plants prostrate, mainly 3-20 cm across; leaves spatulate, 3-18 mm long, 1.2-7 mm wide; flowers 2-3 mm long, the sepals green basally, with white-scarious lobes, these oval; seeds shining. Warm desert shrub, Washington (Atwood sn, missing at BRY) County; Arizona, Nevada, California, and Mexico; 1 (0).

Arenaria L.

Annual, biennial, or perennial herbs, with prostrate to erect stems; leaves opposite, linear to ovate, lacking stipules; flowers solitary or few to many, borne in open or contracted cymes; sepals 5, distinct or nearly so, 1- to 3-veined; petals 5, white, the blade entire or slightly emarginate but not bilobed (except in some *A. fendleri*), showy to inconspicuous or sometimes lacking; stamens usually 10, inserted at the base of a glandular disk; styles usually 3; ovary 1-loculed; capsule opening by 3 or 6 teeth.

Maguire, B. 1951. Studies in Caryophyllaceae - V. *Arenaria* in America north of Mexico. A conspectus. Amer. Midl. Naturalist 46: 493-511.
 —. 1958. *Arenaria rossii* and some of its relatives in America. Rhodora 60: 710.

- 1. Leaves ovate to lanceolate, oblanceolate, or broadly elliptic, acute to rounded apically 2
- Leaves linear to oblong or subulate, acute, apiculate, or abruptly acute to blunt apically 5
- 2(1). Leaves once to twice longer than broad, much shorter than the internodes; plants annual *A. serpyllifolia*
- Leaves mainly 2-10 times longer than broad or more, from slightly shorter to much longer than the internodes; plants perennial 3
- 3(2). Petals notched apically; leaves clasping
- *Stellaria jamesiana* (q.v.)
- Petals not notched apically; leaves attenuate basally .. 4
- 4(3). Stems from a branching caudex; inflorescence mainly terminal *A. lanuginosa*
- Stems from a rhizome (seldom collected); inflorescences mainly from stem middle and sometimes also terminal *A. lateriflora*

- 5(1). Inflorescence congested; leaves very slender, mainly basal, commonly 2-4 cm long *A. congesta*
- Inflorescence more or less open; leaves slender and 1-4 or rarely to 11 cm long, or shorter and proportionately thicker 6
- 6(5). Plants cushionlike, densely pulvinate-caespitose; inflorescence mainly 1-5 cm tall *A. hookeri*
- Plants of various habit, but seldom both cushionlike and densely pulvinate-caespitose (see *A. obtusiloba*) .. 7
- 7(6). Plants subshrubs, woody at the base; inflorescence comprising 1/4-1/3 of plant height *A. macradenia*
- Plants herbaceous, seldom if ever woody at the base; inflorescences various 8
- 8(7). Leaves slender, mainly 1-4 (11) cm long; capsules dehiscent by 6 teeth; plants widespread *A. fendleri*
- Leaves not especially slender, mainly less than 1 cm long; capsules dehiscent by 3 teeth; distribution various, but plants usually of alpine sites 9
- 9(8). Plants soboliferous, with long trailing subterranean stems, forming mats; leaves 5-10 mm long . *A. nuttallii*
- Plants not soboliferous, either annual, biennial, or short lived perennials from taproots, or caespitose perennials from a caudex; leaves often less than 5 mm long 10
- 10(9). Plants caespitose perennials from a caudex; sepals obtuse *A. obtusiloba*
- Plants delicate, clump-forming annuals, biennials, or short-lived perennials from taproots 11
- 11(10). Stems capillary; sepals 2-3 mm long; plants diminutive annuals known from sandy soil in southwestern Utah *A. pusilla*
- Stems not or seldom capillary; sepals often more than 3 mm long; plants biennial or short-lived perennials, of various distribution but seldom, if ever, as above .. 12
- 12(11). Sepals 1-veined; plants glabrous; inflorescence 1-flowered *A. rossii*
- Sepals 3-veined; plants glandular-puberulent or glabrous; inflorescence 1- to several-flowered 13
- 13(12). Leaves 3-veined; plants glandular-puberulent or sometimes glabrous *A. rubella*
- Leaves 1-nerved; plants glabrous *A. filiorum*

Arenaria congesta Nutt. in T. & G. Head Sandwort. Perennial herbs from a woody caudex, mainly 0.6-3.3 dm tall, glabrous; basal leaves subulate to almost filiform, 0.8-6 (8) cm long, erect, flexible or stiff, apiculate to spinulose; cauline leaves of mainly 3-5 pairs, usually shorter than the basal and reduced upward; inflorescence capitate or subumbellate, many-flowered; bracts ovate-acuminate, hyaline, with a stout midrib extending to the acute-attenuate tip; sepals 4-5.5 mm long, ovate, greenish, with broad scarious margins; petals 5-7.5 mm long, white; capsules subequal to or slightly longer than the sepals; seeds 1.5-2 mm long, flat, winged, brownish; 2n = 22. Two geographically correlated and morphologically differing varieties occur in Utah.

- 1. Basal leaves mainly 0.8-2 cm long, rigid, spinulose, and often recurved; plants of the Great Basin.
- *A. congesta* var. *subcongesta*
- Basal leaves mainly 1.5-6 (8) cm long, flexible, apiculate, usually straight; plants of the Wasatch Mts., Wasatch Plateau, and eastward. *A. congesta* var. *congesta*

Var. *congesta* [*A. congesta* var. *lithophila* Rydb., *A. lithophila* (Rydb.) Rydb.; *A. cephaloidea* Rydb.; *A. con-*

gesta var. *cephaloidea* (Rydb.) Maguire]. Pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 2135 to 3360 m in Cache, Daggett, Duchesne, Grand, Rich, San Juan, Summit, Uintah, Utah, and Wasatch counties; Washington and Montana, south to California, Nevada, and Colorado; 71 (x). Some specimens from high elevations in the Uinta Mts. are dwarf, but grade downward into the taller materials. They do not seem to warrant taxonomic recognition.

Var. *subcongesta* (Wats.) Wats. [*A. fendleri* var. *subcongesta* Wats.]. Sagebrush, white fir, and bristlecone pine communities at 2650 to 2780 m in Beaver, Millard, and Washington counties; California and Nevada; 3 (i). This material simulates *A. fendleri* in its vegetative features.

Arenaria fendleri Gray Fendler Sandwort. Perennial herbs from caudices and taproots, more or less caespitose; stems mainly 0.2–2.5 dm tall; basal leaves mainly 0.3–5 (11) cm long, pungent, straight, or recurved; cauline leaves mainly 2–6 pairs; inflorescence open, mostly (1) 2- to several-flowered, the flowers subsessile or on pedicels to 20 mm long, glandular or glabrous; sepals ovate to ovate-lanceolate, acute to obtuse, 3.5–6.5 mm long, greenish or suffused with purple, with broad scarious margins; petals 5–8 mm long, entire, emarginate, or bilobed, white to brown or pinkish red; capsule with 6 teeth, subequal to or much surpassing the sepals; seeds 1.5–2.5 (3) mm long, winged to essentially wingless; $2n = 22$. The *fendleri* complex consists of a variable assemblage of more or less mat-forming, pungent-leaved, and open-cymose plants of broad distribution and broad ecological latitude. The Utah portion of the complex has been interpreted previously (Maguire 1951) as consisting of four species, with three of the species further subdivided into infraspecific taxa, for a total of nine taxa. That the taxa have long been regarded as similar is indicated by names combining various phases of the taxon in a general sense. The lack of consistent diagnostic criteria and considerations of morphological confluence indicate a conservative interpretation, a course followed herein. Four more or less distinctive and geographically correlated varieties are treated. The following tentative key will allow segregation of most specimens.

1. Sepals more or less hooded apically, thus apparently obtuse; plants usually definitely glaucous, known from Box Elder County *A. fendleri* var. *aculeata*
- Sepals not or seldom hooded apically, thus apparently acute or attenuate; plants green or glaucous 2
- 2(1). Sepals mainly 3.3–4.5 mm long, usually purplish medially; inflorescence usually glandular; plants of the Wasatch Mts. and high plateaus and westward *A. fendleri* var. *glabrescens*
- Sepals often more than 4.5 mm long, green or purplish medially; inflorescence glandular or glabrous; plants of eastern and southern Utah 3
- 3(2). Inflorescence glandular-pubescent (usually copiously so); stem with (4) 5 or more pairs of leaves, or the plants dwarf; distribution montane *A. fendleri* var. *fendleri*
- Inflorescence glabrous or glandular; stem leaves mainly 2–4 pairs; plants usually of lower elevations *A. fendleri* var. *eastwoodiae*

Var. *aculeata* (Wats.) Welsh [*A. aculeata* Wats.]. Sagebrush and pinyon-juniper communities at 2135 to 2930 m in Box Elder County; Oregon to Montana, south to California and Nevada; 3 (0).

Var. *eastwoodiae* (Rydb.) Welsh [*A. eastwoodiae* Rydb.]. Shadscale, black sagebrush, big sagebrush, pinyon-juniper, ponderosa pine, and snowberry communities at 1130 to 2680 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Wasatch, Washington, and Wayne counties; Colorado, Arizona, and New Mexico; 103 (xvii). Flower color is usually creamy yellow or whitish, but many specimens have bronze, brownish, or red pink petals. The plants with colored flowers are often at the lowermost elevations, but flower color does not seem to be correlated with other features. They seem not to warrant taxonomic recognition. The antisepalous glands are conspicuous in this taxon.

Var. *fendleri* [*A. fendleri* var. *diffusa* T. C. Porter; *A. fendleri* var. *porteri* Rydb.; *A. fendleri* ssp. *brevifolia* Maguire (type from the La Sal Mts.) var. *brevicaulis* Maguire; *A. fendleri* var. *brevifolia* (Maguire) Maguire; *A. fendleri* var. *tweedyi* (Rydb.) Maguire; *A. tweedyi* Rydb.]. Mountain brush, sagebrush-snowberry, ponderosa pine, spruce-fir, and alpine tundra communities at 2895 to 3360 m in Garfield, Grand, and San Juan counties (Henry, La Sal, and Abajo mts.); Wyoming south to Arizona, New Mexico, and Texas; 13 (0). Utah materials have been treated (Maguire 1951) as belonging to varieties *brevifolia* and *tweedyi* (superceded by var. *brevicaulis* Maguire). Both have sepals in the size range of var. *glabrescens* (*A. kingii* sens. lat.), but have more attenuate sepals. However, besides the alpine dwarfs with short sepals, taller plants with long sepals are known (Neese et al 2192 BRY), as do specimens with very long leaves (Atwood 7061 BRY). These latter specimens would fall in still other of the named units recognized by Maguire (1951). They do not seem to represent taxa and a conservative treatment is indicated.

Var. *glabrescens* Wats. [*Stellaria kingii* Wats.; *A. kingii* (Wats.) Jones; *A. uintahensis* A. Nels.; *A. kingii* ssp. *uintahensis* (A. Nels.) Maguire; *A. aculeata* var. *uintahensis* (A. Nels.) Peck; *A. kingii* ssp. *plateauensis* Maguire, type from Cedar Breaks]. $2n = 44$. Shadscale, horsebrush, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, white fir-Douglas fir, aspen, bristlecone pine, spruce-fir, and grass-forb communities at 1555 to 3355 m in Beaver, Box Elder, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, Rich, Sanpete, Sevier, Tooele, Utah, Washington, and Wayne counties; 118 (xv). Petals in many specimens are deeply bifid; in others they are rounded apically. Transitions are known, and there does not appear to be geographical or morphological correlation of bifid petals with other features. Some plants, apparently the *uintahensis* phase, tend to have rather obtusish sepals and pale midribs, but seem to lack geographical correlation.

Arenaria filiorum Maguire Beach Sandwort. Perennial (or biennial) herbs from taproots and weak caudices, cushionlike; stems mainly 1–4 cm tall; leaves mainly cauline, 2–5 pairs, 2–8 mm long, 1-veined, blunt; inflorescence glabrous, 1- to 3-flowered, the pedicels 1–8 mm long; sepals ovate-acuminate, green, 3-veined, the margins hyaline, 4–5.4 mm long; petals 3.5–4.5 mm long, entire, white; capsules 3-valved, shorter than the sepals; seeds 0.7–1 mm long, wingless. Spruce-fir, lake shore, and alpine tundra communities at 2745 to 3390 m in Duchesne, Iron, Juab, Kane (type from Navajo Lake), and Summit counties; endemic; 9 (i). This small cushion plant

combines characteristics of both *A. rossii* and *A. rubella* (q.v.); the leaves are 1-veined and the plants glabrous as in the former, but the sepals are 3-veined and the inflorescence is mainly 2- or 3-flowered as in the latter. Some phases of *A. rossii* [e.g., var. *elegans* (C. & S.) Welsh] possess 3-veined sepals, but the flower number is seldom, if ever, more than one. Resolution of relationships of this taxon awaits revision of this complex in western North America.

Arenaria hookeri Nutt. in T. & G. Hooker Sandwort. Perennial, compactly pulvinate-caespitose herbs, forming dense cushions; stems mainly 1-5 cm tall, hirtellous or glabrous; basal leaves 1-6 cm long, pungent, spreading and rosettelike, shining, acicular; cauline leaves 1-3 pairs, hyaline-margined, acicular, pungent, 3-8 mm long; inflorescence of congested cymes, mainly 3- to several-flowered, the flowers sessile, subsessile, or on pedicels to 2 mm long; bracts inconspicuous, with broad hyaline margins; sepals 5-8 mm long, lance-acuminate, green, with broad hyaline margins, glabrous or scabrous; petals 4.5-8.5 mm long, about equaling the sepals, white, rounded to obtuse; capsules with 6 teeth, much shorter than the sepals; $2n = 44$. Pinyon-juniper, sagebrush, black sagebrush, and rabbitbrush communities at 1735 to 2930 m in Carbon, Daggett, Duchesne, Emery, Summit, Uintah, Utah, and Wayne counties; Nevada to Montana, south to South Dakota, Wyoming, Nebraska, and Colorado; 35 (iv). Our material belongs to var. *desertorum* Maguire (type from Uintah County). The Hooker sandwort is confined to the Colorado Plateau portion of Utah, except for a single record from Utah County (Brown s.n. 1927 BRY).

Arenaria lanuginosa (Michx.) Rohrb. [*Spergulastrum lanuginosum* Michx.] Perennial, loosely caespitose herbs from a caudex; stems mainly 5-16 cm tall, retrorsely scabrous; leaves mainly cauline, 3-6 pairs, 4-15 mm long, lanceolate to elliptic, (1) 2-4 mm wide, short-ciliate, acute, mucronate; inflorescence of open few- to several-flowered cymes; sepals lanceolate to ovate-lanceolate, attenuate-acuminate, 2.5-3.5 mm long, green, with hyaline margins; petals subequal to the sepals, white; capsules opening by 6 teeth; seeds 0.7-0.9 mm long, narrowly winged. Douglas fir-white fir woods at ca 2200 to 2640 m in Beaver, Piute, San Juan, and Washington counties; coastal eastern U. S. to Colorado and New Mexico; Mexico and South America; 8 (i). Utah material has been regarded at specific level as *A. saxosa* Gray [*A. lanuginosa* ssp. *saxosa* (Gray) Maguire]. The species has often been mistaken for a *Stellaria*, especially *S. longifolia*, and specimens should be sought in herbaria under that epithet. The presence of retrorse scaberulous pubescence in lines distinguishes *A. lanuginosa*.

Arenaria lateriflora L. Bluntleaf Sandwort. [*Moehringia lateriflora* (L.) Fenzl]. Perennial, rhizomatous or stoloniferous plants, the stems arising singly or in small clumps, the stolons or rhizomes lacking conspicuous persistent leaves; flowering stems 4-20 (25) cm tall, erect or ascending; basal leaves smaller than the middle and upper ones; cauline leaves 3-7 pairs, 3-26 mm long, 1-11 mm wide, the largest near the middle of the stems, lanceolate to elliptic or lance-oblong, pinnately 3- to 5-veined, acute to obtuse apically, minutely hairy below, especially along the midrib, ciliate, often with sterile axillary shoots; flowers solitary or 2-5 in terminal and/or lateral cymes; pedicels puberulent to glabrate or glabrous; sepals 2-3 mm long, erect or spreading, with

white, scarios margins, obtuse apically; petals white, 3.5-8 mm long, obovate; capsules 2-4 mm long, 6-valved; seeds subreniform, 0.8-1.1 mm long, black, shining; $2n = 48$. Willow-wet meadow, aspen, lodgepole pine, and spruce-fir communities at 1830 to 2745 m in Cache, Daggett, Duchesne, Garfield, Salt Lake, and Weber counties; Alaska to Newfoundland, south to New Mexico, Missouri, and Rhode Island; Eurasia; 11 (0).

Arenaria macradenia Wats. Shrubby Sandwort. [*A. macradenia* ssp. *ferrisiae* Abrams]. Perennial subshrubs from woody bases; stems mainly 13-45 cm tall; leaves mainly cauline, 4-9 pairs, 0.7-4.5 (7) cm long, acicular or linear, pungent, often scabrous, straight or curved; inflorescence open, with 3 to many flowers, constituting ca 1/4-1/3 of plant height, the flowers on pedicels 3-35 mm long, glabrous or glandular; sepals ovate to lanceolate or elliptic, obtuse to acute, 3.4-6.5 mm long, green, the margins scarios; petals 6.5-9 mm long, entire, white; capsules with 6 teeth, surpassing the sepals; seeds 2-2.5 mm long, dark brown, spinulose-tuberculate, wingless. Creosote bush-Joshua tree, pinyon-juniper, mountain brush, ponderosa pine, white fir-Douglas fir, aspen, and alpine meadow communities at 915 to 2990 m in Beaver, Garfield, Juab, Kane, Millard, Piute, Sanpete, Sevier, Utah, Weber, and Washington counties; California, Nevada, and Arizona; 82 (xi). Our specimens have been regarded as belonging to ssp. *macradenia* and ssp. *ferrisiae*, but supposed differences in sepal length and woodiness are not apparent. Sepal size forms a continuum from 3.5-6.5 mm, and degree of woodiness is difficult to interpret. A conservative approach is indicated.

Arenaria macrophylla Hook. [*Moehringia macrophylla* Torr.]. Perennial, rhizomatous herbs, often mat-forming; stems decumbent to ascending or erect, mainly 5-15 cm tall; leaves in few to several pairs, lanceolate to elliptic or almost linear, acute, 1-7 cm long, 2-15 mm wide, scabrous; flowers solitary or 2-5 in terminal, pedunculate cymes; bracts minute; pedicels 8-30 mm long, scabrous marginally; petals subequal to or surpassing the sepals, white, rounded; capsules shorter than the calyx, 6-valved; seeds smooth. Plants of wooded areas and meadows, not definitely known from Utah, but to be expected; British Columbia to Labrador, south to California, New Mexico, and the Atlantic Coast; 0 (0).

Arenaria nuttallii Pax Nuttall Sandwort. [*A. nuttallii* var. *gracilipes* Jones, type from Piute County]. Perennial, mat-forming, soboliferous herbs from elongated caudex branches and taproot; herbage glandular-hairy; stems prostrate, the bases often buried, mainly 5-20 cm long; leaves cauline, mainly 3-5 pairs, often with fascicled axillary ones, 2-10 mm long, linear-subulate, 3-veined; inflorescence cymose, of solitary or 2-7 or more flowers, bracteate; pedicels 2-20 mm long; sepals lance-linear to ovate-lanceolate, 1- to 5-veined, 3.5-6 mm long, attenuate, usually purplish, with narrow hyaline margins; petals 3-7 mm long, white, entire; capsules shorter than the sepals, dehiscent by 3 valves; seeds ca 1.5 mm long, dark brown, papillate; $2n = 36$. Commonly in talus or on scree slopes at (2070) 2745 to 3660 m in Beaver, Duchesne, Juab, Piute, Rich, Salt Lake, Sanpete, and Utah counties; British Columbia to Alberta, south to California and Wyoming; 23 (iii). This is a distinctive species, especially adapted to shifting slopes, where it adjusts to downward creep by elongating from beneath the talus.

Arenaria obtusiloba (Rydb.) Fern. Rydberg Sandwort. [*A. obtusa* Torr., not All.; *Alsinopsis obtusiloba* Rydb.; *Minuartia obtusiloba* (Rydb.) House]. Perennial, clump-forming herbs, mainly 0.5–1.5 dm wide, arising from a weak to strong, spreading caudex, the caudex branches clothed with persistent leaves; flowering stems 1–8 cm tall, erect or ascending; basal leaves 3–8 mm long, commonly less than 1 mm wide, oblong to linear, 1-veined, abruptly obtuse apically, scabrous-ciliate almost or quite to the apex, or smooth; cauline leaves (0) 1–3 pairs, 2–8 mm long, commonly broader than the basal ones; flowers erect, solitary or in twos; pedicels glandular-hairy; sepals 2.5–4 (5) mm long, erect or ascending in flower, often purplish, the apex obtuse, 3-veined, glandular-hairy to glabrate; petals 4–6 (10) mm long, white, obovate; capsules 4–8 mm long, 3- or 4-valved, the seeds 0.8–1 mm long, smooth or nearly so; $2n = 26, 52, 78$. Lodgepole pine, spruce-fir, and alpine tundra communities at 2895 to 3815 m in Beaver, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, and Uintah counties; Alaska to Labrador and Greenland, south to Oregon and New Mexico; 46 (x). This plant is often mistaken for *A. rubella* (q.v.), which has 3 veins in both sepals and leaves and has acute leaflets. The relationship of this taxon to *A. laricifolia* L. remains to be evaluated. Our plants have been assigned, in part, to *A. sajanensis* Willd. ex Schlecht., but that entity is not known from Utah.

Arenaria pusilla Wats. Dwarf Sandwort. [*Alsinopsis pusilla* (Wats.) Rydb.; *Minuartia pusilla* (Wats.) Mattf.]. Diminutive annuals; stems capillary, mainly 2–5 cm tall, simple or branched; leaves 2–5 mm long, 0.3–1 mm wide, lance-attenuate, more or less clasping basally, 1-veined, obtuse, lacking sterile axillary ones; flowers few to many, borne in open, leafy bracted cymes; sepals 2–3 mm long, 1-veined, lanceolate to lance-acuminate; petals shorter than the sepals or lacking; styles 3; capsule ovoid, subequal to the sepals, opening by 3 valves; seeds brown, less than 0.5 mm long, minutely ornamented. Ponderosa pine and mixed mountain brush community at 1525 to 1830 m in Washington County; Washington to Idaho, south to California, and Nevada; 3 (0).

Arenaria rossii R. Br. ex Richards. Ross Sandwort. Plants short-lived perennials, forming cushions or mats mainly 0.5–2 dm wide, arising from a taproot and caudex branches, the caudex branches prostrate to ascending, clothed with persistent leaves; flowering stems mainly 2–8 cm tall, erect; basal leaves 3–10 mm long, less than 1 mm wide, linear to lance-linear, 1-veined, obtuse apically, glabrous; cauline leaves (0) 2 or 3 pairs, 3–12 mm long, similar to the basal ones, often with short, sterile, axillary branches; flowers erect, solitary; pedicels glabrous; sepals 1.5–3.5 mm long, spreading to ascending in flower, more or less purplish throughout, acute apically; petals white, 2–3.5 mm long, oblanceolate (or lacking); capsules 1.5–2.5 mm long, 3-valved; seeds 0.6–1 mm long, reddish brown, minutely roughened. Alpine tundra at ca 3355 m in Sanpete County (Lewis 4760 BRY); Alaska and Yukon, south to Washington, Idaho, and Colorado; Asia, Greenland; 1 (0). This species is evidently rare in Utah, but should be expected in other locations.

Arenaria rubella (Wahl.) J. E. Sm. Reddish Sandwort. [*Arenaria rubella* Wahl.; *Arenaria verna* var. *rubella* (Wahl.) Wats.; *Minuartia rubella* (Wahl.) Grabner; *Arenaria propinqua* Richards.; *Alsinopsis propinqua*

(Richards.) Rydb.; *Arenaria verna* authors, not L.]. Short-lived perennial (or biennial) herbs, forming cushions or mats, 4–30 cm wide, arising from a taproot and branching caudex, the caudex branches prostrate to ascending or erect, clothed with persistent leaves; flowering stems mainly 2–10 cm tall, erect or ascending; basal leaves 3–10 (12) mm long, less than 1 mm wide, lance-linear, 3-veined, acute, glandular-puberulent to glabrate; cauline leaves 2–6 pairs, 1–14 mm long, similar to the basal ones but reduced upward, often with short, sterile, axillary branches; flowers erect, solitary, or more commonly 2–4; pedicels glandular-hairy; sepals (2) 3–4.5 mm long, spreading in flower, commonly more or less purplish throughout, acute to acuminate apically; petals white, 2.5–5 mm long, oblanceolate; capsules 3–5 mm long, 3- or 4-valved; seeds 0.4–0.6 mm long, reddish brown, minutely roughened; $2n = 24$. Lodgepole pine, spruce-fir, forb-grass, sedge, and alpine tundra communities, often in gravel, at 2315 to 3660 m in Beaver, Daggett, Duchesne, Garfield, Juab, Kane, Piute, Salt Lake, Sanpete, Summit, Uintah, and Utah counties; Alaska east to Greenland, south to California, Nevada, New Mexico, and Caspe; Eurasia; 26 (vii).

Arenaria serpyllifolia L. Thymeleaf Sandwort. Annual herbs from taproots; stems mainly 5–20 cm tall, retrorsely pubescent, ascending to erect, commonly branched; leaves much shorter than the internodes, 2–7 mm long, 1–4 mm wide, ovate to lanceolate, acute, sessile, or the lower ones short-petiolate; flowers few to several, borne in open cymes; pedicels slender, 2–10 mm long; sepals lanceolate, acute, 3–3.5 mm long, 3-veined; petals white, shorter than the sepals; capsules 3–4 mm long, 6-valved; seeds 0.5–0.6 mm long, grayish, tuberculate; $2n = 20, 44$. Pinyon-juniper, mountain brush, and Douglas fir communities at 2195a to 2565 m in Cache and Juab counties; widely distributed in North America; adventive from Eurasia; 2 (0).

Cerastium L.

Annual, biennial, or perennial herbs, with prostrate to erect stems; leaves opposite, ovate to lanceolate, oblong, or linear, lacking stipules; flowers solitary and terminal or more commonly in terminal, open or congested cymes; sepals 5, distinct to the base, 1 (or 3–5)-veined; petals 5, white, showy to inconspicuous, the blade notched or bilobed, or sometimes lacking; stamens commonly 10, inserted at the base of the ovary; styles usually 5, opposite the sepals; ovary 1-loculed; capsule opening by 10 teeth.

Hulten, E. 1956. The *Cerastium alpinum* complex. A case of World-wide introgressive hybridization. Svensk. Bot. Tidskr. 50: 471–495.

1. Plants gray-tomentose; petals 12–18 mm long; cultivated ornamentals *C. tomentosum*
- Plants variously hairy, but seldom, if ever, gray-tomentose; petals less than 12 mm long; indigenous 2
- 2(1). Petals subequal to the sepals; plants annual, biennial, or short-lived, adventive perennials 3
- Petals longer than the sepals; plants indigenous perennials 4
- 3(2). Plants annual, the stems erect-ascending; petals sometimes exceeding the sepals *C. nutans*
- Plants biennial or perennial, rooting at lower nodes, the stems usually decumbent basally; petals about as long as the sepals *C. fontanum*

- 4(2). Leaves linear or lance-linear, oblong, or narrowly elliptic (the uppermost leaves sometimes broader); sterile branches arising in most leaf axils; bracts scarious-margined *C. arvense*
- Leaves lanceolate to elliptic, oblong, or oblanceolate; sterile branches lacking, or present only in lowermost axils; bracts not scarious-margined *C. beeringianum*

***Cerastium arvense* L.** Field Chickweed. Perennial herbs, forming loose to dense clumps 1–4 dm wide, arising from stems 6–30 cm long, decumbent, ascending, or erect, from glabrous to descending or spreading hairy on the middle internodes, becoming densely glandular upward; leaves (3) 10–25 mm long, 1–4 (7) mm wide, linear to lance-linear, oblong, or narrowly elliptic (or the uppermost sometimes lanceolate), 1–veined, more or less pubescent on both sides, ciliate, acute; most cauline leaves with sterile axillary shoots; flowers erect, commonly 3–9 mm long, glandular-hairy; bracts more or less scarious-margined; sepals 4–6.5 mm long, glandular, scarious-margined, the inner mostly broadly so; petals white, 8–12 mm long, deeply bilobed; capsules 6–10 mm long, cylindrical; seeds 0.8–1.2 mm long, yellowish or brownish red; $2n = 36, 72, 90$. Pinyon-juniper, mountain brush, sagebrush, meadow, ponderosa pine, aspen, and lodgepole pine communities at 2375 to 3390 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Juab, San Juan, Sevier, Summit, Uintah, and Utah counties; widely distributed in North America; Eurasia; 24 (0). Apparent intermediates are known between this and the next following species.

***Cerastium beeringianum* C. & S.** Bering Chickweed. [*C. variable* Goodding, type from Uintah County]. Perennial herbs, forming loose to dense mats of clumps, 4–40 cm wide or more, arising from taproots and more or less stoloniferous, prostrate stems; flowering stems 3–25 (35) cm tall, decumbent to erect, the lower internodes glabrous to moderately retrorsely hairy, becoming moderately to densely hairy and often glandular above; leaves 3–38 mm long, 2–8 mm wide, lanceolate to lance-oblong, or less commonly oblong to linear, 1–veined, more or less pubescent on both surfaces (or rarely glabrous except along the vein), ciliate, acute to obtuse or rounded; cauline leaves lacking sterile axillary shoots or bearing them only in the lowermost axils; flowers erect, commonly 3–6 in an open, more or less dichotomous cyme; pedicels 2–25 mm long, glandular-hairy or merely spreading hairy; uppermost bracts narrowly scarious-margined, the inner mostly broadly so; petals white, 6–12 mm long, deeply bilobed; capsules 8–12 mm long, cylindrical; seeds 0.7–1.1 mm long, yellowish to brownish; $2n = 72$. Silver sagebrush, aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 2680 to 3965 m in Beaver, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, San Juan, Sevier, Summit, Uintah, Utah, and Wayne counties; Alaska east to the Mackenzie, south to California, Arizona, and Colorado; Asia; 56 (x).

***Cerastium fontanum* Baumg.** Mouse-ear Chickweed. [*C. vulgatum* L. 1762, non 1755; *C. caespitosum* Gilib.]. Biennial or short-lived perennial herbs, forming clumps mostly 1–4 dm broad, arising from taproots and often from horizontal, stoloniferous branches; flowering stems 5–40 cm long, decumbent to erect, moderately or sparsely villous and often glandular as well; leaves 7–25 mm long, 2–10 mm wide, lanceolate to ovate, lance-oblong, or oblanceolate, 1–veined, coarsely pubescent on

both surfaces, long-ciliate, obtuse to rounded or acute; stems lacking sterile, axillary shoots, but often with axillary flowering shoots; flowers erect or spreading, inconspicuous, commonly several to many in a congested to open cyme; pedicels mostly 3–10 mm long or more, spreading hairy; uppermost bracts distinctly scarious-margined; sepals 5–7 mm long, spreading hairy, scarious-margined; petals white, 5–7 mm long, bilobed; capsules 7–10 mm long, cylindrical; seeds 0.6–0.8 mm long, reddish brown; $2n = 140, 144$. Lawns, open sites, and often in riparian habitats, at 850 to 2746 m in Beaver, Box Elder, Daggett, Duchesne, Emery, Salt Lake, Summit, Tooele, Utah, and Washington counties; widely distributed in North America; adventive from Eurasia; 15 (iii).

***Cerastium nutans* Raf.** Nodding Chickweed. [*C. nutans* var. *brachypodium* Engelm. ex Gray; *C. brachypodium* (Engelm.) Robins. ex Britt.]. Annual herbs, often branched from the base; stems erect-ascending, 5–20 cm tall or more, arising from taproots; herbage glandular-pubescent to pilose; leaves 5–25 mm long or more, spatulate to oblanceolate or linear-lanceolate, 1–veined, ciliate, acute to obtuse apically; cauline leaves lacking sterile axillary shoots; flowers nodding, commonly several in open, leafy-bracteate cymes; pedicels 3–20 mm long; sepals 3–5 mm long; petals subequal to or somewhat exceeding the sepals, or sometimes lacking; capsules cylindrical, much longer than the sepals; seeds brownish, 0.5–0.7 mm long; $2n = 35, 36$. Silver sagebrush and meadow communities at ca 2350 m in Box Elder, Daggett, Duchesne, Summit, and Uintah counties; widely distributed in North America; 5 (0).

***Cerastium tomentosum* L.** Snow-in-summer; Dusty Miller. Perennial herbs, forming mats or clumps mainly 10–40 cm wide or more, arising from taproots and often from horizontal, substoloniferous branches; flowering stems mainly 15–30 cm tall; herbage gray-tomentose; leaves 12–35 mm long, 2–5 mm wide, lance-linear, rounded to obtuse or less commonly acute; stems not bearing sterile axillary shoots; flowers erect, showy, commonly several to many in a congested to open cyme; pedicels mainly 5–15 mm long, tomentose; bracts with distinctive, shining, scarious margins; sepals 6–7.5 mm long, tomentose, with broad, scarious margins; petals white, 12–15 mm long, bilobed; capsules longer than the calyx. Cultivated ornamental, persisting and rarely escaping in lower elevation cities and towns; introduced from Europe; 1 (0).

***Dianthus* L.**

Annual, biennial, or perennial herbs with erect or ascending stems; leaves opposite, lance-linear to oblong or linear, lacking stipules; flowers solitary or 2–4, borne in branching cymes; sepals 5, united to near the apex, each several-veined; petals 5, pink to pink purple or white, showy, the blade spreading at right-angles to the claw, toothed; stamens 10, connate, adnate to the base of the petals; styles usually 2; ovary 1–loculed, stipitate; capsule opening by 4 or 5 valves.

1. Flowers solitary, or 2 to few in open clusters, pedicellate; episepalous bracts much shorter than the calyx *D. caryophyllus*
- Flowers clustered, few to many, sessile to short-pedicellate; episepalous bracts almost as long as the calyx or longer 2

- 2(1). Calyx and bracts villous-pilose; leaves linear . . . *D. armeria*
- Calyx and bracts glabrous; leaves lanceolate to elliptic *D. barbatus*

***Dianthus armeria* L.** Grass Pink. Annual or biennial herbs; stems 1 to several, erect, mainly 2–6 dm tall, glabrous throughout, or puberulent below the nodes and in the inflorescence; leaves linear, erect, mainly 3–10 cm long and 2–5 mm wide, reduced upward; flowers several to many in a compact cyme; calyx tubular, 14–17 mm long, 20– to 25–veined, villous-pilose; episepalous bracts clasping, the base oval-oblong, the apex abruptly long-attenuate; petals 20–25 mm long, pink or red, the claws narrow, the blades obovate, dentate; stipe ca 1 mm long; capsule subequal to the calyx; 2n = 30. Cultivated ornamentals, escaping, and established in Rich and Summit counties; widely established in North America; introduced from Europe; 2 (0).

***Dianthus barbatus* L.** Sweet William. Perennial herbs; stems erect (decumbent at the base), glabrous, 2–6 dm tall; leaves basal and cauline, mainly 2–9 cm long and 0.5–2 cm wide, lanceolate to oblanceolate or elliptic, the cauline ones in 4–10 pairs; flowers numerous, borne in compact cymes; calyx cylindrical, 14–17 mm long, 35– to 40–veined, the teeth attenuate, glabrous; episepalous bracts broadly clasping basally, obovate, the apex abruptly long-attenuate, glabrous; petals narrowly clawed, the claws subequal to the calyx, the blade 6–12 mm long, rhombic-obovate, dentate, white to red or pink, or bicolored; carpophore 3–4 mm long; capsule subequal to the calyx; 2n = 30. Cultivated ornamental, escaping and persisting in Utah County; widely grown in North America; introduced from Eurasia; 4 (0).

***Dianthus carophyllus* L.** Carnation. Perennial herbs (grown as annuals); stems 1 to several, erect, mainly 2–8 dm tall, glabrous and glaucous throughout or more or less puberulent; leaves linear to narrowly elliptic, 1.5–8 cm long, mainly 2–4 mm wide, reduced upward; flowers solitary or few in open cymes; calyx tubular 20–30 mm long, 30– to 50–veined, glabrous; episepalous bracts clasping, less than 1/4 as long as the tube, the apex abruptly short-attenuate; petals 30–50 mm long, the limb 10–15 mm wide or more, usually glabrous, dentate, pink, white, purple, or red; 2n = 30. Widely cultivated ornamental both in gardens and under glass in Utah; introduced from Eurasia; 3 (0). The closely allied maiden pink (*D. deltoides* L.) and rainbow pink (*D. chinensis* L.) are grown in Utah also. They differ from the carnation in the former being puberulent and in the latter having bearded petals.

***Gypsophila* L.**

Perennial (or annual) herbs; leaves opposite, lacking stipules; flowers numerous, borne in open cymes, perfect or imperfect; bracts scarious; sepals 5, connate, with membranous sinuses; petals 5, white or pink to red, lacking appendages; stamens 10; styles 2; ovary 1-loculed; capsule ovoid, 4– to 6-valved; seeds reniform.

- 1. Inflorescence glabrous; petals white *G. paniculata*
- Inflorescence glandular; petals pink to red *G. scorzoniferolia*

***Gypsophila paniculata* L.** Babysbreath. Perennial, glabrous herbs from a taproot; stems mainly 4–10 dm tall,

usually freely branched and umbrelliform; leaves 1–5 cm long or more, lanceolate, 1–veined; flowers numerous on pedicels 2–8 mm long; calyx broadly campanulate, 1.5–2 mm long, with broad, white, membranous intervein areas below the sinuses, the veinal areas blackish; petals white, 2–3.5 mm long; capsules ovoid, 4-valved; seeds 1.5–2 mm long, blackish, cross-wrinkled and papillate. Established in ponderosa pine-mountain brush communities at ca 2090 m in Washington County; widely established in western U. S.; introduced from Eurasia; 2 (0).

***Gypsophila scorzoniferolia* Ser.** in DC. Perennial herbs, glabrous below, glandular in inflorescence, from a caudex and taproot; stems mainly 3–10 dm tall, usually freely branched upward; leaves 1.5–8 cm long, 3–10 mm wide or more, oblong to lance-oblong or elliptic, 3– to 7–veined; flowers numerous, on pedicels 3–8 mm long; calyx obconic to subcylindric, 2.5–3.5 mm long, with moderately broad white membranous intervein areas below the sinuses, the veinal areas broad and green; petals pink to reddish, 4–5 mm long; capsules ovoid, 4-valved; seeds 1–1.5 mm long, blackish, ornamented; 2n = 34, 56, 68. Moist roadsides and pastures at 1300 to 1375 m in Salt Lake and Utah counties; introduced from Europe; 2 (0).

***Herniaria* L.**

Annual or perennial herbs; stems prostrate, spreading; leaves opposite, entire; stipules scarious, minute; flowers very small, sessile in compact axillary clusters; sepals 4 or 5; petals lacking; stamens 2–5; style 2-cleft; fruit a utricle, 1-seeded.

***Herniaria glabra* L.** Annuals or perennials with prostrate stems, these more or less retrorsely puberulent, mainly 3–15 cm long; leaves 3–7 mm long, 1–2 mm wide, narrowly oblanceolate to elliptic, glabrous; stipules 0.5–1 mm long; flowers green, ca 1 mm wide; sepals ca 1 mm long; utricle cylindroid, membranous, surpassing the sepals; seeds ca 0.5 mm long, black, shining. Cultivated ground cover, escaping in Salt Lake County (Arnou 5966 BRY); introduced from Europe; 1 (0).

***Holosteum* L.**

Annual herbs; leaves basal and cauline, opposite, more or less connate-clasping; inflorescence umbellate, long-peduncled; flowers several to many, borne on long, reflexed pedicels; sepals 5, distinct; petals 5, white, irregularly toothed; styles 3; fruit a capsule; seeds reniform.

***Holosteum umbellatum* L.** Plants erect or erect-ascending, simple or branched from the base, mainly 3–22 cm tall or more; basal leaves petiolate, oblanceolate to spatulate; cauline leaves 1–4 pairs, lanceolate to elliptic, 6–20 mm long or more, glandular-ciliate, obtuse to acute, entire; umbels 3– to 10-flowered, the pedicels of various lengths, erect in anthesis, soon deflexed; sepals 3.8–5.3 mm long, lanceolate, green or suffused with red, the margins hyaline; petals white or pinkish, subequal to or longer than the sepals; capsules cylindrical, surpassing the sepals; seeds 0.7–1 mm long, brown, ornamented; 2n = 20. Open sites in mixed desert shrub, sagebrush, and mountain brush communities at 1340 to 1985 m in Box Elder, Cache, Davis, Millard, Salt Lake, Tooele, and Utah counties; widely established in North America; adventive from Europe; 14 (iii). Our material has glands mainly near the stem mid-length and is assigned to **var. umbellatum**.

Loeflingia L.

Annual, glandular-hairy, rigid herbs; leaves opposite, connate-clasping, subulate; flowers axillary, sessile or short-pedicellate, solitary or few; sepals 5, keeled, with rigid, long-attenuate, straight or recurved apices; petals 3–5 or none; stamens 3–5; style 1 or lacking; stigmas 3; capsule 3-valved; seeds numerous.

Loeflingia squarrosa Nutt. Spreading to erect, glandular-pubescent annuals, mainly 3–10 cm tall; leaves 4–6 mm long, subulate; sepals 3.5–4.5 mm long, rigid, toothed on each side; petals minute; capsules shorter than the calyx; seeds ca 0.4 mm long. Mountain brush community in Washington County (Atwood 5025 BRV); California, Arizona, and Mexico; 1 (0).

Lychnis L.

Perennial herbs with erect or ascending stems; leaves opposite or chiefly basal, lance-linear to oblong, lacking stipules; flowers solitary or 2–5 in congested or more or less open cymes; sepals 5, united to near the apex, each 2- to 4-veined; petals 5, white to pink or reddish, the blade spreading at right angles to the claw (when exerted from the calyx), retuse or 2- to 4-lobed; stamens 10, connate, adnate to the petal bases; styles 5 (4); ovary 1-loculed (or incompletely 5-loculed), stipitate; capsules opening by 5 (4) or 10 (8) teeth. Our species have been treated variously within *Melandrium* and *Gastrolychnis*, or as part of an expanded *Silene*, a seemingly practical option. I follow tradition in western American taxonomic works to avoid replacing well known names.

Baker, H. C. 1950. Dioecious *Melandrium* in western North America. *Madrono* 10: 218–221. 1950.

Maguire, B. 1950. A synopsis of the North American species of the subfamily Silenoidea. *Rhodora* 52: 233–245.

1. Petal claws exerted, the blades mostly 5–10 mm long, white; flowers imperfect, dimorphic, those of the pistillate ones much larger than those of the staminate . . . *L. alba*
- Petal claws mostly included, the blades less than 5 mm long, pinkish, purplish, or white; flowers perfect, all about the same size 2
- 2(1). Plants 3–15 (20) cm tall; flowers 1–3, nodding in bud; calyces inflated and turbinate in fruit *L. apetalata*
- Plants mainly 20–60 cm tall; flowers 1–7, erect in bud; calyces inflated or not, cylindroid to turbinate in fruit *L. drummondii*

Lychnis alba Miller White Cockle. [*Melandrium album* (Miller) Garcke; *Silene alba* (Miller) Krause in Sturm]. Commonly dioecious perennial herbs; stems erect or ascending, mainly 4–10 dm tall, pubescent with multicellular hairs, these often glandular upwards; basal leaves petiolate, mainly 4–10 cm long, 0.5–2 cm wide; cauline leaves 4–10 pairs, often larger than the basal ones, becoming sessile and smaller upward; flowers more or less clustered, the clusters borne in open leafy-bracteate, paniculate cymes, dimorphic, with the pistillate ones much larger than the staminate; calyx subcylindric, the teeth triangular to lanceolate, the tube mainly 15–30 mm long, 10- to 20-veined, the staminate smaller and more obscurely veined than the pistillate, inflated in fruit; petals 5, white (or pink), 25–35 mm long, clawed, the blade 8–12 mm long, bilobed, appendaged at juncture of blade and claw; capsule ovoid-cylindric, 10–15 mm long, opening by 10 teeth; seeds reniform, 1.3–1.7

mm long, papillose; $2n = 22 + xx$ or xy . Open sites, often in indigenous vegetation, at 1525 to 2930 m in Cache, Salt Lake, Utah, Wasatch, Wayne, and Weber counties; widespread in North America; adventive from Europe; 6 (0).

Lychnis apetalata L. Nodding *Lychnis*. [*Melandrium apetalum* (L.) Fenzl; *Wahlbergella apetalata* (L.) Fries; *Silene wahlbergella* Chaudhri, not *Silene apetalata* Willd.]. Plants 2.3–18 cm tall, from a taproot and branching caudex, the stems erect or ascending, white-hairy below, becoming glandular-villous above with multicellular hairs, the cross-walls purplish; basal leaves 1–6 cm long, 2–5 mm wide, narrowly oblanceolate to elliptic, 1-veined, acute to obtuse apically, glabrous to puberulent on one or both sides, ciliate; cauline leaves 2 or 3 pairs, reduced upward, the upper ones commonly pubescent with multicellular hairs; flowers solitary or 2 or 3, nodding (or erect?) in bud, spreading to erect in fruit; pedicels villous with multicellular, glandular hairs, the cross walls purplish; calyx urn-shaped to campanulate, purplish veined and commonly more or less hairy like the pedicels, 10–19 mm long, 5–10 mm wide, the teeth 1.5–3 mm long, ciliate; petals pinkish to purplish or white, included or exerted 1–4 mm, bilobed; capsule erect, 10–18 mm long, opening by 5 or 6 (10 or 12) teeth; seeds 1–2 mm long, wing-margined or not; $2n = 24$. This species is circumpolar, with two more or less distinctive varieties present in Utah.

1. Basal leaves glabrous on both sides, ciliate; seeds evidently winged *L. apetalata* var. *montana*
- Basal leaves retrorsely puberulent and ciliate; seeds wingless or nearly so *L. apetalata* var. *kingii*

Var. *kingii* (Wats.) Welsh [*L. kingii* Wats., type from Summit County; *Wahlbergella kingii* (Wats.) Rydb.]. Spruce-fir, sedge, and alpine tundra communities at 3290 to 3450 m in Daggett, Duchesne, Piute, San Juan, Summit, and Uintah counties; Colorado; 21 (iii). Pubescence and seed differences seem to be the main diagnostic features of this taxon. Attitude of flower buds and petal exertion are difficult to apply as taxonomic tools. Even seed differences are only useable when mature fruit is collected, as rarely.

Var. *montana* (Wats.) C. L. Hitchc. [*L. montana* Wats; *L. apetalata* ssp. *montana* (Wats.) Maguire]. Spruce-fir, meadow, and alpine tundra communities at 3355 to 3905 m in Duchesne, Grand, and San Juan counties; Montana, Wyoming, and Colorado; 3 (1).

Lychnis drummondii (Hook.) Wats. Drummond Catchfly. [*Silene drummondii* Wats; *Melandrium drummondii* (Hook.) Porsild; *Gastrolychnis drummondii* (Hook.) Love & Love; *L. striata* Rydb.; *L. drummondii* var. *striata* (Rydb.) Maguire]. Perennial herbs from a taproot and more or less branching caudex; stems mainly 15–50 dm tall, retrorsely hairy below, usually becoming glandular-villous with multicellular hairs upward, the cross-walls purplish; basal leaves with blades 1–10 cm long, 3–15 mm wide, oblanceolate to elliptic or lanceolate, petiolate, glabrous or puberulent on both sides, ciliate; cauline leaves 2–5 pairs, becoming sessile and reduced upward; flowers 1 to several, in bracteate, racemose or paniculate cymes; calyx campanulate to turbinate, 10–15 mm long, expanding and investing the fruit, 10-veined; corolla white or tinged pink, included or the blade exerted; petals clawed, the blades 1–3 mm

long, retuse or 2- to 4-lobed, appendaged; stipe short; capsule dehiscent by 5 (or 4) valves; seeds ca 0.7 mm long, brown, papillate. Sagebrush, piñon-juniper, ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine tundra in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Iron, Kane, Millard, Morgan, Piute, Rich, San Juan, Sanpete, Sevier, Summit, Tooele, and Uintah counties; Northwest Territories, south to Oregon, Nevada, Arizona, and Colorado; 49 (xi). This is a highly variable taxon, varying in stature, flower number, and glandularity. The variation seems to lack geological or morphological correlation.

Paronychia Miller

Perennial, pulvinate-caespitose herbs; leaves opposite, subulate or elliptic; stipules scarious; flowers sessile, solitary or few in cymes; calyx 5-lobed, the lobes awntipped; petals lacking; stamens 5, opposite the sepals; style 1, bifid; fruit a utricle, 1-seeded, enclosed in the calyx.

1. Leaves 0.8–1.2 mm wide, elliptic; plants mainly of high elevations in the Uinta Mts. *P. pulvinata*
 — Leaves 0.4–0.6 mm wide, linear to subulate; plants of middle and lower elevations, variously distributed *P. sessiliflora*

Paronychia pulvinata Gray Plants cushionlike, mainly 6–15 cm wide; stems leafy throughout, usually lacking elongate internodes; leaves 1–6 mm long, elliptic, thickened, glabrous or scabrous-ciliate, yellow green, appearing veinless; stipules ovate, attenuate, surpassing the leaves in youth, scarious; flowers mostly solitary, sessile, borne among the leaves; bracts surpassing the flowers; sepals 2–2.5 mm long, ovate, cuspidate from below the tip; fruit ovoid, ca 1 mm long, excluding the style ca 0.5 mm long; seeds brown, ca 1 mm long; $2n = 32$. Spruce-fir and alpine tundra communities at 3295 to 3815 m in Daggett, Duchesne, Summit, and Uintah counties; Wyoming and Colorado; 13 (i). Our material has been assigned to var. *longiaristata* Chaudhri (type from Mt. Emmons).

Paronychia sessiliflora Nutt. Plants cushionlike, mainly 6–20 cm wide; stems lacking or with 1–3 elongate internodes; leaves 1–8.5 mm long, linear to subulate, scabrous, thickened, gray green, 1-veined; stipules narrowly lance-attenuate, surpassing or shorter than the leaves; flowers usually solitary; bracts subequal to the sepals; sepals 2.5–4 mm long, lanceolate, cuspidate-aristate from below the tip; fruit ovoid, ca 1 mm long, excluding the style ca 0.5 mm long; seed brown, ca 1 mm long; $2n = 64$. Shadscale, piñon-juniper, sagebrush, mountain brush, and fringed sagebrush communities at 1675 to 2930 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Millard, Piute, Rich, Sevier, Summit, Uintah, Wasatch, and Wayne counties; Alberta and Saskatchewan, south to New Mexico and Texas; 36 (vi).

Sagina L.

Annual, biennial, or perennial herbs with prostrate, ascending, or erect stems; leaves opposite, linear, basally connate, apiculate, lacking stipules; flowers solitary or 2 to several in cymes; sepals 4 or 5, distinct, obscurely 1- to 3-veined; petals 4 or 5, usually shorter than the sepals, white, the blades entire or slightly emarginate; stamens 4 or 5, alternate with the sepals; ovary 1-loculed; capsule opening by 4 or 5 valves, these opposite the sepals.

1. Sepals 5, usually erect in fruit; capsules sometimes reflexed, plants common in montane sites *S. saginoides*
 — Sepals 4 (or 5) often spreading in fruit; capsules erect; plants uncommon in ruderal sites *S. procumbens*

Sagina procumbens L. Biennial or perennial (annual) herbs, usually glabrous; stems prostrate to ascending and often rooting at the nodes, mainly 2–15 cm long; rosette leaves mainly 8–25 mm long, the cauline 2–6 mm long, conspicuously sheathing, often with sterile axillary shoots; flowers solitary or 2 to several per stem; pedicels erect in fruit; sepals 4 (or 5), oval, rounded, 1.8–2.5 mm long, spreading in fruit; petals 0.5–1 mm long or lacking; capsules subequal to or surpassing the sepals, 4- or 5-valved; seeds ca 0.3 mm long; $2n = 22$. Weedy species of open disturbed sites at ca 1350 m in Salt Lake County (Arnov 5593 UT; BRY); widely scattered in North America; adventive from Eurasia; 1 (0).

Sagina saginoides (L.) Britt. [*Spergula saginoides* L.; *Sagina linnaci* Presl; *Alsinella saginoides* (L.) Greene]. Biennial to perennial (or annual?) herbs, forming compact to more or less diffuse clumps 3–15 (20) cm wide, arising from a taproot and branching caudex, the caudex branches prostrate to ascending; flowering stems 2–7 (14) cm long, decumbent to erect; basal leaves 4–25 mm long, usually less than 1 mm wide, linear, 1-veined, apiculate, glabrous; cauline leaves 2–5 pairs, often with clustered, secondary, axillary leaves; flowers erect, solitary and terminal or lateral, or 2 or 3 and the lower ones lateral; sepals 1.5–2 mm long, erect, greenish, the margins scarious, glabrous, obtuse to rounded; petals white, 1–1.5 mm long; capsules 2.5–3 mm long, 4- or 5-valved, sometimes recurved at maturity; seeds 0.2–0.4 mm long, reddish brown; $2n = 22$. Aspen and spruce-fir communities, often in sandy gravel along lake margins or stream banks, at 2560 to 3965 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, and Washington counties; Alaska to the Atlantic, south to California, Mexico, Michigan, and Quebec; circumboreal; 35 (ix).

Saponaria L.

Perennial herbs; stems erect, leafy; leaves opposite, palmately 3-veined; flowers numerous, in usually contracted cymes, perfect; calyx tubular, obscurely 15- to 25-veined; petals clawed, appendaged at juncture of blade and claw; stamens 10; styles 2; capsule opening by 4 teeth; seeds reniform.

Saponaria officinalis L. Bounding Bet; Soapwort. Robust perennial herbs, mainly 30–80 cm tall, forming clumps, glabrous or nearly so; leaves 3–12 cm long, 0.8–4 cm wide, lanceolate to elliptic or ovate-lanceolate, reduced and subsessile upward; flowers numerous, usually in compact cymes; calyx 15–25 mm long, the tube subcylindric or tapering toward the apex, the lobes ovate or triangular, acuminate; petals 3–4 cm long, white or pink, showy, the claw usually surpassing the calyx, the lobes spreading, obovate-cuneate, retuse; appendages 2, 1–2 mm long; seeds black, 1.6–1.8 mm long, pitted; $2n = 28$. Cultivated ornamental, escaping and established in Cache, Duchesne, Juab, Salt Lake, Uintah, Utah, and Washington counties; widely established in North America; introduced from Europe; 12 (0). Double flowered forms occur in cultivation. This plant is considered to be poisonous to livestock.

Silene L.

Annual or perennial herbs with prostrate, decumbent, ascending, or erect stems; leaves opposite, lanceolate to lance-oblong or linear, lacking stipules; flowers solitary or few to many in open to contracted cymes; sepals 5, united to near the apex, each 2 (or more) -veined; petals 5, white to pink, red, or purplish, the blade ascending or spreading, entire or several lobed apically, often appendaged at juncture of blade and claw; stamens 10, adnate to base of petals; styles commonly 3 (or less commonly 4 or 5); ovary 1 (or incompletely 3-5) -loculed, stipitate; capsule opening by 6 (rarely 8 or 10) teeth.

1. Plants pulvinate-caespitose, forming dense mats, acaulescent, of alpine sites; leaves linear to oblong, mainly 3-20 mm long, 1-2 mm wide *S. acaulis*
- Plants neither pulvinate-caespitose nor acaulescent, of various distribution; leaves various, but seldom if ever as above 2
- 2(1). Plants annual, from slender taproots 3
- Plants perennial, from a caudex and taproot 5
- 3(2). Plants densely pubescent throughout; reported from Cache and Weber counties *S. noctiflora*
- Plants glabrous or essentially so 4
- 4(3). Stems lacking glutinous bands; calyces cylindrical-clavate, often pinkish; appendages 1-2.5 mm long; plants cultivated, escaping, and established ... *S. armeria*
- Stems with glutinous bands; calyx turbinate, green, with broad, scarious intervein areas; appendages less than 1 mm long; plants indigenous *S. antirrhina*
- 5(2). Plants soboliferous, growing in limestone on the Wasatch and Sevier-Paunsagunt plateaus; petals bright pink the lobes 8-15 mm long *S. petersonii*
- Plants from a caudex, this not soboliferous, seldom with the above distribution; petals pink or white, the lobes mostly less than 7 mm long 6
- 6(5). Corollas white, usually less than 12 mm long; flowers solitary or in open leafy cymes *S. menziesii*
- Corollas white or pink, usually more than 12 mm long; flowers solitary or few to numerous, borne in open to contracted cymes, with much reduced bracts 7
- 7(6). Petal appendages commonly 4; petals equally 4-lobed; plants of northern Utah *S. oregona*
- Petal appendages commonly 2, or if 4, the blades bilobed or unequally 4-lobed; plants of various distribution 8
- 8(7). Calyx puberulent, lacking glands, papery, inflated in fruit; petal blades 4-7 mm long, bilobed or rarely with minute lateral teeth *S. douglasii*
- Calyx glandular, neither papery nor much inflated in fruit; petal blades various 9
- 9(8). Caudex branches with apparent, whitish internodes, usually several per plant; plants of Washington, Kane, and Beaver counties *S. verecunda*
- Caudex branches without apparent internodes, the stem bases often purplish, 1 or few per plant; plants of Piute, Garfield, San Juan, and Washington counties *S. scouleri*

Silene acaulis L. Moss Champion. Perennial, pulvinate-caespitose, dioecious or less commonly perfect plants forming dense mats or cushions 3-40 cm wide or more, arising from a taproot and branching caudex, the caudex branches prostrate to ascending or erect, clothed with persistent leaves; flowering stems lacking or to 5 cm tall,

erect; basal leaves 5-35 mm long, 0.5-2 mm wide, linear to lance-linear, 1 (3) -veined, connate-sheathing basally, acute apically, ciliate with descending hairs, glabrous; cauline leaves lacking or sometimes with 1 (or 2) reduced pairs near the stem base; flowers erect, solitary, sessile or on pedicels 0.5-5 cm long; calyx cylindrical to campanulate, 4.5-8.5 mm long (or longer), often purplish, glabrous, the teeth 1-2 mm long, ciliate; petals pink to pink purple or rarely white, 8-12 mm long, entire to emarginate, the appendages 0.5-1 mm long or lacking; capsules 3-locular, 4-10 mm long; seeds 0.8-1.2 mm long, light brown; $2n = 24$. Spruce-fir and alpine tundra communities at 2680 to 3965 m in Beaver, Daggett, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Summit, Uintah, and Utah counties; Alaska east to the Atlantic, south to Arizona, New Mexico, and New Hampshire; Eurasia: 40 (iii). Our plants are assignable to the weakly separable var. *subacaulescens* (F. Williams) Fern. & St. John [*S. acaulis* f. *subacaulescens* F. Williams; *S. acaulis* ssp. *subacaulescens* (F. Williams) Hulten].

Silene antirrhina L. [*S. antirrhina* var. *vacarifolia* Rydb.]. Annual herbs from yellowish taproots; stems erect or ascending, 10-80 cm tall, usually glandular in bands below the nodes, glabrous above, sometimes puberulent near the base; basal leaves spatulate to oblanceolate, 1-6 cm long, 2-15 mm wide or more, puberulent; cauline leaves 3-7 or more pairs, reduced, sessile, and glabrous upward; flowers solitary or more commonly few to many in a contracted to open cyme; calyx turbinate-campanulate, 4-10 mm long, 10-veined, glabrous; petals white or pink, the claw narrow, much longer than the obcordate blade; appendages 2, very short; capsules 3-locular; seeds brown, 0.5-0.7 mm wide, ornamented; $2n = 24$. Creosote bush, blackbrush, other warm desert shrub, pinyon-juniper, and mountain brush communities at 975 to 1740 m in Cache, Daggett, Garfield, Grand, Juab, Kane, Salt Lake, San Juan, Washington, and Weber counties; widely distributed in North America; 14 (vi).

Silene armeria L. Annual, glabrous or sparingly puberulent herbs; stems erect, 10-70 cm tall; leaves sessile and more or less clasping, the basal ones 1-5 cm long, 3-15 mm wide; cauline leaves in several to many pairs, oblong to lanceolate; flowers several to many in open to compact corymbose cymes; calyx narrowly cylindrical to clavate, 13-17 mm long, 10-veined, glabrous, often suffused with pink; petals pink to lavender, the claw 6-8 mm long, the blade cuneate-obovate, 4-7 mm long, rounded to emarginate, the appendages 2, 2-3 mm long; stipe 7-8 mm long, glabrous; capsule 3 (or 4) -loculed; seeds 0.5-0.7 mm long, rugose, brown; $2n = 24$. Cultivated ornamental, escaping and persisting in Salt Lake County (Neese 11134 BRV); widely established in the U. S.; introduced from Europe; 1 (0).

Silene douglasii Hook. Perennial plants, forming loose clumps, arising from a caudex and taproot, the caudex usually with apparent, often whitish, internodes; flowering stems 10-48 cm long or more, decumbent to ascending or erect; basal leaves smaller than the main cauline ones, often withered by flowering time; cauline leaves 2-8 cm long, 2-7 (12) mm broad, oblanceolate to narrowly lanceolate, 1 (several) -veined, slightly connate basally, acute apically, hairy above and beneath and rarely somewhat glandular; flowers erect or ascending, solitary or more commonly 2 to several, in open or contracted cymes; pedicels 3-35 mm long, retrorsely hairy;

calyx campanulate, (10) 12–15 mm long, greenish or purplish, with broad white interveins, becoming papery, pubescent to merely glabrous, the teeth 1.5–3 mm long, ciliate; petals white to greenish, pinkish, or purplish, 12–16 mm long, the blades bilobed, the appendages 1–3 mm long; capsules 1-loculed, 8–12 mm long (including stipe); seeds 1.1–1.4 mm long, reddish brown, roughened; $2n = 48$. Sagebrush, mountain brush, white fir, mixed conifer, and grass-forb communities at 2040 to 3420 m in Beaver, Box Elder, Cache, Davis, Juab, Millard, Rich, Salt Lake, Utah, and Washington counties; British Columbia, south to California and Nevada; 44 (ii). A specimen from Box Elder County (Atwood & Goodrich 8333 BRY) has 4-lobed petal blades; it approaches *S. parryi* (Wats.) Hitchc. & Maguire in that feature.

Silene menziesii Hook. Menzies Campion. [*Anotites jonesii* Greene, type from American Fork Canyon]. Perennial, dioecious (or perfect?) plants forming loose clumps, arising from elongate rhizomes; flowering stems 5–30 cm long or more, sprawling to decumbent, ascending, or less commonly erect; basal leaves smaller than the main cauline ones and often withered by flowering time; cauline leaves 1–7 cm long, 3–22 mm wide, lanceolate to elliptic or oblong, 1 (several) -veined, not or only slightly connate basally, acuminate to attenuate or acute apically, glandular-pubescent above and beneath, especially along the veins, glandular-ciliate; flowers erect, solitary or more commonly 2 to several in open cymes; pedicels 4–30 mm long, glandular-hairy; calyx campanulate, 5–8 mm long, purplish or greenish, pubescent and glandular, the teeth 1.5–2.5 mm long, ciliate; petals white, 6–10 (12) mm long, the blades bilobed, the appendages 0.4 mm long or less; capsules 1-loculed, 5–8 mm long (including the stipe); seeds 0.7–0.9 mm long, black, shining; $2n = 24, 48$. Riparian, meadow, mountain brush, mixed conifer, aspen, and spruce-fir communities, often in shade, at 1675 to 3175 m in Cache, Carbon, Duchesne, Emery, Garfield, Grand, Millard, Morgan, Piute, Rich, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Alaska and Yukon, south to California and New Mexico; 49 (vii).

Silene noctiflora L. Night-flowering Catchfly. Annual, perfect or occasionally dioecious plants arising from taproots, the stems 2–8 dm tall, erect; leaves 2–10 cm long, 0.6–2.5 (4) cm broad, lanceolate to elliptic or the lower ones oblanceolate, several-veined, slightly connate basally, acute to attenuate or obtuse apically, hairy above and beneath, ciliate; flowers erect, solitary or few to several in open or contracted cymes; pedicels 0.3–1 cm long, glandular-hairy; calyx tubular, 12–25 mm long, greenish or pinkish, or scarious between the veins, glandular-hairy, the teeth 4–9 mm long, ciliate; petals white to pinkish, 20–35 mm long, the blades bilobed, the appendages 0.5–1.5 mm long; capsule 3-locular, 1.5–2.5 cm long (including the stipe); seeds 0.8–1.2 mm long, brown, roughened; $2n = 24$. Reported from Cache and Weber counties; widely distributed in North America; introduced from Asia; 0 (0).

Silene oregana Wats. Oregon Campion. Perennial herbs from a taproot and branching, short-crowned caudex; stems 20–70 cm tall, ascending to erect, puberulent; cauline leaves 3–6 pairs, 2–8 cm long (or more), 3–12 mm wide, the main ones oblanceolate, acute to obtuse, petiolate, reduced and sessile or subsessile upward; inflorescence few-flowered, open or compact, stipi-

tate-glandular; calyx narrowly campanulate, 10–16 mm long, glandular, the lobes 2–4 mm long; petals pink or white, the claws exerted, the 3 veins branched below junction with blade, the appendages 4 or 6, linear, 1–1.5 mm long; blades 3–5 mm long, deeply 4-lobed (the middle lobe sometimes again lobed); capsule 9–13 mm long (including the stipe); styles 3 or 4; seeds 1.2–1.8 mm wide, tuberculate; $2n = 24$. Reported for Box Elder County (Hitchcock and Maguire 1947), but no specimens have been seen from Utah by me; Washington to Montana, south to California, Nevada, and Wyoming; 0 (0).

Silene petersonii Maguire Maguire Campion. Perennial, soboliferous herbs, from creeping, subrhizomatous caudex branches and taproot; stems 3–15 cm tall, erect or ascending, retrorsely puberulent and more or less glandular; leaves mainly cauline, 2–6 pairs, lanceolate to elliptic or oblanceolate, obtuse to acutish, hairy like the stems or glabrous above, 1–5 cm long, 2–10 mm wide, subsessile to sessile, 1-veined, reduced upward; flowers irregular, the upper petal reflexed, 1–5 in open cymes, nodding in bud and at anthesis; pedicels 5–25 mm long; calyx turbinate-campanulate, 13–19 mm long, glandular-villous with multicellular hairs, 10-veined, the veins broad, green or purplish, the lobes 3–6 mm long; petals 15–35 mm long, pink to purplish, the claws subequal to the calyx or shorter, the appendages very small or lacking, the blades 5–15 mm long and as broad, irregularly toothed, lobed, or 4-cleft; capsules included in the accrescent calyx; styles usually 3; seeds 2–2.5 mm wide, brown, tuberculate marginally. Ponderosa pine, aspen, and spruce-fir communities at 2135 to 3450 m in Garfield, Iron, Sanpete (type from Wasatch Plateau) and Sevier counties; endemic; 24 (iii). Specimens from Red Canyon, Garfield County (type locality) have been segregated as var. *minor* Hitchcock & Maguire. They were said to differ in lower stature [5–10 (12) cm vs 10–15 cm], shorter petals (1.5–2 cm vs 2–3 cm), and degree of lobing of the petal blade. Increased harshness of pubescence rounded out the list of supposed diagnostic features of the variety. The characteristics fail singly and in combination. There is a complete transition with the typical material. Short petals are found on short plants within the range of typical specimens and the reverse is true, also. Degree of lobing of petals varies on a single sheet of specimens collected at the same locality. Harshness of pubescence, whose interpretation is tenuous at best, fails as a diagnostic tool. Recognition of infraspecific taxa seems moot.

Silene scouleri Hook. Perennial herbs from a caudex and taproot; stems 20–80 cm tall, erect, puberulent, becoming glandular upward; leaves mainly cauline, 2–5 pair, 3–15 cm long, 4–15 mm wide, elliptic to oblanceolate or lance-linear, acute, puberulent, ciliate, reduced and becoming sessile upward, 1-veined; flowers few to numerous in an elongate, subverticillate (sometimes branched) cyme, often 2–8 per cluster; pedicels 0.5–3 cm long; calyx cylindrical-campanulate, 10–18 mm long, glandular-puberulent, 10-veined, green with intervein areas scarious, the lobes 2–4 mm long; petals 10–20 mm long, purplish or whitish, the blades 3–6 mm long, usually equally 4-lobed, the appendages 2, 1–3 mm long; capsule included in the slightly accrescent calyx; styles 3; ovary 1-loculed; seeds reniform, 0.9–1.5 mm long, papillate; $2n = 48, 96$. Ponderosa pine and pinyon-juniper communities at 2135 to 2440 m in Garfield, Iron, Piute, San Juan, and Washington counties; British Columbia to

Montana, south to California, Arizona, and New Mexico; 4 (i). Our material was designated provisionally as belonging to ssp. *hallii* (Wats.) Hitchc. & Maguire, but apparently does not differ in any substantial way from other southern specimens of the species regarded as ssp. *pringlei* (Wats.) Hitchc. & Maguire. Recognition of our material at infraspecific level seems moot, at least until many additional specimens are available for study.

Silene verecunda Wats. Perennial plants forming loose clumps, arising from a caudex and taproot, the caudex usually with apparent often whitish internodes; flowering stems 10–50 cm tall or more, decumbent to ascending or erect; basal leaves smaller than the main cauline ones, often withered by flowering time; cauline leaves mainly 2–10 cm long, 2–13 mm wide, narrowly oblanceolate to linear, 1-veined, slightly connate basally, acute to attenuate apically, scabrous or glabrous on one or both surfaces or more or less glandular; flowers erect or ascending, solitary or 2 or 3 in racemose cymes; pedicels 3–20 mm long, glandular; calyx tubular-campanulate, 10–14 mm long, the 10 veins green, the intervein areas scarious, usually glandular, the teeth 2–5 mm long, ciliate; petals white, greenish, or pink, 12–20 mm long, the blades bilobed, the appendages 0.5–1.5 mm long; capsules 1-loculed, 10–14 mm long (including stipe); seeds ca 1.5 mm long, brown, papillate. Pinyon-juniper and mountain brush community at ca 1250 m in Beaver, Kane, and Washington counties; California and Nevada; 2 (0). Our material has been assigned to ssp. *andersonii* (Clokey) Hitchc. & Maguire [*S. andersonii* Clokey]. This taxon simulates *S. douglasii* in habit, but has more slender flowers and differs in other technical ways.

Spergularia (Pers.) J. & C. Presl

Annual (biennial or perennial?) herbs with prostrate, decumbent, ascending, or erect stems; leaves opposite or clustered, linear, not connate basally, acute to apiculate; stipules membranous, connate-sheathing; flowers few to many, borne in open, leafy, terminal cymes; sepals 5, distinct, obscurely 1-veined; petals 5, white to pinkish, shorter than the sepals, the blades entire; stamens 2–10; styles 3; ovary 1-loculed; capsule opening by 3 valves.

- 1. Stamens 2–5; leaves, at least some, 10–30 mm long or more; plants of low elevations, saline, banks and shores *S. marina*
- Stamens 6–10, leaves mostly less than 10 mm long; plants of higher middle elevations in the Uinta Mts. *S. rubra*

Spergularia marina (L.) Griseb. [*Arenaria rubra* var. *marina* L.; *S. salina* J. & C. Presl; *Tissa salina* (J. & C. Presl) Britt.]. Annual, stipitate-glandular herbs; stems mostly 5–25 cm tall, ascending to erect, 0.6–2 mm thick; leaves opposite, seldom with sterile axillary ones, mostly 10–30 mm long, 0.6–1.2 mm wide, linear, shortly mucronate; stipules 2–4 mm long; flowers solitary in upper leaf axils, 2.5–5 mm long, glandular or glabrous; petals white to pink, shorter than the sepals; stamens 2–5; capsule surpassing the calyx; seeds 0.6–0.8 mm long, smooth to papillate, often winged; 2n = 18, 36. Stream, pond, and lake margins, often on mud, at 1065 to 1375 m in Box Elder, Davis, Salt Lake, Uintah, Utah, and Washington counties; widespread in North America; adventive (?) from Europe; 9 (0).

Spergularia rubra (L.) J. & C. Presl [*Arenaria rubra* L.]. Plants annual (rarely biennial or perennial?), forming clumps or mats, arising from taproots; stems 5–30 cm long, prostrate to ascending; leaves 3–20 mm long, less than 1 mm wide, linear, mucronate, more or less glandular, usually with clustered secondary, axillary leaves; flowers few to many in leafy cymes; pedicels glandular-hairy; sepals 3–4.5 mm long, greenish, with scarious margins, obtuse apically, glandular-hairy; petals pinkish, 2–3.5 mm long; stamens 6–10; capsules 3–5 mm long, 3-valved; seeds 0.4–0.6 mm long, dark brown, not winged; 2n = 18, 36. Mixed conifer, lodgepole pine, and meadow communities, especially on pond, stream, and lake shores and margins, but also on roadsides, at 2590 to 3050 m in Duchesne, Salt Lake, Summit, Uintah, Wasatch, and Weber counties; widespread in North America; adventive (?) from Europe; 10 (iii). This species is seldom weedy in Utah, growing instead as if it was indigenous. The introduced *S. media* (L.) Presl is reported for Davis County. It differs from *S. rubra* in having glabrous sepals and usually conspicuously winged seeds.

Stellaria L.

Annual or perennial herbs with prostrate to decumbent, ascending, or erect stems; leaves opposite (rarely whorled), linear-lanceolate to ovate, lacking stipules; flowers solitary in leaf axils, or few to many and borne in axillary or terminal cymes; sepals (4) 5, distinct, obscurely 1- to 3-veined; petals (4) 5, white, deeply to shallowly bilobed, or sometimes reduced or lacking; stamens usually 10, inserted at the base of the ovary; styles usually 3 (rarely 4 or 5); ovary 1-loculed; capsule opening by 6 (rarely by 8 or 10) teeth.

Fernald, M. L. 1940. *Stellaria calycantha*. Rhodora 42: 254–259.
 Hulthen, E. 1943. *Stellaria longipes* Goldie and its allies. Bot. Notiser 1943: 251–270.
 Porsild, A. E. 1963. *Stellaria longipes* Goldie and its allies in North America. Nat. Mus. Canada Bull. 186: 1–35.

- 1. Lower leaves distinctly petiolate; pubescence of stems, pedicels, and petioles in longitudinal lines; plants weedy, occurring in open sites *S. media*
- Lower leaves sessile or short-petiolate; pubescence of stems, pedicels, and petioles uniform, or lacking, not in longitudinal lines; plants indigenous, broadly distributed 2
- 2(1). Herbage glandular-pubescent, at least in the inflorescence; petals longer than the sepals *S. jamesiana*
- Herbage glabrous or variously hairy, but seldom if ever glandular; petals shorter than to longer than the sepals or lacking 3
- 3(2). Plants subscapose, annual; stems filiform, not rooting at the lower nodes *S. nitens*
- Plants caulescent perennials, often rooting at lower nodes; stems various, but seldom filiform 4
- 4(3). Leaves about as broad as long, flowers solitary in leaf axils *S. obtusa*
- Leaves mainly 2- to 10-times longer than broad or more; flowers in terminal or axillary cymes, or some of them solitary in leaf axils 5
- 5(4). Leaves linear or narrowly oblong, minutely toothed marginally (use at least 30x); flowers few to many, borne in open, scarious-bracted cymes *S. longifolia*

- Leaves lance-linear to lance-attenuate, lance-ovate, or oblong, minutely toothed or entire marginally; flowers solitary or few to several in leafy or scarious-bracted cymes 6
- 6(5). Leaf margin minutely toothed (use a strong lens) and often ciliate with multicellular hairs; leaves commonly 3–9 mm wide; flowers axillary or in leafy bracted cymes *S. calycantha*
- Leaf margin entire (sometimes ciliate with multicellular hairs in *S. longipes*); leaves 1–3 mm wide, or if broader (as in *S. umbellata*), the pedicels often recurved and the petals lacking 7
- 7(6). Leaves lanceolate to elliptic, commonly less than 4 times longer than broad; flowers in terminal naked cymes; pedicels recurved *S. umbellata*
- Leaves lance-attenuate to lance-linear, commonly 5–10 times longer than broad or more; flowers solitary or 2–5 in open, scarious-bracted cymes; pedicels usually erect *S. longipes*

Stellaria calycantha (Ledeb.) Bong. [*Arenaria calycantha* Ledeb.]. Perennials from elongate rhizomes, forming moderate to large clumps; flowering stems 6–40 cm long or more, glabrous, scabrous, or sparsely short-villous; leaves 8–50 mm long, 2–9 mm wide, lanceolate to lance-attenuate, narrowly oblong or lance-linear, attenuate, acute, or acuminate, sessile or rarely short-petiolate, glabrous, minutely serrulate and usually long-ciliate marginally; flowers solitary and axillary, or often in open terminal cymes, the bracts scarious margined to green throughout; pedicels mostly 4–45 mm long, glabrous or scabrous; sepals 2–4.5 mm long, obscurely 1- to 3-veined, scarious margined, not ciliate; petals white, 1–4 mm long, or lacking; capsules straw colored to purplish, 3.5–6 mm long, opening by 6 teeth; seeds 0.6–1 mm long, reddish brown, smooth to slightly roughened; 2n = 26, 48, 52. Moist sites in Ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 2225 to 3175 m in Daggett, Duchesne, Garfield, Juab, Salt Lake, Sevier, Summit, and Wasatch counties; Alaska to the Atlantic, south to California, Wyoming, Michigan, and New York; Eurasia; 9 (j).

Stellaria jamesiana Torr. [*Arenaria jamesiana* (Torr.) Shinn.]. Perennial herbs, arising from rhizomes, these often with tuberous thickenings; stems mainly 1–5 dm long, usually decumbent-ascending; leaves spreading, lance-attenuate, 2–16 cm long, 2–20 mm wide; inflorescence open, glandular, the flowers solitary or more commonly 3 to several, borne on pedicels 4–45 mm long; sepals ovate-lanceolate, acute, 3.5–7 mm long, green with scarious margins, conspicuously glandular; petals mainly 6–10 mm long, white, bilobed; capsule shorter than the sepals, opening by 3 valves; seeds 2.5–3 mm long, dark brown, wrinkled; 2n = 26, 96. Mountain brush, sagebrush, ponderosa pine, Douglas fir-white fir, bristlecone pine, aspen, and spruce-fir communities at 1830 to 3235 m in probably all Utah counties; Washington to Idaho, south to California, Nevada, New Mexico, and Texas; 96 (xi). The maintenance of this taxon in *Stellaria* seems to be arbitrary. Placement within *Arenaria* by Shinners is not without merit, simulating as it does *A. lateriflora*. The bilobed petals probably have been derived secondarily at several places within the family (see *A. fendleri* var. *glabrescens*).

Stellaria longifolia Torr. Long-leaved Starwort. Perennials from elongate rhizomes forming loose clumps;

flowering stems 10–35 cm long, glabrous or scabrous; leaves 8–40 mm long, 1–3 mm wide, linear to narrowly elliptic, attenuate to acute, sessile, glabrous or sparingly ciliate, minutely serrulate; flowers few to many in open cymes; bracts scarious throughout; pedicels commonly 3–35 mm long, glabrous or scabrous; sepals 2–3 mm long, obscurely 3-veined, scarious margined, not ciliate; petals white, 2–3.5 mm long; capsules 3–6 mm long, greenish or yellowish, opening by 6 teeth; seeds 0.7–0.8 mm long, brown, slightly roughened; 2n = 26. Meadows at ca 2135 m in Rich, Salt Lake, Sevier, Utah, and Wasatch counties; Alaska to Newfoundland, south to California, New Mexico, and South Carolina; 5 (0).

Stellaria longipes Goldie Long-stalked Starwort. Perennials from slender rhizomes, forming small to large clumps or mats; flowering stems 0.3–3.2 dm long, villous, glabrate, or glabrous; leaves 4–26 (40) mm long, 1–4 mm wide, lanceolate to lance-attenuate, sessile, sparingly villous, especially along the margin near the base or glabrous to glabrate, entire, smooth and shiny; flowers solitary or few to several in open cymes, the bracts scarious, scarious margined, or green throughout, ciliate or not; sepals 3–5 mm long, 3-veined, scarious margined, glabrous, usually not ciliate; petals white, 3–8 mm long; capsules 4–6 mm long, often purplish, opening by 6 teeth; seeds 0.6–0.9 mm long, brown, slightly roughened; 2n = 52, 78–104. The *longipes* complex has been treated as consisting of a series of morphologically variable entities, often recognized at specific level. Primary diagnostic criteria include pubescence or its lack, presence or absence of scarious bracts, and number of flowers. Our specimens fall into three categories; 1-flowered, glabrous, foliose-bracteate ones; several-flowered, pubescent, scarious-bracted ones; and several-flowered, glabrous, scarious-bracted ones. Most specimens that lack scarious bracts are 1-flowered, but the correlation might be moot; i.e., cymose inflorescences reduced to a single flower are subtended by foliose bracts. Only when secondary branches are developed do typical scarious or scarious-margined bracts develop. A conservative interpretation is indicated. Two names evidently apply to our material, but they might not represent taxa.

- 1. Flowers commonly more than 1 per stem, subtended by scarious-margined bracts *S. longipes* var. *longipes*
- Flowers commonly 1 per stem, not subtended by scarious bracts *S. longipes* var. *monantha*

Var. *longipes* [*S. stricta* Richards.; *S. longipes* var. *stricta* (Richards.) Rydb; *S. vestita* Greene; *S. longipes* var. *vestita* (Greene) Polunin]. Sagebrush, Douglas fir, ponderosa pine, aspen, lodgepole pine, forb-grass, spruce-fir, and alpine tundra communities at 2135 to 3480 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Sevier, Summit, Uintah, and Wasatch counties; Alaska to Newfoundland, south to California, Arizona, New Mexico, Minnesota, and New York; Eurasia; 32 (iv). Both glabrous and long-haired phases occur together.

Var. *monantha* (Hulten) Welsh [*S. monantha* Hulten; *S. longipes* var. *altocaulis* (Hulten) C. L. Hitchc.]. Pinyon-juniper (?), lodgepole pine, spruce-fir, forb-grass, and alpine tundra at 2440 to 3660 m in Beaver, Duchesne, Garfield, Grand, Piute, Sevier, Summit, and Uintah counties; Alaska to Greenland, south to Washington, Idaho, and Colorado; 13 (ii). This phase seems to occur in

more harsh sites than plants with open inflorescences. The morphology might represent ecological stress more than genetic differences.

Stellaria media (L.) Vill. Common Chickweed. [*Alsine media* L.]. Annual or biennial (overwintering) herbs from taproots, forming loose mats or clumps, the stems mostly 1–5 dm long, decumbent and rooting at the nodes, pubescent with multicellular hairs in longitudinal lines; leaves 10–50 (60) mm long, 5–25 (30) mm wide, the blades ovate to elliptic or broadly lanceolate, abruptly acuminate, glabrous above and beneath, ciliate, at least the lower ones with distinctive petioles to 2 mm long, the petioles pubescent; flowers axillary, or commonly few to several in short, leafy bracted cymes; pedicels 2–60 mm long, hairy like the stems; sepals 3–6 mm long, 3-veined, scarious-margined, ciliate basally, hairy dorsally; petals white, 2–6 mm long; capsules 4–8 mm long, straw colored or greenish, opening by 6 valves; seeds 0.8–1.2 mm long, uniformly warty; $2n = 40, 42, 44$. Weedy plants of open sites, usually associated with cultural activities, at 1280 to 2290 m in Box Elder, Cache, Millard, Salt Lake, Utah, and Weber counties; widely established in North America; adventive from Eurasia; 6 (0).

Stellaria nitens Nutt. Slender, erect annuals; stems 5–25 cm tall, subfiliform, the internodes much longer than the leaves, glabrous to sparingly villous; leaves mainly below middle of plant height; basal leaves petiole, the petioles 2–8 mm long, the blades 1.5–6 (8) mm long, ovate to orbicular; cauline leaves becoming sessile and lance-attenuate to linear, 3–13 mm long, 0.5–2.5 mm wide; flowers few to many in open cymes; bracts scarious; sepals 3–5 mm long, lance-attenuate, acute, 3-veined; petals very short or lacking; capsules 2.2–3.5 mm long, straw colored, included in the calyx; seeds ca 0.5 mm long, minutely warty. Warm and mixed desert shrub communities at 915 to 1830 m in Cache, Salt Lake, Tooele, and Washington counties; British Columbia to Montana, south to California; Mexico; 4 (0). This is a diminutive, early flowering annual; it is easily overlooked and is often mistaken for *Holosteum umbellatum*, which differs inter alia in having reflexed pedicels.

Stellaria obtusa Engelm. Perennial, decumbent to ascending herbs forming mats; stems 2–10 cm long, glabrous or weakly and sparingly villous with moniliform hairs; leaves 2–12 mm long, 1.5–8 mm wide, ovate, lanceolate, or elliptic, long-ciliate basally, the lower ones short-petiole, acute to obtuse; flowers solitary in leaf axils; pedicels 3–25 mm long, glabrous; sepals lance-ovate, 2–2.8 mm long, only slightly if at all scarious marginally, obtuse; petals lacking; stamens 8–10; capsule subglobose, subequal to the sepals; styles 3 or 4; seeds finely though distinctly ridged; $2n = 78$. Damp areas in sagebrush, aspen, spruce-fir, and grass-sedge communities at 1920 to 3390 m in Cache, Salt Lake, Sanpete, Summit, and Utah counties; British Columbia and Alberta, south to California and Colorado; 6 (0).

Stellaria umbellata Turcz. ex Kar. & Kir. Perennials from slender rhizomes, forming small to large clumps or mats; flowering stems 5–50 cm long, glabrous; leaves 5–30 mm long, 2–8 mm wide, lanceolate to oblong, or elliptic, acute, sessile or subsessile, glabrous, or ciliate near the base; flowers few to many in terminal and axillary cymes, the branches subumbellately arranged, ascending to spreading; pedicels 3–30 mm long, subtended by small, scarious bracts, often reflexed; sepals 2–3 mm

long, ovate-lanceolate to lanceolate, scarious-margined, obscurely 3-veined, not ciliate; petals lacking; capsules 3–4.5 mm long, straw colored or greenish, opening by 6–8 teeth, surpassing the sepals; seeds 0.5–0.7 mm long, brownish, roughened; $2n = 26$. Moist sites in white fir, aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 2315 to 3480 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, and Wasatch counties; Alaska south to California and Colorado; Asia; 43 (x).

Vaccaria Medicus

Annual herbs with erect or ascending stems; leaves opposite, lanceolate to oblong, lacking stipules; flowers few to numerous in open cymes; sepals 5, united nearly to the apex; calyx tube 10-veined and sharply angled; petals 5, pinkish, the blade retuse; stamens 10; styles 2 (rarely 3); ovary 1-loculed; capsules opening by 4 teeth.

Vaccaria pyramidata Medicus [*Saponaria vaccaria* L.; *S. segetalis* Necker; *V. segetalis* (Necker) Garcke ex Asch.]. Plants annual from taproots, the stems 15–80 cm tall, glabrous; leaves 3–8 cm long, 5–25 mm wide, lanceolate to lance-ovate or oblong, 1- to 3-veined, attenuate to acute apically, connate-clasping and sessile or short-petiole basally; flowers few to many in open cymes, erect to spreading; pedicels 5–60 mm long, glabrous; calyx constricted apically, 11–15 mm long in flower, the veins purplish or green, glabrous, inflated and strongly 5-angled in fruit, the teeth 1–2 mm long; petals pink, the blades 5–8 mm long, retuse; seeds 1.7–2.1 mm long, reddish black; $2n = 20, 24, 30, 60$. Open habitats and in sagebrush-bunchgrass and mountain brush communities at 1280 to 1525 m in Cache, Juab, Rich, Salt Lake, and Utah counties; widespread in the U. S.; introduced from Europe; 8 (0).

CELASTRACEAE R. Br. in Flinders

Stafftree Family

Shrubs; leaves alternate or opposite, simple, deciduous or persistent; stipules small, caducous, or lacking; flowers perfect, regular, inconspicuous; sepals 4 or 5, persistent; petals 4–5, distinct; stamens 4 or 5 or 8–10; pistil 1 (3), the ovary superior, 1 (2–5)-loculed; style 1, the stigmas 2- to 5-lobed; fruit a capsule or follicle; $x = 8-12$ or more.

1. Leaves opposite 2
- Leaves alternate 3
- 2(1). Plants low indigenous evergreen shrubs, flowering in late winter or early spring, usually as ground cover with conifers *Pachystima*
- Plants cultivated trees or shrubs, deciduous or evergreen *Euonymus*
- 2(1). Leaves deciduous, not leathery-thickened; herbage not scarious; flowers axillary; plants rather broadly distributed *Forsellesia*
- Leaves persistent, leathery-thickened; herbage scarious; flowers in panicles; plant of Washington County *Mortonia*

Euonymus L.

Shrubs or trees with opposite petioled leaves, deciduous or evergreen; stipules small or lacking; flowers cream

to greenish or purplish, borne in axillary cymes, mostly 5- or 4-merous; sepals spreading or recurved; stamens inserted on a broad disk; pistil 1, the ovary 3- to 5-loculed, short; stigma 3- to 5-lobed; capsules loculicidally dehiscent, the seeds 1 or 2 per locule, enveloped by a red or white aril, this visible upon dehiscence of the fruit. Several species of this genus are known from cultivation in Utah. They are poorly represented in herbaria, and the extent of their distributions is not understood. The most common ones are keyed below, but descriptions are not provided.

1. Leaves persistent, leathery, green or varicolored
 (Japanese spindletree) *E. japonica* Thunb.
- Leaves deciduous, not especially thickened, typically green 2
- 2(1). Branches with conspicuous corky wings
 (Winged spindletree) *E. alata* (Thunb.) Sieb.
- Branches lacking wings 3
- 3(2). Leaves pubescent beneath; flowers purple
 (Wahoo; Burning bush) *E. atropurpurea* Jacq.
- Leaves glabrous beneath (except sometimes along the midrib); flowers yellowish or greenish 4
- 4(3). Leaves abruptly long-acuminate; plants small trees
 (Bunge spindletree) *E. bungeana* Maxim.
- Leaves acute to abruptly short-acuminate; plants mainly shrubs 5
- 5(4). Capsules warty; aril red
 (Strawberry bush) *E. americana* L.
- Capsules smooth; aril white
 (European spindletree) *E. europaea* L.

Forsellesia Greene

Intricately branched deciduous shrubs; stems slender, greenish, angled, more or less thorny; leaves simple, entire; flowers usually axillary, pedicellate; sepals 5 (4 or 6), hyaline-margined; petals 5 (4 or 6), white, deciduous; stamens equal or unequal; pistils 1-3, distinct, the ovary, superior, 1-loculed; fruit a follicle. Recent treatments place this genus in the Crossoamataceae Engler in Engler & Prantl.

Ensign, M. 1942. A revision of the Celastraceous genus *Forsellesia* (*Glossopetalon*). Amer. Midl. Nat. 27: 501-511.

1. Stipules lacking or mostly less than 0.5 mm long, subulate; petals constricted below the apex; plants mainly of eastern Utah *F. meionandra*
- Stipules usually more than 0.5 mm long, often flattened and whitish; petals not subapically constricted; plants mainly of western Utah *F. nevadensis*

***Forsellesia meionandra* (Koehne) Heller** Utah Greasebush. [*Glossopetalon meionandrum* Koehne]. Bluntly thorny shrub usually 2-8 dm tall; leaves 3-15 mm long, 1.5-4 mm wide, oblanceolate to elliptic, pubescent, acute; stipules subulate, 0.1-0.5 (0.7) mm long, not flattened; flowers axillary, inconspicuous; pedicels with scarious bracts at the base; sepals 2-3 mm long; petals oblanceolate, white, somewhat constricted subapically, 4-6 mm long, elliptic; follicles multinervate, concavoconvex, thin, 3.5-4.5 mm long and about as wide. Shadscale, sagebrush, mixed desert shrub and pinyon-juniper communities at 1495 to 2320 m in Carbon, Daggett, Duchesne, Emery, San Juan, Sanpete, Sevier, Uintah, and Wayne counties; Colorado; 36 (vii).

***Forsellesia nevadensis* (Gray) Greene** Nevada Greasebush. [*Glossopetalon nevadense* Gray]. Thorny shrubs,

mainly 1-6 (10) dm high; leaves 3-12 mm long, 1-4 mm wide, oblanceolate to obovate, acuminate to obtuse; stipules subulate to narrowly oblanceolate, whitish or purple, mainly 0.4-1 mm long; flowers axillary, inconspicuous; pedicels with scarious bracts or reduced leaves; sepals 1-3 mm long; petals oblanceolate, 4-7 mm long, not constricted subapically; follicles multinervate, concavoconvex, thin, 4-5 mm long and about as wide. Mixed desert shrub and pinyon-juniper communities, often on limestone outcrops, at 1370 to 1985 m in Beaver, Juab, Kane, Millard, Tooele, and Washington counties; Idaho, Nevada, California, and Arizona; 13 (0). The diagnostic criteria used to distinguish the two species are not always discrete, and there is justification for recognition of all of our materials as *F. nevadensis*. However, there does seem to be geographical correlation, and at least trends of differences.

Mortonia Gray

Yellowish, scabrous, rounded shrubs; leaves alternate, simple, leathery, subsessile; stipules minute, glandlike, caducous; flowers borne in terminal thyrsoid cymes; calyx campanulate, 10-ribbed, 5-lobed; petals 5, white; stamens 5; pistil 5-loculed; style 1; stigmas 5, ovules 2 per locule; seeds oblong.

***Mortonia scabrella* Gray** Shrubs mainly 8-12 dm tall, hispitudulous; leaves 8-15 mm long or more, oval to obovate, scabrellous, the margin thickened; petioles very short; inflorescence 2.5-8 cm long, glabrous. Creosote bush community, often on limestone, in lower reaches of Washington County; Nevada, Arizona, California, New Mexico, Texas, and Mexico; 4 (i). The material has been assigned to var. *utahensis* Cov. ex. Gray [*M. utahensis* (Cov.) A. Nels].

Pachystima Raf.

Shrubs; leaves opposite, evergreen, leathery, serrulate; stipules minute, caducous; flowers inconspicuous, perfect, solitary or in few-flowered, axillary cymes; sepals 4; petals 4; stamens borne on the margin of a disk; pistil 1, superior, 2-loculed; style short; stigma 2-lobed; fruit a loculicidal capsule [also *Paxistima*].

***Pachystima myrsinites* (Pursh) Raf.** Mountain Lover. [*Ilex myrsinites* Pursh]. Spreading to prostrate low shrubs; stems mostly 3-8 dm long; branchlets corky, squarish; leaves 8-33 (41) mm long, 2-15 mm wide, elliptic, oblong, oblanceolate, or ovate to obovate rounded to obtuse, truncate or marginate apically, glossy green above, pale beneath, short-petioled; peduncles 2-3 cm long; flowers 1-3; petals reddish brown, ovate; capsules 4-5 mm long. Pinyon-juniper, sagebrush, mountain brush, Douglas fir, ponderosa pine, lodgepole pine, aspen, tall forb, and spruce-fir communities at 1675 to 3209 m in probably all Utah counties; British Columbia south to California, Arizona, and New Mexico; 80 (ix).

CERATOPHYLLACEAE S. F. Gray

Hornwort Family

Herbaceous, submersed aquatics; leaves whorled, dichotomously dissected; flowers imperfect, solitary, sessile in leaf axils, each subtended by a calyxlike involucre of 8-14 bracts, lacking a perianth; stamens 12-16; pistil 1, the ovary superior, of 1 carpel; fruit an achene; $x = 12$ (mostly).

Ceratophyllum L.

The family consists of a single genus.

Ceratophyllum demersum L. Common Hornwort. Stems to 10 dm long or more, freely branched and forming tangled masses; leaves whorled 5–12 per node, each usually dichotomously 1 or 2 times divided, the segments linear and flat, antroersely toothed; achenes 4–5 mm long, ellipsoidal, provided with 2 basal spines; 2n = 24, 28, 38, 48. Ponds, reservoirs, lakes, and slowly flowing streams in Beaver, Box Elder, Cache, Davis, Juab, Salt Lake, Utah, and Wasatch counties; cosmopolitan; 8 (0). This plant simulates the algal genus *Chara*, which has whorled branches, not dichotomously branched whorled leaves. Because of this similarity it seems probable that the common hornwort has not been collected when it was assumed to be *Chara*, which is widespread and common.

CHENOPODIACEAE Vent.

Goosefoot Family

Herbs, subshrubs, or shrubs, often succulent or scurfy; leaves simple, alternate or opposite, estipulate; flowers inconspicuous, monoecious, dioecious, polygamous, or perfect; calyx persistent, 1– to 5-lobed, enclosing the fruit, or lacking in some pistillate flowers; corolla none; stamens opposite the calyx lobes and as many or fewer; pistil 1, the ovary superior, with 1–3 stigmas, 1-loculed and 1-ovuled; fruit a utricle; x = 6–9.

Welsh, S. L. 1984. Utah flora: Chenopodiaceae. Great Basin Naturalist 44: 183–209.

- 1. Leaves scalelike; stems fleshy; plants of saline pans and other salty sites 2
- Leaves well developed, not scalelike; stems not fleshy; plants of various habitats 3
- 2(1). Leaves alternate; plants woody at the base, mainly 3–8 dm tall *Allenrolfea*
- Leaves opposite; plants herbaceous, mainly 0.5–3 dm tall *Salicornia*
- 3(1). Leaves opposite, united at the base; sepals strongly imbricate, scarcely united, chartaceous; plants rare in western Utah *Nitrophila*
- Leaves alternate or rarely some opposite; sepals slightly if at all imbricate, herbaceous 4
- 4(3). Leaves or bracts of inflorescence tipped with a spine or a spinelike bristle 5
- Leaves and floral bracts not bristle- or spine-tipped ... 6
- 5(4). Leaves linear to subulate; bracts of inflorescence ovate-lanceolate, spine-tipped; fruiting sepals winged on the back; flowers not embedded in hair *Salsola*
- Leaves sausagelike, abruptly spine-tipped; bracts of inflorescence not different from the leaves; sepals ending in wings; flowers embedded in hair ... *Halogeton*
- 6(4). Leaves sub- or semicylindric to linear, usually fleshy . . 7
- Leaves with flattened blades, not especially fleshy ... 9
- 7(6). Shrubs, armed with thorny branchlets; staminate flowers in spikes, the pistillate flowers solitary and axillary *Sarcobatus*
- Shrubs or herbs, not armed; flowers perfect or both perfect and pistillate 8
- 8(7). Herbage villous-tomentose; plants low subshrubs . . . *Kochia*

- Herbage glabrous and glaucous, or puberulent; plants annual or perennial, or if subshrubs then tall *Suaeda*
- 9(6). Plants densely white-hairy with at least some dendritic hairs, these becoming golden brown in age; shrubs of broad distribution *Ceratoides*
- Plants variously hairy or glabrous, but not as above; shrubs or herbs of various distribution 10
- 10(9). Flowers imperfect, the pistillate enclosed in 2 accrescent or connate bracts 11
- Flowers perfect or some also pistillate, all with sepals and not enclosed by paired bracts 14
- 11(10). Stigmas 4 or 5; plants green, cultivated potherbs . . . *Spinacia*
- Stigmas 2; plants green, grayish, or yellow green, not or seldom cultivated 12
- 12(11). Bracts dorsally compressed, variously tuberculate, smooth, or winged; pubescence of inflated hairs or none; plants shrubs or perennial or annual herbs; axillary rounded buds lacking *Atriplex*
- Bracts laterally compressed or 6– to 8-ribbed, lacking appendages; pubescence of simple or branched hairs; plants shrubby; axillary rounded buds present . . 13
- 13(12). Shrubs with divaricate often thorny branches; bracts with margins thickened, spongy within; pubescence of branched hairs *Grayia*
- Shrubs with erect nonthorny branches; bracts with margins not spongy thickened, either obcompressed or dorsiventrally compressed and 6-ribbed; pubescence of scurfy or moniliform hairs *Zuckia*
- 14(10). Plants more or less tomentulous; calyx transversely winged in fruit *Cycloloma*
- Plants glabrous, scurfy, pilose, or otherwise pubescent, but not or seldom as above; calyx not transversely winged in fruit, except in *Kochia* (q.v.), and then not tomentulous 15
- 15(14). Perianth developing conspicuous horizontal, scarios wings or armed with curved or uncinatc spines ... 16
- Perianth lobes rounded or keeled on the back, lacking wings or spines 17
- 16(15). Perianth developing conspicuous, horizontal, scarios wings *Kochia*
- Perianth with lobes each armed with a curved or uncinatc spine *Bassia*
- 17(15). Calyx becoming woody in age; ovary partly inferior; plants cultivated, rarely escaping *Beta*
- Calyx not woody; ovary superior; plants not or seldom cultivated 18
- 18(17). Calyx lobes 5, largely concealing to exposing the fruit; stamens usually 5; herbage glabrous or scurfy *Chenopodium*
- Calyx lobes 1–3, the fruit largely exposed; stamens 1–3; plants not scurfy 19
- 19(18). Leaves hastately lobed or if entire 4–12 mm long, the blades mainly 2–8 mm broad or more; calyx 1-lobed; stamens 1; plants widespread, of many habitats . . . *Monolepis*
- Leaves linear, 0.8–6 cm long, entire, 1–2 mm wide; calyx 1– to 3-lobed, stamens 1–3; plants of sandy, low elevation sites *Corispermum*

Allenrolfea Kuntze

Succulent, glabrous subshrubs or shrubs; branches alternate, jointed; leaves reduced to fleshy scales, alter-

nate; flowers perfect, sessile, borne spirally in 3's or 5's in axils of peltate bracts, arranged in cylindrical erect spikes; sepals reduced, 4- to 5-lobed; stamens 1 or 2, exerted; stigmas 2 or 3; utricle ovoid, flattened, the pericarp free, membranous.

Allenrolfea occidentalis (Wats.) Kuntze Iodine Bush; Pickleweed. [*Halostachys occidentalis* Wats., type from Raft River Valley]. Plants mainly 3-8 (12) dm tall, woody at least below, glabrous and more or less glaucous; stems constricted at the nodes, fleshy; leaves very short, obtusely triangular; spikes 6-30 mm long; calyx enclosing the fruit; seeds brown. Saline and alkaline pans, springs, and seeps, and in other saline sites, often with saltgrass, samphire, seepweed, and other halophytes, at 1380 to 1620 m in Beaver, Box Elder, Cache, Davis, Emery, Grand, Iron, Juab, Millard, Salt Lake, Tooele, Utah, Washington, Wayne, and Weber counties; Oregon and Idaho, south to California, Arizona, Texas, and Mexico; 25 (iv). The plants accommodate high soil salinity by including salt within the protoplast, giving the plant a salty flavor; hence the name "pickleweed."

Atriplex L.

Monococious or dioecious herbs or shrubs, often with scurfy (mealy) collapsed hairs; leaves alternate or opposite; flowers small, inconspicuous, borne in axillary clusters, glomerules, or in spicate panicles; staminate flowers with 3- to 5-parted calyx, bractless, with 3-5 stamens; pistillate flowers without a perianth and the pistil naked or rarely with a perianth, commonly enclosed within a pair of foliaceous bracts, enlarged in fruit, variously thickened and appendaged; styles 2; utricle with the pericarp free; seeds flattened, mainly erect. The genus is complex both taxonomically and nomenclaturally. It consists of native and introduced herbs and shrubs. Indigenous shrubby species form hybrids with all or most of their constituent taxa, wherever they come in contact. The resulting plasticity allows these remarkable plants to occupy numerous habitats, but poses problems that preclude a "neat" taxonomic treatment. The following keys are tentative at best.

Hanson, C. A. 1962. Perennial *Atriplex* of Utah and the northern deserts. Unpublished M.S. thesis, Brigham Young University. 133 pp.

Stutz, H. C. and S. C. Sanderson. 1983. Evolutionary studies in *Atriplex*: Chromosome races of *A. confertifolia* (Shadscale). Amer. J. Bot. 70: 1536-1547.

Thorne, K. H. 1977. A revision of the herbaceous members of the genus *Atriplex* (Chenopodiaceae) for the state of Utah. Unpublished M.S. thesis, Brigham Young University. 78 pp.

- 1. Plants herbaceous annuals Key 1
- Plants woody, at least below, perennial Key 2

Key 1.

Plants herbaceous annuals.

- 1. Seeds of 2 types, black and brown; plants mainly introduced 2
- Seeds all alike, either black or brown; plants indigenous 5
- 2(1). Fruiting bracts orbicular or nearly so, the dorsal surfaces smooth, entire 3
- Fruiting bracts triangular to ovate or rhombic, the dorsal surfaces usually tubercled, denticulate to entire 4
- 3(2). Black seeds horizontal, enclosed in a membranous calyx; brown seeds vertical between very large bracts *A. hortensis*

- Black seeds vertical between small bracts; brown seeds vertical between large bracts ... *A. heterosperma*
- 4(2). Lowermost leaves ovate, dentate, sessile or short-petiolate *A. rosea*
- Lowermost leaves lanceolate, rhombic, triangular, or hastate, dentate or entire, petiolate *A. patula*
- 5(1). Plants dioecious, widely distributed in eastern Utah, rarely elsewhere *A. powellii*
- Plants monoecious, of various distribution 6
- 6(5). Fruiting bracts orbicular or nearly so, the margins denticulate to lacerate; plants of Washington County *A. elegans*
- Fruiting bracts various in outline, but, if orbicular, the margins entire and seldom if ever in Washington County 7
- 7(6). Lower leaves linear to lanceolate, sessile, not over 2.5 cm long *A. wolfii*
- Lower leaves rhombic, deltoid, or cordate, usually at least some petiolate 8
- 8(7). Fruiting bracts all stipitate, or some of them sessile to subsessile, when stipitate usually prominently tubercled; plants forming low rounded clumps on saline substrates in eastern Utah *A. saccaria*
- Fruiting bracts all sessile or subsessile, variously tubercled or, if stipitate, as in *A. graciliflora* and *A. pleiantha* the surfaces smooth; plants slender or clump-forming, variously distributed 9
- 9(8). Fruiting bracts truncate and with 3 minute teeth apically; upper leaves sessile *A. truncata*
- Fruiting bracts not truncate apically; upper leaves petiolate or subsessile 10
- 10(9). Fruiting bracts with margins dentate, foliaceous well below the apex, the surfaces sometimes with appendages *A. argentea*
- Fruiting bracts samaralike and orbicular or triangular-ovate, the surfaces smooth 11
- 11(10). Fruiting bracts samaralike and orbicular, enclosing a single flower; plants widespread in southeastern Utah *A. graciliflora*
- Fruiting bracts triangular-ovate, enclosing 2 to 6 flowers; plants known from southeastern San Juan County *A. pleiantha*

Key 2.

Plants woody, at least below, perennial.

- 1. Leaves dentate (at least some); plants of Washington County 2
- Leaves entire; plants of various distribution 3
- 2(1). Plants monoecious; leaves green, ovate, irregularly and shortly dentate; weedy species near St. George *A. semibaccata*
- Plants dioecious; leaves silvery white, orbicular, definitely and coarsely toothed, indigenous *A. hymenelytra*
- 3(1). Leaf blades subhastate; shrubs to 3 m tall; plants of Washington County 4
- Leaf blades attenuate to rounded basally; shrubs mainly less than 2 m tall; plants of various distribution 5
- 4(3). Branchlets terete *A. lentiformis*
- Branchlets angled *A. torreyi*
- 5(3). Bracts with 4 lateral wings or 4 rows of teeth; plants unarmed 6

- Bracts without lateral wings, merely tuberculate or smooth dorsally; plants sometimes thorny 8
- 6(5). Leaves more than 8 mm wide; bract tip with or without lateral teeth; canyons of the Colorado . . . *A. garrettii*
- Leaves less than 8 mm wide; bract tip without lateral teeth; distribution various 7
- 7(6). Bracts more than 9 mm wide, with tips not exceeding the wings; staminate flowers yellow; shrubs to 2 m tall, widely distributed *A. canescens*
- Bracts less than 9 mm wide, with tips exceeding the wings; staminate flowers mostly brown; plants mainly 5–10 dm tall, of playas in western Utah . . . *A. gardneri*
- 8(5). Plants with thorny branches; bracts foliose, united only basally, the surfaces smooth; staminate flowers yellow; widely distributed *A. confertifolia*
- Plants lacking thorny branches; bracts not foliose, at least 1/3 united and the surfaces with appendages; staminate flowers yellow or brown 9
- 9(8). Leaves 2–4 mm wide; bracts with appendages on lower 1/3; staminate flowers in spikes; plants prostrate *A. corrugata*
- Leaves often more than 4 mm wide; bracts with appendages various; staminate flowers mainly in panicles; plants not or seldom prostrate 10
- 10(9). Leaves oblong-ovate to orbicular, more than 10 mm wide, the lowermost alternate; staminate glomerules very numerous; plants of San Juan County . . . *A. obovata*
- Leaves linear to oblong, mainly less than 10 mm wide, or if wider, the lowermost opposite; staminate glomerules merely numerous; plants of Great Basin and northern Colorado River drainage, less commonly in San Juan County *A. gardneri*

Atriplex argentea Nutt. Silver Orach. [*A. rydbergii* Standley, type from south of Moab]. Plants annual, monoecious; stems simple or freely branched; leaves petiolate or the upper ones subsessile, the blades 0.5–6 cm long, 0.4–5 cm wide, lance-ovate, lanceolate, deltoid, or cordate, runcinate to substovate basally, obtuse to acute apically, entire or essentially so, scurfy (glabrous); staminate flowers with 5-parted calyx; fruiting bracts sessile or subsessile, 4–5 mm long, 4–10 mm wide, the margin foliaceous below the apex, dentate to lacinate, the face smooth, tubercled, or crested; seeds ca 2 mm wide, brown; $2n = 18$. Mat-atrilex, shadscale, and greasewood communities at 1125 to 1770 m in Duchesne, Emery, Kane, Rich, Salt Lake (?), San Juan, Sevier, Summit, and Uintah counties; widespread in western U. S. and Mexico; 20 (0).

Atriplex canescens (Pursh) Nutt. Four-wing Saltbush. [*Calligonum canescens* Pursh]. Dioecious or rarely monoecious shrubs, mainly 8–20 dm tall, not especially armed; leaves persistent, alternate, sessile or nearly so, 10–40 mm long, 2–8 mm wide, linear to oblanceolate, oblong, or obovate, entire, retuse to obtuse apically; staminate flowers yellow (rarely brown), in clusters 2–3 mm wide, in panicles; pistillate flowers borne in panicles 5–40 cm long; fruiting bracts 9–25 mm long and as wide, on pedicels 1–8 mm long, with 4 prominent wings extending the bract length, united throughout; surface of wings and body smooth or reticulate; wings dentate to entire; apex toothed; seeds 1.5–2.5 mm wide; $2n = 18, 36$, or higher. Sandy, commonly non-saline, sites in Joshua tree, blackbrush, greasewood, salt desert shrub, sagebrush, mountain brush, and pinyon-juniper communities at 670 to 2380 m in all Utah counties, except Cache,

Morgan, Rich, Summit, and Wasatch; Washington to Alberta and South Dakota, south to Mexico and Texas; 199 (xxiv). This species forms hybrids with *A. confertifolia* and *A. gardneri* varieties (see var. *bonnevilleensis*). Materials from the type locality of the species in South Dakota are low subherbaceous plants that differ from our shrubby tall material. In a strict sense the common phase of our plants seems best regarded at varietal status as *A. canescens* var. *occidentalis* (Torr. & Frem.) Welsh & Stutz [*Pterchiton occidentale* Torr. & Frem. in Frem., type from the Great Salt Lake]. A second more or less distinctive phase occurs within the distribution of var. *occidentalis*, but is restricted ecologically and differs morphologically from that variety. These dune plants were noted by Hanson (1962) as having bracts to 25 mm wide and elongated internodes. To these features can be added the presence of adventitious roots at buried internodes and a diploid chromosome number of $2n = 18$. They are var. *gigantea* Welsh & Stutz and grow in interdune valleys of the Lymndyl sand dunes, Juab County (type locality), where they are encroached upon by the following dune. They survive being buried as the dune advances by producing adventitious roots along the stem and by continued growth above the encroaching sand. The species is an important browse plant for both wildlife and domestic livestock. It is used in reclamation projects and might be found established at sites beyond its usual range and habitat latitude.

Atriplex confertifolia (Torr. & Frem.) Wats. Shadscale [*Obione confertifolia* Torr. & Frem. in Frem., type from Weber County; *A. collina* Woot. & Standl.]. Dioecious spinescent shrubs, 3–8 dm tall; leaves persistent, alternate, with petioles 1–4 mm long; blades 9–25 mm long, 4–20 mm wide, orbicular to ovate, elliptic, or oval, entire, obtuse apically; staminate flowers yellow, in clusters 2–4 mm wide or in spikes to 1 cm long; inflorescence paniculate, 3–15 cm long; fruiting bracts sessile or subsessile, suborbicular to rhombic or elliptic, 4–12 mm long and wide, the surface smooth, lacking appendages; terminal teeth distinct, foliaceous, shorter than the bracts, entire or toothed below, spreading at maturity; seeds 1.5–2 mm broad; $2n = 18, 36, 54$, or higher. Gravelly to fine textured soils in greasewood, mat-atrilex, other salt desert shrub, sagebrush, and pinyon-juniper communities at 850 to 2140 m in all Utah counties, except Morgan, Rich, and Summit; Oregon east to North Dakota, south to California, Arizona, New Mexico, and Texas; 144 (xii). Shadscale forms hybrids with *A. canescens*, *A. garrettii*, *A. corrugata*, and *A. gardneri* varieties. This is a valuable browse plant for wildlife and livestock, especially sheep.

Atriplex corrugata Wats. Mat-saltbush; Mat-atrilex. Dioecious, low, spreading shrubs, mainly 3–15 cm tall and 3–15 dm broad; leaves persistent, sessile, opposite below, alternate above, 3–18 mm long, 1–6 mm wide, linear to linear-oblanceolate, or oblong, entire, obtuse apically; staminate flowers yellow to brownish, in clusters 3–6 mm wide, borne in spikes 1–8 cm long; pistillate flowers in leafy bracteate spikes 5–15 cm long; fruiting bracts sessile or subsessile, 3–5 mm long, 4–6 mm wide, densely tuberculate (or smooth), entire or undulate, rounded to acute apically; seeds ca 1.5 mm wide; $2n = 36$. Saline, usually fine-textured substrates derived from Mancos Shale, Tropic Shale, Morrison, Duchesne River, and other similar formations in mat-atrilex and Castle

Valley saltbush communities at 1220 to 2150 m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, and Wayne counties; New Mexico and Colorado; 105 (viii). Mat-saltbush is known to form intermediates with both *A. confertifolia* and *A. gardneri* var. *cuneata*. This saltbush is a valuable browse plant on the sparsely vegetated clays and silts of eastern Utah, where it is often the only woody vegetation present.

***Atriplex elegans* (Moq.) D. Dietr.** Wheel-scale Orach. [*Obione elegans* Moq.]. Annual herbs, the stems erect to ascending or prostrate-decumbent, mainly 1–6 dm tall, scurfy to glabrate; leaves mostly alternate, subsessile or shortly petiolate, 5–30 mm long, 2–8 mm wide, elliptic to spatulate, oblanceolate, oblong, or obovate, the base cuneate, entire to denticulate, densely scurfy; flowers monoecious, in axillary clusters; staminate flowers with a 3–5 parted perianth; fruiting bracts shortly stalked, compressed, united except at the thin margin, orbicular, 2–4 mm wide, the margins dentate, the terminal teeth often prominent, the faces smooth; seeds 1–4 mm wide, brown. Disturbed sites at ca 885 m in Washington County; California, Nevada, Arizona, New Mexico, Texas, and Mexico; 3 (0).

***Atriplex gardneri* (Moq.) D. Dietr.** Gardner Saltbush. [*Obione gardneri* Moq.; *A. nuttallii* Wats.]. Dioecious or monoecious shrubs or subshrubs, 1–10 dm tall, unarmed; leaves more or less persistent, alternate or opposite to subopposite, sessile to petiolate, linear to oblanceolate, obovate, spatulate, or orbicular, 5–55 mm long, 2–25 mm wide, entire (rarely dentate), retuse to obtuse or rounded apically; staminate flowers in spikes or panicles, 2–30 cm long, yellow or brown, in clusters 2–4 mm wide; pistillate flowers in spikes or panicles to 30 cm long; fruiting bracts 3–9 mm long, 2–9 mm wide, bearing tubercles or wings or the tubercles aligned in 4 rows or rarely smooth, the apex toothed and usually with 2 or more lateral teeth; seeds 1.5–2.5 mm wide, tan or brown. This is a widely distributed complex of intergrading genotypes of great plasticity. Plants of this complex occur commonly in fine-textured saline substrates in much of the western Great Plains and in the intermountain region. Diploids, triploids, tetraploids, and hexaploids (and higher polyploids, all multiples of the base number 9) are known within the complex, and hybrids are known between the constituents and the other woody species which they contact, i.e., *A. canescens*, *A. confertifolia* and *A. corrugata*. The treatment essentially follows the alignment of taxa suggested by Hanson (1962), with the exception that they are reduced to varietal status and var. *bonnevillensis* is placed within the *gardneri* phase and not with *A. canescens*. The use of the epithet *nuttallii* for this complex was reviewed by Hanson (1962), and other problems aside, the name *A. gardneri* clearly has priority over *A. nuttallii* and must be used according to stipulations of the International Code. Within Utah there are six morphologically intergrading entities that seem worthy of taxonomic recognition.

- 1. Fruiting bracts with 4 lateral wings or rows of tubercles; plants of valley bottoms and playas in Juab and Millard counties *A. gardneri* var. *bonnevillensis*
- Fruiting bracts lacking lateral wings, the tubercles, when present, often more or less aligned; plants of various distribution 2
- 2(1). Lower leaves opposite or subopposite; plants prostrate to ascending, in eastern Utah 3

- Lower leaves alternate; plants ascending to erect, of various distribution 4
- 3(2). Leaves mainly 10–25 mm wide, grayish green; bracts 5–9 mm wide, heavily tuberculate; plants of the Uinta and Navajo basins *A. gardneri* var. *cuneata*
- Leaves mainly 4–12 mm wide, green; bracts 2–5 mm wide, not tuberculate or the tubercles very short; plants of Daggett County *A. gardneri* var. *gardneri*
- 4(2). Staminate flowers mostly brown; fruiting bracts with apical teeth half-united, lacking lateral teeth; plants of Great Basin and Rich County *A. gardneri* var. *falcata*
- Staminate flowers mostly yellow; fruiting bracts with apical teeth free, subtended by lateral teeth; plants of various distribution 5
- 5(4). Leaves mainly 5–15 times longer than wide; fruiting inflorescences spicate; plants of Grand County *A. gardneri* var. *welshii*
- Leaves mainly less than 5 times longer than wide; fruiting inflorescences paniculate; plants of broad distribution *A. gardneri* var. *tridentata*

Var. *bonnevillensis* (C. A. Hanson) Welsh Bonneville Saltbush. [*A. bonnevillensis* C. A. Hanson, type from Pine Valley playa, Millard County]. Greasewood communities in valley bottoms and playas at 1500 to 1585 m in Juab and Millard counties; Nevada; 10 (i); 2n = 18. The Bonneville saltbush is apparently a partially stabilized introgressant involving *A. gardneri* var. *falcata* and *A. canescens*. The habitat is intermediate between that of the parental taxa. There is evidence that the introgression is continuing in some populations at least.

Var. *cuneata* (A. Nels.) Welsh Castle Valley Saltbush. [*A. cuneata* A. Nels., type from Emery]. 2n = 18, 27, 36, and higher. Saline fine textured substrates on Mancos Shale, and other formations of similar texture and salinity, in greasewood and mat-atrilex communities at 1220 to 2170 m in Carbon, Duchesne, Emery, Garfield, Grand, San Juan, and Uintah counties; Colorado and New Mexico; 166 (xii). A series of at least partially stabilized introgressants between var. *cuneata* and var. *tridentata* in Carbon county form the basis of *A. cuneata* ssp. *introgressa* C. A. Hanson (type from Wellington). Possibly they warrant taxonomic recognition, but no nomenclatural combination is intended or implied herein.

Var. *falcata* (Jones) Welsh Jones Saltbush. [*A. nuttallii* var. *falcata* Jones; *A. falcata* (Jones) Standley]. Sagebrush, shadscale, and greasewood communities at 1310 to 1985 m in Box Elder, Iron, Juab, Millard, Rich, and Tooele counties; Washington to Montana, south to Nevada and Wyoming; 30 (i).

Var. *gardneri* Gardner Saltbush. Greasewood and sagebrush-saltbush communities at ca 1895 m in Daggett County; Wyoming, Colorado, and Montana; 6 (0).

Var. *tridentata* (Kuntze) Macbr. Basin Saltbush. [*A. tridentata* Kuntze, type from Corinne; *A. nuttallii* var. *utahensis* Jones, type from Salt Lake City]. 2n = 18, 36, 54. Greasewood, shadscale, alkali saccaton, kochia, saltgrass, and sedge-rush communities at 1280 to 1985 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Iron, Juab, Millard, Piute, Salt Lake, Sanpete, Sevier, Tooele, and Uintah counties; Colorado, Nevada, Idaho, and Wyoming; 95 (iv). Materials from eastern Utah have leaves narrower on the average than those from the Great Basin. The bracts are more heavily tuberculate also.

Var. *welshii* (C. A. Hanson) Welsh Welsh Saltbush. [*A. welshii* C. A. Hanson, type from south of Cisco]. $2n = 18$. Mat-saltbush and Castle Valley saltbush communities at 1280 to 1315 m in Grand County; endemic; 10 (ii).

Atriplex garrettii Rydb. Garrett Saltbush [*A. canescens* ssp. *garrettii* (Rydb.) H. & C.; *A. canescens* var. *garrettii* (Rydb.) L. Benson]. Dioecious (rarely monoecious) shrubs or subshrubs, mainly 2–6 dm tall, unarmed; leaves opposite or subopposite below, petiolate, the blades 8–55 mm long, 6–32 mm wide, ovate to obovate, elliptic, or orbicular, yellow green, sparingly scurfy, entire or repand-dentate, obtuse to cuneate basally, rounded to acute apically; staminate flowers brown to tan (rarely yellow), in clusters 2–4 mm wide on panicles 2–8 cm long; pistillate flowers in spikes or spicate panicles 4–30 cm long; fruiting bracts 6–10 mm long and wide, winged, the surface smooth, reticulate, or with flattened processes, toothed apically; seeds ca 2 mm wide, brown. $2n = 18$. Shadscale, ephedra, eriogonum, blackbrush, and mixed shrub-grass communities on talus slopes of canyons of the Colorado at 1125 to 1895 m in Garfield, Grand (type from near Moab), Kane, San Juan, and Wayne counties; endemic; 41 (xii). This distinctive plant has been regarded as a portion of the variation within an expanded *A. canescens*, with which it shares the feature of 4-winged pistillate fruiting bracts, but it is possibly more closely allied with *A. confertifolia*, with which it hybridizes.

Atriplex graciliflora Jones Blue Valley Orach. Monoecious annual herbs, mainly 1–3 dm tall, branching from the base; leaves alternate, petiolate, the blades 8–10 mm long and about as wide or wider, cordate-ovate to orbicular, cordate, or deltoid, truncate to cordate basally, rounded to obtuse or acute apically, entire; staminate flowers in panicles overtopping the foliage, the perianth 5-lobed; pistillate flowers axillary; fruiting bracts samara-like, 6–16 mm wide, stipitate, compressed, orbicular, oblong or cordate in outline, winged, the wings undulate or entire, the surfaces smooth; seeds ca 3 mm wide, dull white. Saltbush, seepweed, greasewood, rabbitbrush, and tamarix communities on saline, often salt encrusted, soils at 1125 to 1900 m in Carbon, Emery, Garfield, Kane, San Juan, eastern Sevier, and Wayne (type from Blue Valley) counties; Colorado; 18 (iii).

Atriplex heterosperma Bunge Two-seed Orach. Monoecious annual herbs, mainly 1.5–14 dm tall, erect, branched from below the middle or above; leaves opposite or subopposite below, commonly alternate above and petiolate, the blades mainly 15–80 mm long and as wide or wider, hastately lobed, triangular, the base truncate to cordate or obtuse, acute apically; staminate flowers with 5 sepals; fruiting bracts 2–7 mm long, orbicular to suborbicular or ovate, entire, the surfaces smooth, dimorphic, the larger with a pale brown vertical seed 2–3 mm wide, the smaller with a shiny black vertical seed ca 1 mm wide; $2n = 36$. Riparian and palustrine (less commonly ruderal) habitats in greasewood, saltgrass, cocklebur, tamarix, cottonwood, and rush-cattail communities at 1310 to 1985 m in Box Elder, Cache, Davis, Duchesne, Emery, Juab, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, and Weber counties; western North America; adventive from Eurasia; 29 (ii). This is a handsome vigorous annual that appears to be invading saline lowland and other disturbed areas throughout the state.

Atriplex hortensis L. Garden Orach. Monoecious annual herbs, mainly 5–20 dm tall, erect, branching from the middle or above; leaves opposite or subopposite below, alternate above, petiolate, the blades commonly 1.5–13.5 cm long and 1–13 cm wide, ovate to lanceolate, not especially hastate, the base acute to cordate, acute to rounded apically; staminate flowers with 3–5 sepals; pistillate flowers dimorphic, the pistil vertical and enclosed in bracts or the pistil horizontal and enclosed in a 4- or 5-lobed calyx, both shortly pedicellate; fruiting bracts 8–19 mm long, orbicular to ovate, entire, the surfaces smooth, greenish or reddish; seeds dimorphic, either 2–4 mm wide and brown or ca 1 mm wide and black. Disturbed sites in riparian and ruderal habitats at 1310 to 2135 m in Cache, Duchesne, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, and Weber counties; practically cosmopolitan, introduced from Eurasia; 12 (i). This plant is grown as a potherb, and is to be expected practically anywhere. It persists and escapes following cultivation.

Atriplex hymenelytra (Torr.) Wats. Desert Holly. [*Obione hymenelytra* Torr.]. Dioecious shrubs, 3–10 dm tall or more, unarmed; leaves persistent, petiolate, alternate, the blades 10–40 mm long and as wide or wider, orbicular to reniform or oval, greenish to silvery white, permanently scurfy, prominently dentate; staminate flowers yellow to purple brown, in clusters 3–4 mm thick, borne in panicles to 3 cm long; pistillate bracts subsessile, 7–10 mm long and wide, orbicular to reniform, the margins entire to crenate; seeds ca 2 mm wide, brown; $2n = 18$. Warm desert shrub community at ca 730 m in Washington County; Arizona, Nevada, California, and Mexico; 6 (ii). This is a handsome rounded shrub with silvery white foliage. It flowers very early in springtime.

Atriplex lentiformis (Torr.) Wats. Big Saltbush. [*Obione lentiformis* Torr. in Sitgr.]. Dioecious or less commonly monoecious shrubs, mainly 10–25 dm tall, unarmed; branchlets terete; leaves persistent, alternate, petiolate, the blades 0.5–4 cm long, 0.3–3 cm wide, deltoid to rhombic, ovate, or oblong-elliptic, gray green, scurfy, entire to repand or subhastately lobed, rounded to obtuse apically; staminate flowers yellow, in clusters 1–2 mm wide, borne in panicles 0.5–5 dm long; fruiting bracts 3–4 mm long and wide, sessile, orbicular to oval, crenulate, rounded apically; seeds ca 1–1.5 mm wide, brown; $n = 9$. Drainages, stream and canal banks, and roadsides in warm desert shrub communities at 760 to 950 m in Washington County; Arizona, Nevada, California, and Mexico; 8 (0).

Atriplex obovata Moq. New Mexico Saltbush. Dioecious shrubs, mainly 2–8 dm tall; leaves tardily deciduous, alternate, shortly petiolate, the blades 8–30 mm long, 6–20 mm wide, obovate to elliptic or orbicular, gray green, entire or rarely dentate, rounded to retuse or obtuse apically; staminate flowers yellow, in clusters 2–3 mm wide, borne in panicles 6–30 cm long; fruiting bracts 4–5 mm long, 5–9 mm wide, sessile, broadly cuneate, the surfaces smooth or rarely tubercled, the margins entire, the apical tooth subtended by 2–6 equal or smaller teeth; seeds 1–1.5 mm wide, brownish. Salt desert shrub and lower pinyon-juniper communities at ca 1525 to 1650 m in San Juan County; Arizona, New Mexico, and Mexico; 7 (ii).

Atriplex patula L. Fat-ben Saltbush. Monoecious annual herbs, mainly 1.5–10 dm tall, prostrate-ascending or

erect, simple or branched; leaves alternate or some or all opposite, petiolate, the blades mainly 1–12 cm long, 1–5 cm wide or more, ovate, deltoid, lance-ovate, or lance-linear, cordate to hastate, truncate, or acute to cuneate basally, rounded to obtuse or acute apically, entire to dentate or hastate, thin or thick, green, glabrous or scurfy; flowers in paniculate clusters; staminate flowers with 4 or 5 sepals; fruiting bracts sessile, subsessile, or rarely stipitate, 2–12 mm long, 3–9 mm wide, deltoid to ovate or rhombic, sometimes spongy-thickened, the margin entire or denticulate, the face smooth, roughened, or tuberculate; seeds vertical, dimorphic, either black and 1–2 mm wide or brown and 1–3 mm wide; $n = 9, 18, 36$. This species complex consists of plants with circumboreal representation. Our material apparently consists of introduced and indigenous portions of that complex, often treated at specific status or in various infraspecific categories. Treatment as a broad highly variable taxon consisting of two infraspecific taxa seems to best represent our material. The following key will serve to segregate most specimens.

- 1. Principal lower leaves triangular-hastate; leaf bases truncate, broadly cuneate, or subcordate; plants common *A. patula* var. *triangularis*
- Principal lower leaves various, but seldom hastate; leaf bases acute to cuneate; plants uncommon *A. patula* var. *patula*

Var. *patula* Sedge-reed, tamarix-Russian olive, and willow-cottonwood communities at 1370 to 1985 m in Rich, Sanpete, and Utah counties; widespread in North America; Eurasia; 3 (i). Materials tentatively assigned here are thin-leaved, but bracts vary in outline from rhombic to ovate or narrowly oblong and the surfaces from smooth to tubercled.

Var. *triangularis* (Willd.) K. Thorne & Welsh [*A. triangularis* Willd.; *A. hastata* authors, not L.; *Chenopodium subspicatum* Nutt.; *A. subspicata* (Nutt.) Rydb.; *A. carnosae* A. Nels.]. $2n = 18$. Saltgrass, sedge-rush, rush-cattail, and other palustrine and riparian habitats, usually in saline mucky soils at 850 to 1985 m in Cache, Davis, Duchesne, Emery, Millard, Salt Lake, San Juan, Sanpete, Uintah, and Washington counties; widely distributed in North America; Europe; 31 (v). Both thick and thin-leaved specimens are included in this variety. The problem of typification of *A. hastata* L. was reviewed by Taschereau (Canad. J. Bot. 50: 1585, 1972). That name evidently replaces the long established *A. calotheca* (Rafn) Fries, a plant not known from Utah. The next available epithet at specific rank is apparently *A. triangularis* Willd., herein treated at varietal level. It seems likely that another name might well supersede that name at varietal rank.

***Atriplex pleiantha* W. A. Weber** Four-corners Orach. Monoecious, glabrous or sparingly scurfy annual herbs, mainly 0.5–1.5 dm tall, branching from the base; leaves alternate to subopposite, petiolate, the blades 5–15 mm long and about as wide, ovate to suborbicular, obtuse to acute apically, entire; staminate flowers in short terminal spikes; fruiting bracts 3–7 mm wide and about as long, triangular-ovate, short-stipitate, compressed, entire, enclosing 2–5 flowers, these with perianth well developed, consisting of 5 hyaline, sparsely ciliate scales 1–1.2 mm long; utricle black, smooth and shining, ca 1.5 mm long, falling at maturity. Salt desert shrub community, Mor-

ison Formation, southeastern San Juan County; Colorado and New Mexico; a Navajo Basin endemic; 1 (i).

***Atriplex powellii* Wats.** Powell Orach. Dioecious (sparingly monoecious) annual herbs; stems slender to stout, mainly 1–5 (7) dm tall, branching almost throughout; herbage pubescent with scurfy and arachnoid hairs; leaves alternate, petiolate, or the upper sessile, the blades 0.4–5 cm long, 0.2–3 cm wide, ovate to rhombic or elliptic, entire, rounded to cuneate basally, acute to obtuse apically, prominently 3-veined; staminate flowers with calyx 4- or 5-lobed; fruiting bracts sessile, 2–2.8 mm long, 1.5–3.2 mm wide, thick, united to the apex, ovate to oblong or broadly cuneate, truncate to cuspidate apically, the surfaces with thickened processes or rarely smooth; seeds ca 2 mm long, greenish; $2n = 18$. Saline, usually fine textured substrates, in greasewood, rabbit-brush, shadscale, seepweed, mat-atrilex, juniper-pinyon, and blackbrush communities at 1220 to 1830 m in Carbon, Duchesne, Emery, Garfield, Grand, Iron, Kane, Millard, Sanpete, Sevier, Tooele, Uintah, Utah, and Wayne counties; Montana and South Dakota to Arizona and New Mexico; 54 (ix). This is the only annual atrilex in Utah that approaches being truly dioecious, but occasionally a few flowers of the opposite gender occur, resulting in sparingly monoecious individuals. The species in Utah is characteristic of the Colorado Drainage system. The few specimens from the Great Basin possibly represent recent introductions.

***Atriplex rosea* L.** Tumbling Orach. Monoecious, coarse, annual herbs; stems simple or more commonly branching throughout, mainly 2–8 dm tall; herbage scurfy to glabrate; leaves alternate, petiolate, the blades mainly 1.2–7 cm long, 0.6–3.5 cm wide, ovate to lanceolate, acute to obtuse apically, irregularly dentate and often subhastately lobed; staminate flowers with 4 or 5 sepals; fruiting bracts sessile, 4–6 (8) mm long and as wide, ovate to rhombic, united to the middle, dentate, sharply tuberculate on the surfaces; seeds dimorphic, brown and 2–2.5 mm wide, or black and 1–2 mm wide; $n = 9$. Widely established weedy species of disturbed sites, often in riparian habitats or in barnyards or on animal bedgrounds, at 850 to 2560 m in all or nearly all Utah counties; widespread in North America; Eurasia and elsewhere; 47 (v).

***Atriplex saccaria* Wats.** Stalked Orach. Low monoecious herbs, forming rounded clumps, mainly 0.5–2 (2.5) dm tall; stems usually branched from the base; herbage scurfy; leaves alternate or the lowermost subopposite, petiolate, the blades mainly 0.6–4 cm long, 0.4–3 cm wide, ovate to deltoid-ovate or oval, entire or in some the base subhastately lobed, truncate to subcordate or broadly cuneate basally, acute to rounded apically; staminate flowers with 5-parted perianth; fruiting bracts stipitate, or some subsessile to sessile, the faces smooth to coarsely tubercled or appendaged, mainly 4–6 mm long and as wide; seeds 2–3 mm wide, brownish to whitish; $n = 9$. Two rather continuously intergrading varieties are present.

- 1. Pedicels of fruiting bracts 3–8 mm long or more, the bracts all essentially alike; plants uncommon *A. saccaria* var. *caput-medusae*
- Pedicels of fruiting bracts mainly less than 3 mm long, the bracts of lower axils tending to be subsessile and less tubercled than the upper ones ... *A. saccaria* var. *saccaria*

Var. *caput-medusae* (Eastw.) Welsh Medusa-head Orach. [*A. caput-medusae* Eastw., type from Recapture Creek, San Juan County; *A. argentea* var. *caput-medusae* (Eastw.) Fosberg]. Greasewood, saltbush, and other salt-desert shrub communities at ca 1525 to 1600 m in Emery, San Juan (type from Recapture Creek), and Uintah counties; New Mexico and Arizona; 3 (i).

Var. *saccaria* [*A. cornuta* Jones, type from Green River]. Mat-atriplex, shadscale, greasewood, and pinyon-juniper communities at 1125 to 1830 m in Carbon, Daggett, Emery, Garfield, San Juan, eastern Sevier, Uintah, and Wayne counties; Wyoming to Arizona and New Mexico; 30 (vi).

Atriplex semibaccata R. Br. Australia Saltbush. Decumbent, monoecious subshrubs, mainly 5–30 cm high and to 1 m wide or more, unarmed; leaves alternate subsessile or shortly petiolate, mainly 0.8–3 cm long, 4–9 mm wide, obovate to oblong, remotely dentate, obtuse apically, attenuate basally, 1–veined; staminate flowers in clusters ca 1.5 mm wide; fruiting bracts sessile, 3–6 mm long and as wide, rhombic, united below, convex, red-fleshy at maturity, obtuse to acute apically, strongly veined; seeds dimorphic, ca 1.5 mm long and black, and ca 2 mm long and brown; $2n = 18$. Disturbed sites at ca 850 m in Washington County; southwestern U. S.; introduced from Australia; 5 (0).

Atriplex torreyi Wats. Torrey Saltbush. Dioecious shrubs, mostly 8–30 dm tall, forming broad clumps; branchlets angled, becoming bluntly thorny; leaves alternate, persistent, with petioles 1–4 mm long, the blades 0.5–3 cm long, 4–16 mm wide, ovate to deltoid, rhombic, oval, or lanceolate, entire (rarely toothed), obtuse apically, truncate to obtuse basally; staminate flowers yellow, in clusters ca 1 mm wide, in panicles mainly 1–3 dm long; fruiting bracts sessile, 2–3 mm long and wide, orbicular, crenate, rounded apically; seeds ca 1–1.4 mm wide, brown. Mesquite, creosote bush, shadscale and black-brush communities at ca 800 to 900 m in Washington County; Nevada and California; 15 (ii).

Atriplex truncata (Torr.) Gray Wedge Orach. [*Obione truncata* Torr. in Wats.; *A. subdecumbens* Jones, type from Fish Lake, Sevier County]. Monoecious annual herbs; stems simple or more commonly branched throughout, mainly 3–8 dm tall; herbage scurfy, becoming glabrate; leaves alternate, petiolate below, sessile above, the blades mainly 4–30 mm long, 3–30 mm wide, ovate to deltoid or oval, acute to obtuse apically, entire or dentate, truncate or subhastate to rounded basally; staminate flowers with 4 or 5 sepals; fruiting bracts sessile, 2–3 mm long and as wide, broadly cuneate, truncate apically, with 3 (or more) teeth across the summit, the surfaces smooth (rarely tubercled); seeds 1–2 mm wide, brown; $2n = 18$. Saline saltgrass-greasewood and other palustrine habitats at ca 850 to 1375 (2700) m in Box Elder, Cache, Carbon, Emery, Juab, Millard, Rich, Salt Lake, Sevier, Utah, Washington, and Wayne counties; British Columbia to Montana, south to California and New Mexico; 12 (0).

Atriplex wolfii Wats. Slender Orach. [*A. tenuissima* A. Nels., type from Gunnison]. Monoecious, slender, delicate, annual herbs; stems simple or more commonly branched throughout, mainly 0.7–3.5 dm tall; herbage scurfy; leaves alternate, sessile, mainly 0.4–2.5 cm long, 1–3 mm wide, linear to narrowly lanceolate; staminate flowers with 5 sepals; fruiting bracts sessile, 1.5–3 mm

long, 1–2.5 mm wide, ovate to cuneate in outline, truncate to attenuate apically, the faces smooth or tuberculate; seeds 1–2 mm long, brown. Greasewood community at 1525 to 2135 m in Carbon, Duchesne, Emery, Garfield, Piute, Sanpete, Sevier, and Uintah counties; Wyoming and Colorado; 7 (ii).

Bassia All.

Annual herbs; leaves alternate, entire, sessile; herbage pilose or tomentose, at least in inflorescence; flowers perfect and pistillate, glomerate or solitary in leaf axils and in short axillary spikes, bracteate; calyx 5-lobed, depressed-globose, enclosing the fruit and usually prominently armed with a curved or hooked spine on the dorsal surface of each lobe; stamens 5, hypogynous; styles 1, with 2 (3) stigmas; fruit compressed; seed horizontal.

Bassia hyssopifolia (Pallas) Kuntze [*Salsola hyssopifolia* Pallas; *Echinopsilon hyssopifolius* (Pallas) Moq. in DC.; *Kochia hyssopifolia* (Pallas) Schrader]. Annual herbs, the main stem erect, the lower lateral ones often decumbent, 2–10 dm tall; herbage more or less lanate, especially in the inflorescence; leaves 4–40 mm long, 1–5 mm wide, linear to oblong or narrowly oblanceolate; flowers clustered in terminal or lateral spikes, or solitary in leaf axils; floral bracts reduced; pistillate and sterile flowers mixed with perfect ones; fruiting calyx ca 2 mm wide, each lobe with a stout curved to uncinat spine; pericarp membranous, planoconvex; $2n = 18$. Commonly on saline substrates, often in riparian or palustrine habitats, in saltgrass, greasewood, horsebrush, shadscale, and cottonwood-tamarix communities at 850 to 2380 m in most, if not all, Utah counties; adventive from Eurasia; 34 (vii). This species forms apparent intergeneric hybrids with *Kochia scoparia*, from which *Bassia* differs in having spines on the sepals instead of horizontal flattened processes, inter alia.

Beta L.

Glabrous annual or biennial herbs; leaves alternate, petiolate, essentially entire; flowers perfect, solitary or borne in few-flowered cymes, these arranged in spicate terminal or axillary spikes; sepals 5; stamens 5; ovary partially inferior, connate with receptacle in fruit; stigmas 2 or 3; fruits adhering, fused by the swollen perianth and receptacle; seeds horizontal.

Beta vulgaris L. Stems mainly 4–10 dm tall or more; basal leaves well developed, long-petiolate, the blades mainly 5–25 cm long, 2–10 cm wide, undulate-cripsed; inflorescence elongate, with lower bracts prominent; sepals incurved in fruit. Cultivated food plant, occasionally escaping but not persisting, mainly below 2135 m in much of Utah; introduced from Europe; 7 (0). This is the beet of commerce, including the red table beet and sugar beet. The latter was a major cash crop in Utah until the 1960's. Swiss chard, grown for use as a potherb, is a cultivar of this species.

Ceratooides Cagnebin

Monoecious tomentose shrubs; leaves alternate, entire; staminate flowers bracteate, with calyx 4-lobed; stamens 4; pistillate flowers lacking a perianth, enclosed in 2 villous-pilose, partially connate bracteoles, the tips divergent and hornlike; styles 2, slender; pericarp thin, free from the seed [*Eurotia* Adanson; *Krascheninnikovia* Gueldenst.].

Howell, J. T. 1971. A new name for winterfat. *Wasmann J. Biol.* 29: 105.

Ceratooides lanata (Pursh) J. T. Howell Winterfat; White-sage. [*Diotis lanata* Pursh; *Eurotia lanata* (Pursh) Moq.]. Shrubs, woody for 0.2–8 dm above ground (or more), and with numerous annual branchlets mainly 0.5–3 (5) dm long; herbage stellate-hairy, commonly with longer straight hairs intermixed, the hairs white or becoming yellowish in age; leaves 1–4.5 cm long, 1–6.5 mm wide, linear to narrowly lanceolate, entire, revolute to almost flat, sessile above, short-petiolate below; flowers borne in dense axillary clusters or more or less spicate along branch tips; pistillate flowers 2–4 per axil; staminate flowers in spicate axillary clusters, the perianth segments 1.5–2 mm long; fruiting bracts 3–6 mm long, obscured by the long covering hair; 2n = 18. Shadscale, black sagebrush, bullgrass, sagebrush, and pinyon-juniper communities at 730 to 2840 m, known in all Utah counties except Davis, Morgan, Salt Lake, Summit, and Weber; Yukon to Saskatchewan, south to California, New Mexico, and Texas; 105 (ix). Three weakly differentiated morphological phases of winterfat are present in Utah. The common and most widely distributed phase (var. *lanata*) is woody only at the base, has erect annual growth, and is moderately long-hairy as well as stellate. In Washington County and to a lesser extent in Kane County (mainly along Lake Powell) is a definitely woody plant with divaricate branches, which tend to persist as blunt thorns. The pubescence consists of a preponderance of stellate hairs, with few or none of the long slender ones being present. These plants are known as var. *subspinosa* (Rydb.) J. T. Howell [*Eurotia subspinosa* Rydb., type from Washington County]. A third phase is present in Grand and San Juan counties, where it grows in sandy parks surrounded by monoliths. The stems are woody for a distance of up to 8 dm or more, but the branching or current annual growth is erect as in var. *lanata* and the pubescence is intermediate between that of var. *subspinosa* and var. *lanata*. This latter plant is var. *ruinina* Welsh. This variety, named for Ruin Park (type locality), San Juan County, is a striking phase of the species, with (7) individuals in the populations exceeding 12 dm in height. All phases are considered as valuable browse plants for livestock, especially for sheep.

Chenopodium L.

Annual herbs, glabrous, pubescent, glandular, or farinose (mealy); leaves alternate, flat, entire, toothed, or lobed; flowers perfect or some pistillate only, ebracteate, usually in cymes, variously arranged in spicate or paniculate inflorescences; calyx segments usually 4 or 5, persistent, flat or keeled, more or less covering the fruit, rarely becoming fleshy; stamens commonly 5; styles 2 (3); seeds lenticular, horizontal or vertical. Note: The genus is notoriously complex for several reasons. The floral features are greatly reduced and diagnostic characteristics are often based on either vegetative structures or on minutiae of calyx, pericarp, and seed coat, which are often subject to interpretation and might be demonstrated ultimately as trivial. Nomenclature is tangled both within the native and introduced entities, leading to taxonomic treatments that do not satisfactorily circumscribe the taxa as represented by actual specimens. Further, there is variability within the diagnostic features leading to contradictory statements in taxonomic treatments; e.g., with regard to

such characters as adherent versus non-adherent pericarps. Thus, the treatment presented below attempts to provide names for the taxa recognizable in Utah based on examination of actual specimens. The entities seem to be real, but the names might be misapplied in some cases.

Bassett, I. J. and C. W. Crompton. 1952. The genus *Chenopodium* in Canada. *Canad. J. Bot.* 60: 586–610.

Wahl, H. A. 1954. A preliminary study of the genus *Chenopodium* in North America. *Bartonia* 27: 1–46.

- 1. Plants with yellow glands or glandular hairs, not farinose, aromatic 2
- Plants glabrous or farinose, eglandular, not aromatic ... 3
- 2(1). Flowers solitary in small cymes, these spreading-recurved along the axis of an elongate panicle; plants common *C. botrys*
- Flowers in small sessile clusters, borne in bracteate panicles; plants rare *C. ambrosioides*
- 3(1). Seeds all, or at least some, vertical in the flowers (except sometimes in *C. glaucum*, keyed both ways) ... 4
- Seeds usually all horizontal 6
- 4(3). Leaves mainly 0.5–2 cm long, 2–7 mm wide, irregularly dentate, glaucous-farinose beneath ... *C. glaucum*
- Leaves mainly larger and often hastately lobed, green or reddish beneath 5
- 5(4). Flowers in elongate axillary clusters, these forming erect or steeply ascending compact panicles; plants commonly palustrine *C. rubrum*
- Flowers in subglobose axillary clusters, these forming bracteate spikes; plants usually montane ... *C. capitatum*
- 6(3). Leaves 0.5–2 cm long, 2–7 mm wide, sinuate-dentate, glaucous-farinose beneath *C. glaucum*
- Leaves various, but not simultaneously as above 7
- 7(6). Larger cauline leaves more or less cordate to truncate basally, often over 4 cm wide, glabrous; sepals not keeled dorsally; panicles large and open ... *C. hybridum*
- Larger cauline leaves with bases various, but seldom as above, and less than 4 cm wide, often farinose beneath; sepals usually keeled 8
- 8(7). Larger cauline leaf blades mainly 3–5 or more times longer than wide, entire or with a pair of basal lobes ... 9
- Larger cauline leaf blades mainly 1–3 times longer than broad, hastately lobed, toothed, or entire 10
- 9(8). Leaves 1-veined, linear, entire; pericarp adherent to the seed *C. leptophyllum*
- Leaves 3-veined (at least near the base in larger ones), entire or with 2 basal lobes; pericarp not adherent to the seed *C. dessicatum*
- 10(8). Leaf blades hastately lobed (the lobe sometimes again lobed or toothed), or oval to elliptic and entire, or rarely with one or more teeth on the apical larger lobe; calyx lobes obscurely or narrowly membranous-margined; plants indigenous 11
- Leaf blades sinuate dentate, ovate to lanceolate, or entire; calyx lobes with broad scarious margins; plants adventive 12
- 11(10). Leaf blades not hastately lobed; pericarp usually adherent; plants usually of upper middle to higher elevations *C. atrovirens*
- Leaf blades often hastately lobed; pericarp not adherent; plants of wide altitudinal range *C. fremontii*
- 12(10). Fruits sharply angled on the margin; seed coat with minute rounded pits; plants common in Washington and Sevier counties *C. murale*

- Fruits rounded to obtuse on the margin; seed coat smooth to sculptured; plants common or uncommon, of various distribution *C. album*

Chenopodium album L. Lambsquarter; Pigweed. Erect annual herbs, the stems red-striate, 1–10 dm tall or more, simple or more commonly branched; herbage more or less farinose, at least when young; leaves petiolate, the blades 1–6.5 cm long, 0.5–5.6 cm wide, ovate to rhombic-ovate or lanceolate, sinuate-dentate and often subhastately lobed or the upper (rarely all) entire; flowers in dense glomerules, these spicate in upper axils; calyx with keeled lobes, enclosing the fruit; pericarp adherent; seeds horizontal, rounded marginally, smooth to sculptured, black, 1–1.5 mm wide; $2n = 18, 36, 54, 108$. Two phases are present, which have been given taxonomic recognition.

1. Seeds sculptured, alveolate-reticulate or reticulate
 *C. album* var. *berlandieri*
 — Seeds smooth or faintly striate *C. album* var. *album*

Var. *album* $n = 26$. Weedy plants of disturbed habitats at 850 to 2265 m, probably in all Utah counties; widespread in North America; adventive from Eurasia; 53 (v). This taxon has been confused with *C. fremontii*, q.v., but in those plants having mature fruits the adherent pericarps are diagnostic.

Var. *berlandieri* (Moq.) Mack. & Bush [*C. berlandieri* Moq.; *C. berlandieri* ssp. *zschackei* (Murray) Zabel; *C. zschackei* Murray]. $n = 18$. Weedy or pioneer plants of disturbed substrates in several plant communities at 1280 to 2585 m in Duchesne, Grand, Juab, Millard, San Juan, Sevier, and Utah counties; widespread in North America; 8 (v). The specimen from Utah county (Welsh 3798 BRY) has the fruit not adherent.

Chenopodium ambrosioides L. Mexican-tea. Aromatic annual herbs; stems erect or ascending, mainly 4–10 dm tall; herbage pubescent and with sessile glands; leaves short-petioled, the blades 2–10 cm long, 3–30 mm wide (or more?), usually lanceolate, dentate to laciniate; inflorescence paniculate, the cymes sessile on ultimate branches, usually bracteate; calyx united to the middle or above; seeds 0.5–0.8 mm wide; $2n = 32, 36, 48?, 64$. Ruderal and garden weeds of Utah and Washington counties; widespread in tropical and temperate New World; adventive from Mexico; 2 (0).

Chenopodium atrovirens Rydb. Mountain Goosefoot. [*C. fremontii* var. *atrovirens* (Rydb.) Fosberg; *C. hians* Standley; *C. incognitum* Wahl]. Plants mainly 2–75 cm tall, the stems erect or steeply ascending, usually branched; herbage sparingly scurfy to glabrous; leaves petiolate, the blades 0.6–4 cm long, 2–23 mm wide, lanceolate to ovate, entire or obscurely hastately lobed, otherwise entire, obtuse basally; flowers clustered in leaf axils or in interrupted terminal spikes, the lower ones subtended by foliose bracts, becoming ebracteate upwards; perianth lobes free to below the middle, keeled dorsally; pericarp adherent or less commonly not adherent to the horizontal rugulose to smooth, obtusely margined seed; seeds ca 0.9–1.3 (1.5) mm wide; $2n = 18$. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, Douglas fir, aspen-tall forb, and spruce-fir communities at 1705 to 3175 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Rich, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties;

British Columbia to Saskatchewan, south to California, Nevada, Colorado, and Iowa; 24 (ii). Relationship of this species probably lies closer to the *leptophyllum* end of the spectrum. The occasional specimens with free pericarps might indicate intermediacy with *C. fremontii*, however. There has been little agreement between previous authors as to whether the pericarp was adherent or not, but in the specimens examined from Utah, the pericarps are usually adherent.

Chenopodium botrys L. Jerusalem-oak. Aromatic annual herbs; stems commonly 1–5 dm tall, erect or ascending, usually branched; herbage glandular-villous; leaves petiolate, the blades sinuate-pinnatifid, the lobes again toothed or lobed, oblong to oval in outline; inflorescence an erect panicle of loosely spreading-recurved cymes, mainly shortly bracteate; sepals ca 1 mm long; seeds horizontal or vertical, 0.5–0.8 mm wide, dull, dark; $2n = 18, 36$. Widespread ruderal weedy species, established locally in indigenous communities, especially in gravelly washes at 760 to 1985 m in Beaver, Box Elder, Cache, western Garfield, Iron, Juab, Millard, Salt Lake, Sanpete, Sevier, Tooele, Utah, and Washington counties; widely distributed in the U. S.; adventive from Eurasia; 22 (iii).

Chenopodium capitatum (L.) Asch. Strawberry-spinach. [*Blitum capitatum* L.; *C. overi* Aellen in Fedde?; *C. chenopodioides* authors, not (L.) Aellen]. Plants mainly 1–4 dm tall, the stems erect or decumbent-ascending, simple or more commonly branched from the base; herbage glabrous; leaves petiolate, the blades (1) 1.5–10 cm long, 1–10 cm wide, triangular-hastate to lanceolate, shallowly to deeply toothed or subentire, hastately lobed or the upper entire, acute to obtuse apically, often turning reddish; flowers clustered in axillary capitulate spikes, the lower clusters subtended by foliose bracts, the upper ones ebracteate or with reduced bracts; perianth lobes free to below the middle, not mealy, dry and greenish or becoming fleshy and reddish, shorter than the fruit; pericarp adherent to the erect (or less commonly horizontal) seed; fruit ca 1 mm long; $2n = 18$. Two varieties are present in Utah.

1. Flower clusters often over 5 mm wide, the calyx becoming red and fleshy at maturity; plants uncommon
 *C. capitatum* var. *capitatum*
 — Flower clusters commonly less than 5 mm wide, the calyx not fleshy, though sometimes reddish at maturity; plants common *C. capitatum* var. *parvicapitatum*

Var. *capitatum* $2n = 18$. Gravelly soil in lodgepole pine forest, north slope of Uinta Mts. (Welsh & Moore 6696 BRY), Summit County; Alaska to Quebec, south to California, New Mexico, and New England; 1 (i).

Var. *parvicapitatum* Welsh Mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1860 to 3050 m in Beaver (type from the Tuschar Mts.), Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Morgan, Piute, Rich, Salt Lake, Sanpete, Summit, Tooele, Uinta, Utah, and Wasatch counties; British Columbia to Saskatchewan, south to California, Nevada, and Colorado; 60 (xiv). This common plant of montane habitats has been identified variously as *C. capitatum* or *C. rubrum* and, more recently, as *C. chenopodioides* (L.) Aellen. The latter plant is a portion of the flora of the Soviet Union and might represent nothing more than phases of *C. rubrum* sensu

lato. Certainly the description provided for that entity (Flora USSR 6: 51. 1936) is not of our specimens, and neither is the habitat cited (i.e., "wet solonchaks"). The name given here is for the purpose of providing an unequivocal epithet for this montane western American phase of *C. capitatum*.

Chenopodium dessicatum A. Nels. Desert Goosefoot. [*C. pratericola* Rydb.; *C. petiolare* var. *leptophylloides* Murray; *C. leptophyllum* var. *dessicatum* (A. Nels.) Aellen; *C. leptophyllum* var. *oblongifolium* Wats.; *C. pratericola* var. *oblongifolium* (Wats.) Wahl]. Plants mainly 3–8 dm tall, the stems erect, simple or branched; herbage commonly more or less scurfy; leaves petiolate, the blades mostly 1.3–6 cm long and 2–10 (15) mm wide, linear to narrowly lanceolate or elliptic, entire or less commonly hastately lobed, cuneate basally; flowers clustered in terminal or axillary spicate panicles; perianth lobes free to below the middle, keeled dorsally; pericarp not adherent to the horizontal smooth to rugulose, obtusely margined seed; seeds 0.9–1.2 mm wide; $2n = 18$. Shadscale, hopsage, rabbitbrush, tamarix-poplar, sagebrush, and pinyon-juniper communities at 850 to 1925 m in Duchesne, Emery, Garfield, Grand, Kane, Salt Lake, San Juan, Uintah, Utah, Washington, and Wayne counties; Yukon to Manitoba, south to California, New Mexico, and Nebraska; 26 (iii). Material assigned to *C. dessicatum* in a strict sense, as distinct from *C. pratericola* in a strict sense, has perianth lobes covering the mature fruit, as opposed to having the fruit not covered. The distinction is not great. Reduction of this taxon to *C. leptophyllum* (as var. *oblongifolium*) begs the question of a probably nearer relationship to *C. fremontii*, with which it shares non-adherent pericarp and broader, more veined leaves. Furthermore, apparent intermediates between *C. fremontii* and *C. dessicatum* exist. The entire complex is in need of monographic study.

Chenopodium fremontii Wats. Fremont Goosefoot. Plants mainly 1–8 (12) dm tall, the stems erect or ascending, usually branched; herbage more or less scurfy to glabrous; leaves petiolate, the blades 0.6–5 (6) cm long, and about as broad, less commonly 2–3 times longer than broad, triangular-ovate to ovate or lanceolate, commonly hastately lobed, the lobes often again lobed or toothed, otherwise entire or rarely with 1 or few teeth on the main apical lobe, broadly cuneate to subcordate basally; flowers clustered in large terminal and smaller lateral spikes, scurfy; perianth lobes free to below the middle, keeled dorsally; pericarp not adherent to the horizontal, smooth to rugulose, obtusely margined seed; seeds 0.9–1.2 mm wide; $n = 9$. This closely interrelated complex of forms involves the linear-leaved *C. leptophyllum* (q.v.) at one end of the spectrum and the broad-leaved phases of *C. fremontii* at the other end (and with both *C. atrovirens* and *C. dessicatum*, inter alia, between the extremes). The intervening plants have been regarded as species or some of them have been placed within expanded species concepts at both ends of the series. The course followed herein is a compromise between having one all inclusive species, with numerous varieties, and that of recognition of all of the named entities at specific level. The proposed treatment attempts to represent the major taxa as they occur in Utah; the synonymy might not be properly applied in all cases.

1. Plants mainly less than 25 cm tall, branching from the base, the curved ascending branches subequal to the main stem; leaves more or less white-farinose, at least beneath *C. fremontii* var. *incanum*

- Plants 0.5–8 dm tall, variously branched but, if as above, the lateral branches much shorter than the main stem; leaves white-farinose to glabrous *C. fremontii* var. *fremontii*

Var. *fremontii* $2n = 18$. Blackbrush (and other warm desert shrub), salt desert shrub, sagebrush, mountain brush, pinyon-juniper, aspen, and spruce-fir communities at 850 to 3050 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; British Columbia to Manitoba, south to California and Mexico; 63 (xix). Specimens assigned here are not uniform with regard to leaf shape, plant height, and openness of the inflorescence. More work is indicated.

Var. *incanum* Wats. [*C. incanum* (Wats.) Heller; *C. watsonii* of authors, not A. Nels.?). $2n = 18$. Blackbrush, salt desert shrub, pinyon-juniper, mountain brush, and ponderosa pine communities at 850 to 2350 m in Carbon, Duchesne, Emery, Garfield, Juab, Kane, Piute, Salt Lake, Tooele, Uintah, Wayne, and Washington counties; Nevada to Nebraska, south to Texas and Mexico; 28 (iii). The variety is transitional to the next.

Chenopodium glaucum L. Oakleaf Goosefoot. [*C. salinum* Standley]. Plants mainly 3–30 cm long, the stems prostrate to ascending or erect, usually branched; herbage farinose, especially on lower leaf surfaces; leaves shortly petiolate, the blades 4–25 mm long, 2–10 mm wide, lanceolate to oblong or ovate, coarsely sinuate-dentate; flowers in clusters in numerous short, bracteate or ebracteate, axillary spikes and a terminal spicate panicle; perianth cleft almost to base, not enclosing the fruit; pericarp not adherent to the seed; seeds horizontal or vertical, 0.8–1.3 mm wide, smooth; $2n = 18, 36$. Often in saline substrates on lake shores and stream banks, in sedge-rush, tamarix-sedge, rabbitbrush, pinyon-juniper, and aspen to spruce-fir communities at 1220 to 2745 m in Box Elder, Cache, Carbon, Duchesne, Garfield, Grand, Kane, Millard, Morgan, Rich, Salt Lake, Sanpete, Sevier, Tooele, Uintah, Utah, Wasatch, and Wayne counties; widespread in U.S. and Canada; Eurasia; 26 (xiv). Our material is assignable to var. *salinum* (Standley) J. Boivin, on the basis of its larger fruits (0.8–1.3 mm, not 0.6–0.9 mm).

Chenopodium hybridum L. Mapleleaf Goosefoot. [*C. gigantospermum* Aellen; *C. hybridum* var. *gigantospermum* (Aellen) Rouleau]. Plants mainly 2–10 dm tall, the stems erect, simple or branched; herbage glabrous, except in inflorescence; leaves alternate or the lower often opposite, long-petiolate, the blades commonly 1.7–10 cm long, 1.2–10 cm wide, ovate to deltoid ovate, sinuate-dentate to -lobate, with 2–4 teeth or lobes, cordate to truncate or obtuse basally; flowers in small cymes, these arranged in large terminal and smaller axillary panicles, more or less farinose and often sparingly glandular; perianth cleft nearly to the base, not strongly keeled dorsally; pericarp not or moderately adherent; seeds 1.2–1.9 mm wide, with obtuse margin, smooth or somewhat sculptured; $2n = 18, 36$. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities, less commonly in riparian or palustrine habitats, at 1280 to 2135 m in Beaver, Cache, Daggett, Millard, Rich, Salt Lake, Sanpete, Summit, Tooele, Utah, and Weber counties; widely distributed in U. S. and Canada; Europe; 12 (iv). Our specimens have been identified as var. *gigan-*

tospermum (Aellen) Rouleau, on the basis of the seed being less sculptured than in typical European material. Plants of this species formed huge stands in burned over sagebrush and aspen communities in Summit County in 1963.

Chenopodium leptophyllum (Moq.) Wats. Narrowleaf Goosefoot. [*C. album* var. *leptophyllum* Moq.]. Plants mainly 12–70 cm tall, erect or the branches ascending, simple or branched; leaves short-petiolate, the blades mainly 0.7–4 cm long, 1–5 (7) mm wide, linear to narrowly oblong or narrowly lanceolate, 1-veined, cuneate to acute basally, entire; flowers in loose to compact cymes aggregated into terminal or axillary spicate panicles; perianth lobes cleft to well below the middle, keeled dorsally; pericarp adherent; seeds horizontal, 0.9–1.1 mm wide, black, finely rugulose to smooth; $2n = 18$. Shadscale, greasewood, rabbitbrush, tamarix, sagebrush, fringed sagebrush, mountain brush, and aspen communities at 1125 to 2900 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Millard, Piute, Salt Lake, San Juan, Sevier, Summit, Tooele, Uintah, Washington, and Wayne counties; British Columbia to Saskatchewan, south to California and Mexico; 34 (xiii). The 1-veined, narrow leaf blades and adherent pericarps are apparently definitive for this plant.

Chenopodium murale L. Nettleleaf Goosefoot. Plants mainly 2–5 dm tall, the stems erect or with branches ascending; herbage glabrous or sparingly farinose, especially in inflorescences; leaves petiolate, the blades 1–5 (7) cm long and as broad or nearly so, ovate to oval or lanceolate, irregularly sinuate-dentate and some often subhastate, cuneate to subcordate basally; flowers sessile and solitary to clustered in axillary or terminal panicles, not much, if at all, surpassing the leaves; perianth lobes free to below the middle, keeled dorsally; pericarp adherent to the horizontal, rugulose to smooth, sharply margined seed; seeds 1–1.5 mm long; $2n = 18$. Ruderal weeds at 730 to 1620 m in Sevier, Wasatch, and Washington counties; widespread in U. S. and Canada; adventive from Eurasia; 5 (0).

Chenopodium rubrum L. Red Goosefoot. Plants mainly 0.5–10 dm tall, erect, simple or with steeply ascending branches; herbage glabrous or somewhat villous in inflorescence; leaves petiolate, the blades 0.7–9 cm long, 0.4–7 cm wide, triangular to ovate, lanceolate, or elliptic, sinuate-dentate or -lobed, some often subhastate, fleshy and often suffused with red, flowers sessile, the clusters borne in simple or branched axillary and terminal spicate panicles; perianth lobes cleft to the middle or below, rounded or sometimes keeled dorsally; pericarp not adherent; seeds nearly always vertical, oval in outline, 0.7–1 mm long; $2n = 18, 36$. Saline moist substrates in palustrine and riparian habitats at 1280 to 2440 m in Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Juab, Rich, Salt Lake, San Juan, Sevier, Uintah, Utah, and Weber counties; widespread in U. S. and Canada; Eurasia; 18 (i).

Corispermum L.

Annual herbs, often pubescent with stellate hairs; leaves alternate, sessile, entire, 1-veined; flowers perfect, solitary or clustered in bract axils, arranged in dense or lax spikes; perianth segments 1–3, minute, unequal, the posterior 1 largest, erect, 1-nerved, scarious; stamens 1–3(5); stigmas 2, connate basally; achenes strongly flattened, plano-convex, indurate, the margin winged or acute.

Corispermum villosum Rydb. Bugseed; Tickseed. [*C. hyssopifolium* authors, not L.; *C. nitidum* authors, not Kit. in Schultes; *C. imbricatum* A. Nels.; *C. emarginatum* Rydb.; *C. marginale* Rydb.; *C. simplicissimum* Lunnell?]. Stems mainly 8–50 cm tall, commonly branched throughout, the lower branches often curved-ascending to ascending, usually reddish; herbage glabrous or sparsely to densely pubescent with soft, branched hairs; leaves alternate, sessile, semicylindric and more or less involute or subulate, mostly 0.8–6 cm long, 0.5–3 mm wide, apiculate; inflorescence slender and elongate or compact, the bracts broadly scarious-margined, with the lower ones narrower or broader than the fruit, the upper ones usually broader than the fruit; perianth mostly consisting of a single posterior erose segment (rarely with 2 additional small anterior-lateral segments); stamens 3–5; fruit 2.2–4.1 mm long, 1.6–2.6 mm wide, oval to suborbicular, smooth, glabrous, brownish; wings opaque, stramineous, 1/8–1/5 as wide as the body; $2n = 18$? Usually growing on sandy substrates, in ephedra, four-wing salt-bush, rabbitbrush, scurfpea, and pinyon-juniper communities, at 1065 to 1955 m in Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, and Wayne counties; Montana and North Dakota, south to Arizona, New Mexico, and Texas; 20 (iv). Our specimens have long been presumed to be introduced and conspecific with either *C. hyssopifolium* L. and/or *C. nitidum* Kit. in Schultes. While the details of those taxa are reported in contradictory fashion in Flora USSR (6: 146–149, 1936) versus the Flora Europaea (1: 99–100, 1964), it seems clear that our plants cannot be *C. hyssopifolium*, which is reported to have flat leaves. The description of our specimens more nearly fits that of *C. nitidum*, but that plant has filiform leaves, not semicylindric ones as in ours. Further, our plants grow in native plant communities and are not weedy; their distribution pattern is that of numerous other indigenous taxa. Plants of this genus were described historically from the edge of civilization and beyond in North America (Nuttall, Genera of North American Plants 1: 4, 1818; Hooker, Flora Boreale Americana 2: 126, 1838; Watson, Proc. Amer. Acad. 9: 123, 1874). While not definitive evidence of nativity these historical data are additive to the weight of evidence for the indigenous nature of the genus in North America. Because of these considerations I have, arbitrarily, chosen the earliest name available at specific level for our plants. Both elongate slender and short broad inflorescences are represented within our specimens, along with occasional intermediates. There is little correlation of inflorescence type with other morphological features or geography.

Cycloloma Moq.

Annual herbs; stems commonly branched and forming rounded clumps; leaves alternate, sinuate-dentate; herbage more or less pubescent, eglandular; inflorescence a panicle of interrupted spikes; flowers sessile; perianth 5-lobed, the segments in fruit with a transverse wing on the back, the wings connate and completely encircling the fruit; stamens 5; achenes depressed; seeds horizontal.

Cycloloma atriplicifolia (Sprengel) Coult. Winged-pigweed. [*Salsola atriplicifolia* Sprengel]. Plants mainly 0.8–5 dm tall (rarely more), divaricately branched, the stems striate, loosely and sparingly tomentulous, becom-

ing glabrate; leaves short-petioled to sessile, the blades 1–8 cm long, 2–15 mm wide, coarsely serrate-dentate, acute apically, cuneate basally; flowers perfect and pistillate; sepals 5, keeled, the perianth developing into a horizontal wing; wings white-hyaline, lobed or toothed, 4–5 mm in diameter, often red or purple at maturity; ovary tomentulose; styles 2 or 3; fruit enclosed in calyx; seed ca 1.5 mm wide, black, smooth; pericarp not adherent; 2n = 36. Sandy habitats in blackbrush, mixed desert shrub, and juniper communities at ca 1125 to 1465 m in Emery, Garfield, Grand, Kane, San Juan, Uintah, and Wayne counties; Manitoba and Indiana, south to Arizona and Texas; adventive in Europe; 11 (iii).

Grayia H. & A.

Monoecious shrubs or subshrubs; branches more or less thorny; axillary buds subglobose, prominent; leaves alternate, entire; herbage pubescent with simple and stellate hairs; flowers in terminal and axillary spicate panicles, imperfect; staminate flowers 2–5 in clusters in bract axils, not separately bracteolate, the perianth 4- or 5-lobed, subequal to the 4 or 5 stamens; pistillate flowers 1–several per bract, often some vestigial, each enclosed by 2 connate bracteoles, the more or less accrescent bracteoles obcompressed, the margins thickened and spongy within; fruits vertical; stigmas 2.

Grayia spinosa (Hook.) Moq. Hopsage. [*Chenopodium* (?) *spinosum* Hook.; *G. polygaloides* H. & A.]. Shrubs, mainly 5–12 (15) dm tall; branches gray brown; branchlets often spinose-persistent, the bark exfoliating in long strips, pubescent with scurfy and stellate hairs when young; leaves 5–30 mm long (or more), mainly 2–12 mm wide, spatulate to oblanceolate, entire, tapering to a short petiole; staminate flowers with usually 4-lobed perianth, enclosing the 4 stamens, 1.5–2 mm long; pistillate flowers in short spicate inflorescences, the subtending bracts reduced, enclosed by paired, accrescent, obcompressed bracts, orbicular or cordate, the wings thickened and spongy within, 6–15 mm wide, greenish, straw colored, or suffused with red; 2n = 36. Blackbrush, other warm desert shrub, shadscale, horsebrush, rabbitbrush, sagebrush, and pinyon-juniper communities at 760 to 2900 m in Beaver, Box Elder, Daggett, Davis, Duchesne, Garfield, Grand, Juab, Kane, Millard, Piute, San Juan, Sevier, Tooele, Uintah, Utah, Washington, and Weber counties; Washington to Montana, south to California, Arizona, and New Mexico; 91 (xvii). This is a valuable browse plant for livestock, especially for sheep. Locally it is called "applebush" because of its palatability. For consideration of relationship to *G. brandegei* Gray see discussion under *Zuckia*.

Halogeton C. A. Mey.

Annual herbs; leaves alternate, fleshy and sausage-like, bearing an apical slender spine; flowers perfect or partially pistillate, usually bracteolate; perianth of 5 segments, free nearly to the base, embedded in white hair, the segments gibbous, winged in fruit; stamens 2–5, connate basally into a glandular, hypogynous disk; stigmas 2; seeds vertical, laterally flattened, adherent to the pericarp.

Halogeton glomeratus (Bieb.) C. A. Mey. Halogeton. [*Anabasis glomerata* Bieb.]. Plants mainly 3–45 cm tall and as broad, glaucous, usually branched from the base, with curved-ascending branches; leaves mainly 3–15 mm

long and 1–2 mm thick, terete, dilated and semiamplexicaul basally, obtuse and terminating in a deciduous slender spine ca 1–1.5 mm long, bearing a tuft of hairs and fasciated leaves in the axils; bracteoles ovate; perianth segments membranous, ovate to oblong, 1-veined, with lustrous, membranous, fanlike, veiny wings 2–3 mm long and 3–4 mm wide; stamens united into 2 clusters of 2 or 3, with 1 anther per cluster; fruit oval to obovate, 1.2–1.8 mm long, with an erect cusp on one or both sides; 2n = 18. Mainly in disturbed sites in cheatgrass, Russian thistle, salt grass, mixed desert shrub, salt desert shrub, and pinyon-juniper communities at 1220 to 1985 m in most, if not all, Utah counties; widely distributed in western U. S.; adventive from Eurasia; 47 (x). This plant was introduced into northern Nevada in the early 1930's (first collected in 1934), possibly for use in grazing experiments. It spread quickly into the desert lands of Nevada and western Utah, and subsequently into eastern Utah and other states. The plant is rich in oxalates and poses a serious threat to grazing animals, especially to sheep, which have suffered heavy death losses for several decades.

Kochia Roth

Annual herbs or subshrubs; leaves alternate (or some opposite), linear to narrowly lanceolate, in some fleshy and terete; flowers 1 to several, sessile in axils of foliose bracts, mostly perfect, 5-merous, the perianth lobes enclosing the fruit, keeled and horizontally winged; stamens mostly 5; stigmas 2 or 3; pericarp thin, free from the horizontal, smooth seed.

- 1. Plants subshrubs, introduced for reclamation *K. prostrata*
- Plants annual or perennial herbs, woody if at all only at the base 2
- 2(1). Plants annual, introduced weeds of disturbed habitats *K. scoparia*
- Plants perennial, woody at the base, indigenous in saline habitats *K. americana*

Kochia americana Wats. Gray Molly. [*K. americana* var. *vestita* Wats., type from shores of the Great Salt Lake; *K. vestita* (Wats.) Rydb.]. Plants mainly 5–30 cm tall, with erect branches from a woody base; herbage villous-pilose to glabrous; leaves 5–25 mm long, 1–2 mm wide, linear, semiterete and fleshy; flowers solitary or 2–5, sessile in axils of scarcely reduced leaves; inflorescence often more than half the branch length; perianth segments pubescent, at least apically, 1–1.5 mm long, hooded above, somewhat enlarged in fruit, ultimately keeled and with a membranous, striate wing to 2 mm long and 3 mm wide. Greasewood, seepweed, saltbush, saltgrass, matchweed, horsebrush, and pinyon-juniper communities at 1125 to 1985 m in Beaver, Box Elder, Cache, Davis, Emery, Garfield, Grand, Iron, Juab, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, and Wayne counties; Oregon to Montana, south to California, Arizona, and New Mexico; 65 (v).

Kochia prostrata (L.) Schrader [*Salsola prostrata* L.]. Subshrubs, mainly 10–75 cm tall; stems erect or steeply ascending, more or less pubescent with short crinkly hairs often intermixed with longer villous ones; leaves 3–12 mm long, 0.3–0.7 mm wide, linear to filiform, flat; inflorescence spiciform to paniculate; flower clusters inter-

rupted; perianth hairy dorsally, the appendages round, flat, and tuberculate or oblong and winglike (ca 1 mm long and 1.5 mm wide), often suffused with red; seeds oval or orbicular in outline, ca 2 mm wide, brown, smooth. This plant is being tried in reclamation plantings and is to be expected throughout Utah; introduced from Eurasia; 1 (0).

Kochia scoparia (L.) Schrader Summer-cypress. [*Chenopodium scoparium* L.]. Annual herbs, mainly 3–12 (15) dm tall, green, or suffused with red in autumn, simple or branched from the base, villous and often finely lanate to glabrous; leaves 0.8–4.5 (6) cm long, 1–4 mm wide, lanceolate to oblanceolate, elliptic or linear, usually 3- to 5-veined, glabrous or softly pilose below (and above) or glabrous above, generally ciliate, acute; inflorescence spicate, interrupted; fruiting perianth of perfect flowers glabrous dorsally, ciliate, mostly transversely keeled, tubercled or sometimes horizontally winged from middle of the keel; pistillate flowers often lacking a keel; seeds ovate in outline, 1.5–2 mm long; $2n = 18$. Disturbed roadsides, canal banks, field margins, and other waste places in salt marsh, sedge-rush, sagebrush, mountain brush, and pinyon-juniper communities at 850 to 1985 m in probably all Utah counties; widespread in North America; adventive from Eurasia; 38 (ii). The cultivated ornamental phase, with bright red or red orange foliage is f. *trichophylla* (Hort.) Stapf ex Schinz & Thell. [*K. trichophylla* Hort. ex Voss]. Some workers have suggested that our material belongs to the Russian species *K. iranica* (Hausskn. & Bornm.) Litv. [*Salsola iranica* Hausskn. & Bornm.], but materials examined fit neither key diagnostic nor other descriptive features of that taxon (see Flora USSR 6: 128–134. 1936).

Monolepis Schrader

Annual, polygamo-monoecious herbs; leaves simple, hastately lobed or entire, alternate, mealy to subglabrous, fleshy; flowers unisexual, inconspicuous, borne in axillary clusters; perianth consisting of 1 bractlike scale (rarely 2 or 3, or lacking), not enclosing the fruit; stigmas 2; pericarp reticulately patterned or warty, adherent to the erect seed.

1. Plants rare, dichotomously branched, the ultimate branches filiform; leaves small and inconspicuous, entire; flowers 5 or fewer per axillary cluster; perianth segments 1–3, linear *M. pusilla*
- Plants common, not dichotomously branched, the ultimate branches not filiform; leaves conspicuous, commonly at least some hastately lobed *M. nuttalliana*

Monolepis nuttalliana (Schultes) Greene Povertyweed. [*Blitum nuttallianum* Schultes in R. & S., based on *B. chenopodioides* Nutt.; *M. chenopodioides* (Nutt.) Moq. in DC.]. Plants mainly 4–30 cm tall, the stems prostrate or ascending to erect, simple or much branched from the base, mealy to subglabrous; leaves 5–50 mm long, the blades 1–15 mm wide, lanceolate to elliptic or oblong, with 1 pair of lateral lobes near the middle, reduced upwards and sometimes entire, the petiole 1–20 mm long; flowers borne in dense, sessile, axillary clusters; perianth segments 1–2 mm long, more or less acute apically; pericarp pitted, usually pale; fruit 0.9–1.5 mm broad; $2n = 18$. Pioneer plant of open sites in blackbrush, shadscale, mat saltbush, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, Douglas fir-limber

pine, aspen, and lodgepole pine communities at 850 to 3355 m in probably all Utah counties; Alaska and Yukon to California and New Mexico, east to Manitoba and Missouri; 70 (xiv). The correct name for this plant seems to be *M. chenopodioides*, there being no apparent obstacle to transfer of *Blitum chenopodioides* to *Monolepis*. However, I hesitate to suggest the change until further research corroborates such a necessity.

Monolepis pusilla Torr. ex Wats. Plants clump-forming, 3–20 cm tall and as broad or wider; leaves 4–12 mm long, oblong, entire, short-petioled; flowers 1–5, in sessile clusters; sepals spatulate, obtuse, 1–3; pericarp tuberculate; seeds dull, ca 0.5 mm wide. Salt desert shrub at ca 1500 m in Uintah County (Holmgren et al 1934 BRV); Oregon to Wyoming, south to California and Nevada; 1 (0).

Nitrophila Wats.

Perennial rhizomatous herbs from a definite caudex; leaves opposite, linear to oblong, fleshy, clasping, entire; flowers perfect, axillary, 2-bracteolate, solitary or in 3's; calyx chartaceous, with 5 sepals, these keeled, 1-veined; stamens 5, united basally into a perigynous disk; style filiform, with paired stigmas; fruit ovoid, beaked, included in connivent sepals; seeds vertical, lenticular.

Nitrophila occidentalis (Moq.) Wats. Niterwort. [*Banalia occidentalis* Moq. in DC.]. Plants glabrous, mainly 10–30 cm tall; stems with opposite branches, erect or ascending; leaves 0.7–2 cm long, linear, semicylindric, sessile, mucronate; flowers sessile; sepals 2–3 mm long, oblong, stramineous (pinkish when fresh); fruit brown; seed shining, black, ca 1 mm wide. Saline clay substrate in saltbush, pickleweed, alkali saccaton community in western Juab and Millard counties; Oregon to California, Nevada, and Mexico; 1 (i).

Salicornia L.

Annual or perennial herbs from taproots or rhizomes; leaves simple, scalelike, opposite, connate, glabrous; flowers perfect, borne sessile in opposite groups of 3, sunken in depressions of thickened, terminal spikes, subtended by scalelike bracts; perianth consisting of 4 connate segments free at the tip around a slitlike opening, enclosing the fruit; stigmas commonly 2; pericarp thin, free from the erect, retrorsely pubescent seed.

1. Plants annual, from slender taproots, the main stems mostly less than 3 mm thick; central flower much above the lateral ones *S. europaea*
- Plants perennial from thick rhizomes and fibrous roots, the main stem mostly more than 3 mm thick; central flower not much above the lateral ones *S. utahensis*

Salicornia europaea L. Annual Samphire. [*S. rubra* A. Nels.; *S. europaea* ssp. *rubra* (A. Nels.) Breitung; *S. trona* Lunell; *S. europaea* var. *trona* (Lunell) J. Boivin]. Plants annual, mainly 9–30 cm tall, from slender taproots; stems fleshy, erect or ascending, commonly branched, often reddish at maturity; leaves scalelike, often with a scarious margin; spikes 0.5–5 cm long, 2–3 mm thick, the joints 2–4 mm long; central flower much above the lateral ones; fruit debiscent, the seeds falling separately; $2n = 18, 36$. Saline substrates in salt marsh, seepweed, poverty weed, alkali saccaton, and saltgrass communities at 1280 to 1465 m in Beaver, Box Elder, Cache, Davis, Juab,

Millard, Rich, Salt Lake, Tooele, Uintah, and Utah counties; widespread in North America; Eurasia; 19 (ii). Our specimens are supposed to differ from the more coastal ones in having slender spikes with joints about as thick as long, but no such correlation is apparent. Recognition of our material at infraspecific level seems moot.

Salicornia utahensis Tidestr. Utah Samphire. [*S. pacifica* var. *utahensis* (Tidestr.) Munz]. Plants perennial, mainly 9–30 cm tall, from coarse rhizomes and thick fibrous roots; stems fleshy, erect or ascending, not creeping and rooting at the nodes, turning gray or brown at maturity; leaves scalelike, with scarios margins; spikes 0.6–5 cm long, 3–4 mm thick the joints 3–5 mm long, breaking at the joints when mature, the central flower not especially above the others; fruit dehiscent, the seeds falling separately, sometimes adherent to the calyx. Saline substrates in salt marsh, pickleweed, and saltgrass communities at 1280 to 1405 m in Box Elder, Davis, Millard, Salt Lake, Tooele (type from shore of Great Salt Lake), Utah, and Weber counties; endemic? (reported from California?); 11 (ii). Our material differs markedly from the similar coastal species assigned variously to either *S. pacifica* Standley or *S. virginica* L.

Salsola L.

Annual herbs; leaves alternate, entire, commonly spinulose; flowers perfect, 5-merous, solitary or clustered in axils of spiny bracts, each with 2 smaller bracteoles, borne in spicate inflorescences; fruiting perianth with winglike, mostly horizontally spreading ridges; stamens 5, usually inserted at the margin of a lobed disk; styles 2 or 3; fruit closely enveloped in the persistent calyx; seeds horizontal to oblique.

Beatley, J. C., 1973. Russian thistle (*Salsola*) species in western United States. *J. Range Management* 26: 225–226.

1. Leaves mainly 0.3–1.8 mm wide and 1.5–4 (6) cm long, slender; wings of fruiting calyx usually 1–2 mm long *S. iberica*
 — Leaves mainly 1–1.5 mm thick and 0.5–2 cm long, thick and rigid; wings of fruiting calyx mainly 3–4 mm long *S. paulsenii*

Salsola iberica Sennen & Pau Russian-thistle; Tumbleweed. [*S. pestifer* A. Nels.; *S. kali* authors, not L.?]. Plants with simple stems or freely branched, clump-forming, appearing taller than wide, 1–10 dm tall; stems with red purple, longitudinal striations, glabrous or pubescent; leaves mainly 1.5–4 (6) cm long, 0.3–0.8 mm wide, narrowly linear or filiform, spinulose apically, modified upward as spinescent bracts with expanded bases and scarios margins; perianth segments distinct, membranous in anthesis, in fruit becoming transversely winged, the wings mainly 1–2 mm long; seeds horizontal; $2n = 18, 36$. Weedy species of disturbed habitats at 760 to 2440 m in probably all Utah counties; widespread in North America; adventive from Asia; 62 (vi). This species forms intermediates with the next. It is unfortunate that so many specific epithets have been applied to this weedy introduction, and possibly even the above name is not unequivocally correct.

Salsola paulsenii Litv. Barbwire Russian-thistle. Plants commonly freely branched, clump-forming, appearing wider than tall, mainly 10–40 cm tall and usually broader; stems yellowish green, seldom purplish striate, pubes-

cent or glabrous; leaves mainly 0.5–2 cm long, 1–2 mm thick, linear, rigid, spinose apically, modified upwards as spinose bracts with wide bases and scarios margins; perianth segments yellowish, membranous in anthesis, becoming transversely winged, the wings 2–4 mm long in fruit; seeds horizontal. Weedy species of disturbed habitats at 915 to 1830 m in Cache, Carbon, Garfield, Grand, Juab, Kane, Millard, Tooele, Washington, and Wayne counties; Arizona, Nevada, and California; 12 (iii). A third species, *S. collina* Pallas, might be present in Utah. It has long slender spicate inflorescences with appressed bracts and bracteoles, and in the lower portions the flowers are usually gall-like.

Sarcobatus Nees

Thorny shrubs; leaves mostly alternate, linear, fleshy, sessile; flowers imperfect, borne in axillary spikes, the staminate ones spirally arranged, ebracteate, and lacking a perianth; stamens 2 or 3, borne beneath stalked peltate scales; pistillate flowers sessile, 1 or 2, in the axils of scarcely reduced leaflike bracts, the pistil surrounded by a cuplike, shallowly lobed to subtentate perianth, this accrescent and adherent to the fruit base, its upper portion flaring to form a broad, winglike border; seeds erect, flattened, orbicular.

Sarcobatus vermiculatus (Hook.) Torr. in Emory Greasewood. [*Batis* (?) *vermiculata* Hook.; *Fremontia vermicularis* (Hook.) Torr. & Frem.]. Shrubs, mainly 10–20 dm tall or more; branches rigid, spreading, often modified as thorns; leaves 0.3–4.5 cm long, 1–3 mm wide, semicylindric, linear; staminate spikes catkinlike, 1–4 cm long; pistillate flowers fewer than the staminate ones, the perianth ca 1 mm long; calyx wing 2–6 mm long; fruit 4–5 mm long, cup-shaped below the wing; seeds brown, ca. 2 mm long; $n = 18$. Greasewood, seepweed, saltbush, and other plant communities of saline substrates, at 1220 to 2170 m in most if not all Utah counties; Washington and Alberta to North Dakota, south to California, Arizona, New Mexico, and Texas; 72 (x). Our plants are referable to var. *vermiculatus*. This is an important browse species for cattle and sheep, even though potentially poisonous due to oxalate salts of sodium and potassium and oxalic acid.

Spinacia L.

Annual or biennial glabrous herbs; flowers borne in dense spicate inflorescences; pistillate flowers lacking a perianth, but with 2 (rarely 3 or 4) persistent bracteoles that enlarge, become connate, and harden in fruit; stigmas 4 or 5; seeds vertical.

Spinacia oleracea L. Spinach. Plants mainly 2–6 dm tall or more, erect; leaves mainly 3–15 cm long and 2–10 cm wide, ovate to triangular, often hastately lobed; bracteoles in fruit orbicular to obovate, often with a spreading spine at the apex. Cultivated potherb throughout Utah, mainly below 2135 m; introduced from Eurasia; 1 (0). This plant escapes occasionally, but does not persist.

Suaeda Forskal ex Scop.

Annual or perennial herbs or shrubs; leaves alternate, entire, terete or flattened, often succulent; flowers inconspicuous, mostly perfect, solitary or clustered in leaf axils, bracteate; calyx 5-lobed, fleshy, the lobes equal and unappendaged or unequal and some more or less cornicu-

lately appendaged; stamens 5, the filaments short; ovary subglobose or depressed; seeds horizontal or vertical.

1. Plants suffrutescent or definitely shrubby; leaves abruptly short-petiolate; calyx lobes equal, not appendaged, smooth dorsally; herbage glabrous or puberulent; seeds vertical or horizontal *S. torreyana*
- Plants annual; leaves sessile; calyx lobes unequal in fruit, horned; herbage glabrous; seeds horizontal 2
- 2(1). Plants often over 3 dm tall, erect, not clump-forming, the branches stiffly erect-ascending; flowers mostly 3–7 per axil *S. calceoliformis*
- Plants mainly 0.5–3 dm tall, forming depressed rounded clumps, the branches spreading, more or less flexuous; flowers 1–3 per axil *S. occidentalis*

Suaeda calceoliformis (Hook.) Moq. Broom Seepweed. [*Chenopodium calceoliforme* Hook.; *S. depressa* authors, not (Pursh) Wats.; *S. depressa* var. *erecta* Wats.]. Plants glabrous, often glaucous, erect, simple or with erect-ascending branches and broomlike, 1–5 (8) dm tall; leaves mainly 1–4 cm long, 1–2 mm wide, linear or tapering from base to apex, semiterete, intergrading with floral bracts upwards; spikes slender; flowers sessile, mostly in clusters of 3–7; calyx lobes unequal, ca 1.5 mm long, at least some conspicuously horned; fruit horizontal; seeds smooth, 1–1.5 mm wide, dark brown; $2n = 54$. Saline palustrine or riparian sites in saltgrass, greasewood, seepweed, alkali saccaton, and cattail-sedge communities at 850 to 2440 m in Box Elder, Cache, Davis, Duchesne, Emery, Grand, Millard, Rich, Salt Lake, Sanpete, Sevier, Uintah, Utah, Washington, and Weber counties; British Columbia to Saskatchewan, south to California, Arizona, New Mexico, and Texas; 35 (vi).

Suaeda occidentalis (Wats.) Wats. Western Seepweed. [*Schoberia occidentalis* Wats.]. Plants glabrous, often glaucous, forming depressed rounded clumps, not broomlike, mainly 0.5–3 dm tall, seldom simple; leaves mostly 0.5–2 (3) cm long, linear-oblong, semicylindric, intergrading with floral bracts upwards; spikes slender; flowers sessile, mostly 1–3 per cluster; calyx lobes unequal, ca 1.5 mm long, at least some conspicuously horned; fruit horizontal; seeds smooth 1–1.5 mm wide, dark brown. Saline palustrine or riparian habitats in greasewood, saltgrass, seepweed, and other such communities at 1280 to 2135 m in Beaver, Box Elder, Cache, Davis, Duchesne, Rich, Salt Lake, Sanpete, Sevier, and Utah counties; Washington to Wyoming, south to Nevada and Colorado; 12 (i).

Suaeda torreyana Wats. Torrey Seepweed. Plants glabrous or pubescent, sometimes glaucous, suffrutescent or definitely shrubby, 1–12 (15) dm tall or more, with slender ascending to spreading branches; leaves 0.5–3.5 cm long, 1–3 mm thick, subterete to flattened, abruptly short-petiolate, intergrading with floral bracts upwards; flowers 1–8 or more per axil; calyx lobes equal, ca 1.5–2 mm long, the lobes merely rounded dorsally, not horned or tuberculate; fruit horizontal or vertical; seeds 0.8–1.2 mm wide, black, shiny; $n = 9, 18$. Greasewood, seepweed, saltgrass, and other salt desert shrub communities, often in riparian or palustrine habitats at 1125 to 1955 m in Box Elder, Carbon, Cache, Davis, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Sevier, Tooele, Uintah, Utah, and Wayne counties; California, Nevada, Wyoming, Arizona, and Mexico; 79 (xiv). Materials cited with the above description belong to

var. *torreyana* [*Chenopodium linearis* Torr., type from Great Salt Lake; *C. nigra* authors, not (Raf.) Macbr.] A second variety, sometimes treated at specific rank, is based on densely puberulent plants. It is var. *ramosissima* (Standley) Munz [*Dondia ramosissima* Standley; *S. intermedia* Wats., type from Sevier or Washington counties]. Saltgrass, shadscale, greasewood and other salt desert shrub communities at 850 to 1400 m in Juab, Millard, Salt Lake, Sevier, and Washington counties; Arizona and California; 11 (0). Phases of this variety from Washington County seem to have more steeply ascending and more elongate branches than those from elsewhere in Utah. Possibly all of the variants are taxonomically negligible.

Zuckia Standley

Diocious or less commonly monoecious shrubs or subshrubs; branches not thorny; axillary buds subglobose, prominent; leaves alternate, entire or more or less lobed; herbage more or less scurfy; staminate flowers 2–5 in clusters in bract axils, not separately bracteolate, the perianth 4– or 5-lobed, subequal to the 4 or 5 stamens; pistillate flowers 1 to several per bract, often some vestigial, each enclosed by 2 bracteoles, these dorsiventrally flattened and unequally 6-keeled or obcompressed and thin-margined, often subtended by a single filiform bractlet; fruits vertical or horizontal; stigmas 2.

Zuckia brandegei (Gray) Welsh & Stutz Siltbush. [*Grayia brandegei* Gray]. Plants mainly 1–5 dm tall; branching from a persistent woody base ca 0.5–2 dm tall, the annual stems erect or ascending; herbage more or less scurfy and less commonly with some moniliform hairs in the inflorescence; leaves subsessile or tapering to a short petiole, 13–80 mm long, 15–42 mm wide, linear or narrowly oblanceolate-spatulate to elliptic, ovate, obovate, or orbicular, entire or rarely hastately lobed; staminate flowers with a 4– or 5-lobed stramineous perianth, cleft to the middle or below, ca 1.5–1.8 mm long; pistillate bracts obcompressed or dorsiventrally compressed, with vertical or horizontal fruits respectively, but not exclusively, when mature either flattened and 4–8 mm wide or 6-keeled (with 4 small and 2 large keels) and 2–4 (5) mm wide; fruits included within the bracts; $2n = 36$. It has long been recognized that *Grayia brandegei* was not a close congener of *G. spinosa*, type species of the genus *Grayia*, even though they shared features of bract compression and rounded axillary buds. They differ markedly in gross morphology, in vestiture, and in nature of the bracts. The bracts of *G. spinosa* are thickened marginally, and filled internally with a spongy cellular matrix. Those of *brandegei* are thin margined, and do not possess a spongy cellular matrix. Some workers have suggested that *G. brandegei* should be removed from its long association with *G. spinosa* and placed within the *gardneri* phase of *Atriplex*. The differences between *Z. brandegei* and any of the *Atriplex* species are striking even though the plants in vegetative condition might be confused. Bract and bud differences in *Zuckia* are correlated, apparently, with C-3 type of photosynthesis and its attendant foliar morphology, while the shrubby *atriplexes* have the C-4 type of photosynthesis with its foliar morphology. Two more or less distinctive but intergrading phases are present.

1. Fruit dorsiventrally compressed; bracts 6-keeled, fruit mostly horizontal *Z. brandegei* var. *arizonica*

— Fruit obcompressed; bracts 2-winged, samaralike; fruit mostly vertical *Z. brandegei* var. *brandegei*

Var. *arizonica* (Standley) Welsh [*Z. arizonica* Standley]. Fine-textured or sandy, often saline and seleniferous substrates on Entrada, Morrison, and Duchesne River formations in Emery, Uintah, and Wayne counties; Arizona; 10 (i). Despite the distinctive bracts and horizontal fruits, the plants are well within the range of vegetative variation existing in plants of *Z. brandegei* in a strict sense. Staminate plants of this variety have not previously been discerned from among the general collections of *Z. brandegei*. Previous descriptions of *Zuckia* and its only species (*arizonica*) are conspicuous in lacking discussion of staminate features. Supposed differences in vesture between the taxa apparently do not exist, and other diagnostic morphology is unknown.

Var. *brandegei* Fine-textured, often saline and seleniferous substrates on the Duchesne R., Uinta, Kaiparowits, Summerville, Morrison, Chinle, and Moenkopi formations (and probably others) at 1280 to 2440 m in Daggett, Emery, Garfield, Grand, Kane, San Juan (? type from San Juan River), Sevier, Uintah, and Wayne counties; Colorado and Arizona; 66 (xii). Both broad and narrow-leaved phases of both of the varieties are known, and there is a tendency for the wideness of leaves to be geographically correlated (i.e., the broad-leaved populations from the Uinta Basin and those on "The Blues" of the Kaiparowits Formation northeast of Henrieville and north of Fourmile Bench), but the plants differ in no other discernible way. Probably these variants do not warrant taxonomic recognition.

COMPOSITAE Giseko

Sunflower Family

Annual, biennial, or perennial herbs, or shrubs; leaves alternate, opposite, or whorled, simple, pinnatifid, or compound; inflorescence of involucre heads, these solitary or several in corymbose, racemose, paniculate, or cymose clusters; flowers few to numerous on a common receptacle, surrounded by green bracts forming a cup-shaped, cylindrical, or urn-shaped involucre enclosing the flowers in bud; heads entirely of tubular (disk) corollas, entirely of ligulate (ray) corollas, or with tubular corollas forming a central disk and an outer radiating row of ligulate corollas; receptacle flat, convex, conic, or cylindrical, naked or bearing chaffy bracts, scales, or hairs; calyx lacking, or crowning the summit of the ovary and modified as a pappus of capillary bristles, scales, or awns; stamens alternate with corolla lobes; filaments free (rarely connate); the anthers united and forming a tube (rarely separate); ovary inferior, of 2 carpels, 1-loculed and with a single ovule; styles 1, 2-cleft, exerted through the anther tube; fruit an achene; $x = 2-19+$ [Asteraceae Dumort.]. Note: All involucre measurements are from dried pressed herbarium specimens. The width measurements are sometimes broader than in fresh material.

Welsh, S. L. 1983. Utah flora: Compositae (Asteraceae). Great Basin Naturalist 43: 179-357.

- 1. Corollas all raylike; plants usually with milky juice . Key 1
- Corollas not all raylike, some or all of them tubular; juice seldom if ever milky 2

- 2(1). Corollas all tubular; no ray flowers present, or the rays vestigial and minute Key 2
- Corollas not all tubular; ray flowers present 3
- 3(2). Pappus of capillary bristles, at least in part Key 3
- Pappus of awns or scales, or lacking 4
- 4(3). Pappus lacking Key 4
- Pappus present, of awns or scales Key 5

Key 1.

Corollas all raylike; plants usually with milky juice.

- 1. Pappus lacking 2
- Pappus present 3
- 2(1). Rays 10-20 mm long; plants glabrous, with leaves in a basal rosette *Atrichoseris*
- Rays 5-7 mm long; plants pubescent, with well-developed cauline leaves *Lapsana*
- 3(1). Pappus, at least in part, of plumose bristles 4
- Pappus of simple bristles, awns, or scales 7
- 4(3). Plants acaulescent, with merely bracteate stems *Hypochoeris*
- Plants caulescent 5
- 5(4). Achenes not beaked, truncate at apex; involucre usually less than 15 mm long *Stephanomeria*
- Achenes tapering or beaked at apex; involucre usually more than 15 mm long 6
- 6(5). Leaves pinnatifid; corollas white or pinkish; involucre with an outer series of short bractlets; plants of southern Utah *Rafinesquia*
- Leaves not pinnatifid, entire; corollas yellow or purplish; involucre lacking short outer bractlets; plants widespread *Tragopogon*
- 7(3). Pappus of 1-3 series of unawned or awned scales 8
- Pappus of capillary bristles 9
- 8(7). Pappus of 2 or 3 series of unawned scales; corollas blue, closing by midmorning *Cichorium*
- Pappus scales in a single series, awned; corollas yellow, not closing by midmorning *Microseris*
- 9(7). Achenes more or less flattened; stems leafy; heads in panicles or in umbellate clusters 10
- Achenes not flattened; stems leafy or scapose; heads solitary or variously disposed 11
- 10(9). Involucre cylindrical or ovoid-cylindrical; achenes beaked; flowers yellow or blue *Lactuca*
- Involucre broadly campanulate to hemispheric; achenes not beaked; flowers yellow *Sonchus*
- 11(9). Corollas pink or purplish 12
- Corollas yellow or yellowish, or white or cream colored 14
- 12(11). Plants annual; heads mainly 5-7 mm long (from base of involucre to tip of pappus) *Prenantheella*
- Plants perennial; heads mainly 8-20 mm long or more 13
- 13(12). Plants with rigid spine-tipped branches . *Stephanomeria*
- Plants unarmed, the branches soft *Lygodesmia*
- 14(11). Leaves all basal; heads solitary on scapose peduncles 15
- Leaves not all basal, the stems leafy; heads not on scapose peduncles 17

- 15(14). Achenes not beaked, truncate; pappus bristles barbellate *Microseris*
- Achenes beaked or tapering to apex; pappus not of barbellate bristles 16
- 16(15). Achenes 10-ribbed or 10-nerved, not spinulose; involucre bracts usually imbricated in several series *Agoseris*
- Achenes 4- to 5-ribbed, spinulose, especially near apex; principal bracts in a single series, the outer much shorter *Taraxacum*
- 17(14). Achenes ridged or tuberculate between the angles; leaves either crustaceous-margined or peduncles stipitate-glandular; plants of southwestern Utah 18
- Achenes striate between the angles; leaves and peduncles otherwise (rarely glandular setose in some *Crepis* species); plants widely distributed 19
- 18(17). Plants depressed annuals with crustaceous-margined leaves, not stipitate-glandular; achenes abruptly beaked, transversely ridged between the ribs *Glyptopleura*
- Plants erect, lacking crustaceous-margined leaves, conspicuously stipitate-glandular above; achenes tapering to a beak, not transversely ridged .. *Calycoseris*
- 19(17). Pappus bristles early deciduous, more or less united below and falling together, only a few of the stout outer ones may be persistent *Malacothrix*
- Pappus bristles persistent or tardily deciduous, and then falling separately 20
- 20(19). Pappus tan to brown; involucre bracts not thickened *Hieracium*
- Pappus white or whitish; involucre bracts somewhat thickened at base or on midrib *Crepis*

Key 2.

Corollas all tubular; no ray flowers present.

- 1. Heads unisexual, the pistillate heads with 1-4 flowers enclosed in involucre; involucre burlike or nutlike, only style tips exerted 2
- Heads perfect or unisexual; involucre not burlike or nutlike 4
- 2(1). Involucre bracts of the staminate heads separate; fruiting involucre burlike, covered with hooked appendages *Xanthium*
- Involucre bracts of the staminate heads united; fruiting involucre various but, if burlike, lacking hooked appendages 3
- 3(2). Shrubs; fruiting involucre with several transverse, scarious wings; leaves or their lobes linear-filiform *Hymenoclea*
- Shrubs or herbs; fruiting involucre lacking transverse wings; leaves and their lobes not linear-filiform *Ambrosia*
- 4(1). Stamens not united by their anthers; flowers always unisexual, the pistillate corollas none or much reduced 5
- Stamens with united anthers or rarely not united in some species with perfect flowers, at least some flowers usually perfect 7
- 5(4). Achenes long-villous; leaves or their lobes linear-filiform *Oxytenia*
- Achenes not long-villous; leaves or their lobes not linear-filiform 6
- 6(5). Pistillate flowers subtended by large, chaffy scales simulating inner involucre bracts; achenes with pectinate or winged margins *Dicoria*

- Pistillate flowers subtended by chaffy scales or these lacking; achenes without pectinate or toothed wings *Iva*
- 7(4). Involucre bracts with translucent, usually yellow or orange dots *Porophyllum*
- Involucre bracts without distinct dots; pappus vari-ous, but not as above 8
- 8(7). Pappus of capillary bristles, at least in part, these smooth, scabrous, barbellate, or plumose 9
- Pappus lacking or, if present, not of capillary bristles 43
- 9(8). Leaves opposite or whorled, some or all cauline 10
- Leaves alternate, at least basally, or basal and actually alternate 14
- 10(9). Plants rushlike, xeric herbs of low elevations in Wash-ington County *Bebbia*
- Plants not rushlike or xeric, of various habitats and distribution, but not as above 11
- 11(10). Corollas yellow; involucre bracts in 1 series or in 2 series, but all equal in length *Arnica*
- Corollas white, ochroleucous, flesh colored, blue, or purple; involucre bracts in 2 to several series 12
- 12(11). Pappus double—the outer series of short scales, the inner series of capillary bristles; shrubs with white bark *Hofmeistera*
- Pappus single, or the plants herbaceous; shrubs or herbs 13
- 13(12). Achenes 5-angled or 5-ribbed; involucre bracts subequal or in 2 series *Eupatorium*
- Achenes 10-angled or 10-ribbed; involucre bracts imbricated in several series of different lengths *Brickellia*
- 14(9). Leaves spinescent, usually with spiny teeth or lobes, rarely entire but then with spine-tipped apex, mostly thistlelike 15
- Leaves entire, denticulate or lobed, lacking spines, not thistlelike 19
- 15(14). Corollas of some or all flowers bilabiate; basal leaf axils woolly; leaves spinulose-dentate; flowers pink; arid sites in Kane and Washington counties *Perezia*
- Corollas not bilabiate; leaves not or seldom spinulose-dentate; basal leaf axils woolly; flowers pinkish white or cream; various distribution 16
- 16(15). Pappus of 2 series of awns, the outer long and naked, the inner short and hispidulous; flowers yellow .. *Cnicus*
- Pappus of plumose or barbellate capillary bristles; flowers not yellow 17
- 17(16). Pappus bristles plumose (rarely some otherwise); recep-tacle densely bristly *Cirsium*
- Pappus bristles merely barbellate 18
- 18(17). Receptacle densely bristly, not fleshy or honey-combed; heads nodding *Carduus*
- Receptacle not bristly or scarcely so, fleshy and honey-combed, heads not nodding *Onopordum*
- 19(14). Receptacle with dense bristles or narrow, chaffy scales between disk flowers 20
- Receptacle naked or at most short-hairy, never with dense bristles or scales 22
- 20(19). Involucre bracts with hooked spines; lower leaves large (resembling rhubarb), cordate at base ... *Arctium*
- Involucre bracts without spines, or spines not hooked; lower leaves not large and cordate at base .. 21

- 21(20). Receptacle chaffy except in center; plants small, woolly *Filago*
 — Receptacle chaffy throughout; plants not small and woolly *Centaurea*
- 22(19). Heads unisexual; plants dioecious (staminate flowers may have styles but ovary does not develop) 23
 — Heads with at least central flowers perfect 25
- 23(22). Plants shrubs or else woody at base, not tomentose; leaves sometimes toothed or lobed; involucrel bracts not strongly scarious margined *Baccharis*
 — Plants herbaceous, more or less tomentose; leaves entire; involucrel bracts strongly scarious, at least along margins 24
- 24(23). Pappus bristles of pistillate flowers united at base and falling together; pappus bristles of staminate flowers usually club-shaped at apex; plants typically less than 30 cm tall; basal leaves commonly in a rosette; cauline leaves reduced and different in shape; leaves usually tomentose on both sides *Antennaria*
 — Pappus of pistillate flowers separate at base and falling separately; pappus bristles of staminate flowers not club-shaped at apex; plants mostly over 30 cm tall; leaves all alike, usually green and glabrate above *Anaphalis*
- 25(22). Stems longitudinally brown-striate; involucrel bracts imbricate, chartaceous, the inner with scarious margins and broadly rounded apices; shrubs with yellow flowers, of western Millard County *Lepidospartum*
 — Stems striate or not; involucrel bracts scarious, hyaline, or herbaceous but not as above; herbs, or shrubs with flowers and distribution various 26
- 26(25). Involucrel bracts scarious or hyaline (only partly so in *Pluchea*) 27
 — Involucrel bracts herbaceous, at least in the center .. 29
- 27(26). Involucrel bracts subscarious; corollas purplish; plants not tomentose, slender woody shrubs or annual to perennial herbs *Pluchea*
 — Involucrel bracts scarious; corollas rarely purplish; plants tomentose, prostrate to erect herbs 28
- 28(27). Plants perennial, subdioecious pistillate heads usually with a few, central, perfect flowers *Anaphalis*
 — Plants annual or perennial, not dioecious; heads all alike, the marginal flowers pistillate and central ones perfect *Cnaphalium*
- 29(26). Involucrel bracts in a single series, a few very short ones may be present at the very base 30
 — Involucrel bracts of 2 or more series, these often of different lengths 33
- 30(29). Plants woody, shrubs; involucrel bracts 4–6 per head *Tetradymia*
 — Plants herbaceous; bracts more than 6 per head 31
- 31(30). Plants annual; heads with inner flowers perfect, the outer pistillate *Conyza*
 — Plants perennial; heads with all flowers perfect 32
- 32(31). Style branches with a tuft of hairs near the truncate apex; involucrel bracts in 1 series only (a few short bracts may be present) *Senecio*
 — Style branches without a tuft of hairs near the truncate apex; involucrel bracts actually in 2 or more series *Erigeron*
- 33(29). Pappus double, the outer series of short scales, the inner ones of capillary bristles; shrubs with white bark *Hofmeistera*
 — Pappus simple or else the plants herbaceous 34
- 34(33). Plants annual 35
 — Plants perennial or woody shrubs 37
- 35(34). Plants low, depressed, scurfy pubescent herbs; leaves broadly ovate or roundish, entire or toothed *Psathyrotes*
 — Plants not as above 36
- 36(35). Leaves all entire *Aster*
 — Leaves toothed or lobed, at least the lower *Conyza*
- 37(34). Involucrel bracts in more or less distinct vertical rows *Chrysothamnus*
 — Involucrel bracts not in vertical rows 38
- 38(37). Involucrel bracts usually in one subequal series ... *Erigeron*
 — Involucrel bracts imbricate, in 2 or more series 39
- 39(38). Involucrel bracts not longitudinally striate; flowers commonly yellow 40
 — Involucrel bracts longitudinally striate; flowers commonly cream to off-white, or pink to purplish 41
- 40(39). Plants woody shrubs, evergreen; involucrel bracts in 2 series, the outer subterete and subulate; plants of Washington County *Peucephyllum*
 — Plants herbs or shrubs; involucrel bracts in 2 or more series but, if 2, not terete and subulate ... *Haplopappus*
- 41(39). Flowers pink to purplish; plants of northwestern Utah *Eupatorium*
 — Flowers cream to white; plants of various distribution 42
- 42(41). Pappus plumose; plants perennial herbs *Kuhnia*
 — Pappus scabrous or hispidulose; plants shrubs or herbs *Brickellia*
- 43(8). Receptacle with bristles or chaffy scales among the flowers 44
 — Receptacle naked or merely short-hairy 52
- 44(43). Receptacle densely bristly *Centaurea*
 — Receptacle with chaffy scales 45
- 45(44). Plants low woolly annuals; outer bracts boat-shaped and enclosing the achenes 46
 — Plants various, but not low and woolly; outer bracts various but not usually enclosing the achenes 47
- 46(45). Stem leaves opposite; style lateral *Psilocarpus*
 — Stem leaves alternate; style terminal *Stylocline*
- 47(45). Involucrel bracts in 2 distinct sets—the outer herbaceous, the inner differing in shape and texture; leaves opposite, at least below, or alternate 48
 — Involucrel bracts not in 2 unlike sets; leaves alternate or basal 49
- 48(47). Leaves alternate throughout; outer involucrel bracts ca 5, spreading, herbaceous, the inner (1–3 subtending pistillate flowers) larger and broader, becoming strongly accrescent and hooded in fruit *Dicoria*
 — Leaves opposite, at least below; outer involucrel bracts various, but not as above, not accrescent and hooded in fruit *Thelesperma*
- 49(47). Involucrel bracts in 1 series, boat-shaped, each bract enclosing a marginal flower; rays short, yellow .. *Madia*
 — Involucrel bracts in 1 or more series, not boat-shaped and enclosing marginal flowers; rays lacking 50
- 50(49). Plants woody shrubs; mostly along the canyons of the Colorado and Green rivers *Encelia*
 — Plants herbaceous; widely distributed 51

- 51(50). Receptacles high-conical, mostly over 3 cm long; stems leafy *Rudbeckia*
- Receptacles merely convex, much less than 3 cm long; leaves all basal *Enceliopsis*
- 52(43). Pappus none 53
- Pappus present 56
- 53(52). Leaves opposite, some cauline, somewhat connate at base; plants of Grand, San Juan, and Tooele counties *Flaveria*
- Leaves alternate or basal 54
- 54(53). Heads numerous, in spikes, racemes, or panicles; anthers with acute tips; receptacles flat; plants woody or herbaceous *Artemisia*
- Heads solitary on ends of stems, or sometimes corymbose or capitate; anthers with rounded tips; receptacles convex or conic; plants herbaceous, or woody only at base 55
- 55(54). Plants annual; heads solitary or paniculately arranged; leaves green and glabrous *Chamomilla*
- Plants perennial; heads corymbose or capitate; leaves usually silvery-canescenscent *Chrysanthemum*
- 56(52). Plants dioecious shrubs *Baccharis*
- Plants not dioecious herbs or shrubs 57
- 57(56). Pappus of 2–8 caducous awns; plants usually strongly glutinous *Grindelia*
- Pappus various, but not of 2–8 caducous awns 58
- 58(57). Leaves and involucre conspicuously punctate with translucent oil glands *Dyssodia*
- Leaves and involucre sometimes impressed-punctate, but without translucent oil glands 59
- 59(58). Pappus of 12 or more scale or bristlelike segments, these nearly or quite as long as achene 60
- Pappus of fewer than 12 scalelike segments or else much shorter than achene 61
- 60(59). Pappus of 12–16 linear, acuminate awns; involucre glutinous; leaves 3- to 5-nerved *Vanclveea*
- Pappus of ca 35 flattened, silvery scales and bristles of different widths; involucre not glutinous; leaves 1-nerved *AcampTOPappus*
- 61(59). Achenes strongly compressed; pappus of 1 or 2 slender awns *Perityle*
- Achenes not compressed or, if so, the pappus not of 1 or 2 slender awns 62
- 62(61). Pappus a crown with margins entire or of short scales united into a crown 63
- Pappus not as above 65
- 63(62). Plants annual; heads solitary or paniculately arranged; flowers all perfect; leaves green and glabrous *Chamomilla*
- Plants perennial; heads corymbose or capitate, rarely solitary, with some marginal flowers pistillate only; leaves mostly silvery-canescenscent 64
- 64(63). Plants 0.5–1 m tall; leaves doubly pinnately dissected, mainly 10–20 cm long *Tanacetum*
- Plants mainly less than 0.3 m tall; leaves entire, once pinnately dissected, ternate, merely toothed apically, or entire, mainly less than 10 cm long *Sphaeromeria*
- 65(62). Involucral bracts with a thin, scarious, white, yellow, or purplish margin and tip *Hymenopappus*
- Involucral bracts without a scarious, colored margin and tip 66

- 66(65). Plants scapose; leaves roundish, entire, or crenate *Chamaechaenactis*
- Plants leafy stemmed; leaves not roundish and entire or subentire 67
- 67(66). Pappus scales with a strong midrib; leaves lanceolate or linear, entire; southern Utah *Palafoxia*
- Pappus scales nerveless or essentially so; leaves, at least in part, toothed to pinnatifid; widely distributed *Chaenactis*

Key 3.

Corollas not all tubular; ray flowers present
pappus of capillary bristles.

- 1. Rays white, pink, violet, or purple, not yellow 2
- Rays yellow or orange yellow 9
- 2(1). Pappus of numerous unequal bristles, alternating with shorter, lacerate scales; involucre bracts subequal; low winter annuals *Monoptilon*
- Pappus of numerous bristles; involucre bracts imbricate or subequal; plants various, but seldom low winter annuals 3
- 3(2). Pappus, at least of disk flowers, of several to many rigid bristles; achenes pubescent with 2-forked hairs or the hairs barbed at apex *Townsendia*
- Pappus, at least of disk flowers, of many capillary bristles, at least in part; achenes glabrous or pubescent with simple hairs 4
- 4(3). Rays very inconspicuous, shorter than the tube and scarcely if at all exceeding their pappus; central perfect flowers few; plants annual *Conyza*
- Rays usually conspicuous, longer than the tube and pappus; central perfect flowers several to many; plants annual, biennial, or perennial 5
- 5(4). Involucre subequal, rarely somewhat graduated; rays usually narrow; style tips very short, triangular, rounded, or obtuse *Erigeron*
- Involucre usually strongly graduated; rays comparatively broad; style tips ovate and acute to subulate, usually lanceolate 6
- 6(5). Plants perennial, rhizomatous, or annual, or, if from a caudex then ordinarily less than 10 cm tall (see also *Aster kingii*) 7
- Plants from a caudex or taproot 8
- 7(6). Low, white-rayed perennial herbs from spreading cordlike rootstocks, in arid sites; flowering in spring-time *Leucelene*
- Low to tall, white- to pink- or purple-rayed annual or perennial herbs from rhizomes or fibrous roots (a caudex in *A. kingii*); mainly flowering in summer and autumn *Aster*
- 8(6). Plants herbaceous, from a taproot, biennial or perennial; heads usually several to numerous *Machaeranthera*
- Plants more or less woody, from a ligneous caudex; heads usually solitary and large (primary sel-enophytes) *Xylorhiza*
- 9(1). Leaves opposite, at least below 10
- Leaves alternate throughout 12
- 10(9). Plants subshrubs *Perityle*
- Plants herbaceous 11
- 11(10). Leaves with stiff marginal bristles; involucre and leaves with conspicuous oil glands; plants annual *Pectis*

- Leaves without stiff marginal bristles; involucre and leaves without oil glands; plants perennial *Arnica*
- 12(9). Plants 1–1.5 m tall, herbaceous; heads 3–5 cm wide; rays 1–2 cm long *Inula*
- Plants various, usually less than 1 m tall or, if taller, woody; heads much smaller; rays seldom to 1 cm long 13
- 13(12). Pappus of 2–8 stiff, caducous bristles; plants usually glutinous *Grindelia*
- Pappus of numerous, usually soft, persistent bristles 14
- 14(13). Pappus of ca 20 twisted, flattish bristles *Amphipappus*
- Pappus of numerous, straight, capillary bristles 15
- 15(16). Pappus double, the inner of numerous bristles, the outer sometimes scalelike 16
- Pappus not double, of subequal capillary bristles only 17
- 16(15). Leaves essentially filiform *Conyza*
- Leaves not filiform, linear-oblong or broader *Heterotheca*
- 17(15). Involucral bracts in distinct vertical ranks 18
- Involucral bracts not in distinct vertical ranks 19
- 18(19). Outer involucral bracts with loose herbaceous tips; erect stems perennial; plants shrubs; leaves deciduous *Chrysothamnus*
- Outer involucral bracts without loose herbaceous tips; erect stems annual; plants herbaceous; leaves persistent *Petradoria*
- 19(17). Involucral bracts in 1 series, frequently with some smaller bracts at base; style branches truncate apically *Senecio*
- Involucral bracts neither in 1 series nor with smaller bracts at base; style branches without truncate tips 20
- 20(19). Heads small, the involucre usually less than 6 mm high, usually very numerous and densely paniculate, rarely racemose or corymbose; plants rhizomatous, fibrous rooted *Solidago*
- Heads medium to large, the involucre usually more than 6 mm high, neither very numerous nor densely paniculate; plants with taproots, occasionally also rhizomatous *Haplopappus*

Key 4.

Corollas not all tubular; ray flowers present; pappus lacking.

- 1. Rays white, pink, or pink purple, sometimes yellow at base 2
- Rays yellow, sometimes partly purplish or maroon 7
- 2(1). Receptacle naked 3
- Receptacle with chaffy scales 6
- 3(2). Leaves all basal; plants scapose *Bellis*
- Leaves not all basal, at least some cauline; plants caulescent 4
- 4(3). Leaves palmately lobed, the blades about as broad as long; heads less than 6.5 mm high *Perityle*
- Leaves pinnately lobed to serrate, the blades longer than broad; involucre more than 8 mm high, or otherwise differing from above 5
- 5(4). Receptacle broad and flattish; involucral bracts with a dark brown submarginal line *Chrysanthemum*

- Receptacle convex, conic, or hemispheric; involucral bracts without a dark brown submarginal line *Chamomilla*
- 6(2). Heads small, numerous, in dense, flattish or rounded cymose panicles; plants perennial *Achillea*
- Heads comparatively large, solitary or few; plants annual or perennial *Anthemis*
- 7(1). Receptacles not chaffy 8
- Receptacles chaffy, at least toward the margin 13
- 8(7). Heads 1- or 2-flowered, in dense glomerate clusters, sessile in the forks of the stem, or terminal and leafy involucre *Flaveria*
- Heads several- to many-flowered, solitary on terminal peduncles 9
- 9(8). Plants woolly 10
- Plants not woolly 11
- 10(9). Rays persistent, becoming papery *Baileya*
- Rays not persistent *Eriophyllum*
- 11(9). Involucre and leaves with translucent oil glands. *Pectis*
- Involucre and leaves without translucent oil glands 12
- 12(11). Rays conspicuous; involucral bracts acuminate, without scarious margins *Bahia*
- Rays minute; involucral bracts obtuse, with scarious margins *Tanacetum*
- 13(7). Ray achenes partly or wholly enfolded by their involucral bracts; plants annual, glandular-viscid above *Madia*
- Ray achenes not conspicuously enfolded by their involucral bracts or, if so, the plants perennial; plants perennial or, if annual, not glandular above 14
- 14(13). Involucre distinctly double, the outer bracts herbaceous, the inner ones broader and united to about the middle *Thelesperma*
- Involucre not double, the bracts distinct to the base 15
- 15(14). Plants scapose perennials; leaves broad, silvery-pubescent, entire; heads very broad *Enceliopsis*
- Plants leafy stemmed or subscapose; leaves various but not broad and silvery-pubescent or, if so, sagittate; heads broad or narrow 16
- 16(15). Plants subscapose; leaves variously dissected or sagittate; heads broad *Balsamorhiza*
- Plants with stems definitely leafy; leaves usually not dissected or sagittate 17
- 17(16). Plants shrubby; achenes conspicuously ciliate on the margins, notched at the apex, very flat *Encelia*
- Plants herbaceous; achenes not conspicuously ciliate on the margins 18
- 18(17). Leaves doubly pinnately dissected; heads numerous in corymbose cymes *Achillea*
- Leaves simple, entire or toothed to lobed; heads few to several 19
- 19(18). Achenes 2-winged; disks 15–25 mm wide; leaves white-strigose beneath, green above *Verbesina*
- Achenes not 2-winged; disks 6–15 mm wide; leaves green on both sides *Helioneris*

Key 5.

Corollas not all tubular; ray flowers present; pappus of awns or scales.

- 1. Receptacle chaffy 2
- Receptacle not chaffy, either naked or bristly 17

- 2(1). Pappus scales fimbriate; ray flowers 4 or 5, white, only slightly surpassing the disk; introduced weedy plants, to be expected in Utah *Galinsoga parviflora* Cav.
- Pappus scales or awns not fimbriate; ray flowers various in size and color; indigenous or introduced 3
- 3(2). Receptacle bearing a row of chaffy scales between the ray flowers and the outer disk flowers, otherwise naked; pappus of 10–20 slender setiform scales ... *Layia*
- Receptacle chaffy throughout; pappus not of 10–20 slender scales 4
- 4(3). Ray achenes dorsiventrally compressed, the thickened margins attached to a contiguous pair of infertile disk flowers and the subtending bract, and falling as a unit; pulvinate herbs of eastern Utah and shrubs of southwestern Utah *Parthenium*
- Ray achenes various, but not as above; herbs or shrubs 5
- 5(4). Pappus of awns only, without scales 6
- Pappus, at least in part, of scales 10
- 6(5). Achenes flat and obcompressed; awns retrorsely hispid *Bidens*
- Achenes not obcompressed; awns not retrorsely hispid 7
- 7(6). Achenes plump; pappus of 2 to several caducous awns *Helianthus*
- Achenes flat, very strongly compressed; pappus various 8
- 8(7). Plants scapose; heads large, solitary *Enceliopsis*
- Plants leafy stemmed; heads medium sized, usually several 9
- 9(8). Plants shrubby; achenes narrowly white-margined, the margin not continuous between weak awns ... *Encelia*
- Plants herbaceous annuals; achenes strongly white-margined the margin continuous between stout awns *Geraca*
- 10(5). Achenes very flat, strongly compressed 11
- Achenes not very flat, usually much thickened 13
- 11(10). Leaves once to twice pinnatifid *Anthemis*
- Leaves not pinnatifid, entire or nearly so 12
- 12(11). Plants scapose *Enceliopsis*
- Plants leafy stemmed *Helianthella*
- 13(10). Pappus caducous (of 2 awns and rarely some scales) *Helianthus*
- Pappus persistent 14
- 14(13). Inner involucre bracts united to middle into a cup *Thelesperma*
- Inner involucre bracts not united into a cup 15
- 15(14). Receptacle merely convex; rays pistillate *Wythia*
- Receptacle conic or cylindrical; rays neuter 16
- 16(15). Involucre bracts subequal, in 2 or 3 series ... *Rudbeckia*
- Involucre bracts unequal, in 2 series, the inner ones shorter *Ratibida*
- 17(1). Rays white or purple 18
- Rays yellow, sometimes marked with purple 23
- 18(17). Pappus a short crown 19
- Pappus of awns or scales 21
- 19(18). Leaves entire or pinnately divided ... *Chrysanthemum*
- Leaves irregularly 2–3 times pinnately dissected ... 20
- 20(19). Plants annual; heads 1–2.5 cm wide; receptacle conic, hollow *Chamomilla*
- Plants biennial or perennial; heads 3–5 cm wide; receptacle hemispheric *Matricaria*
- 21(18). Pappus of 1 plumose awn and a denticulate crown *Monoptilon*
- Pappus of 2 to several awns or scales 22
- 22(21). Plants dwarf woolly annuals *Eriophyllum*
- Plants annual or perennial, not woolly ... *Townsendia*
- 23(17). Receptacle densely bristly or hairy 24
- Receptacle naked 25
- 24(23). Heads very small; involucre less than 10 mm wide *Gutierrezia*
- Heads medium sized; involucre more than 10 mm wide *Gaillardia*
- 25(23). Pappus of 4 hyaline scales united at the base; rays reddish purple to yellow *Hulsea*
- Pappus a crown, or of caducous or persistent awns or scales; rays mostly yellow 26
- 26(25). Pappus a mere crown or of caducous awns 27
- Pappus persistent, of awns or scales 29
- 27(26). Pappus of 2–8 caducous awns; plants glutinous *Grindelia*
- Pappus a short crown; plants seldom if ever glutinous 28
- 28(27). Leaves entire, bristly margined basally *Pectis*
- Leaves 2- or 3-pinnate *Tanacetum*
- 29(26). Pappus of 1 or 2 awns or scales (rarely more) with or without a crown *Perityle*
- Pappus of 4 to many awns or scales 30
- 30(29). Pappus of about 20 slender, twisted awns; rays 1 or 2 small *Amphipappus*
- Pappus of 4–16 twisted or plane awns or scales; rays usually several 31
- 31(30). Pappus of several scales dissected nearly to base; dwarf woolly annuals *Syntrichopappus*
- Pappus awns or scales not dissected or else plants perennial or woody 32
- 32(31). Pappus of several more or less united scales; rays broad, papery, and persistent *Psilostrophe*
- Pappus not of united scales; rays not papery and persistent (occasionally so in *Hymenoxys*) 33
- 33(32). Leaves and involucre with conspicuous oil glands *Dyssodia*
- Leaves and involucre without conspicuous oil glands 34
- 34(33). Achenes slender, elongate-clavate 35
- Achenes stouter, oblong or obovoid 36
- 35(34). Plants woolly *Eriophyllum*
- Plants merely strigose *Platyschukhria*
- 36(34). Involucre bracts spreading or reflexed; receptacle convex to subglobose; leaves decurrent *Helentium*
- Involucre bracts appressed; receptacle almost flat; leaves not decurrent 37
- 37(36). Pappus of numerous scales; stems leafy; leaves linear or linear-spatulate, entire, 2.5 mm wide or less *Gutierrezia*
- Pappus of about 5 scales; leaves lobed or, if entire, broader and mostly or entirely basal *Hymenoxys*

Acamptopappus Gray

Shrubs with white bark; leaves alternate, entire, 1-nerved; heads yellow, discoid, subglobose, cymose at

tips of branches; flowers all fertile; involucre bracts ca 4-seriate, strongly imbricate, broad, rounded, the tip greenish, the margin scarious, erose; receptacle convex, fimbriate; style branches linear; achenes subtrilobate, densely villous; pappus persistent, of ca 35 flattened silvery scales and bristles of different widths.

Acamptopappus sphaerocephalus (Harv. & Gray) Gray Goldenhead. [*Haplopappus sphaerocephalus* Harv. & Gray]. Low rounded shrubs to 1 m tall, much branched, glabrous throughout or scabrous along some leaf margins; leaves spatulate to almost linear, 4–28 mm long, 1–5 mm wide, obtuse to acute, mucronulate, thick, sessile; heads subglobose, 6–10 mm high; involucre 4–6 mm high; $n = 9$. Blackbrush, indigobush, and creosote bush communities at 850 to 1375 m in Kane, San Juan, and Washington counties; Arizona, Nevada, and California; 22 (iv).

Achillea L.

Perennial, rhizomatous, aromatic herbs, with watery juice; stems erect or ascending; leaves alternate, 1- to 3-pinnately dissected; heads several to many, borne in compact to open corymbose cymes; involucre bracts imbricate in several series, chaffy, the margins scarious and hyaline; receptacle chaffy; ray flowers present, usually 3–12, pistillate, fertile, yellow, white, pink, or pink purple; disk flowers mostly 10 or more, perfect, fertile; pappus none; style branches flattened; achenes compressed, callus-margined, glabrous, beakless.

1. Flowers yellow; leaves coarsely twice pinnately dissected; plants cultivated *A. filipendulina*
- Flowers white, pink, or pink purple; leaves finely 2–3 times dissected; plants indigenous or cultivated *A. millefolium*

Achillea filipendulina Lam. Fernleaf Yarrow. Herbs, the stems erect, 8–12 dm tall or more, longitudinally furrowed and minutely glandular; leaves 4–35 cm long, doubly pinnatifid, the lateral lobes with one large lobe on the upper side; heads numerous, borne in hemispheric or flat-topped corymbose cymes; involucre 3–4 mm high, the bracts with pale scarious margins, villous; rays ca 5, to 1 mm long, yellow; disk flowers 30–40, yellow; achenes 1–2 mm long; $2n = 18, 36$. Cultivated ornamental, Salt Lake and Utah counties, and to be expected elsewhere; introduced from Asia; 2 (0).

Achillea millefolium L. Milfoil Yarrow. Herbs, the rhizomes horizontal; stems ascending to erect, 0.5–10 dm tall, villous-tomentose, simple or branched above; leaves 2–26 cm long, reduced upwards, pinnately once to thrice dissected, the segments very slender; heads numerous, borne in hemispheric or flat-topped, corymbose cymes; involucre 4–6 mm high, the bracts dark to pale margined, villous to glabrate; rays usually ca 5, 2–3.5 mm long, white to pink or pink purple; disk flowers 10–20; achenes 1–2 mm long. Sagebrush, pinyon-juniper, cottonwood, juniper, rabbitbrush, ponderosa pine, mountain brush, aspen, Douglas fir, spruce-fir, and alpine tundra communities at 1070 to 3750 m in all Utah counties; widely distributed in North America; circumboreal; 133 (xv). Two very similar taxa are present in Utah; the common, indigenous ssp. *lanulosa* (Nutt.) Piper [*A. lanulosa* Nutt.; ($n = 18$)], and the introduced, cultivated, ssp. *millefolium* ($n = 9, 27, 54$). A trend is recognizable within

ssp. *lanulosa*; the high elevation specimens tend to have dark involucre bracts, fewer heads, and lower stature. These alpine plants have been treated as var. *alpicola* (Rydb.) Garrett, but they intergrade completely with specimens attributable to var. *lanulosa*. Indeed, the two extremes can be found mounted on the same herbarium sheet, taken from the same locality.

Agoseris Raf.

Perennial scapose herbs with milky juice, from taproots; leaves all basal, entire to pinnately lobed or merely toothed; heads solitary on a naked scape; involucre bracts in 2 to several series, herbaceous, or the inner ones hyaline or nearly so; receptacle usually naked; corollas all raylike, perfect, yellow to orange, often drying pinkish or purplish; pappus of capillary bristles; style branches semi-cylindric; achenes angular or terete, prominently nerved, usually beaked.

1. Plants annual; achene beak 2–3 times as long as the body; rare in Utah *A. heterophylla*
- Plants perennial; achene beak less than half to 2 or more times as long as the body 2
- 2(1). Achene beak striate, mostly less than half as long as the body (longer in some var. *laciniata*); flowers yellow, often drying bluish to pinkish *A. glauca*
- Achene beaks scarcely striate, more than half to 2 or more times as long as the body 3
- 3(2). Flowers brownish orange to yellow orange, often drying purplish; achene beak less than twice as long as the body *A. aurantiaca*
- Flowers yellow, often drying bluish or pinkish; achene beak more than twice as long as the body 4
- 4(3). Achene body with ribs swollen apically, forming a shoulder, tapering abruptly to the beak; involucre bracts in two sets *A. retrorsa*
- Achene body with ribs not swollen apically, rather gradually tapering to the beak; involucre bracts not especially in two sets *A. grandiflora*

Agoseris aurantiaca (Hook.) Greene Orange Agoseris. Plants 0.6–6.6 dm tall, from a simple or branched caudex; leaves 3.5–36 cm long, 0.5–3 cm broad, narrowly oblanceolate, entire to toothed or lobed, villous to glabrate; scapes villous-tomentose to nearly glabrous; involucre 10–27 mm long, 10–42 mm wide, the outer bracts villous to glabrate and ciliate, often purple-spotted; corollas brownish orange to yellow orange, often drying purplish; achene body 4–8 mm long, the slender beak not striate, from more than half as long to longer than the body; $n = 18, 36$. Two rather weak and intergrading phases are recognized at varietal rank.

1. Involucre with bracts subequal or nearly so, slender, tapering, some often over 20 mm long *A. aurantiaca* var. *aurantiaca*
- Involucre with bracts definitely imbricate, broad, and rounded apically or abruptly tapering *A. aurantiaca* var. *purpurea*

Var. *aurantiaca* [*Troximon aurantiacum* Hook.; *A. arizonica* Greene; *A. gracilens* (Gray) Kuntze; *A. longirostris* Greene, type from Fish Lake]. Sagebrush, mountain brush, juniper, pinyon-juniper, and alpine meadow communities at 1375 to 3355 m in Beaver, Box Elder, Carbon, Duchesne, Grand, Juab, Salt Lake, San

Juan, Sevier, Summit, Tooele, Uintah, Utah, Wasatch and Wayne counties; Alberta to British Columbia, south to California and New Mexico; 33 (v).

Var. *purpurea* (Gray) Cronq. [*Troximon aurantiacum* var. *purpureum* Gray; *A. purpurea* (Gray) Greene; *A. confinis* Greene, type from near Marysville]. Mountain brush, aspen, aspen-fir, and spruce-fir communities at 1700 to 3425 m in Cache, Carbon, Emery, Garfield, Grand, Iron, Juab, Kane, Piute, Sanpete, Sevier, Summit, Tooele, Wasatch, and Washington counties; Montana to Arizona and New Mexico; 20 (vi).

Agoseris glauca (Pursh) Raf. Pale Agoseris; Mountain Dandelion. Plants perennial, 0.2–6.4 dm tall, from a simple or branched caudex; leaves 2–26 cm long, 0.2–3 cm broad, narrowly oblanceolate to linear or spatulate to elliptic, entire or toothed to lobed, villous to glabrate; involucre 12–28 mm high, 0.8–4 cm wide, the outer bracts villous to glabrous, ciliate or not, sometimes purple-spotted; corollas yellow, often drying bluish to pinkish; achene body 4–10 mm long, the striate beak stout, to half as long as the body (slender and to as long as the body in some var. *laciniata*); n = 9, 18. Three intergrading and partially sympatric varieties are present in Utah.

- 1. Leaves laciniately toothed or lobed; plants of broad distribution, common *A. glauca* var. *laciniata*
- Leaves entire, rarely with a few teeth or lobes; plants variously distributed, locally common 2
- 2(1). Plants pubescent, at least below the heads, mainly of spruce-fir and alpine communities, sometimes lower *A. glauca* var. *dasycephala*
- Plants glabrous throughout, mainly of lower elevation wet meadows, but sometimes of high elevation meadows *A. glauca* var. *glauca*

Var. *dasycephala* (T. & G.) Jepson [*Troximon glaucum* var. *dasycephalum* T. & G.; *Ammogeton scorzoneraefolius* Schrader; *A. scorzoneraefolia* (Schrader) Greene; *T. pumilum* Nutt.; *A. pumila* (Nutt.) Rydb.; *A. glauca* var. *pumila* (Nutt.) Garrett; *A. villosa* Rydb.]. Sagebrush, mountain brush, aspen, spruce-fir, and alpine tundra communities at 1830 to 3385 m in Duchesne, Garfield, Iron, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, and Washington counties; Alaska to Manitoba and south to Colorado. Plants of this variety pass by degree into each of the following; 29 (v).

Var. *glauca* [*Troximon glaucum* Pursh; *A. isomeris* Greene, type from the Uinta Mts.]. Meadows at 2325 to 3660 m in Box Elder, Cache, Davis, Duchesne, Iron, Juab, Kane, Salt Lake, Sanpete, Sevier, Summit, Uintah, Wasatch, Washington and Weber counties; British Columbia to Manitoba and south to California and Arizona; 22 (iv).

Var. *laciniata* (D. C. Eaton) Smiley [*Macrorhynchus glaucus* var. *laciniatus* D.C. Eaton; *Troximon parviflorum* Nutt.; *A. parviflora* (Nutt.) D. Dietr.; *A. glauca* var. *parviflora* (Nutt.) Rydb.; *T. taracifolium* Nutt.; *A. taracifolia* (Nutt.) D. Dietr.; *A. taraxacoides* Greene, type from near Marysville; *A. caudata* Greene, type from Salina Canyon; *A. agrestis* Osterh.; *A. glauca* var. *agrestis* (Osterh.) Q. Jones]. Sagebrush, mountain brush, juniper, pinyon-juniper, Douglas fir, aspen, and spruce-fir communities at 1300 to 3050 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, San Juan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wash-

ington, Wayne, and Weber counties; Washington to Montana and south to Arizona; 84 (xii). The phase designated as var. *agrestis* blends completely in our area with that treated herein as var. *laciniata*.

Agoseris grandiflora (Nutt.) Greene [*Stylopappus grandiflorus* Nutt.]. Plants perennial, 1.5–4.5 (7) dm tall, from a simple or branching caudex; leaves 8–25 cm long, 1–3 cm broad, narrowly oblanceolate, pinnatifid to subentire, villous to glabrate; involucre 15–38 mm long, 20–43 mm wide, the outer bracts villous-tomentose to glabrate, ciliate, often suffused with purple; corolla yellow, drying bluish to pinkish; achene body 4–7 mm long, the nerveless beak more than twice as long as the body; n = 9. Sagebrush and mountain brush communities at 1830 to 2135 m in Cache, Iron, Tooele, and Washington counties; British Columbia to California and Nevada; 4 (i).

Agoseris heterophylla (Nutt.) Greene Annual Agoseris. [*Macrorhynchus heterophyllus* Nutt.]. Plants annual, 0.3–2.5 (4) dm tall, with 1 to several scapes from the base; leaves 1–20 (15) cm long, 3–15 mm wide, narrowly oblanceolate, toothed or pinnatifid to entire, all basal, or with some not strictly basal; involucre 5–20 mm long, 4–10 mm wide, sparingly villous with multicellular hairs, the cross-walls purplish; corolla yellow, sometimes turning pinkish on drying; achene body 2–5 mm long, prominently ribbed or winged, the beak 2–3 times as long as the body; n = 18. Sagebrush-grass and mountain brush communities at 1280 to 1435 m in Cache and Salt Lake counties; British Columbia to California and Arizona; 5 (0).

Agoseris retrorsa (Benth.) Greene Retrors Agoseris. [*Macrorhynchus retrorsus* Benth.]. Plants perennial, mainly 1–4 dm tall, with 1 to several scapes from the base; herbage woolly when young, becoming glabrate in age; leaves 8–20 cm long, 5–15 mm wide, oblanceolate to lance-elliptic, pinnately parted, the segments linear to lanceolate and retrorse, the terminal one very long; involucre 2.5–4 cm high, the phyllaries in 2 sets; corollas yellow, often drying pinkish; achene body 5–7 mm long, more or less truncate apically and abruptly narrowed into a slender beak about twice as long as the body. Mixed desert shrub and pinyon-juniper communities at ca 1525 to 1830 m in Juab and Washington counties; Washington to California and Nevada; 3 (0).

Ambrosia L.

Annual or perennial herbs or shrubs; leaves alternate or opposite, pinnately or palmately lobed, toothed, or dissected; heads unisexual, discoid; staminate heads in slender spicate, bractless racemes; involucre 5– to 12–lobed; receptacle flat, bearing flattened filiform-setose bracts; staminal filaments monadelphous, the anthers scarcely united; pistillate heads borne below the staminate ones, mostly axillary, their involucre closed, nutlike, armed with prickles arranged in one or more series; pistil naked, the corolla lacking; pappus lacking.

Payne, W. W. 1964. A reevaluation of the genus *Ambrosia*. *J. Arnold Arboretum* 45: 401–438.

- 1. Plants woody shrubs of southwestern Utah 2
- Plants annual or perennial herbs, of various distribution 3
- 2(1). Leaves mainly less than 15 mm long, pinnately lobed, the lobes again toothed or lobed, silvery-strigose overall *A. dumosa*

- Leaves mainly more than 20 mm long, merely toothed or lobed, the lobes not again toothed or lobed, bicolor- ed, the upper surface green, the lower surface white- tomentose *A. eriocentra*
- 3(1). Leaves palmately lobed, the lobes serrate; plants tall coarse herbs *A. trifida*
- Leaves pinnatifid or pinnately lobed; plants slender herbs usually less than 5 dm tall 4
- 4(3). Leaves bicolor- ed, the lower surface obscured by ap- pressed white hairs; plants low rhizomatous perennials *A. tomentosa*
- Leaves various, but not definitely bicolor- ed; plants from tap-roots or rhizomes but, if the latter, not as above 5
- 5(4). Plants perennial, rhizomatous; leaves opposite *A. psilostachya*
- Plants annual; leaves mainly alternate 6
- 6(5). Lower stems and leaves with pustular-based, stiff, multi- cellular hairs; plants often with lower lateral branches decumbent-ascending; burs with spines in more than 1 series *A. acanthicarpa*
- Lower stems lacking pustular-based hairs, all stems slender and curved ascending-appressed; burs with spines in one series *A. artemisiifolia*

***Ambrosia acanthicarpa* Hook.** Bur Ragweed. [*Franse- ria acanthicarpa* (Hook.) Cov. Plants annual, 0.9–7.5 dm tall, often branching from the base, the lower branches commonly decumbent-ascending; pubescence of stiff multicellular hairs, the bases pustular; leaves mostly alternate, petiolate, the blades 0.9–4.5 cm long, 0.6–3.5 cm wide, bipinnatifid to pinnatifid; heads numerous in terminal or axillary racemes, staminate above, pistillate below; staminate heads short-pedunculate, not bracteate; pistillate solitary or clustered in upper axils, with 2–3 series of flattened, curved spines. Blackbrush, salt desert shrub, desert shrub, pinyon-juniper, and riparian communities, often in sandy substrates, at 850 to 2000 m, in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, San Juan, Sanpete, Tooele, Uintah, Utah, Wash- ington, and Wayne counties; Washington to Sas- katchewan, south to California, Arizona, and Texas; 60 (xi).

***Ambrosia artemisiifolia* L.** Common Ragweed. [*A. elatior* L.]. Plants annual, mostly 3–9 dm tall, branching from above the middle; pubescence of lax multicellular hairs, the bases not pustular; leaves alternate, or the lower usually opposite, petiolate, the blades 2.5–8.5 cm long, 1.9–7.5 cm wide, 1– to 2–pinnatifid; heads numerous in terminal or axillary racemes, the staminate above, pistillate below, clustered or solitary, with 1 series of tuberculate spines; $2n = 36$. Moist disturbed sites at 1375 to 1680 m in Box Elder, Cache, Duchesne, Garfield, Juab, Millard, Salt Lake, San Juan, Utah, and We- ber counties; widespread in North America; 11 (i).

***Ambrosia dumosa* (Gray) Payne** Bur-sage. [*Franse- ria dumosa* Gray]. Shrubs, 2–6 dm tall, rounded, much-branched; branchlets white, subspinescent; pubescence dense, strigose; leaves alternate, petiolate, the blades 9–30 mm long, 5–15 mm wide, mostly bipinnatifid, uniformly hairy on both sides; staminate heads spicate, rather few; pistillate heads often scattered among the staminate; mature pistillate involucre armed with 20–35 lance-subulate spines; $n = 18, 36, 54$. Creosote bush, blackbrush, and Joshua tree communi- ties at 670 to 1000 m in Washington County; Arizona, Califor- nia, and Mexico; 25 (i).

***Ambrosia eriocentra* (Gray) Payne** [*Franse- ria eriocen- tra* Gray]. Shrubs, 3–10 (12) dm tall, aromatic, the branchlets white, subspinescent, pubescence of white tomentum and coarse multicellular hairs; leaves alter- nate, subsessile, sinuately toothed to lobed or 1–pinnatifid, 8–40 (50) mm long, 2–20 mm wide; stami- nate heads more or less clustered; pistillate heads 1–flowered; pistillate involucre with 12–20 flattened, subulate spines. Creosote bush, blackbrush, and Joshua tree communities at 670 to 1000 m in Washington County; Arizona, Nevada, and California; 12 (ii).

***Ambrosia psilostachya* DC.** Western Ragweed. [*A. coronopifolia* T. & G.]. Perennial herbs, mostly 3–6 dm tall, simple or branching above the middle; pubescence of harsh, spreading, multicellular, pustular-based hairs (at least in part); leaves opposite, at least below, petiolate to subsessile, the blades 4–10 cm long, 2.5–4.5 cm wide, mostly once pinnatifid; staminate heads in terminal or axillary spicate racemes; pistillate involucre merely tu- berculate or quite unarmed; $2n = 18, 27, 36, 45, 54, 63, 72, 108$. Meadows, stream banks, and roadsides in sage- brush and other communities at 1300 to 2100 m in Cache, Davis, Juab, Millard, Salt Lake, Tooele, Utah, and We- ber counties; Washington to Illinois, south to Arizona and Mexico; 20 (ii).

***Ambrosia tomentosa* Nutt.** Low Ragweed. [*Franse- ria discolor* Nutt.; *F. tomentosa* (Nutt.) A. Nels., not *A. tomentosa* Gray]. Perennial rhizomatous herbs, mostly 1–3.5 dm tall, branching from above the base; pubescence of short, stiff, appressed hairs; leaves alter- nate, petiolate, the blades 2–15 cm long, 0.4–3.5 cm wide, 1– to 3–pinnatifid; staminate heads racemose; pis- tillate heads armed with 2 or 3 series of coarse spines. Meadows and stream banks at 1155 to 1525 m in Box Elder, Davis, Duchesne, Garfield, Grand, Uintah, and Weber counties; Wyoming and Colorado; 10 (iii).

***Ambrosia trifida* L.** Giant Ragweed. Annual, robust herbs, 10–15 dm tall or more; pubescence spreading-hir- sute to hispid, at least above; leaves opposite, petiolate, the blades palmately 3– to 5–lobed, or unlobed, mainly 5–20 cm long, 4–15 cm wide, scabrous on both surfaces, serrate; staminate involucre 3–nerved; pistillate involu- cres 5–10 mm long, bearing short spines at the tip; $n = 12$. Uncommon (introduced?) weedy plants of disturbed sites in Salt Lake County; widely distributed in North America; 1 (0).

Amphipappus T. & G.

Low shrubs; branches white-barked, divaricate; leaves alternate, entire, short-petiolate; heads small, radiate, few-flowered, clustered at tips of branches; involucre in ca 3 series, strongly imbricate, straw colored to greenish, the bracts broad, rounded; receptacle fimbriate; ray flowers yellow, 1 or 2, small; disk flowers 3–6, perfect; ray achenes hairy, broadly oblanceolate, compressed, their pappus of more or less united bristles, awns, or scales; disk achenes undeveloped, glabrous or sparingly pilose, their pappus of twisted, hispidulous bristles or scales.

Porter, C. L. 1943. The genus *Amphipappus* Torr. & Gray. Amer. J. Bot. 30: 451–453.

***Amphipappus fremontii* T. & G.** Chaff-bush. Shrubs 3–8 dm tall, the herbage scabrous-puberulent; leaves 5–12 mm long, 2–5 mm wide, oblanceolate to elliptic, cuneate basally, acute to obtuse and apiculate, green;

heads 4–6 mm high, the bracts greenish medially near the apex, the margins hyaline and more or less erose. Joshua tree and creosote bush communities at 700 to 900 m in Washington County; Nevada, Arizona, and California. Our material belongs to *var. spinosus* (A. Nels.) C.L. Porter [*Amphiachyris fremontii* var. *spinosus* A. Nels.; *ssp. spinosus* (A. Nels.) Keck]; 12 (iii).

Anaphalis DC.

Perennial, dioecious or polygamo-dioecious, rhizomatous herbs, with watery juice; stems ascending to erect, simple or branched above; leaves simple, alternate, entire; heads several to many, in hemispheric or flat-topped corymbose cymes; involucre bracts imbricate in several rows, chaffy, scarious, white, or with a dark triangular basal spot; receptacle naked; corollas of disk flowers only, imperfect, whitish, the pistillate heads sometimes bearing some central staminate flowers, the pistillate corollas tubular-filiform, the staminate corollas tubular-funnel-form; pappus of capillary bristles; style branches somewhat flattened; achenes small, roughened, glabrous to sparingly hairy.

Anaphalis margaritacea (L.) Benth. & Hook. Pearly Everlasting. [*Gnaphalium margaritaceum* L.]. Plants 1.5–8 dm tall, the stems white villous-tomentose; leaves only gradually reduced upwards, 2.5–12 cm long, 0.5–2 cm wide, narrowly lanceolate to oblong, elliptic, or oblanceolate, sessile, entire, flat to slightly revolute, white-tomentose below, commonly less pubescent and greenish above; heads showy, the involucre 4–7 mm high, 5–10 mm broad, the bracts pearly-white, with a dark triangular base, glabrous; achenes ca 1 mm long; 2n = 28. Meadows, streambanks, and openings in ponderosa pine, lodgepole pine, boxelder, and aspen communities at 1150 to 2700 m in Box Elder, Cache, Daggett, Duchesne, Iron, Juab, Salt Lake, Summit, Uintah, Wasatch, Washington, and Weber counties; widely distributed in North America; Asia; 33 (vi).

Antennaria Gaertner

Perennial, dioecious herbs with stolons, caudices, or rhizomes, the juice watery; stems ascending to erect, usually simple; leaves simple, alternate and basal, the cauline generally reduced upward; heads solitary to many, borne in corymbose cymes; involucre bracts imbricate in several rows, scarious (at least marginally), often colored; receptacle naked; corollas of disk flowers only, imperfect, whitish or tawny; pistillate corollas tubular-filiform, the pappus of numerous capillary bristles; staminate corollas tubular-funnel-form, the pappus of few clavate to barbellate, usually flattened bristles; style branches slightly flattened; achenes terete to slightly compressed, glabrous or papillose.

- 1. Heads solitary; flowering stems usually less than 5 cm tall *A. dimorpha*
- Heads (1) 2 to many (see *A. rosulata*); flowering stems often more than 5 cm tall 2
- 2(1). Upper leaf surface green; leaf blades broadly spatulate, rounded to obtuse *A. neglecta*
- Upper leaf surface not notably different from the lower; blades seldom both spatulate and rounded to obtuse 3
- 3(2). Plants not forming mats, lacking leafy stolons, some caespitose from caudex or rhizome 4

- Plants mat-forming, with leafy stolons 6
- 4(3). Involucre bracts glabrous or nearly so, scarious near the base, white-opaque apically *A. luzuloides*
- Involucre bracts densely tomentose in the lower half, opaque to dark with pale scarious apices 5
- 5(4). Involucre bracts blackish in aspect, the tips pale and scarious *A. pulcherrima*
- Involucre bracts opaque white, somewhat darkened at the middle *A. anaphaloides*
- 6(3). Terminal scarious portion of involucre bracts dirty brownish to blackish green on at least the middle and outer ones 7
- Terminal scarious portion of involucre bracts white to pink, with a dark basal spot on some only 8
- 7(6). Terminal scarious portion of involucre bracts blackish green; plants usually alpine in Uinta, Wasatch, and Tushar mts., and on the Markagunt Plateau .. *A. alpina*
- Terminal scarious portion of bracts merely discolored and pale brown, or the inner bracts whitish at the tips; plants usually of lower elevations *A. umbrinella*
- 8(6). Flowering stems less than 5 cm tall; heads 1 or 2; plants of Beaver, Garfield, Grand, Iron, Kane, and Wayne counties *A. rosulata*
- Flowering stems commonly more than 5 cm tall; heads usually 3 or more; plants of broad or other distribution 9
- 9(8). Involucre bracts with a black spot between the tomentose greenish base and the opaque white-scarious apex *A. corymbosa*
- Involucre bracts lacking a conspicuous black spot ... 10
- 10(9). Involucre mostly 4–7 mm high, often bright pink; pistillate corollas mostly 2–4.5 mm long *A. microphylla*
- Involucre mostly 7–11 mm high, seldom pink; pistillate corollas mostly 5–8 mm long *A. parvifolia*

Antennaria alpina (L.) Gaertner Alpine Pussytoes. [*Gnaphalium alpinum* L.]. Plants caespitose from a caudex, mat-forming and stoloniferous, 2–13 cm tall; basal leaves 0.6–2.2 cm long, 2–6 mm wide, cuneate-oblanceolate to spatulate, acute to obtuse or rounded apically, grayish tomentose on both surfaces or greenish and subglabrous above on some leaves; heads 3–5, borne in subcapitate cymes; pistillate involucre 5–7 mm high, villous-tomentose below, the scarious tips of bracts uniformly blackish or brownish green, all rather blunt apically, often erose; staminate involucre mostly 4–5 mm high, the scarious tips of bracts often pale apically; achenes glabrous; 2n = 63. Lodgepole pine, spruce-fir, and alpine tundra communities at 3050 to 3550 m in Beaver, Cache, Daggett, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Sevier, Uintah, and Utah counties; north to Alaska and east to Labrador; circumboreal; 27 (vii). Our material belongs to *var. media* (Greene) Jepson [*A. media* Greene; *A. austromontana* E. Nels., type from Tushar Mts.]. There is a tendency for some specimens to approach *A. parvifolia* in the Uinta Mts. and *A. umbrinella* elsewhere.

Antennaria anaphaloides Rydb. Pearly Pussytoes. Plants from a caudex, not mat-forming or stoloniferous, 1.5–3.5 (5) dm tall; basal leaves 2.5–19 cm long, 4–18 mm wide, narrowly oblanceolate to elliptic, tomentose on both surfaces; heads several to many in branching or compact cymes; pistillate involucre 5–8 mm high, villous-tomentose below, the scarious tips opaque white, all

rounded or obtuse, often erose; staminate involucre 5–8 mm high, similar to the pistillate; achenes glabrous. Aspen, spruce-fir, sagebrush, and mountain brush communities at 2440 to 3325 m in Box Elder, Daggett, Summit, and Uintah counties; British Columbia to Montana and south to Nevada and Colorado; 7 (i).

Antennaria corymbosa E. Nels. Plains Pussytoes. [*A. nardina* Greene]. Plants caespitose, mat-forming and stoloniferous, 5–26 cm tall; basal leaves 0.6–3.7 cm long, 2–6 mm wide, narrowly oblanceolate to spatulate, acute to obtuse apically, gray to greenish and tomentose on both surfaces; heads commonly 3–8, in compact to branching cymes; pistillate and staminate involucre 4.5–6 mm high, the bracts green and tomentose basally, with a dark spot at the base of the white or sordid terminal portion; achenes puberulent; $2n = 28$. Alpine tundra, krummholz, spruce-fir, lodgepole pine, and willow-alder communities, often along stream banks and in wet meadows or bogs, at 2240 to 3355 m in Beaver, Duchesne, Garfield, Summit, and Uintah counties; Montana and Idaho to Colorado and California(?); 22 (iii). The main body of the species in Utah lies in the Uinta Mts., with outliers in the Stansbury and Tusbar mts., and in the Markagunt Plateau.

Antennaria dimorpha (Nutt.) T. & G. Low Pussytoes. [*Gnaphalium dimorphum* Nutt.; *A. dimorpha* var. *macrocephala* D. C. Eaton, type from Salt Lake City]. Plants caespitose, mat-forming, rooting from short caudex branches, not truly stoloniferous, 1–5 (7) cm tall; basal leaves narrowly oblanceolate, 0.6–4 cm long, 1–14 mm wide, acute apically, grayish tomentose on both sides; heads solitary, terminal on short leafy stems; pistillate involucre (7) 10–18 mm long, the bracts strongly imbricated, slender, attenuate, green at base, suffused with brown above the base, the apical portions yellowish to brownish scarious; staminate involucre 6–9 mm long, tomentose at the base, brown above the base, the broad apical portion hyaline to scarious; achenes puberulent. Mat-saltbush, sagebrush, juniper, oak-serviceberry, ponderosa pine, and spruce-fir-lodgepole pine communities at 1430 to 3050 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Iron, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Washington counties; British Columbia to Montana, south to California, Nevada, Colorado, and Nebraska; 37 (viii).

Antennaria luzuloides T. & G. Rush Pussytoes. [*A. oblanceolata* Rydb.]. Caespitose from a caudex, 1.1–5 (7) dm tall; basal leaves 2–5 (8) cm long, 2–8 mm wide, greenish, tomentose on both surfaces; heads numerous in a compact or more often branched corymbose inflorescence; pistillate and staminate involucre similar, 4–5 mm high, glabrous to the base, the bracts brownish scarious and more or less hyaline below, opaque whitish above; achenes puberulent. Openings in aspen-conifer and lodgepole pine-spruce communities at 2950 to 3050 m in Daggett, Duchesne, Summit, Uintah, and Wasatch counties; British Columbia to Montana, south to California, Nevada, and Colorado; 14 (i).

Antennaria microphylla Rydb. Rosy Pussytoes. [*A. rosea* Rydb.; *A. concinna* E. Nels.; *A. arida* A. Nels.]. Plants caespitose, stoloniferous and mat-forming, 0.4–3 (4) dm tall; basal leaves 0.5–3 cm long, 2–8 mm wide, oblanceolate to spatulate; heads 2–13 (or more), in congested to open cymes; pistillate involucre 4–7 mm high, the bracts tomentose below, greenish or scarious below

the middle, often somewhat brownish below the scarious, whitish or pinkish, terminal portion; mainly known from pistillate individuals; achenes glabrous or sparingly hispidulous; $2n = 56$, 126. Sagebrush, juniper, ponderosa pine, Douglas fir, lodgepole pine, spruce-fir, and alpine meadow communities at 1830 to 3450 m in all Utah counties, except Davis, Morgan, and San Juan; Alaska to Ontario, south to California and New Mexico; 105 (xxiii).

Antennaria neglecta Greene Field Pussytoes. [*A. marginata* Greene]. Plants caespitose, stoloniferous and mat-forming, 5–15 (25) cm tall; basal leaves 1.8–3.5 cm long, 3–15 mm wide, spatulate, thinly tomentose to glabrous and green above, white-tomentose beneath; heads mainly 3–5, in compact cymes; pistillate involucre 6–11 mm high, the bracts tomentose on the greenish base, the apical scarious portion white or suffused with pink; staminate plants rare; achenes glabrous or minutely pubescent; $2n = 28$. Pinyon-juniper and shrub communities at 1525 to 1900 m in Emery, Grand, San Juan, Sanpete, Utah, and Washington counties; Alaska to Newfoundland, south to California, Arizona, and Virginia; 8 (i). Our few specimens are hardly adequate to represent this species clearly in Utah.

Antennaria parvifolia Nutt. Common Pussytoes. [*A. aprica* Greene; *A. obtusata* Greene, type from Uinta Mts., Uintah County]. Plants caespitose, stoloniferous and mat-forming, 3–15 cm tall; basal leaves 0.8–3.5 cm long, 3–8 mm wide, spatulate, obtuse to acute apically, tomentose on both sides; heads 2–6 or more; pistillate involucre 7–11 mm high, the bracts more or less tomentose on the greenish base, the scarious portion white, sordid, or pink; staminate plants rarely collected; achenes glabrous. Mountain brush, pinyon-juniper, sagebrush, ponderosa pine, aspen, lodgepole, and spruce-fir communities at 1650 to 3250 m in Beaver, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wayne counties; British Columbia to Manitoba, south to Arizona and New Mexico; 46 (iv).

Antennaria pulcherrima (Hook.) Greene Showy Pussytoes. [*A. carpathica* var. *pulcherrima* Hook.]. Plants from a caudex, not mat-forming or stoloniferous, 23–40 cm tall; basal leaves 4–19 cm long, 5–23 mm wide, narrowly to broadly oblanceolate to elliptic, tomentose on both surfaces; heads several to many in branching or compact cymes; pistillate and staminate involucre both 6.5–8 mm long, the bracts tomentose at the greenish base, the terminal scarious portion blackish to brownish or the apex whitish; achenes glabrous. Sedge-rush meadows, streamsides, and bogs at 2440 to 2800 m in Duchesne, Garfield, and Summit counties; Alaska to Newfoundland, south to Colorado; 6 (i).

Antennaria rosulata Rydb. Breaks Pussytoes. Plants caespitose, stoloniferous and mat-forming, 1–3 cm tall; basal leaves 0.5–1.1 cm long, 2–5 mm broad, spatulate, obtuse to rounded apically, tomentose on both surfaces; heads 1 or 2, terminating short erect branches; pistillate involucre 5–9 mm high, the outer bracts greenish and tomentose to the apex, the inner ones green at base, with scarious slender white tips; staminate involucre 4–5 mm high, the bracts densely tomentose at base, the broad scarious tips white opaque; achenes puberulent. Ponderosa pine, aspen, Douglas fir, limber pine, sagebrush, and spruce communities, and in alpine meadows, at 2600

to 3350 m in Beaver, Garfield, Grand, Iron, Kane, and Wayne counties; Colorado, New Mexico, and Arizona; 14 (i).

Antennaria umbrinella Rydb. Mountain Pussytoes. [*A. dioica* authors, not (L.) Gaertner]. Plants caespitose, mat-forming and stoloniferous, 2–14 mm tall; basal leaves 0.7–2 cm long, 2–15 mm wide, cuneate-oblong to spatulate, acute to obtuse apically, tomentose on both sides; heads 2–6, borne in subcapitate cymes; pistillate involucre 5–8 mm long, the bracts greenish and tomentose at the base, the scarious tips dirty brownish to pale tan, or the innermost almost white, acute to rounded, usually erose; staminate plants rare in our region; achenes glabrous. Aspen communities and alpine meadows at 2745 to 3500 m in Duchesne, Garfield, Iron, Juab, and Summit counties; Alaska to Hudson Bay, south to California, Arizona, and Colorado; 12 (0). Specimens assigned here are more or less intermediate between *A. alpina* and *A. microphylla*. Many more specimens are required to provide definitive information on this entity in Utah.

Anthemis L.

Annual or short-lived perennial aromatic herbs from taproots, the juice watery; stems erect, commonly branched; leaves alternate, 1–3 pinnately dissected; heads solitary on the uppermost branches; involucre bracts imbricated in several series, chaffy, the margins scarious or hyaline; receptacle hemispheric, chaffy at least near the middle; ray flowers present, white or yellow, usually 10 or more, sterile; disk flowers numerous, perfect, fertile; pappus none or a short crown; style branches flattened; achenes subterete or compressed, not callous-margined, glabrous, beakless.

1. Rays white; pappus lacking; disk commonly less than 10 mm broad *A. cotula*
- Rays yellow; pappus a short crown; disk commonly more than 12 mm broad *A. tinctoria*

Anthemis cotula L. Mayweed. Plants annual, 1–7.5 dm tall; stems simple or branched, ill-scented; leaves 1–6 cm long, twice pinnatifid, the ultimate segments lance-oblong, sparsely villous and glandular-dotted; heads borne solitary at the upper ends of the uppermost branches; ray flowers commonly 10–20, white, sterile, 5–10 mm long; disk flowers numerous; disk 4–10 (12) mm wide; receptacle chaffy only in the middle, the bracts narrowly subulate; achenes slightly flattened, glandular, the pappus lacking; $2n = 18$. Introduced Old World weeds of fields, roadsides, revegetated woodlands, and other disturbed sites at 1280 to 1400 m in Cache, Duchesne, Morgan, Salt Lake, Sanpete, Utah, Wasatch, and Weber counties (likely elsewhere); widespread in North America; 7 (0).

Anthemis tinctoria L. Yellow Camomile. Plants short-lived perennials, 2.5–6 dm tall; stems simple or branched; leaves 1.5–7 cm long, 1- to 2- pinnatifid, the segments oblong in outline, merely toothed or lobed, villous-tomentose below, glabrous or glabrate above, sparsely glandular-dotted; heads borne solitary at ends of the uppermost branches; ray flowers 20–35, yellow, fertile, 7–14 mm long; disk flowers numerous; disk 12–15 mm wide or more; receptacle chaffy throughout, the bracts narrow and with yellow awn-tips; achenes compressed; pappus a short crown; $2n = 18$. Old World

cultivated ornamentals; widely planted and occasionally escaping (Salt Lake County, Garrett 8865 BRY); widespread in North America; 1 (0).

Arctium L.

Biennial, coarse herbs with watery juice, from a taproot; leaves rhubarblike, basal and alternate, entire or toothed; heads few to numerous in axillary or terminal corymbose or racemose inflorescences; flowers all tubular, perfect, the corollas pink to purplish; involucre urn-shaped, the bracts imbricate in many series, the tips slender and inwardly hooked; receptacle flat, densely bristly; achenes slightly compressed, more or less 3-angled, many-nerved, truncate apically; pappus of numerous, scaly, deciduous bristles.

1. Heads mainly 1.5–2.5 cm thick, arranged in racemelike axillary clusters, the terminal also racemelike *A. minus*
- Heads commonly over 2.5 cm thick, arranged in corymbose clusters, especially the terminal *A. lappa*

Arctium lappa L. Great Burdock. Plants 8–15 dm tall; basal leaves long-petiolate, the blades commonly 2–5 dm long, 1–3 dm broad, cordate-ovate, obtuse, thinly tomentose beneath, glabrous or nearly so above; inflorescence corymbosely disposed, the peduncles glandular or glandular-hairy; heads 2.5–4 cm broad, the involucre greenish stramineous, glabrous or glandular, often sparingly arachnoid-tomentose; $2n = 36$. Cultivated for its edible roots, and persisting; introduced from Eurasia; 1 (0).

Arctium minus (Hill) Bernh. Burdock. Plants 5–15 dm tall; basal leaves long-petiolate, the blades commonly 1–3.5 (4) dm long, 1–3 dm wide, cordate-ovate, obtuse, thinly tomentose to glabrous beneath, glabrous above or nearly so; inflorescence racemously disposed, the peduncles short or lacking; heads 1–2.5 cm thick (rarely more), the bracts glabrous or glandular to definitely arachnoid; $2n = 36$. Introduced Old World weed of consequence in Cache, Juab, Millard, Piute, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber counties, and probably cosmopolitan; widespread in North America; Eurasia; 23 (i).

Arnica L.

Perennial herbs from rhizomes or caudices, the juice watery; stems erect, simple or branched above; leaves opposite or the uppermost alternate, simple, entire or toothed; heads solitary, or 3–9 (11) in corymbose clusters; involucre bracts subequal or evidently biseriolate, herbaceous; receptacle naked, convex; ray flowers present, yellow or orange, several to many, fertile, or lacking (in *A. parryi*); disk flowers numerous, perfect, fertile; pappus of barbellate or subplumose capillary bristles; style branches flattened; achenes cylindrical, 5- to 10-nerved, pubescent to glabrate or glabrous, often glandular.

Maguire, B. 1943. A monograph of the genus *Arnica*. Brittonia 4: 386–510.

1. Heads discoid (rarely some with rays), the lateral (lower) ones spreading or reflexed, the uppermost one erect *A. parryi*
- Heads radiate, the lateral ones (if any) erect like the uppermost 2
- 2(1). Cauline leaves (4) 5–9 pairs; pappus brownish; heads often 5 or more per main stem 3

- Cauline leaves 1–4 (5) pairs; pappus white or brownish; heads mainly 1–4 per stem 4
- 3(2). Involucral bracts merely acute to abruptly rounded (rarely acuminate), bearing an apical or subapical tuft of hairs *A. chamissonis*
- Involucral bracts acuminate to attenuate, not especially more hairy at the apex *A. longifolia*
- 4(2). Leaves (at least the lower) cordate, ovate, or broadly ovate-lanceolate, often cordate, truncate, or obtuse basally, seldom cuneate 5
- Leaves narrowly lanceolate to lance-oblong or lanceolate, usually cuneate basally 7
- 5(4). Pappus brownish, subplumose; main cauline leaves obtuse to subcuneate basally *A. diversifolia*
- Pappus white, merely barbellate; main cauline leaves usually cordate, truncate, or obtuse basally 6
- 6(5). Blades of main cauline leaves much longer than the petiole, or sessile; achenes glabrous throughout, or at least near the base *A. latifolia*
- Blades of main cauline leaves subequal to or shorter than the petioles; achenes uniformly, though sometimes sparingly, hairy *A. cordifolia*
- 7(4). Pappus brownish, subplumose *A. mollis*
- Pappus usually white or tawny, merely barbellate 8
- 8(7). Heads turbinate-campanulate, commonly with 7–10 rays; lower cauline leaves sessile or nearly so *A. rydbergii*
- Heads hemispheric, commonly with 10–20 rays; lower cauline leaves often petiolate 9
- 9(8). Old leaf bases bearing dense brown wool in the axils; disk corollas both spreading hairy and stipitate-glandular *A. fulgens*
- Old leaf bases lacking axillary tufts of hair, or with white hair only; disk corollas merely stipitate-glandular *A. sororia*

Arnica chamissonis Less. Chamisso Arnica. [*A. foliosa* Nutt.; *A. chamissonis* ssp. *foliosa* (Nutt.) Maguire; *A. foliosa* var. *incana* Gray]. Plants 1–6 (8) dm tall, the stems erect or ascending, simple or more commonly branched in the inflorescence, sparsely to densely villous with multicellular hairs and often glandular as well; basal leaves 3–11 (15) cm long, 3–16 (20) mm wide, lanceolate to oblong or oblanceolate, with 3–5 main veins, pilose to villous or tomentose, tapering to a slender petiole, entire to distinctly toothed, smaller than the cauline ones and often withered by flowering time; cauline leaves (4) 5–8 (9) pairs, lanceolate to lance-elliptic, the largest near the middle of stem or slightly below, the lower ones petiolate and with membranous connate-sheathing bases, the upper sessile, entire to distinctly toothed; heads (1) 3–9, the peduncle apex sparingly to densely villous with whitish hairs often intermixed with glands; involucre 9–15 mm high, the bracts lanceolate, obtuse, acute, or less commonly acuminate, sparsely to densely pilose, ciliate, the tips with a conspicuous tuft of whitish hairs; rays usually 10–16, yellow; achenes 4–6 mm long, hairy to glandular or glabrate; pappus brownish to straw colored, barbellate; $2n = 60$. Stream banks, gravel bars and lake shores in aspen, willow, and spruce-fir communities at 2300 to 3350 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Iron, Kane, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Wasatch, Washington, and Wayne counties; Alaska to Hudson Bay, south to California and

New Mexico; 29 (v). Maguire (1943) treated all Utah material as ssp. *foliosa* (Nutt.) Maguire. Cronquist (Univ. Washington Publ. Biol. 17(5): 45–54, 1955) cited var. *incana* (Gray) Hulten [ssp. *incana* (Gray) Maguire] from Utah. Our specimens are only arbitrarily separable into two phases, differing mainly in degree of pubescence.

Arnica cordifolia Hook. Heartleaf Arnica. Plants 1.5–4 dm tall, the stems erect or ascending, simple or branched above, sparsely villous with multicellular hairs and often glandular as well; basal leaves smaller than the cauline, often withered at anthesis; petioles of main leaves (at least) often longer than the blades; cauline leaves 2–4 (5) pairs, the blades 2–9 cm long (from sinus to apex), 1–9 cm wide, cordate-ovate to orbicular or reniform, or the uppermost lanceolate, the largest below the middle of the stem, the lower leaves petiolate, the upper ones sessile or subsessile, serrate-dentate to subentire; heads 1 (3), rarely more, the peduncle apex villous with whitish hairs often intermixed with glands; involucre 14–20 mm high, the bracts lanceolate to oblong, acuminate to acute, sparsely to densely pilose and often glandular-ciliate, the tip with a moderate tuft of hair; rays usually 10–15, yellow; achenes 4–5.5 mm long, uniformly hairy and often glandular; pappus white, barbellate; $n = 19, 38+$. Sagebrush, Douglas fir, white fir, lodgepole pine, ponderosa pine, aspen, and spruce-fir communities at 1525 to 3355 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Garfield, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties (likely universal); Alaska to Michigan, south to California, Arizona, New Mexico, and Nebraska; 102 (xii). The white pappus and cordate long-petiolate leaves are diagnostic for this species.

Arnica diversifolia Greene Varying Arnica. Plants 1.5–4.2 dm tall, the stems erect or ascending, simple or branched above, sparsely villous with multicellular hairs and often glandular, or almost glabrous; basal leaves smaller than the cauline and often withered by flowering time, borne on slender to broadly winged petioles shorter than or subequal to the blades; cauline leaves 2–4 (5) pairs, blades 2–8 cm long, 0.8–4 (6) cm wide, ovate or the uppermost lanceolate, the largest at the middle or below, becoming sessile to subsessile above, subentire or irregularly serrate; heads 1–3 or more, the peduncle apex sparsely to moderately villous with whitish hairs and often with glands; involucre 10–16 mm high; bracts lanceolate, acuminate to acute, sparsely to densely pilose and often glandular, ciliate, the tip lacking a tuft of hairs; rays usually 10–15, yellow; achenes 5–7 mm long, glabrous or sparsely and uniformly hairy; pappus brownish, subplumose; $2n = 54–57, 76$. Streamsides, meadows, and scree slopes in spruce-fir and alpine tundra communities at 2560 to 3400 m in Duchesne, Grand, Piute, Salt Lake, San Juan, Sanpete, Summit, Uintah, and Utah counties; Alaska and Yukon, south to Oregon and Colorado; 19 (ii). This taxon is not well collected in Utah. The broad leaves and brownish subplumose pappus are diagnostic for these plants which might be regarded as consisting of a series of hybrid derivatives between *A. mollis* and *A. cordifolia*, *A. latifolia*, or *A. rydbergii*. More work is necessary.

Arnica fulgens Pursh Orange Arnica. [*A. pedunculata* Rydb.]. Plants 1.5–6 (7) dm tall, the stems erect, the basal leaf axils with tufts of long brown woolly hair, otherwise

stipitate-glandular and often hairy as well; basal leaves smaller than the cauline, often withered at anthesis, with broadly winged petioles or subsessile; cauline leaves 2–4 pair, the blades oblanceolate to elliptic (often narrowly so), mostly 3–12 cm long, 0.6–4 cm wide, the largest ones near the base, becoming sessile upwards, subtentire to entire; heads 1–3, the peduncle apex yellowish villous; involucre 10–15 (18) mm high, the bracts narrowly elliptic to lance-elliptic, attenuate to an obtuse or acute apex, villous, the tips pubescent within; rays mostly 10–20, yellow to yellow orange; achenes 4–5.5 mm long, densely hairy; pappus whitish to cream colored, barbellate; $2n = 38$. Dry sagebrush and meadow communities at 2000 m in Daggett County; British Columbia to Saskatchewan, south to California, Nevada, and Colorado; 2 (0).

Arnica latifolia Bong. Broadleaf Arnica. [*A. gracilis* Rydb.; *A. jonesii* Rydb., type from Alta]. Plants 1–4 (6) dm tall, the stems erect or ascending, simple or branched above, sparsely villous with multicellular hairs and often glandular; basal leaves smaller than the cauline, usually withered by flowering time, the petioles (if any) usually shorter than the blades; cauline leaves 2–5 pairs, the blades 2–4.5 (7) cm broad, cordate-ovate to lanceolate, the largest ones at the middle or below, the lower ones with petioles shorter than the blades, the upper ones sessile or subsessile, serrate-dentate, less commonly entire or nearly so; heads 1–5 or rarely more, the peduncle apex sparsely to moderately villous with whitish or yellowish hairs and often glandular; involucre 9–17 mm high, the bracts lanceolate, acuminate to acute, sparsely pilose and often glandular, ciliate, lacking an apical tuft of hair; rays usually 8–12, yellow; achenes 5–8 mm long, glabrous or sparsely hairy, or glabrous in the lower portion; pappus white, barbellate; $n = 19$, ca 36. Lodgepole pine, spruce-fir, and alpine tundra communities at 2240 to 3400 m in Cache, Davis, Duchesne, Salt Lake, Summit, Uintah, Utah, and Wasatch counties; Alaska and Yukon to California and Colorado; 24 (v). Specimens available for study are variable. They occur in the Uinta and Wasatch mountains and on the Tavaputs Plateau. The var. *gracilis* (Rydb.) Cronq. was reported from Utah by Maguire (i.e., as *A. gracilis* Rydb.), but has not been seen by me. It differs from the bulk of our material in its small size (1–3 dm), more numerous heads (3–9), and narrow small involucre 9–13 mm high. The single collection cited by Maguire is from Salt Lake or Utah County. More material is necessary.

Arnica longifolia D. C. Eaton in Wats. Longleaf Arnica. [*A. caudata* Rydb., type from Big Cottonwood Canyon]. Plants 3–10.5 dm tall; stems erect or sprawling, tufted from caudex-like shortened rhizomes, simple or branched above, shortly villous to puberulent and often somewhat glandular-viscid; basal leaves lacking or soon withering, the cauline ones 5.5–20 cm long, 0.6–3 cm wide, lanceolate to elliptic, with 3–5 main veins, puberulent, all sessile, 5–7 pairs, the largest near the middle of the stem, the lower ones connate-sheathing, entire or nearly so; heads 1–9, the peduncle apex sparingly yellowish villous; involucre 6–13 mm high, the bracts lanceolate to lance-oblong, acute to acuminate, sparingly pilose and glandular, ciliate, the tips sparingly white-hairy; rays mainly 8–13, yellow; achenes 4.5–5.5 mm long, glabrate, or uniformly stipitate-glandular; pappus brownish to straw colored, barbellate; $2n = 56$, 76. Snow flushes, talus, and stream banks in lodgepole pine, aspen,

ponderosa pine, Douglas fir, white fir, and spruce-fir communities at 1890 to 3325 m in Box Elder, Cache, Duchesne, Emery, Garfield, Grand, Juab, Rich, Salt Lake, Sanpete, Summit (type from the Uinta Mts.), Tooele, Utah, Wasatch, and Washington counties; Washington to Alberta, south to California, Nevada, and Colorado; 16 (i). Our material belongs to var. *longifolia*.

Arnica mollis Hook. Hairy Arnica. [*A. arachnoidea* Rydb., type from Big Cottonwood Canyon; *A. chamissonis* var. *longinodosa* A. Nels., type from near Marysville; *A. ovata* Greene, type from Alta]. Plants 1.5–6.5 dm tall, the stems erect or ascending, loosely to compactly clump-forming, simple, or branched in inflorescence, puberulent to villous and glandular; basal leaves smaller than the cauline ones, often withered at anthesis, the cauline ones 4.5–18 cm long, 0.8–4 cm wide, oblanceolate to obovate, lanceolate or elliptic, the lower slenderly to broadly petiolate, becoming sessile upwards, 3–4 pairs, the largest below the middle, the lower connate-sheathing, entire to irregularly denticulate; heads 1–5 (7), the peduncle apex sparingly yellowish villous; involucre 10–17 mm high, the bracts lanceolate to lance-elliptic, acute to attenuate, sparingly to densely villous-pilose and more or less glandular, lacking a subapical tuft of hair; rays mainly 12–18, yellow; pappus brownish, subplumose; achenes pubescent to stipitate-glandular; $2n = 38$, 57, 74, 76. Meadows, bogs, streambanks, seeps, talus slopes, and rock stripes in sagebrush, ponderosa pine, lodgepole pine, Douglas fir, white fir, aspen, spruce-fir, and alpine tundra communities at 1950 to 3550 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Juab, Kane, Piute, Rich, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, Utah, and Wasatch counties; British Columbia to California, Nevada, and Colorado; 50 (xii).

Arnica parryi Gray Rayless Arnica. Plants 1.5–5 (6) dm tall, erect or ascending, from elongate rhizomes, simple or branched in inflorescence, villous and more or less glandular; basal leaves smaller than the cauline ones, often withered at anthesis, the cauline ones long-petioled below, becoming sessile upwards, the blades 2–9.5 cm long, 0.4–4 cm wide, lanceolate to ovate, the base obtuse to truncate or cuneate, 2–4 (5) pairs, the largest near the stem base, the lower connate-sheathing, entire to denticulate; heads 3–12, nodding in bud, the peduncle apex glandular-villous; involucre 10–16 mm high, the bracts narrowly lanceolate, acute to attenuate, glandular-villous, lacking a subapical tuft of hairs; rays lacking, or rarely present, yellow; pappus brownish, barbellate to subplumose; achenes glabrous to glandular or hairy; $2n = 76$. Aspen and spruce-fir communities at 2415 to 3175 m in Cache, Carbon, Daggett (?), Garfield, Iron, Rich, Salt Lake, San Juan, Sanpete, Summit, and Wasatch counties; British Columbia and Alberta to California and Colorado; 12 (ii). Some specimens from Piute and San Juan counties have ray flowers well developed.

Arnica rydbergii Greene Rydberg Arnica. Plants 1–2.6 dm tall, erect or ascending, from elongate rhizomes, sparingly villous and shortly stipitate-glandular; basal leaves smaller than the cauline, sometimes bladeless, often withered at anthesis, the cauline ones short- to long-petioled below, becoming sessile upwards, the blades 2–5 cm long, 4–15 mm wide, lanceolate to elliptic, ovate, or obovate, the base obtuse to cuneate, 2 or 3 (4) pair, the largest at or near the middle of the stem, the

lower connate-sheathing, entire or denticulate; heads 1–5, the peduncle apex yellowish villous, glandular; involucre 9–13 mm high, the bracts narrowly lanceolate, acute to attenuate, stipitate-glandular, ciliate, lacking a subapical tuft of hair; rays mainly 7–10, yellow; pappus white, barbellate; achenes shortly pilose; $2n = 76$. Spruce-fir and lodgepole pine forests in Duchesne, Summit, and Utah counties; British Columbia and Alberta to Oregon and Colorado; 12 (iii).

***Arnica sororia* Greene** Meadow Arnica. Plants 1.5–6 dm tall, the stems erect, the basal axils lacking tufts of hair, otherwise more or less villous and glandular; basal leaves smaller than the cauline, often withered at anthesis, with winged to narrow petioles or sessile; cauline leaves 2–4 pair, the blades lanceolate to elliptic, mostly 3–10 cm long, 0.5–2 cm wide, the largest ones near the base, becoming sessile upwards, mainly entire; heads 1–3, the peduncle apex sparingly villous; involucre 10–15 mm high, the bracts narrowly oblong-lanceolate, attenuate, villous, the tips more or less hairy within; rays mainly 9–15, yellow; achenes 4–6 mm long, densely short-hairy; pappus white, barbellate; $2n = 38$. Meadows and foothills in sagebrush and aspen communities at 1675 to 2100 m in Cache, Rich, Sanpete, and Sevier counties; Alberta and British Columbia to Wyoming, Nevada, and California; 4 (0).

***Artemisia* L.**

Annual, biennial, or perennial herbs, subshrubs, or shrubs from taproots, caudices, or rhizomes, the juice watery; stems decumbent to ascending or erect, simple or branched; leaves alternate or basal, entire or toothed, lobed, or divided; heads several to numerous, borne in spicate, racemose, or panicle clusters; involucral bracts imbricate in several series, dry, at least the inner with scarious margins; receptacle naked or beset with long hairs, often glandular; corollas of disk flowers only (rarely with minute bilabiate ray flowers in *A. bigelovii*), perfect, or sometimes the central ones sterile, the marginal merely pistillate; marginal corollas tubular (or bilabiate), the central ones tubular-funneliform; pappus lacking, or a short crown; style branches flattened; achenes subterete or angular, glabrous.

Beetle, A. A. 1960. A study of sagebrush - The section Tridentate of *Artemisia*. Univ. Wyoming Agr. Expt. Sta. Bull. 368: 83 pp.
 Keck, D. D. 1946. A revision of the *Artemisia vulgaris* complex in North America. Proc. Calif. Acad. 25: 421–465.

- 1. Plants shrubs or subshrubs 2
- Plants herbs 14
- 2(1). Heads with both ray and disk flowers, the ray flowers 2-lipped; branchlets of inflorescence spreading to reflexed; plants mainly of rimrock areas in Colorado drainage, rarely in southern Great Basin .. *A. bigelovii*
- Heads discoid, branchlets of inflorescence variously disposed; plants seldom of rimrock, the distribution various 3
- 3(2). Leaves 1- to 3-pinnately or ternately dissected, the segments linear 4
- Leaves entire or toothed or, if lobed, the lobes oblong or broader or, if linear (see *A. filifolia*), tall shrubs of sandy areas at low elevations 7
- 4(3). Plants silvery-canescens; receptacle hairy, growing commonly on windswept ridges, but not always so restricted *A. frigida*

- Plants green to gray green, receptacle glabrous or, if hairy, plants of low elevations 5
- 5(4). Shrubs with spreading branches, spinescent, flowering in springtime *A. spinescens*
- Shrubs with erect or ascending branches, not spinescent, flowering in late summer and autumn 6
- 6(5). Plants mainly less than 2 dm tall, indigenous on harsh substrates; leaves 0.3–1 cm long *A. pygmaea*
- Plants mainly over 5 dm tall, introduced; leaves mainly 2.5–6 cm long *A. abrotanum*
- 7(3). Leaves linear-filiform, less than 1 mm wide, entire, or 3-parted, tall plants of sandy low elevation sites *A. filifolia*
- Leaves broader, entire, or the segments broader than 1 mm wide; plants of various habitats and elevations ... 8
- 8(7). Persistent leaves entire or with 1 or 2 teeth (the ephemeral ones often tridentate); heads borne in slender panicles, plants of high elevations *A. cana*
- Persistent and ephemeral leaves toothed or lobed at the apex; heads borne in slender spicate to broad panicles 9
- 9(8). Plants usually less than 3 dm tall; leaves usually less than 1 cm long; foliage dull yellowish to lead gray or rarely silvery *A. nova*
- Plants mainly more than 3 dm tall, leaves usually more than 1 cm long (at least some); foliage silvery-canescens 10
- 10(9). Leaves all, or many of them, deeply cleft into narrowly oblong lobes which may be further divided; flowers commonly 5–8 per head *A. tripartita*
- Leaves mainly merely toothed apically; flowers various 11
- 11(10). Leaves coarsely and deeply 3-lobed, the lobes broad and rounded apically; inflorescence narrow, seldom over 1.5 cm wide; plants of Rich and Summit counties *A. longiloba*
- Leaves variously 3- to 5-toothed, seldom lobed; inflorescence various; plants variously distributed 12
- 12(11). Inflorescence open, paniculate, commonly more than 2 cm wide; plants of broad distribution, our common sagebrush species *A. tridentata*
- Inflorescence narrow, spicate, commonly less than 1.5 cm wide; plants less broadly distributed 13
- 13(12). Leaves mainly less than 1.5 cm long; heads small; plants often less than 4 dm tall, usually of middle elevations *A. arbuscula*
- Leaves mostly over 2 cm long; heads large; plants often over 4 dm tall, of high elevations ... *A. spiciformis*
- 14(1). Leaves all entire, or the lower ones toothed or lobed, glabrous and green above and beneath, or white-hairy on both surfaces (see also *A. carruthii* and *A. michauxiana*), usually much longer than broad 15
- Leaves deeply incised, pinnatifid, or ternately divided, variously pubescent, various in length-width proportions 16
- 15(14). Leaves green above and beneath; central flowers of heads with normal ovaries *A. dracunculus*
- Leaves white-hairy above and beneath or green above; central flowers of head with abortive ovaries *A. ludoviciana*
- 16(14). Plants annual or biennial from a taproot; leaves green, essentially glabrous; adventive 17
- Plants perennial from a rhizome or caudex; leaves tomentose, strigose, or pilose 18

- 17(16). Inflorescence paniculate, loose and open; heads borne on short peduncles; involucre 1–2 mm high *A. annua*
- Inflorescence a spicate panicle, the branches appressed-ascending; heads sessile or nearly so; involucre more than 2 mm high *A. biennis*
- 18(16). Cauline leaves reduced upward, the largest leaves in a basal rosette, silvery villous to strigulose, scarcely tomentose and uniformly colored above and beneath; plants from caudices, only occasionally rhizomatous . . . 19
- Cauline leaves not especially reduced upwards, seldom with a basal rosette, variously tomentose and often bicolored; plants often rhizomatous (except in *A. absinthium*) 22
- 19(18). Pubescence of leaves loosely villous to glabrous; corollas hairy, the receptacle glabrous; plants of high elevations in the Uinta and La Sal mts. 20
- Pubescence of leaves appressed strigose or villosulose; corollas glabrous or hairy but, if hairy, the receptacle long-villous; plants variously distributed 21
- 20(19). Involucres 3–4 mm high; plants of the La Sal Mts. *A. parryi*
- Involucres 4–5.3 mm high; plants of the Uinta Mts. *A. norvegica*
- 21(19). Inflorescence a spicate raceme; receptacle and corolla long-villous; plants of high elevations . . . *A. scopulorum*
- Inflorescence a slender panicle; receptacle and corollas glabrous; plants of low elevations, seldom of high elevations *A. campestris*
- 22(18). Receptacle beset with numerous long hairs between the flowers; leaves about equally hairy above as below; plants introduced, weedy, of low elevations *A. absinthium*
- Receptacle naked; leaves more or less tomentose below, usually green or greenish above, or equally tomentose on both sides; plants indigenous, not weedy, of mid- to high elevations 23
- 23(22). Leaves entire or with entire lobes; plants of moderate elevations in central and southern Utah . . . *A. carruthii*
- Leaves bipinnatifid, the lobes again toothed; plants of high elevations in the Uinta, Wasatch, and La Sal mts. *A. michauxiana*

Artemisia abrotanum L. Garden Sagebrush. Fragrant shrubs, mainly 5–10 dm tall; herbage greenish; leaves (2.5) 3–6 cm long or more, (1) 2 or 3 times pinnately dissected into linear-filiform segments, glabrous or sparsely puberulent above, sparingly tomentulose beneath; inflorescence paniculate, leafy below, 15–40 cm long, 4–15 cm broad; flowers all fertile, the outer pistillate, the others perfect; receptacle glabrous; involucre mainly 2–2.5 mm high and 2.5–3 mm broad; bracts with scarious margins, canescent or somewhat tomentose to glabrous; ray flowers 5–15, the corolla ca 1.5 mm long; disk-flowers 10–20, the corolla campanulate, glabrous; achenes 4– or 5–angled, glabrous. Saltgrass meadow at a saline seep at 1200 m in Washington County (along the Motoqua Road); introduced as a garden plant in the U. S.; native to Eurasia; 1 (i).

Artemisia absinthium L. Absinthe. Perennial fragrant herbs from a rhizomatous caudex, 5–10 (12) dm tall, appressed sericeous; leaves bi- or tripinnatifid, the main lobes again lobed or toothed, silvery-sericeous on both surfaces, with very short tangled hairs, hardly tomentose, 1.5–5.5 cm long on flowering stems (2–10 cm long on sterile stems) the main ultimate segments mostly 2–4 mm

wide, petiolate below, shortly petiolate and less commonly divided above; involucre 2–3 mm high, the bracts scarious over the greenish center, the margins brownish hyaline; flowers all fertile, the marginal ones pistillate; receptacles with numerous long slender hairs; achenes glabrous; $2n = 18$. Roadsides, streambanks, and abandoned fields in Garfield, Rich, and Utah counties; widely established in North America; adventive from Europe; 6 (ii).

Artemisia annua L. Sweet Wormwood. Annual fragrant herbs, mainly 0.3–1.5 (3) m tall; stems sparingly glandular; leaves 2– or 3–pinnatifid, the main lobes again lobed, green and minutely glandular on both surfaces, 1.5–8 (10) cm long, the main ultimate segments 0.5–3 mm wide, petiolate below, subsessile or shortly petiolate above; involucre 1.3–2 mm high; involucre bracts with green centers minutely glandular, the margins hyaline; receptacles naked; achenes glabrous; $2n = 18$. Introduced weedy species of disturbed sites in Sanpete and Washington counties; adventive from Eurasia, now widely naturalized in North America; 2 (0).

Artemisia arbuscula Nutt. Low Sagebrush. [*A. tridentata* ssp. *arbuscula* (Nutt.) H. & C.; *A. tridentata* var. *arbuscula* (Nutt.) McMinn]. Shrubs, commonly 2–4 (5) dm tall, the vegetative stems 1.5–10 cm long, the flowering stems erect, 8–30 cm long; leaves 0.4–1.6 cm long, shallowly 3– to 5–dentate to deeply lobed, cuneate basally, appressed canescent; inflorescence spicate, mostly less than 2 cm wide; involucre 4–6 mm long, campanulate; involucre bracts 4–8, canescent, the margins brownish scarious; flowers 4–9, all perfect; receptacle naked; achenes glabrous; $2n = 18, 36$. Pinyon-juniper, mountain brush, sagebrush, white fir, aspen, and spruce-fir communities at 1375 to 2550 m in Box Elder, Cache, Millard, Rich, Salt Lake, Summit, and Tooele counties; Washington to Montana, south to California and Nevada; 14 (0). *A. arbuscula*, or low sagebrush, has been confused with both *A. tridentata* and *A. nova*. It can be distinguished from the former by its narrow inflorescence, and from the latter by its canescent involucre. Beetle (l.c.) reports intermediates with *A. longiloba*, a taxon with broadly campanulate heads and bluntly lobed leaves.

Artemisia biennis Willd. Biennial Wormwood. Plants annual or biennial, with taproots, the stems 0.3–9 (10) dm tall or more, glabrous; basal leaves often withered by anthesis; cauline leaves well developed, 1.5–10 (15) cm long, once pinnately divided, the segments oblong to oblanceolate, again toothed, essentially glabrous, green; inflorescence spicate or in spicate panicles; heads numerous, crowded, sessile or subsessile, erect or nearly so; involucre 2–3 mm high, 2–4 mm broad, the bracts glabrous, greenish to yellowish, the margins hyaline; marginal flowers perfect, fertile, the corollas glabrous; receptacle and achenes glabrous; $n = 9$. Floodplains, lake beds and shores, mud flats, and pond margins at 1375 to 2900 m in Box Elder, Cache, Carbon, Duchesne, Garfield, Grand, Iron, Millard, Piute, Salt Lake, Sanpete, Tooele, Uintah, and Utah counties; widespread in North America, where presumably indigenous in the western portion; Europe; 20 (v).

Artemisia bigelovii Gray Bigelow Sagebrush. Shrubs, commonly 2–7 (10) dm tall or more, the vegetative stems 1–3 dm long, the flowering stems erect, 3–4.5 dm tall; leaves 0.3–2.3 cm long, 1–7 mm wide, entire or shallowly 3–toothed, basally cuneate, appressed to loosely canes-

cent-tomentose; inflorescence narrowly paniculate, mostly less than 4 cm wide, the branches often lax and with heads tending to be pendulous; involucre mainly 2.5–3.5 mm high, subcylindrical to narrowly campanulate, the bracts 5–10, silvery canescent, with narrow scarious margins; flowers 3 or 4, imperfect or some perfect, the marginal pistillate (ray) flowers bilaterally symmetrical; receptacle naked; achenes glabrous; $2n = 18, 26, 35, 36$. Rimrock areas in pinyon-juniper and mixed desert shrub communities at 975 to 2135 m in Duchesne, Emery, Garfield, Grand, Kane, Millard, San Juan, Sevier, Uintah, and Wayne counties; California and Nevada east to Colorado, New Mexico, and Texas; 45 (xvii).

Artemisia campestris L. Field Wormwood. Perennial herbs from a caudex and taproot, the stems (1.5) 2.5–7 dm tall (rarely taller), tomentose or glabrous; basal leaves well developed (often withered at anthesis), 2–12 cm long, 2- to 3-pinnatifid or ternate, the segments linear to narrowly oblong or spatulate, villous or pilose to glabrous on both sides; cauline leaves reduced upwards, once pinnatifid, ternate, or entire; inflorescence of narrow to lax panicles; heads numerous, shortly pedunculate on contracted to lax branchlets, finally pendulous; involucre 2.5–3.8 mm high, 2–2.3 mm wide, the bracts glabrous, greenish to yellowish, the margin hyaline; marginal flowers pistillate, fertile, the corollas glabrous; disk flowers sterile, the ovaries abortive; receptacle and achenes glabrous; $2n = 18, 36$. Saltbush, greasewood, sagebrush, mountain brush, and pinyon-juniper communities, mainly in dunes and other sandy sites at 1250 to 2075 m in Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Washington, and Wayne counties; Arizona, New Mexico, Colorado, Wyoming, and west to the Pacific; 25 (vii). Our material is assignable to ssp. *borealis* (Pallas) H. & C., in a broad sense, and belongs to var. *scouleriana* (Benth.) Cronq. [*A. pacifica* Nutt.; *A. campestris* ssp. *pacifica* (Nutt.) H. & C.; *A. forwoodii* authors, not Wats.; *A. caudata* authors, not Michx.] in a more narrow sense.

Artemisia cana Pursh Silver Sagebrush. Shrubs, commonly 2.5–12 (15) dm tall, the vegetative branches 1–3 (5) dm long; flowering stems erect, 1–3 dm tall; leaves 0.8–5.3 (7) cm long, linear to narrowly elliptic or oblong, entire, or some of them toothed or deeply lobed, usually acute basally, acute to obtuse apically, appressed tomentose; inflorescence narrowly spicate or glomerate-paniculate, mostly less than 5 cm wide, often conspicuously bracteate, the branches, when present, erect, the heads erect; involucre 3.3–6.1 mm high, 3.5–6 mm wide, campanulate; bracts numerous, the outer silvery canescent, with greenish median, the margins brownish scarious, rounded-erose; flowers 10–20, perfect; receptacle naked; achenes glabrous; $2n = 18, 36$. Meadows and stream terraces, less commonly on moist slopes away from meadows and streams at 2270 to 3050 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Piute, Rich, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; British Columbia to Saskatchewan, south to California, Nevada, and New Mexico. Our materials are assigned to var. *viscidula* Osterh. [*A. cana* ssp. *viscidula* (Osterh.) Beetle], which differs from typical var. *cana* in its smaller, narrower leaves and less canescent herbage. Silver sagebrush forms intermediates with both *A. tridentata* var. *vaseyana* and *A. spiciformis*, within whose altitudinal range it occurs, but whose habitats are ordinarily separate; 42 (viii).

Artemisia carruthii Wood ex Carruth Carruth Wormwood. [*A. wrightii* Gray; *A. vulgaris* ssp. *wrightii* (Gray) H. & C.]. Perennial herbs, with well-developed rhizomes, the stems 2–7 dm tall, sparingly to densely tomentose; basal leaves not well developed; cauline leaves various but usually pinnatifid with linear lobes, those of innovations and sometimes the primary ones at base of flowering stems entire or merely lobed, 0.6–3 cm long, the lobes 0.5–1.5 (2) mm wide, linear or narrowly oblong, tomentose on both sides, or less so above; inflorescence paniculate (narrowly so) or spicate; heads numerous, shortly pedunculate to sessile, erect; involucre 2.3–3 mm high, 2–2.5 mm wide, the bracts sparingly tomentose, pale greenish with hyaline margins; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corollas glabrous; receptacle and achenes glabrous; $2n = 18$. Sagebrush, mountain brush, aspen, and spruce-fir communities at 1890 to 3050 m in Beaver, Emery, Garfield, Iron, Kane, Piute, San Juan, Sevier, Utah, Washington, and Wayne counties; east to Kansas and south to Arizona, New Mexico, and Texas; 28 (ii). This taxon is allied to *A. ludoviciana*, and some specimens appear to be intermediate between them. There is justification for inclusion of *A. carruthii* within an expanded *A. ludoviciana*, but no formal proposal is intended or implied herein. The deeply pinnatisect main foliage leaves are thought to be diagnostic. The species has not been collected in sufficient numbers as to understand its distribution in any definitive manner.

Artemisia dracunculoides L. Terragon. [*A. aromatica* A. Nels.; *A. dracunculoides* Pursh]. Shortly rhizomatous, perennial herbs, the stems (2) 5–12 (15) dm tall, glabrous (rarely tomentose?); leaves primarily cauline, entire or rarely a few of them cleft, 1.2–7.5 cm long, 1–6 mm wide, glabrous, green on both surfaces; inflorescence paniculate; heads numerous, short-pedunculate to subsessile, more or less pendulous; involucre 2–2.8 mm high, 2.2–3 mm wide, the bracts glabrous, greenish, with broad hyaline margins; marginal flowers pistillate, fertile; central flowers sterile, the ovaries abortive, the corolla glabrous (often glandular); receptacle and achenes glabrous; $2n = 18, 36, 54, 90$. Rabbitbrush, sagebrush, skunkbush, wildrye, salt desert shrub, pinyon-juniper, ponderosa pine, aspen, spruce-fir, and hanging garden communities at 1220 to 3200 m in all Utah counties, except Carbon, Davis, Morgan, Summit, and Weber; Yukon southeast to Illinois and south to Mexico; 87 (xviii). Our material fits within the concept of var. *glauca* (Pallas) Besser in Hook. [*A. glauca* Pallas; *A. dracunculoides* ssp. *glauca* (Pallas) H. & C.], which is probably not separable from var. *dracunculoides* of the Old World.

Artemisia filifolia Torr. Sand Sagebrush; Old-man Sagebrush. Shrubs commonly 5–15 dm tall, the vegetative branches 1–3 dm long; flowering branches erect, 1.5–6 dm long; leaves 0.6–8 cm long, 0.3–1.5 mm wide, revolute (appearing terete) or somewhat flattened (and still revolute), entire or the lower ternate, appressed villous-tomentose; inflorescence paniculate, mostly more than 3 cm wide, conspicuously bracteate, the branches erect, the heads pendulous; involucre 1.6–2.2 mm long 1.5–2.2 mm wide, campanulate to subglobose; bracts 5–9, densely silvery canescent; flowers 3–9, the marginal ones pistillate, fertile, the central ones sterile; receptacle naked; achenes glabrous; $2n = 18$. Sandy sites in blackbrush, creosote bush, ephedra, *Poliomintha*, *Eri-*

ogonum, rabbitbrush, and pinyon-juniper communities at 825 to 2290 m in Emery, Garfield, Grand, Iron, Kane, San Juan, Washington, and Wayne counties; Colorado and South Dakota, south to Arizona, Texas, and Mexico; 43 (vi).

Artemisia frigida Willd. Fringed Sagebrush; Prairie Sage-wort. Shrubs 0.5–4.5 dm tall, white-tomentose to strigulose; flowering stems arising from short prostrate or ascending woody offsets; leaves of basal offsets much like the stem leaves, 0.5–1.5 (2.5) cm long, 2- to 3-ternately (or subpinnately) divided into linear segments mainly 0.3–0.8 mm wide, often with stipulelike divisions near the base, whitish pilose-tomentose throughout (fading brownish); inflorescence paniculate or less commonly borne sessile or on very short peduncles; involucre 2–3.5 mm high, 4–6 mm broad, the bracts pilose-tomentose, with brownish scarious margins; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corolla glabrous (often glandular), yellow or tinged reddish; receptacle long-hairy; achenes glabrous; $2n = 18$. Shadscale, sagebrush, pinyon-juniper, ponderosa pine, mountain brush, aspen, spruce, and alpine (often on windswept ridge crests) communities at 900 to 3480 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties (likely elsewhere); Alaska to Quebec, south to Arizona and Kansas; Asia; 78 (x).

Artemisia longiloba (Osterh.) Beetle Longleaf Sagebrush. [*A. spiciformis* (?) *longiloba* Osterh.]. Shrubs, mainly 2–5 dm tall, appressed villous-tomentose; flowering stems 1–2 dm long; leaves 0.4–2 cm long, broadly cuneate, deeply 3-lobed, the lobes obtuse, appressed villous-tomentose; inflorescence spicate, the heads several, shortly pedunculate to sessile, erect; involucre 4–6 mm high, 3–5 mm wide, the 4–12 bracts villous-tomentose, green, with brownish scarious margins; marginal and central flowers perfect, fertile, the corolla glabrous (glandular), cream colored; receptacle and achenes glabrous; $n = 9, 18$. Sagebrush and grass communities at 1675 to 2440 m in Rich and Summit counties; Oregon to Montana, south to Nevada and Colorado; 4 (0). This entity is reported to grow in tight to heavy soils (Beetle 1960), and matures seed in July and August. The plants have large heads similar to those of *A. cana* and the low habit of *A. nova*. Possibly they would best be treated within an expanded *A. tridentata*, but no combination is proposed herein.

Artemisia ludoviciana Nutt. Louisiana Wormwood. Perennial rhizomatous herbs, the stems 2–10 dm tall (or more), white-tomentose or glabrate to glabrous; leaves mainly cauline, entire, lobed, or pinnately incised, white-tomentose below, green and glabrous or tomentose above (rarely glabrous throughout), 0.8–9 cm long, 0.1–1 (2) cm wide; inflorescence spicate to paniculate; heads numerous, shortly pedunculate to sessile, more or less pendulous; involucre 2.5–4.5 mm high, 3–7 mm wide (or more), the bracts tomentose to glabrous, with broad scarious margins; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corolla glabrous, yellow; receptacle and achenes glabrous; $2n = 18, 36$. This is a widespread species of many phases and habitats. In Utah there are five more or less distinctive varieties. Two of the varieties, *ludoviciana* and *incompta* are especially abundant, the remaining three less so. Not all specimens are readily separable into the named varieties, and the following key is arbitrary.

1. Inflorescence an open panicle, often more than 8 cm wide; plants of southern and southeastern Utah 2
- Inflorescence a spicate panicle, usually less than 6 cm wide; plants of various distribution 3
- 2(1). Leaves mainly less than 2.5 cm long, the margin often narrowly revolute *A. ludoviciana* var. *albula*
- Leaves mainly over 2 cm long, the margins not revolute *A. ludoviciana* var. *mexicana*
- 3(1). Leaves entire or less commonly some of them toothed or lobed *A. ludoviciana* var. *ludoviciana*
- Leaves more or less deeply parted or divided 4
- 4(3). Involucres 3.5–4.2 mm high, 4–7 mm wide *A. ludoviciana* var. *latiloba*
- Involucres 2.5–3.5 (3.8) mm high, 2.5–5 mm wide *A. ludoviciana* var. *incompta*

Var. *albula* (Wooton) Shinn. [*A. albula* Wooton, nomen novum pro *A. microcephala* Wooton]. This distinctive short-leaved variety has open inflorescences; it occurs in riparian areas with rabbitbrush, cottonwood, and copperweed at 880 to 1680 m in Emery, Garfield, Kane, San Juan, and Washington counties; Nevada and Colorado south to Mexico; 6 (iv).

Var. *incompta* (Nutt.) Cronq. [*A. incompta* Nutt.; *A. ludoviciana* ssp. *incompta* (Nutt.) Keck]. The deeply lobed or cleft leaves and compactly spicate inflorescence are diagnostic. The plants occur at moderate to high elevations (2135 to 3500 m) in aspen, spruce-fir, willow-wet meadow, and riparian communities in Cache, Carbon, Duchesne, Juab, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, and Wasatch counties; Oregon to Montana, south to California, Nevada, and Colorado; 85 (viii). This variety passes by degree into *A. michauxiana* at high elevations.

Var. *latiloba* Nutt. [*A. candicans* Rydb.; *A. ludoviciana* ssp. *candicans* (Rydb.) Keck]. This variety is similar to var. *incompta*, differing in larger (higher and wider) heads. Mountain brush and montane communities in Cache, Daggett, and Utah counties; Washington to Montana, south to California and Nevada; 3 (0). This entity is poorly understood in Utah.

Var. *ludoviciana* [*A. gnaphaloides* Nutt.; *A. ludoviciana* var. *gnaphaloides* (Nutt.) T. & G.; *A. purshiana* Besser in Hook.]. The typical variety is a plant with entire or cleft (rarely deeply cleft or parted) leaves and loose, but not open, inflorescences. Rabbitbrush, sagebrush-grass, mountain brush, pinyon-juniper, ponderosa pine, and hanging garden communities at 880 to 2750 m in all Utah counties, except for Morgan, Piute, and Summit (and likely there also); British Columbia to Ontario, south to California, Arizona, New Mexico, Texas, and Indiana; 86 (xvi).

Var. *mexicana* (Willd.) Fern. [*A. mexicana* Willd.; *A. ludoviciana* ssp. *mexicana* (Willd.) Keck]. This is the long-leaved plant with open inflorescences, which forms the counterpart of var. *albula*. It is a component of riparian, pinyon-juniper, ponderosa pine, and aspen communities at 750 to 2600 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Colorado to Missouri, south to Mexico; 19 (viii).

***Artemisia michauxiana* Besser** Michaux Wormwood. [*A. discolor* Dougl. ex Besser]. Perennial herbs, the stems 0.8–4 dm tall (rarely more), white tomentose to glabrate or glabrous; leaves mainly cauline, 0.5–4 (5) cm long and about as broad, bipinnately dissected, the sec-

ondary segments again toothed or lobed, acute, the uppermost seldom entire, commonly green above and tomentose beneath, but often green beneath also; inflorescence spicate; heads several to numerous, commonly pedicellate, erect or nodding; involucre 3.4–4.4 mm high, 3–6 mm wide, the bracts glabrous or sparingly tomentose, green, the broad margins brownish scariosus and erose-ciliate; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corolla glabrous (glandular), yellow; receptacle and achenes glabrous. Spruce-lodgepole pine and alpine tundra communities, often in boulder stripes and talus, at 2950 to 3500 m in Beaver, Duchesne, San Juan, Summit, Tooele, and Utah counties; British Columbia and Alberta south to Nevada and Wyoming; 11 (ii). Keck (1946) notes that *A. michauxiana* is connected through a series of intermediates with *A. ludoviciana* var. *incompta* in Nevada specimens. This is true for ours also. There appears to be some justification for treating *A. michauxiana* within an enlarged *A. ludoviciana*, but such a combination is not implied herein.

Artemisia norvegica Fries Spruce Wormwood. Perennial herbs, 2–4.1 dm tall, from a simple or branched caudex and stout taproot, the caudex branches short, clothed with persistent leaf bases, the flowering stems arising directly from the caudex, villous, often reddish; leaves of basal rosettes 2–19 cm long, bi- or tripinnatifid, the segments lance-attenuate to acute, villous on both surfaces; cauline leaves becoming smaller upwards, often with stipule-like divisions near the base; inflorescence racemose; heads several to numerous, finally nodding, the peduncles to 4.5 cm long; involucre 4–5.3 mm high, 6–11 mm wide, the bracts sparingly to densely villous-pilose, more or less green, the margins broadly dark brownish scariosus; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corollas long-hairy from near the base, cream colored; receptacle and achenes glabrous. Spruce-fir, lodgepole pine, and alpine tundra communities in Duchesne and Summit counties; Alaska east to Mackenzie, and south to California and Colorado; 4 (iii). Our material belongs to var. *piceetorum* Welsh & Goodrich.

Artemisia nova A. Nels. Black Sagebrush. [*A. tridentata* ssp. *nova* (A. Nels.) H. & C.; *A. tridentata* var. *nova* (A. Nels.) McMinn; *A. arbuscula* ssp. *nova* (A. Nels.) G. Ward]. Shrubs, 1–3 (5) dm tall, the main branches spreading, the vegetative stems 1–3 dm long (rarely more); flowering stems mainly 1.5–3 (4) dm long; leaves 0.3–2.1 cm long, shallowly to deeply 3- to 5-lobed or -toothed, the lobes or teeth rounded, often lead gray or gray green, cuneate basally, appressed caescent and often minutely punctate; inflorescence narrowly paniculate, seldom more than 3 cm wide; involucre 3.1–5.8 mm long, 1.4–3.4 mm wide, cylindric to narrowly campanulate; bracts 8–12, caescent to glabrous, green to yellowish, the margin hyaline; flowers 3–8, all perfect; receptacle glabrous; achenes glabrous; $2n = 18, 36$. Horsebrush, greasewood, shadscale, ephedra, juniper, sagebrush, rabbitbrush, winterfat, pinyon-juniper, and mountain brush communities at 1400 to 2600 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Rich, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, and Weber counties; Oregon to Montana, south to California, Arizona, and New Mexico; 57 (x). Black sagebrush forms intermediates with all other members of the section Tri-

dentatae that it contacts. The intermediates form narrow bands along lines of contact, but generally the habitats are mutually exclusive. There is little justification for considering black sagebrush in an expanded *A. tridentata* unless one is willing to accept most of the remainder of the section as portions of that species also.

Artemisia parryi Gray Parry Wormwood. Perennial herbs, 0.8–2 (4) dm tall, from a simple or branched caudex and stout taproot, the caudex branches short, clothed with persistent leaf bases, the flowering stems arising directly from the caudex, sparingly and loosely villous to glabrous, often reddish; leaves of basal rosettes 2–4 (8) cm long, bipinnatifid, the segments oblong to lance-oblong, sparingly and loosely villous (to glabrous?); cauline leaves becoming smaller upwards; inflorescence racemose to subsapicate; heads several to numerous, commonly nodding, the peduncles 1–5 mm long; involucre 3–4 mm long, 3–5 mm wide, the bracts sparingly villous to glabrate, with green to brownish middle and brownish scariosus margins; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corollas long-hairy (to glabrous?); receptacle and achenes glabrous. Alpine sites in the La Sal Mts. (Grand and San Juan counties); Colorado; 0 (0). The species is reported for Utah by Hall and Clements (l.c.), but no specimens have been seen from the state by me. Possibly it is only a phase of *A. norvegica*.

Artemisia pygmaea Gray Pygmy Sagebrush. Shrubs 0.5–2 dm tall, from superficial woody caudexlike branches and stout taproots, the vegetative stems to 0.5 dm long; flowering stems erect, to 2 dm tall; leaves 0.3–1 cm long, pinnately (or subbipinnately) 3- to 10-lobed, the lobes acute, yellow to gray green, sparingly villous to glabrous; inflorescence spicate or narrowly paniculate, less than 2 cm wide; involucre 5.2–6.3 mm high, 3–4.5 mm wide, cylindric or becoming campanulate upon drying; involucre bracts oblong, 15 or more, sparingly villous to glabrous, green, the margins stramineous hyaline; marginal flowers lacking; central flowers 3–5, perfect, fertile, the corollas cream colored, glandular; receptacle and achenes glabrous; $2n = 18, 36$. Black sagebrush, rabbitbrush, shadscale, greasewood, juniper, pinyon-juniper, and ponderosa pine communities at 1600 to 2300 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Millard, Piute, Sevier, and Uintah counties; Arizona and Nevada; 32 (viii). This dwarf sagebrush occurs in peculiar edaphic situations on Green River Shale, in clay soils forming the matrix in igneous gravels, on calcareous gravels, and on dolomitic outcrops and gravels. It is often a component of communities that support rare plant species.

Artemisia scopulorum Gray Dwarf Sagewort. Perennial herbs, 0.5–3.7 dm tall, from a simple or branched caudex and stout taproot, the caudex branches short, clothed with persistent leaf bases, the flowering stems arising directly from the caudex, appressed pilose to loosely and sparingly villous, often reddish or purplish; leaves of basal rosettes 1.5–9 cm long, bipinnatifid, the segments oblong to elliptic, pubescent like the stems; inflorescence spicate to racemose; heads several to numerous, erect or nodding, the peduncles lacking, or to 2.3 cm long; involucre 3–5.2 mm high, 3–8 mm wide, the bracts villous, green to brownish in the middle, the margins brown scariosus; marginal flowers pistillate, fertile; central flowers perfect, fertile, the corollas cream col-

ored, long-hairy; receptacle copiously long-villous; achenes glabrous; $2n = 18$. Talus slopes, moraines, and outwash plains and terraces in alpine tundra and meadows in spruce, lodgepole pine, and Douglas fir communities at 3050 to 4000 m in Boulder, Tushar, La Sal, and Uinta mts.; Beaver, Daggett, Duchesne, Garfield, Grand, Piute, San Juan, Summit, Uintah, and Wayne counties; Montana, Wyoming, Colorado, and New Mexico; 30 (xi). The hairy corollas and long-villous receptacles are diagnostic for this distinctive species.

Artemisia spiciformis Osterh. Osterhout Sagebrush. [*A. tridentata* ssp. *spiciformis* (Osterh.) Goodrich & McArthur]. Shrubs, mainly 5–8 dm tall, the vegetative stems 0.4–1 dm long, the flowering stems erect, 1.5–3.4 dm long; leaves 1.7–5.7 cm long, shallowly to deeply 3- to 5-lobed or -toothed, often widest below the teeth, the lobes acute to obtuse (or rounded) or lacking, gray green, long-cuneate basally, appressed villous-canescens; inflorescences narrowly paniculate, usually less than 4 cm wide; involucre 5–6.3 mm long, 3.5–7 mm wide, cylindrical to campanulate; involucre bracts 8–12 or more, canescent to glabrate, green, with broad yellowish brown scarious margins; flowers 6–10 or more, all perfect; receptacle and achenes glabrous. Ridge margins and snowflashes in sagebrush-grass, snowberry, aspen, spruce-fir, and Douglas fir communities at 2680 to 3050 m in Cache, Duchesne, Emery, Juab, Sanpete, Sevier, Summit, Tooele, Utah, and Wasatch counties; Colorado and Wyoming; 16 (ii). The plants flower in July and August. This is the material that has long passed under the name of *A. rothrockii* Gray in Utah. Resemblance to that species appears to be superficial, with relationships running to both *A. cana* and *A. tridentata* var. *vaseyana*. Its habitat is intermediate between the high elevation, moderately xeric conditions, of var. *vaseyana* and the more mesic stream terrace and valley bottom of *A. cana*.

Artemisia spinescens D. C. Eaton in Wats. Budsage. Shrubs, flowering in springtime, the branches spreading and often prostrate, 0.5–3 dm long or more, the vegetative stems mainly 0.3–0.8 dm long, commonly surpassing the flowering stems; leaves 0.4–2 cm long, petiolate, the blade palmately 3- to 5-cleft, the main divisions again cleft, suborbicular in outline, villous; inflorescence of short leafy-bracted racemose or spicate branches, or of solitary heads, the rachis persistent as a thorn; involucre 2–3.5 mm high, 3.5–5 mm wide; involucre bracts 4–8, villous, green, with narrow hyaline margins; flowers 6–20 or more, the marginal ones pistillate, fertile, the central ones sterile; corollas copiously long-hairy; receptacle naked; achenes long-hairy; $2n = 18, 36$. Silty, clayey, or gravelly, often saline, substrates in black sagebrush, shadscale, tetradymia, greasewood, blackbrush, juniper, and winterfat communities at 1200 to 1925 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sevier, Tooele, Uintah, and Utah counties; Oregon to Montana, south to California and New Mexico; 92 (vii). This low shrub is a principal browse plant for domestic livestock on the spring ranges of western and southern Utah.

Artemisia tridentata Nutt. Big or Common Sagebrush. Shrubs 4–20 (30) dm tall; branches spreading to erect, the vegetative branchlets 0.5–2 dm long; flowering stems mostly 1.5–4 dm long, usually much surpassing the vegetative ones; leaves 0.5–5 cm long, 3- to 5-toothed apically, or the upper ones entire, long-cuneate; inflores-

cence paniculate, 3–20 (15) cm wide; involucre 3–5 mm long, 2–4 mm wide, the bracts 10–20, green, canescent, the margins scarious; flowers 3–8, all perfect, the corollas cream colored, glandular; receptacle and achenes glabrous; $2n = 18, 36$. Three more or less completely intergrading varieties are known from Utah; they tend to occupy distinctive habitats, but intermediates form wherever they meet. While it is not possible to segregate all specimens, the following key will prove useful to those who must manage the sagebrush lands of Utah and the west.

1. Vegetative stems short, standing at about the same height, the inflorescence rather uniformly overtopping them; plants of middle and higher elevations [ssp. *vaseyana* (Rydb.) Beetle] 2
- Vegetative stems short to long, the inflorescence not uniformly overtopping them; plants of low to moderate elevations [ssp. *tridentata*] 3
- 2(1). Flowers 4–6 per head; involucre less than 1.5 mm wide; inflorescence paniculate with numerous heads *A. tridentata* var. *pauciflora*
- Flowers 7–11 per head; involucre over 1.5 mm wide; inflorescence narrow and spiciform, with relatively few heads *A. tridentata* var. *vaseyana*
- 3(1). Leaves mainly to 2 cm long or more, narrowly cuneate; plants of low to moderate elevations *A. tridentata* var. *tridentata*
- Leaves mainly less than 1.2 cm long, cuneate to cuneate-flabellate; plants mainly of moderate elevations, in drier sites *A. tridentata* var. *wyomingensis*

Var. *pauciflora* Winward & Goodrich. Sagebrush, piñon-juniper, mountain brush, and aspen communities at 1830 to 3050 m in all Utah counties; Washington to the Dakotas, south to California and Colorado; U. S.; 50 (v).

Var. *tridentata* Big Sagebrush. Sagebrush, juniper, piñon-juniper, and rabbitbrush communities, in deep alluvial soils, at 1220 to 2410 m in most, if not all, Utah counties; Washington to Montana, south to California, Arizona, and New Mexico; 57 (xviii).

Var. *vaseyana* (Rydb.) J. Boivin Vasey Sagebrush. [*A. tridentata* ssp. *vaseyana* (Rydb.) Beetle, sens. str.]. Sagebrush, rabbitbrush, mountain brush, piñon-juniper, aspen, Douglas fir, ponderosa pine, and spruce-fir communities at 2865 to 3050 m in Duchesne, Emery, and Sanpete counties; Oregon, Washington, and Idaho; 3 (i).

Var. *wyomingensis* (Beetle & A. Young) Welsh [*A. tridentata* ssp. *wyomingensis* Beetle & A. Young]. Wyoming Sagebrush. Shadscale, rabbitbrush, sagebrush, juniper, bitterbrush, and mountain mahogany communities at 1525 to 1980 m in Box Elder, Garfield, Emery, Millard, Rich, Tooele, and Uintah counties; Wyoming and Idaho to Colorado. This is the sagebrush of drier sites at middle elevations. Its distribution is poorly understood; likely it is widespread. Its recognition allows management considerations by professionals in the various state and federal agencies; 9 (0).

***Artemisia tripartita* Rydb.** Threecup Sagebrush. Shrubs 2–20 dm tall, the branches erect, the vegetative ones 0.3–1.5 dm long, the flowering stems 0.6–3.5 dm long; leaves 1–4 cm long, deeply 3-cleft, the linear lobes 0.5–0.8 mm wide, canescent, the lobes sometimes again divided, or the upper ones entire; inflorescence paniculate, commonly 2–5 cm wide; involucre campanulate, 3–4 mm long, 1.5–4 mm wide; bracts many, imbricate,

canescent and more or less green, the inner with broad brownish scarious margins; flowers 4–8, all perfect, the corollas stramineous to cream colored, more or less glandular; achenes and receptacle glabrous; $n = 9$. Sagebrush and mountain brush communities at ca 1525 to 1830 m in Box Elder and Cache counties; British Columbia to Montana, south to California and Colorado; 1 (0).

Aster L.

Annual or perennial herbs from rhizomes (suffrutescent in *A. spinosus*) or caudex, with watery juice; stems decumbent to ascending or erect, simple or branched; leaves alternate, simple, entire or toothed; heads solitary or few to several in corymbose clusters; involucre bracts strongly imbricate to subequal (or the outer surpassing the inner), herbaceous throughout, or with scarious margins near the base; receptacle flat or merely convex, naked; rays blue, purple, pink, or white, few to numerous, pistillate; disk flowers numerous, perfect, fertile, yellow or tinged reddish or purplish; pappus of capillary bristles; style branches flattened, oblong to lanceolate, mostly more than 0.5 mm long; achenes mostly several-nerved.

- 1. Plants suffrutescent, rushlike, armed with axillary or subaxillary thorns, from a deep-seated rhizome; known from Garfield, Kane, San Juan, and Wayne counties *A. spinosus*
- Plants herbaceous, annual or perennial, unarmed, from a taproot or rhizome; distribution various 2
- 2(1). Plants annual, from taproots 3
- Plants perennial, from rhizomes or subrhizomatous caudices, or from branching caudices 4
- 3(2). Involucre bracts definitely acute; rays wanting or nearly so, the pistillate corollas tubular, shorter than the style *A. brachyactis*
- Involucre bracts obtuse to obtusish; rays to 2 mm long, longer than the style *A. frondosus*
- 4(2). Plants with a well-developed caudex; involucre bracts reflexed, at least the outer; plants of rock crevices in the Wasatch and Canyon mts. *A. kingii*
- Plants with caudex lacking or poorly developed, rhizomatous; involucre bracts not reflexed; plants of various habitats and localities 5
- 5(4). Leaves all erect-ascending, thickened, to about 4 mm wide; pappus double, the outer series of very short bristles; heads solitary; plants known from Box Elder County *A. scopulorum*
- Leaves various, seldom as above; pappus in one series, or rarely double; heads solitary to numerous; distribution various 6
- 6(5). Involucre bracts dry, chartaceous, with scarious tips (at least the innermost), with a distinctive mid-vein, not herbaceous (the outer sometimes so) 7
- Involucre bracts herbaceous at the tips or throughout, lacking a distinctive midvein 9
- 7(6). Involucre bracts (at least the outer) bluntly obtuse apically; herbage strongly glaucous; plants often of open calcareous sites *A. glaucodes*
- Involucre bracts acute; herbage green, not glaucous; plants of various habitats 8
- 8(7). Rays white (drying pinkish); main leaves often over 20 mm wide; plants 6–15 dm tall, of montane areas in central northern Utah *A. engelmannii*
- Rays purple or violet; leaves mainly less than 15 mm wide; plants 2–6 dm tall, of central northern and western Utah *A. perelegans*
- 9(6). Involucres and peduncles glandular 10
- Involucres and peduncles lacking glands or apparently so 14
- 10(9). Stems glabrous; leaves linear to linear-oblongeolate, 2–5 mm wide, 1.5–7 cm long; plants of saline or hot water seeps and springs *A. pauciflorus*
- Stems puberulent to villous or hirsute with multicellular hairs or glabrous but, if so, differing in other respects 11
- 11(10). Rays white; leaves glaucous; plants of central to south-central Utah *A. wasatchensis*
- Rays blue to purple, lavender, or violet 12
- 12(11). Cauline leaves not or only slightly clasping, 2–10 mm wide; involucres 5–8 mm high *A. campestris*
- Cauline leaves clasping the stem, mainly 15–40 mm wide; involucres 8–15 mm high 13
- 13(12). Stems mostly 4–10 dm tall or more; lower leaves sessile; rays typically more than 30 per head; plants introduced, escaping and established ... *A. novi-angliae*
- Stems mainly 2–4 dm tall; lower leaves petiolate; rays mainly less than 25; plants indigenous, in central northern Utah *A. integrifolius*
- 14(9). Pubescence occurring in decurrent lines below leaf bases, commonly not uniform below the heads, or only in the inflorescence; inflorescence often conic, mostly large and leafy *A. hesperius*
- Pubescence of stem uniform or, if in decurrent lines, uniform below the heads and confined to the inflorescence; inflorescence few- to many-flowered and not usually leafy to large and leafy (see also *A. eatonii*) .. 15
- 15(14). Rays white; involucre bracts strigulose dorsally (rarely glabrous), with spreading to squarrose minutely spinulose tips; heads numerous 16
- Rays pink to purple, or less commonly white; involucre bracts mucronate at the tip; heads few to numerous 18
- 16(15). Pappus purplish or brownish; involucres 6–9 mm tall, greenish throughout or commonly suffused with purple; plants rare in the Uinta Mts. *A. sibiricus*
- Pappus typically white; involucres less than 6.5 mm long; plants of various distribution 17
- 17(16). Rhizomes well developed, creeping; involucres 4.6–6.5 mm high, 7–9.5 mm wide (when pressed); plants of western Utah *A. falcatus*
- Rhizomes mainly poorly developed, or reduced and caudexlike; involucres 3.8–4.9 mm high, 4.5–6 mm wide; plants of eastern Utah *A. pansus*
- 18(15). Achenes glabrous or nearly so; herbage glabrous except for lines of puberulence in the inflorescence, tending to be glaucous; rare plants in southeastern Utah *A. laevis*
- Achenes pubescent, except in some *A. foliaceus*; herbage pubescent to almost glabrous, scarcely glaucous 19
- 19(18). Involucre bracts strongly imbricate, the outer ones at least obtuse or obtusish (sometimes acute), not foliaceous; pubescence below the heads harsh ... *A. chilensis*
- Involucre bracts not strongly imbricate or, if so, the bracts sharply acute, the outer ones acute or, if obtuse, foliaceous; pubescence below heads soft or minute 20
- 20(19). Inflorescence a long slender leafy panicle; heads numerous; stem pubescence short, uniform; leaves mostly more than 7 times longer than wide; rays usually pink to white *A. eatonii*

- Inflorescence an open or congested panicle; heads solitary to several; pubescence various; rays usually blue to violet 21
- 21(20). Involucral bracts slender, never foliaceous; leaves at mid-stem mostly less than 1 cm wide, mostly over 7 times longer than broad *A. occidentalis*
- Involucral bracts various, but some of them usually enlarged and foliaceous; leaves at mid-stem mostly less than 7 times longer than broad *A. foliaceus*

Aster brachyactis Blake in Tidestr. [*Tripolium angustum* Lindl. in Hook.; *A. angustus* (Lindl.) T. & G., not Nees; *Brachyactis angustus* (Lindl.) Britt. in Britt. & Br.]. Annual herbs, with taproots, glabrous throughout, except for leaf margins and involucral bracts; stems 0.9–5.3 (7) dm tall; leaves 1.3–8 (12) cm long, 1–7 (9) mm wide, linear to narrowly oblong, entire, the lower ones soon deciduous; heads few to numerous, in paniculate to spicate inflorescences; involucre 5.5–9.4 (11) mm high, 7–15 (17) mm wide, the bracts linear-oblong, acute to attenuate, herbaceous, subequal to somewhat imbricate, or some outer ones often surpassing the inner; marginal flowers pistillate, the corollas tubular filiform, lacking rays, much shorter than the styles; pappus abundant, white, longer than the corollas; $2n = 14$. Sandbars, terraces, stream banks, marshes and pond margins, often where saline, in tamarix, rush, rabbitbrush, and cottonwood communities at 1220 to 1525 m in Box Elder, Carbon, Davis, Duchesne, Emery, Garfield, Grand, Juab, Millard, Salt Lake, Sevier, Uintah, Utah, Wayne, and Weber counties; British Columbia to Minnesota, south to Washington and Colorado; 23 (i).

Aster campestris Nutt. Meadow Aster. Perennial rhizomatous herbs, glandular, at least in inflorescence; stems puberulent to glabrous, mainly 1–5 dm tall; leaves 2–8 cm long, 2–8 mm wide, linear to oblong, entire, sessile, sometimes clasping, the lower ones larger and more or less petiolate, or smaller, soon deciduous; heads solitary or several to many; involucre 5–8 mm high, glandular, the bracts subequal to definitely imbricate, acute or attenuate, with long herbaceous tips; rays 15–20, violet to purple, 6–12 mm long; $2n = 10$. Meadows at 1525 to 2475 m, reported for Utah (Univ. Washington Publ. Biol. 17(5): 77. 1955), but I have seen no specimens from the state.

Aster chilensis Nees Pacific Aster. [*A. halophilus* Greene, type from Beeks Hot Springs, Salt Lake County; *A. leucopsis* Greene, type from Salt Lake City]. Perennial rhizomatous to subrhizomatous herbs, uniformly harshly strigose to strigulose, at least above; stems (0.8) 1.2–10.5 dm tall; leaves 0.6–16.5 cm long, 2–16 (20) mm wide, entire or nearly so, pubescent to glabrous, ciliate, the lower ones more or less petiolate, often deciduous at anthesis in taller plants, becoming smaller and sessile upwards, sometimes markedly reduced bracteate in inflorescence; inflorescence of 1 to many heads, narrow, corymbose, or open paniculate; involucre 5–8 mm high, 6–15 mm broad, the bracts imbricate, green-tipped (machaeranthroid), the chartaceous bases white to straw colored, the outer ones abruptly pointed but mucronate; rays commonly 15–40, purplish to violet (rarely white) or pink, 5–15 mm long; achenes pubescent; $n = 13, 15, 27, 36$. Alluvial fans, terraces, and slopes along stream and canal banks, in hanging gardens, rabbitbrush, sagebrush, grass-sedge, cottonwood-willow, ponderosa pine, juniper-pinyon, mountain brush, aspen, and spruce-fir

communities at 850 to 3200 m in all Utah counties; Washington to Saskatchewan, south to California and New Mexico; 189 (xxviii). The Pacific aster is a generalized taxon with no clearly defined diagnostic features. It is separated from its near congeners by a group of intangible characteristics. Involucral bracts are definitely imbricate, with the greenish portion usually glabrous, and margins ciliate. The tips of outer bracts are often but not always obtuse, and the tip, even when abruptly contracted, is mucronate. These features, which I designate as "machaeranthroid," are shared to a greater or lesser extent with *A. eatonii*, *A. occidentalis*, and *A. foliaceus*. The harsh pubescence below the heads appears to be diagnostic, but is difficult to distinguish from the soft or merely puberulent vestiture of closely related species. Not all specimens can be assigned with certainty to any of the taxa. There are two intergrading morphological phases of the Pacific aster, which are striking in their extremes, but which probably represent nothing more than developmental gradients. These are represented by plants with few flowers that lack distinctive reduced bracteate leaves in the inflorescence, and taller plants with more numerous heads and distinctively bracteate inflorescences. The inflorescences of the taller plants are mainly corymbiform, and not cylindrical as in *A. eatonii*. More work is indicated. Our material belongs to *ssp. ascendens* (Lindl.) Cronq. [*A. ascendens* Lindl. in Lindl.].

Aster eatonii (Gray) Howell Eaton Aster. [*A. foliaceus* var. *eatonii* Gray; *A. oregonus* authors, not (Nutt.) T. & G.]. Perennial rhizomatous to subrhizomatous herbs, uniformly puberulent, at least above (below the heads and sometimes on upper leaves), the stems (2.7) 6–10.5 dm tall, often reddish; leaves 0.8–15 cm long, 2–25 mm wide, entire or serrate, puberulent to glabrous, ciliate, the lowermost shortly petiolate, often deciduous in anthesis, becoming smaller and sessile upwards, linear to narrowly elliptic or lanceolate to oblanceolate; inflorescence of few to numerous heads, commonly open-cylindrical to conic in form; involucre 4.5–8 (10) mm high, 6–10 mm wide, the bracts more or less subequal to indistinctly imbricate, green-tipped (but not especially machaeranthroid), the chartaceous bases white to straw colored, all or most of them mucronate; rays 20–40, commonly pink (sometimes white), 5–12 mm long; achenes pubescent; $n = 8, 9$. Gravel bars, stream terraces, meadows, canal banks, hanging gardens, and marshes at 1370 to 2325 m in Box Elder, Cache, Garfield, Grand, Iron, Juab, Kane, Salt Lake, Summit, Uintah, Utah, Wasatch, and Washington counties; British Columbia to Saskatchewan, south to California, Arizona, and New Mexico; 48 (ix). The pink or white rays, uniform upper stem puberulence and leaves many times longer than broad are diagnostic for most specimens. Reports of *A. junceiformis* Rydb. for Utah appear to be based on slender phases of the Eaton aster with linear leaves and slender rhizomes.

Aster engelmannii (D. C. Eaton) Gray Engelmann Aster. [*A. elegans* var. *engelmannii* D. C. Eaton]. Perennial rhizomatous or subrhizomatous herbs, puberulent to sparingly villous with multicellular hairs, or somewhat glandular, the stems 2–15.2 dm tall, reddish at the base; leaves 2–13.5 cm long, 3–16 mm wide, elliptic to lanceolate, entire (or nearly so), sparingly puberulent to glabrous or sparsely villous, sessile, largest near midstem, the lowermost reduced to scales; inflorescence of 1 to numerous large heads, corymbose or conic; involu-

eres 8–13 mm high, 11–25 mm wide, the bracts mainly strongly imbricate, with a definite midvein, commonly purplish (at least the inner), the outer sometimes green and more or less foliaceous, sometimes all greenish or straw colored to the tip, glabrous dorsally, ciliate; rays 8–23, white (drying pinkish), 12–25 mm long; achenes pubescent; n = 9. Mountain brush, juniper, Douglas fir, aspen, white fir, lodgepole pine, and spruce-fir communities at 1950 to 3200 m in Cache, Carbon, Davis, Duchesne, Juab, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, and Wasatch counties; British Columbia and Alberta, south to Nevada and Colorado; 57 (vi).

Aster falcatus Lindl. [*A. multiflorus* var. *commutatus* T. & G.; *A. commutatus* (T. & G.) Gray]. Perennial rhizomatous herbs, villous or villous-hirsute with multicellular hairs, the stems 2.8–7.5 dm tall; leaves 1.2–6 (8) cm long, 2–8 mm wide, entire, antrorsely scaberulous on both surfaces (or glabrous), sessile, linear to narrowly oblong, often spinulose-mucronate, the lowermost often lacking at anthesis; inflorescences several- to many-headed, cylindroid; involucre 4.6–6.5 mm high, 7–9.5 mm wide, the bracts strongly to only somewhat imbricate, with a green tip, scaberulous to glabrous dorsally and ciliate; rays mainly 17–25, white (drying pale lavender in some), 6–8 mm long; achenes pubescent; n = 9. Oak, sagebrush, and ponderosa pine communities at 1525 to 2135 m in Kane, Utah, and Washington counties; Alaska to Minnesota, south to California, New Mexico, and Kansas; 6 (i). The species is closely allied to *A. pansus* (q.v.), which has smaller heads.

Aster foliaceus Lindl. in DC. Leafybract Aster. Perennial rhizomatous or subrhizomatous herbs, uniformly and shortly soft-villous below the heads, uniformly villous to glabrous below, or in lines below leaf bases, the stems 1.3–7 dm tall; leaves 1.8–16 cm long, 3–34 mm wide, entire or nearly so, strigose to glabrous, ciliate, the lower ones petiolate (often lacking at anthesis), becoming smaller and sessile (and more or less clasping) upwards; inflorescence of 1–19 (50) corymbosely arranged large and showy heads; involucre 6–12 mm high, 10–20 mm wide, the bracts imbricate to slightly so, foliaceous or slender, green with pale white to yellowish or brownish chartaceous bases (at least the inner), acute to obtuse or rounded, mucronate; rays mainly 15–50, pink to purple, blue, or violet, 9–16 (20) mm long; achenes hairy; n = 8, 25, 32. The leafybract aster is a portion of an assemblage that includes the concept of *A. subspicatus* Nees. Both *A. foliaceus* and *A. subspicatus* were described from coastal Alaska (Unalaska and Yakutat Bay respectively). Brownish bases of involucre bracts, commonly serrate leaves, and reddish pappus are supposedly diagnostic for *A. subspicatus*, which is not known from Utah, but some specimens of *A. foliaceus* have one of more of these features. In the Alaska Flora (Welsh 1974), I treated both species under the older name of *A. subspicatus*. Now, I follow tradition so as to avoid creation of synonyms should further study indicate a better course of action. Three more or less distinctive infraspecific taxa are present in Utah.

- 1. Involucre bracts foliaceous, 2–6 mm broad; plants uncommon *A. foliaceus* var. *canbyi*
- Involucre bracts not especially foliaceous, mainly less than 2 (2.5) mm wide; plants common to uncommon ... 2

- 2(1). Plants mainly 0.5–2.5 dm tall, decumbent or ascending; bracts often purple-margined or -tipped; known from high elevations, rare *A. foliaceus* var. *apricus*
- Plants often more than 2 dm tall, erect; bracts seldom as above; known from low to high elevations, common *A. foliaceus* var. *parryi*

Var. *apricus* Gray Meadows in spruce-fir forest at 3050 to 3660 m in Sanpete and Summit counties; British Columbia to Montana, south to California and Colorado; 3 (0).

Var. *canbyi* Gray Mountain brush, aspen, and spruce-fir communities at 1950 to 2900 m in Box Elder, Cache, Duchesne, Iron, Juab, Salt Lake, Summit, Utah, and Wasatch counties; Washington to Wyoming, south to California and New Mexico; 5 (0).

Var. *parryi* (D. C. Eaton) Gray [*A. ascendens* var. *parryi* D. C. Eaton; *A. foliaceus* var. *frondosus* Gray]. Meadows and openings in aspen, spruce, lodgepole pine, and Douglas fir communities at 1890 to 3265 m in Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, Sanpete, Summit, Tooele, Uintah, and Utah counties; Washington to Wyoming, south to California and New Mexico; 36 (viii). This is the phase of the leafybract aster which simulates *A. occidentalis* (q.v.), but which seldom has long peduncles, dark blue purple ray corollas, and much reduced upper stem leaves of that species.

Aster frondosus (Nutt.) T. & G. Leafy Aster. [*Tripolium frondosum* Nutt.; *Brachyactis frondosa* Gray]. Annual herbs from taproots; stems 0.2–3.6 cm tall; leaves 1–6 cm long, 2–12 mm wide, linear to oblong or oblanceolate, entire, the lower ones sometimes deciduous; heads few to numerous, in a narrow panicle to spicate inflorescence; involucre 5–9 mm high, 6–13 mm wide, the bracts oblong to narrowly oblanceolate, obtuse or obtusish, herbaceous, subequal to moderately imbricate; marginal flowers pistillate, the rays developed, pink, to 2 mm long; pappus abundant, white, longer than the disk corolla. Lake shores, seep margins, wet meadows, and stream banks in salt-grass, tamarix, Russian olive, rabbitbrush, and greasewood communities at 1250 to 2270 m in Beaver, Duchesne, Garfield, Grand, Juab, Kane, Salt Lake, San Juan, Sanpete, Uintah, Utah, Washington, and Wayne counties; Washington to Wyoming, south to California and New Mexico; 26 (vi).

Aster glaucodes Blake Blueleaf Aster. Perennial rhizomatous herbs, glabrous and glaucous, or puberulent to glandular in the inflorescence; stems 1.1–7 dm tall; leaves 1.4–12.5 cm long, 4–25 mm wide, entire, lance-oblong to oblong or elliptic, glaucous, glabrous, sessile and clasping, the lower often lacking at anthesis, reduced upwards; heads few to numerous in corymbose inflorescences; involucre 6–9 mm tall, 7–9 mm wide, the bracts imbricate, dry, chartaceous throughout or sometimes some of them greenish, the midvein prominent, commonly suffused with pink or purple, mainly obtuse to less commonly acute apically; rays 10–20, white or pink, 11–17 mm long; n = 9. There are two varieties among our specimens.

- 1. Peduncles and/or involucre glandular-pubescent; plants of Washington and adjacent western Kane counties *A. glaucodes* var. *pulcher*
- Peduncles and involucre lacking glandular pubescence; plants widespread *A. glaucodes* var. *glaucodes*

Var. *glaucoodes* This is the common phase of the species, often on calcareous substrates at higher elevations and in saline seeps at moderate to lower elevations in sagebrush, pinyon-juniper, mountain brush, ponderosa pine, ryegrass, spruce-fir, Douglas fir, lodgepole pine, and hanging garden communities at 1220 to 3050 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Wayne counties; Idaho and Wyoming, south to Arizona and Colorado; 56 (ix).

Var. *pulcher* (Blake) Kearney & Peebles [*A. glaucoodes* ssp. *pulcher* Blake, type from Elk Ranch, Kane County]. Salt desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 825 to 2136 m in Washington and adjacent western Kane counties; Arizona; 6 (0).

Aster hesperius Gray Siskiyou Aster. [*A. lactivirens* Greene]. Perennial rhizomatous herbs, villous with multicellular hairs in decurrent lines from leaf bases, or less commonly almost glabrous and with decurrent lines below the heads; stems 3.6–9.5 (15) dm tall; leaves 3–17 (21) cm long, 5–27 mm wide, entire or serrate, glabrous or scabrous, ciliate, the lower ones commonly petiolate, often deciduous at anthesis, becoming smaller, sessile, and more or less clasping upwards, sometimes much reduced in inflorescence; heads few to numerous in open to narrow subcorymbose inflorescences; involucre 4.5–7 (8) mm high, 7–12 mm wide, the bracts imbricate to subequal, green-tipped, the chartaceous base white to straw colored, all acute and mucronate; rays commonly 20–50, pink to blue or white, 6–14 mm long; achenes hairy; $n = 12, 32$. Wet meadows, canal banks, and stream-sides with sedges, rabbitbrush, willow, and other riparian communities at 850 to 2135 m in Box Elder, Cache, Duchesne, Garfield, Grand, Kane, Millard, Summit, Uintah, Utah, Wasatch, Washington, and Weber counties; Alberta to Saskatchewan, south to California, Arizona, New Mexico, and Missouri; 32 (vii). This plant occurs at lower elevations in Utah and has been confused with *A. foliaceus*, with which some plants share the subequal bracts. It has also been mistaken for *A. chilensis*, with which it is partially sympatric. The lack of uniformly disposed hair in the inflorescence appears to be diagnostic.

Aster integrifolius Nutt. Thickstem Aster. Perennial subrhizomatous herbs, glandular villous with multicellular hairs, at least above; stems 2.3–6.4 (7) dm tall; leaves 2.5–19 cm long, 8–50 mm wide, entire, oblanceolate to elliptic or lanceolate, glandular-villous, ciliate, the lower ones petiolate, becoming smaller, sessile and clasping upwards; heads few to several (numerous), large and showy, in elongate to subcorymbose clusters; involucre 8–13 (14) mm high, 12–23 mm wide, the bracts mainly subequal, green or suffused with purple, glandular dorsally, foliaceous or not; rays commonly 10–25, dark purple, 10–15 mm long. Meadows and moist woods in sedge-willow, sagebrush, Douglas fir, and spruce communities at 2275 to 3125 m in Cache, Emery, Piute, Rich, Salt Lake, Sanpete, Summit, and Wasatch counties; Washington and Montana, south to California and Colorado; 8 (0).

Aster kingii D. C. Eaton King Aster. [*Machaeranthera kingii* (D. C. Eaton) Cronq. & Keck]. Perennial herbs from a caudex and taproot, the caudex branches clothed with blackish or dark brown marcescent leaf bases, these scarious and ashy when young; stems 3–12 (15) cm long,

more or less villous below, stipitate-glandular above; basal leaves 0.8–12 cm long, 3–22 mm wide, petiolate, the petiole bases expanded and scarious, the blades oblanceolate or spatulate, glabrous or glandular, or less commonly hispidulous or merely puberulent on one or both sides; heads 1–5, racemously or corymbosely arranged; involucre 8–11 mm high, 10–16 mm wide; bracts glandular to shortly stipitate-glandular, herbaceous above the middle, scarious below, often suffused purplish, especially the inner, the tips of at least the outer reflexed; rays 15–27, white (often fading pale pink), 8–17 mm long, 1.5–2.8 mm wide; achenes ca 3.5 mm long. Douglas fir-white fir, mountain brush, and cottonwood communities at 1839 to 3050 m in Juab, Millard, Salt Lake (type from Cottonwood Canyon), and Utah counties; endemic; 21 (i). The southern populations have at least some toothed leaves and stems with longer stipitate-glandular hairs; they belong to **var. *barnebyana*** (Welsh & Goodrich) Welsh [*Machaeranthera kingii* var. *barnebyana* Welsh & Goodrich, type from Canyon Mts., Millard County]; 6 (0). Northern plants belong to **var. *kingii***. Attempts to segregate genera within the Astereae are often fraught with difficulties. This is especially true of that core of genera involving *Haplopappus*, *Machaeranthera*, *Xylorhiza*, and *Aster*. Cronquist and Keck (1957. *Brittonia* 9: 231–329) reconstituted the genus *Machaeranthera*, and included within that expanded generic definition those species treated elsewhere herein as *Machaeranthera* and *Xylorhiza*. Included within the series *Integrifoliae* of section *Xylorhiza* was *Aster kingii*. Watson (1978. *Madrono* 25: 205–210) has shown the chromosome number to be $2n = 18$ for *Aster kingii*, and he notes that its placement within *Machaeranthera* section *Xylorhiza* “. . . is phenologically, ecologically, morphologically, and chromosomally anomalous . . .” The chromosome numbers reported for *Xylorhiza* are $2n = 12$ or 24; that of *Machaeranthera*, in a restricted sense, is $2n = 8, 10$, or 16; that of *Aster* is mainly $2n = 18$. The taproots and squarrose involucre bracts suggest an alliance with *Machaeranthera*, shorn of *Xylorhiza*, but the similarity seems superficial, especially in light of different chromosome numbers. Some asters in a strict sense, i.e., *A. alpigenus* Rydb., have a caudex, with the rhizome abbreviated. The logical conclusion of such an abbreviation is the caudex of *A. kingii*, and the squarrose bracts seem to have been secondarily derived, being present to a greater or lesser degree in other *Aster* species as well as in *Machaeranthera*. Hence, it seems best to treat this taxon within *Aster*.

Aster laevis L. Smooth Aster. Subrhizomatous perennial herbs, glabrous or nearly so; stems mainly 5–12 dm tall; leaves 0.8–14 cm long, 2–30 mm wide, entire or serrate, linear-subulate to lanceolate or elliptic, the lower ones petiolate, often lacking at anthesis, becoming smaller, sessile, and more or less clasping upwards; heads numerous, in corymbose inflorescences; involucre 5–8 mm high, 7–12 mm broad (when pressed), the bracts slender, green-tipped, the chartaceous bases straw colored to brownish or white, acute and mucronate; rays 15–30, blue or purple, 6–9 mm long; achenes glabrous; $2n = 24, 48$. Riparian communities at ca 1400 m in Grand (and San Juan?) County; Yukon to Maine, south to Oregon, New Mexico, and Georgia; 1 (i). This plant is rare in collections from Utah, due presumably to the paucity of late season collections from southeastern Utah.

Aster novae-angliae L. New England Aster. Rhizomatous to subrhizomatous perennial herbs, hirsute and

more or less glandular, especially upward; stems 4–10 dm tall or more, very leafy; leaves 3–12 cm long, lanceolate to oblong, entire, sessile and cordate-clasping, becoming smaller and bracteate in the inflorescence; heads numerous, in corymbose inflorescences; involucre 8–11 mm high, hemispheric or campanulate, the bracts slender, green-tipped, whitish near the base, attenuated and spreading apically, glandular; rays typically more than 30 per head, rose to violet purple; achenes silky hairy. Cultivated ornamental in much of the lower elevation portions of Utah, now escaped and established locally in Juab, Salt Lake, and Uintah counties; introduced from the eastern U.S.; 3 (0).

Aster occidentalis (Nutt.) T. & G. Western Aster. [*Tripolium occidentale* Nutt.]. Rhizomatous or subrhizomatous perennial herbs, uniformly, softly, and often loosely villous (at least above); stems 0.9–8.5 dm tall; leaves 1–15 cm long, 1–20 mm wide, entire or toothed, glabrous or nearly so, ciliate, the lower ones petiolate, sometimes lacking at anthesis, rather abruptly smaller and finally sessile upwards; inflorescence mainly of 1–7 (rarely to 15), corymbosely arranged, large and showy heads; involucre 5–12 mm high, 7–20 mm wide, the bracts imbricate to subequal, slender, green, with pale yellowish to white or brownish chartaceous bases (at least the inner), mainly acute, mucronate; rays 20–50, blue to purple, 6–15 mm long; achenes hairy; $2n = 16, 27$. Meadows and streambanks in lodgepole pine, cottonwood, willow, aspen, and spruce-fir communities at 2175 to 3175 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, Sanpete, Sevier, Summit, Uintah, Wasatch, and Washington counties; Mackenzie to Colorado and California; 43 (ix). This species shares the features of soft loose pubescence and general aspect with the partially sympatric *A. foliaceus*. The very slender and abruptly reduced cauline leaves are diagnostic in most instances.

Aster pansus (Blake) Cronq. Elongate Aster. [*A. multiflorus* var. *pansus* Blake]. Subrhizomatous herbs, villous or villous-hirsute with multicellular hairs, the stems 3–12 (or more) dm tall; leaves 1–6 cm long, 2–8 mm wide, entire, antrorsely scaberulous on both surfaces, sessile, linear to narrowly oblong, often spinulose-mucronate, the lowermost commonly lacking at anthesis; inflorescence paniculate to secund-paniculate, narrow; involucre 3.8–4.9 mm high, 4.5–6 mm wide, the bracts strongly imbricate, green-tipped, scaberulous dorsally and ciliate; rays mainly 15–25, white, 3–8 mm long; achenes hairy; $n = 5$. Drainages, meadows, seeps, and hanging gardens at 1220 to 1690 m in Daggett, Grand, San Juan, and Uintah counties; British Columbia to Montana, south to Colorado and Nebraska; 6 (iv). This species forms the basis for inclusion in previous botanical works of the name *A. ericoides* L. in the Utah flora. It is closely allied to *A. falcatus*, but differs in the smaller heads, taller stature, and eastern distribution.

Aster pauciflorus Nutt. Alkali Aster. [*A. thermalis* Jones, type from Monroe Hot Springs]. Subrhizomatous perennial herbs, glabrous below, stipitate-glandular above and in inflorescence; stems 2–7.5 dm tall; leaves 1.1–12.5 cm long, 1–4 mm wide, entire, acicular to lance-linear or linear, glaucous, glabrous, all sessile or the lowermost petiolate, reduced upwards; heads few to several in corymbose inflorescences; involucre 4.3–7 mm long, 7–10 mm wide, the bracts imbricate to subequal,

glandular dorsally, green throughout, narrow and acute; rays mainly 20–35, blue to purple, 5–12 mm long; achenes hairy; $n = 9$. Hot springs, stream terraces, and salt grass meadows, often in saline or alkaline substrates at 1300 to 2135 m in Box Elder, Duchesne, Emery, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Utah counties; Saskatchewan to Nevada, Arizona, and Mexico. This distinctive glandular aster has been collected in full anthesis on 27 April growing in hot water at Monroe Hot Springs in Sevier County. It continues to flower into October; 21 (vi).

Aster perelegans Nels. & Macbr. Nuttall Aster. [*Eucephalus elegans* Nutt.; *A. elegans* (Nutt.) T. & G., not Willd.]. Subrhizomatous perennial herb, puberulent to glabrate (sometimes glandular); stems 3–7 dm tall; leaves 1.3–6.5 cm long, 3–14 mm wide, entire, oblong to oblong-lanceolate or elliptic, scabrous, firm, sessile, the lowermost reduced in size; heads 3–16, in corymbose inflorescences; involucre 7–10 mm high, 7–12 mm wide, the bracts chartaceous, imbricate, with prominent midvein, and acute to obtuse apex, the margins hyaline and ciliate, more or less puberulent dorsally; rays 5–16, dark purple, 7–13 mm long; achenes hairy. Sagebrush, mountain brush, Douglas fir, aspen, and limber pine communities at 1725 to 3050 m in Cache, Carbon, Duchesne, Juab, Millard, Rich, Salt Lake, Wasatch, and Weber counties; Oregon to Montana, south to Nevada; 21 (iv).

Aster scopulorum Gray Crag Aster. [*Chrysopsis alpina* Nutt., not *A. alpinus* L.]. Perennial subrhizomatous herbs with a woody caudex, villous on stems and peduncles; stems 4–12 cm tall; leaves 5–12 (15) mm long, 1–3 mm wide, overlapping, elliptic to oblong or linear, firm, scabrous or puberulent, often with some villous hairs above, spinulose-mucronate; heads solitary, pedunculate; involucre 7–11 mm high, 8–12 mm wide, the bracts imbricate, sparingly villous-hirsute and glandular, with a prominent midvein in the lower half, greenish, with chartaceous border and hyaline margins, acute; rays mainly 8–15, blue or purplish, 6–15 mm long; achenes hairy; $n = 9, 18$. Sagebrush community at 2440 to 2745 m in Box Elder County; Oregon to Montana, south to California and Nevada; 8 (0).

Aster sibiricus L. Siberian Aster. Plants with elongate rhizomes, the stems arising singly or few to several together, ascending to erect, 0.5–1.5 dm tall, sparsely to moderately villous with multicellular hairs, rarely glabrate; basal leaves smaller than the middle cauline ones, usually withered by flowering time; cauline leaves 2–8 (10) cm long, 0.5–3.5 cm broad, lanceolate to elliptic, oblong, or oblanceolate, sharply serrate to entire, sessile or the lower ones short-petiolate, not auriculate-clasping, acute to acuminate or less commonly obtuse apically, hairy above and beneath or glabrate to glabrous above; heads solitary or more commonly few in corymbose clusters, the peduncles villous, not glandular; involucre 2–15 mm high, not glandular; involucre 6–9 mm high, 10–18 mm broad, the bracts oblong to lance-oblong, hairy dorsally, not glandular, ciliate, in several subequal or distinctly imbricate series, greenish throughout or commonly suffused with purple; rays purple, mostly 8–15 mm long, 1.5–2.5 mm wide; pappus brown or suffused with purple; achenes several-nerved, hairy; $n = 9, 18$. Spruce community on limestone and quartzite contact zone at ca 3142 m in Summit County (Goodrich 16211 BRY); Alaska and Yukon, south to Oregon, Idaho, and Wyoming; Eurasia; 1 (0).

Aster waspinosus Benth. Mexican Devilweed. Suffrutescent, rushlike plants from a deeply placed rhizome, glabrous; stems 6–12 (or more) dm tall, with axillary or supra-axillary thorns to 1.5 cm long; leaves 2–4 cm long, 2–5 mm wide, firm, entire to toothed, reduced above to scales; heads solitary at ends of branches, or some axillary; involucre 4–6 mm high, 6–8 mm wide, the bracts imbricate, slender, acute to acuminate, green, with prominent scarious margin; rays 15–30, white, very short; achenes glabrous; $n = 9$. Riparian communities below 1130 m in Garfield, Kane, San Juan, and Wayne counties; California to Texas, south to Central America; 9 (viii). The plant was originally collected at the mouth of Ticaboo Canyon, along the Colorado River in Glen Canyon (Lindsay 20, 1958 UT), at a site now inundated by Lake Powell. This is one of a series of extirpations related to construction of Glen Canyon Dam. Small populations of this plant were drowned by the high water of the 1983 flood at the mouth of Llewellyn Canyon and Wilson Creek, along Lake Powell. Fortunately, the plant is locally common in Cataract Canyon.

Aster wasatchensis (Jones) Blake Markagunt Aster. [*A. glaucus* var. *wasatchensis* Jones, type from near Marysvale]. Subrhizomatous perennial, glandular-puberulent; stems 3.5–6.5 dm tall; leaves 1.8–8.5 cm long, 6–24 mm wide, entire, lanceolate to oblong, or oblanceolate, glandular-puberulent to glabrous, firm, more or less glaucous, the lowermost often smaller and commonly lacking at anthesis; heads several to numerous, more or less corymbosely arranged; involucre 8–11.5 mm long, 10–20 mm wide, the bracts herbaceous throughout or the inner with scarious bases, glandular dorsally, abruptly acute to attenuate, apically; rays 15–25, white or pink, 10–20 mm long; achenes hairy. Pinyon-juniper, aspen, limber pine, and spruce-fir communities at 1890 to 3050 m in Garfield, Iron, Millard, and Piute counties; endemic; 14 (vi). This remarkable aster is unique in Utah in having foliaceous or subfoliaceous glandular involucre bracts and glaucous leaves.

Atrichoseris Gray

Annual scapose herbs, with milky juice, from taproots; leaves all basal, sinuate-dentate, often spotted; heads on slender peduncles, few to numerous, corymbosely arranged; involucre of about 12–15 subequal but biseriolate, lance-linear scarious-margined bracts and some shorter outer bracts; receptacle naked; corollas all raylike, perfect, white; pappus lacking; achenes oblong, with corky-thickened ribs.

Atrichoseris platyphylla Gray Tobacco-weed; Gravel Ghost. Plants 3–10 dm tall (or more), from slender taproots; leaves 1.2–10.5 cm long, 0.5–6 cm wide, obovate to broadly spatulate, tapering abruptly to a broad petiole, sinuate-dentate, the teeth mucronate-cuspidate, glabrous, often mottled, more or less glaucous; involucre 6–8 mm high, 12–16 mm wide, the outer bracts ovate-lanceolate, hyaline, more or less scurfy, the inner ones lance-acuminate, with broad hyaline margins; corollas white, 8–20 mm long; achenes white, with corky ridges; $n = 9$. Joshua tree, ambrosia, yucca, cholla communities at 670 to 750 m in Washington County; California and Arizona; 11 (vi).

Baccharis L.

Diocious shrubs; leaves alternate, entire or toothed; heads discoid, many-flowered, the corollas white, tur-

binate, borne in corymbose or paniculate clusters; involucre imbricate, the bracts chartaceous, whitish; pistillate heads with tubular-filiform obscurely toothed or truncate corollas, the pappus of copious capillary bristles; staminate heads of tubular 5-toothed corollas, the pappus (often scanty) of usually twisted clavellate scales; receptacle naked; style branches flattened; achenes subcylindric, 5- to 10-ribbed.

1. Plants low shrubs, mainly less than 5 dm tall; pappus reddish or purplish; known from San Juan County *B. wrightii*
- Plants low to tall shrubs; pappus white or somewhat tawny but not reddish; known from various distributions 2
- 2(1). Branches fastigiate, deeply sulcate and more or less ridged, the leaves commonly deciduous at anthesis; achenes 10-ribbed 3
- Branches not especially fastigiate, commonly spreading to ascending; leaves commonly persistent at flowering time; achenes 5- or 10-ribbed 4
- 3(2). Main leaves linear; pistillate pappus to 10 mm long or more in fruit; plant not definitely known for Utah, included previously on the basis of a specimen now presumed to be mislabeled *B. sarothroides* Gray
- Main leaves obovate-spatulate; pistillate pappus to 3 mm long in fruit *B. sergilloides*
- 4(2). Leaves long-cuneate basally, thickened, entire or few toothed towards apex; branches often subfastigiate, achenes 10-nerved; plants of Virgin and Colorado drainages 5
- Leaves not especially long-cuneate basally, commonly thin, entire, or toothed from below the middle; achenes 5-nerved 6
- 5(4). Staminate involucre 3.5–5.3 mm long, 3.7–4.8 mm wide; pistillate involucre 7.3–8.5 mm long; pappus 11–13 mm long; plants of Washington and Kane counties *B. emoryi*
- Staminate involucre 5.3–6 mm long, 5–10 mm wide; pistillate involucre 6–6.5 mm long; pappus 8–9.5 mm long; plants of Emery, Grand, Garfield, and San Juan counties *B. salicina*
- 6(4). Leaves mainly entire; panicles terminating short lateral branches; plants of Washington County *B. viminea*
- Leaves usually serrate; panicles terminating main stems; plants of Washington and Kane counties *B. glutinosa*

Baccharis emoryi Gray in Torr. Emory Seepwillow. Shrubs, mainly 1–2 (3) m tall, the branches green to olive or brownish, ascending, subfastigiate, more or less glutinous; leaves 1.2–8.5 cm long, 3–20 mm wide, spatulate-oblanceolate to elliptic or linear, cuneate to a slender petiole, thick, entire or sparingly and irregularly toothed, obtuse to acute apically; heads numerous in a conic to pyramidal panicle; pistillate involucre 7.3–8.3 mm high, 4.5–7 mm wide, the bracts in several series, scarious, often glutinous, with thickened green or brown to reddish tips and hyaline margins; staminate involucre 3.7–5.3 mm high, 3.7–4.8 mm wide; pistillate corollas 4.5–5.5 mm long, the pappus 11–13 mm long; achenes 10-ribbed. Stream and canal banks and hanging gardens at 825 to 1220 m in Kane, San Juan, and Washington counties; Arizona, Texas, and California; Mexico; 19 (iv).

Baccharis glutinosa Pers. Sticky Seepwillow. Shrubs, mainly 1–3 m tall, the branches straw colored to brownish

or greenish, ascending-spreading, not fastigiate, glutinous; leaves 1.2–12.5 (15) cm long, 4–18 mm wide, elliptic to narrowly lanceolate, acuminate to attenuate, cuneate to a short petiole, evenly serrate to entire; heads numerous in terminal cymose panicles (less commonly in lateral ones) with pistillate and staminate heads about the same size; involucre 3.5–4.5 mm high, 4–5.5 (7.5) mm wide; corollas 2.2–3 mm long, the pistillate pappus 3.5–4.5 mm long; involucre bracts in several series, chartaceous, greenish in the center, the margins scarious, not glutinous; achenes 5-ribbed; $n = 9$. Stream bars and banks, and in seeps, at 670 to 1130 m in Kane and Washington counties; Colorado and Nevada to Texas and California; South America; 6 (ii).

Baccharis salicina T. & G. Rio Grande Seepwillow. Shrubs, mainly 1.5–3 m tall, the branches green to brownish, subfastigiate, glutinous; leaves 1.4–8 cm long, 4–18 mm wide, elliptic to oblanceolate or linear, cuneate to a short petiole, thick or thin, entire or sparingly toothed or lobed mainly near the apex, acute to rounded apically; heads few to numerous in axillary and/or terminal panicles; pistillate involucre 6–6.5 mm high, 4–6 mm wide, the bracts in several series, scarious, often glutinous, with thickened greenish to reddish tips and hyaline margins; staminate involucre 5.3–6 mm high, 5–10 mm wide; pistillate corollas 2.5–3.5 mm long, the pappus 8–10 mm long; achenes 10-ribbed. Stream banks and hanging gardens at 1220 to 1525 m in Emery, Garfield, Grand, and San Juan counties; Colorado to Kansas, south to New Mexico and Texas; 8 (iv). Our material of *B. salicina* has long been mistaken for *B. emoryi*, to which it is allied. The shorter pistillate involucre and broader staminate involucre are diagnostic.

Baccharis sergilloides Gray Squaw Waterweed. Shrubs, mainly 0.3–2 m tall, the branches green to brown, fastigiate, glutinous, finally almost leafless; leaves 0.5–2.5 cm long, 1–10 mm wide, spatulate to obovate, entire or few-toothed, thick; heads numerous, borne in conic to pyramidal panicles; involucre 2.5–3.5 mm high, 2.5–3.5 mm wide, the bracts in several series; straw colored, or with thickened brownish centers; pappus 2.5–3 mm long; achenes 10-ribbed. Stream bars and banks at 670 to 825 m in Washington County; California and Arizona; 8 (iii).

Baccharis viminea DC. Mule-fat. Shrubs, mainly 2–3 m tall, the branches green to straw colored or brownish, spreading-ascending, not fastigiate, glutinous; leaves 0.8–9.5 cm long, 2–9 mm wide, elliptic to lance-elliptic or narrowly oblong, attenuate to acute, cuneate to a short petiole, entire to evenly serrate; heads few to many in terminal cymose panicles on short lateral branches, with pistillate and staminate heads about the same size; involucre 3–5.7 mm high, 6–9 mm wide; corollas 2.5–3.8 mm long; pistillate pappus 5–6 mm long; involucre bracts in several series, chartaceous, commonly with reddish centers, the margins scarious, not glutinous; achenes 5-ribbed. Stream bars and banks at 650 to 900 m in Washington County; California and Arizona; 10 (ii).

Baccharis wrighii Gray Low shrub or subshrub mainly 1–5 (7.5) dm tall, glabrous, typically branched from near the base; branchlets angled; leaves few, sessile, punctate, linear to narrowly lanceolate; lower leaves mainly 5–10 (25) mm long, oblanceolate to oblong, 1–3 mm broad or more, the upper ones usually subulate and with apices recurved, entire or serrulate, 1-veined; pis-

tillate heads hemispheric, 9–12 mm long, the bracts lanceolate, acute to acuminate, green or brown veined, the margins scarious; receptacle flat, naked; corolla filiform, 3.7–4.7 mm long; pappus copious, multiseriate, antrorsely barbellate, mainly 10–15 mm long, pinkish or purplish (finally brownish); achene 3–5 mm long, glandular, 5- to 10-ribbed, transversely ridged; staminate involucre hemispheric, 8–9 mm long, the bracts linear to lanceolate, acute, the margins slightly serrate to entire, scarious, the corollas filiform, 4.6–5 mm long, the pappus subequal to the corolla, plumose-tipped, crisped; ovary abortive. Desert shrub communities at ca 1220 to 1375 m in San Juan County; Arizona to Oklahoma, south to Mexico; 1 (0). This species differs from all other *Baccharis* taxa in Utah by being a xerophyte.

Bahia Lag.

Biennial or short-lived perennial herbs with watery juice, arising from taproots; stems erect or ascending, puberulent; leaves alternate, once to twice ternately divided; heads few to numerous, in corymbose panicles; involucre bracts subequal, in 1 or 2 series, greenish; ray flowers present, yellow, pistillate, fertile; disk flowers perfect, fertile; pappus none; style branches flattened; achenes 4-angled, 12-curved.

Bahia dissecta (Gray) Britt. Cutleaf. [*Amauria* (?) *dissecta* Gray]. Biennial or short-lived perennial herbs, the stems 2–8 dm tall, minutely puberulent; leaves 1–10 cm long, the blade 1- to 3-ternately divided, oval to cordate in outline, strigulose; peduncles glandular hairy; involucre hemispheric, 3.4–6 mm high, 8–12 mm wide, the bracts more or less glandular hairy (or merely villous), greenish, abruptly contracted to a broadened apex; rays mainly 10–15, yellow, 4.5–9 mm long; achenes glabrous; $n = 18$. Sagebrush, pinyon-juniper, mountain brush, aspen, lodgepole pine, ponderosa pine, and spruce communities at 1700 to 2930 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, Washington, and Wayne counties; Nevada to Wyoming, south to California, Arizona, and Mexico; 24 (iii). Those species treated elsewhere in this work as *Platyschukuria* belong to *Bahia* in a broad sense, and are probably best treated in the latter genus, but their combination is not implied here.

Baileya Harv. & Gray

Annual, biennial, or perennial herbs from taproots, with watery juice; stem erect, white-tomentose; leaves alternate, once or twice pinnatifid to entire; heads solitary or few in cymose clusters; involucre bracts subequal, white-tomentose; receptacle naked; ray flowers persistent, yellow, pistillate, fertile; disk flowers perfect, fertile; pappus none; style branches short, truncate; achenes oblong or clavate, striate.

- 1. Ray flowers 7 or fewer; plants slender annuals with involucre less than 8 mm wide; reported from Washington County, but no specimens have been seen by me *B. pauciradiata* Harv. & Gray
- Ray flowers 20 or more; plants annual, biennial, or perennial, with involucre 10–26 mm wide 2
- 2(1). Rays 11–22 mm long; peduncles (4.5) 12–32 cm long in anthesis; involucre 5.7–7.5 mm high, 13–26 mm wide *B. multiradiata*

- Rays 8–10 mm long; peduncles 1–8 (11) cm long in anthesis; involucre 3–5.5 mm high, 10–16 mm wide
 *B. pleniradiata*

***Baileya multiradiata* Harv. & Gray** Desert Baileya. Biennial or short-lived perennial herbs; stems 1.9–5 (5.2) dm tall; herbage white-tomentose; leaves 0.8–10 cm long, the blade 1– to 2-pinnately lobed to entire, ovate-oval to linear; peduncles (4.5) 13–32 cm long in anthesis; involucre 5–7.5 mm high, 13–26 mm wide, the bracts slender, greenish; rays 25–40 or more, yellow, 11–22 mm long; achenes glabrous; $n = 16, 17$. Creosote bush, Joshua tree, burrobush, blackbrush, and sagebrush communities at 670 to 1320 m in western Kane and Washington counties; Nevada and California south to Mexico; 36 (iii).

***Baileya pleniradiata* Harv. & Gray** Annual to short-lived perennial herbs; stems 0.8–5 dm tall; herbage white-tomentose; leaves 0.8–12 cm long, the blades 1– to 2-pinnately lobed to entire, obovate to linear; peduncles 1–8 (11) cm long in anthesis; involucre 3.5–5.5 mm high, 6–13 mm wide, the bracts slender, greenish; rays 18–58, yellow, 8–10 mm long; achenes glabrous. Creosote bush, blackbrush, shadscale, mesquite, sagebrush, and pinyon-juniper communities at 820 to 1100 m in Washington County; Nevada and California to Texas; Mexico; 29 (ii).

***Balsamorhiza* Nutt.**

Perennial scapose or subscapose herbs from taproots, the juice watery; leaves mainly basal, simple and entire or variously pinnatifid, reduced and bractlike upwards; heads solitary, or few to several; involucre bracts in several series, imbricate or subequal, herbaceous; receptacle chaffy, convex, the bracts enclosing the achenes; ray flowers present, pistillate, fertile, usually yellow; disk flowers numerous, perfect, fertile, yellow; pappus none; style branches slender; achenes compressed. Note: The genus is notorious for the lack of genetic barriers to hybridization. Any two taxa can intergrade where they occur together.

1. Leaves sagittate, with entire margins *B. sagittata*
 — Leaves pinnatifid or variously cleft 2
 2(1). Leaves mainly 3–6 dm long, with segments typically 5–12 cm long, these entire or few-lobed or -toothed . . .
 *B. macrophylla*
 — Leaves mainly 1–3 dm long, with segments mostly 1–5 cm long, these entire or variously lobed or toothed 3
 3(2). Involucre bracts abruptly tapering to a long-attenuate apex; stem leaves relatively well developed, pinnatifid or bipinnatifid; reported for northern Utah, but no specimens have been seen *B. hirsuta* Nutt.
 — Involucre bracts gradually tapering to an attenuate apex; stem leaves lacking or small and inconspicuous
 *B. hookeri*

***Balsamorhiza hookeri* Nutt.** Hooker Balsamroot. Perennial scapose herbs from a thick taproot, mainly 0.9–4.5 (5.2) dm tall; leaves 6–30 cm long, (0.3) 1.5–11 cm wide, pinnatifid or bipinnatifid, the segments to 5.5 cm long; peduncles naked or with a few inconspicuous, linear, entire or pinnatifid bracts near the base; heads solitary; involucre 13–24 mm high, 21–47 mm wide, the bracts lance-linear, evenly tapering to the apex or somewhat enlarged at the base, long-ciliate, glandular to tomentose dorsally; rays mainly 10–16, yellow, 16–40 mm long; achenes glabrous. Phases of this taxon are known to

form intermediates with *B. sagittata*, and presumably with *B. macrophyllum*. Ours are separable into two modestly distinctive varieties.

1. Involucre densely villous-tomentose dorsally; plants of Daggett, Duchesne, and Uintah counties
 *B. hookeri* var. *neglecta*
 — Involucre glandular to glabrous dorsally; plants of broad distribution, occasionally of Daggett and Duchesne counties
 *B. hookeri* var. *hispidula*

Var. *hispidula* (W. Sharp) Cronq. [*B. hispidula* W. Sharp, type from Lake Point, Tooele County]. This is the common phase of the species in Utah, and it has been confused with *B. hirsuta* Nutt., with which it is compared in the key. Bunchgrass, sagebrush, mountain brush, juniper, pinyon-juniper, and salt desert shrub communities at 1240 to 2745 m in Beaver, Box Elder, Daggett, Duchesne, Juab, Salt Lake, Tooele, Uintah, Utah, Wasatch, and Washington counties; Nevada, Idaho, and Wyoming (?); 31 (ii).

Var. *neglecta* (W. Sharp) Cronq. [*B. hirsuta* var. *neglecta* W. Sharp]. Salt desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 1640 to 2625 m in Box Elder, Daggett, Duchesne, Tooele, and Uintah counties; Nevada, Idaho, and Wyoming (?); 18 (ii). Plants of this variety form hybrids with *B. sagittata*.

***Balsamorhiza macrophylla* Nutt.** Cutleaf Balsamroot. Perennial scapose herbs from a thick taproot, mainly 3–7 dm tall; leaves 15–60 cm long, 3.7–25 cm wide, pinnatifid, the segments entire, few-toothed or -lobed, up to 12.5 cm long; peduncles sparingly long shaggy-villous, naked, or with one to few reduced leaves near the base; heads solitary; involucre 23–35 mm high, 30–60 mm wide, the bracts lance-linear, attenuate, long-ciliate, glandular and more or less long-villous dorsally; rays 9–14, yellow, 30–55 mm long; achenes glabrous. Mountain brush and sagebrush or bunchgrass communities at 1525 to 2290 m in Box Elder, Cache, Davis, Morgan, Salt Lake, Summit, Utah, and Weber counties; Idaho to Montana and Wyoming; 7 (0).

***Balsamorhiza sagittata* (Pursh) Nutt.** Arrowleaf Balsamroot. [*Bupthalmium sagittatum* Pursh]. Perennial scapose herbs, from thick taproot, mainly 1.5–8 dm tall; leaves (including long slender petioles) 5–45 cm long, 1.5–15 cm wide, sagittate, entire, or the cauline ones from near the summit to near the middle of the subscapose stem and linear to elliptic; peduncles villous-tomentose; heads solitary (or with additional reduced ones); involucre 15–30 mm long, 20–50 mm wide, the bracts lance-linear, attenuate, villous-tomentose; rays 8–25, yellow, 25–60 mm long; achenes glabrous; $n = 19$. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, Douglas fir, aspen, and fir communities at 1340 to 3020 m in Beaver, Box Elder, Cache, Daggett, Davis, Garfield, Iron, Juab, Kane, Millard, San Juan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Washington, and Weber counties; British Columbia to Montana and South Dakota, south to California, Nevada, and Colorado; 43 (vii).

***Bebbia* Greene**

Shrubs or subshrubs with rushlike, sparingly leafy, much-branched stems; leaves opposite below, often alternate above, entire or few toothed or lobed; heads solitary or few in loosely cymose clusters, discoid, yellow; involu-

eres hemispheric, the bracts in ca 3 series, striate, shorter than the disk; receptacle, paleaceous, the bracts partially enfolding the achenes; corolla tube glandular, the limb hairy; achenes slender, pubescent with appressed hairs; pappus of 15–20 plumose bristles.

Bebbia juncea (Benth.) Greene Sweetbush. [*Carphephorus juncea* Benth.]. Plants rounded, often much branched, mainly 6–10 dm tall, often rough-hairy; leaves mostly opposite, few, linear, entire or with a few linear lobes, mainly 2–7 cm long, 2–7 mm wide; involucre 4–8 mm high; bracts ovate-lanceolate to lanceolate, the outer typically harshly hairy with pustular-based hairs, the inner ones often becoming reddish or purplish; ray flowers lacking; disk flowers mainly 20–30, perfect, fertile, pale yellow; achenes trigonously compressed, with 2 sharp angles and a blunt one. Gravels of Beaver Dam Wash and adjacent area at ca 850 m in Washington County; California to Texas; Mexico; 2 (0).

Bellis L.

Scapose perennial herbs, with fibrous roots and short stolons, the juice watery; stems leafless simple; leaves all basal, simple, petiolate, toothed to entire; heads solitary; involucre bracts in 2 subequal series, herbaceous; receptacle conic to hemispheric, naked; rays white, pink, or purple, numerous, pistillate; disk flowers numerous, perfect, yellow; pappus lacking; style branches flattened; achenes flattened, usually 2-nerved, pubescent.

Bellis perennis L. European Daisy. Plants 2–20 cm tall; leaves all basal, with short to long petioles, the blades 0.7–3 (4) cm long, 5–25 mm wide, obovate to oval or orbicular, dentate to entire, obtuse to rounded or emarginate apically, pubescent on both sides with coarse spreading hairs; scapes pubescent with ascending hairs; heads solitary; involucre 4–7 mm high, 9–15 mm wide, the bracts ovate to broadly lanceolate, rounded to obtuse apically, sparsely hairy dorsally, often suffused with purple, mostly 8–10 mm long, 1.5–2.5 mm wide; pappus lacking; achenes flattened; 2n = 18. Cultivated ornamental, escaping and persisting in lawns of lower valleys in Salt Lake and Utah counties; adventive from Europe; 4 (0).

Bidens L.

Annual herbs with fibrous roots, or rooting along the lower stem, the juice watery; stems decumbent to erect, commonly branched; leaves opposite, simple or pinnately compound; heads few to several in cymose inflorescences; involucre bracts in 2 series, the outer herbaceous, the inner somewhat petaloid and striate; receptacle flat or slightly convex, chaffy throughout, the chaff similar to the inner involucre bracts; ray flowers present, yellow, neutral or pistillate, or lacking; disk flowers numerous, perfect, fertile, yellow; pappus of (1) 2–4 awns or teeth, these retrorsely barbed, persistent; style branches flattened; achenes flattened, pubescent, usually 2- to 4-awned.

Sherff, E. E. 1937. The genus *Bidens*. Field Mus. Pub. Bot. 16: 1–709.

- 1. Leaves pinnately compound, with 3–5 leaflets, all petiolate *B. frondosa*
- Leaves simple, the middle and upper ones (at least) sessile or subsessile 2
- 2(1). Heads erect; disk corollas 4-lobed; anthers included; awns typically 3; plants local along the Wasatch Front *B. comosa*

— Heads typically nodding; disk corollas 5-lobed; anthers exerted; awns typically 4; plants of broad distribution

..... *B. cernua*

Bidens cernua L. Bur-marigold. Plants 1–13 dm tall, the stems sparingly spreading-hairy to glabrous; leaves simple, 1.5–15 cm long, 0.5–4 cm wide, narrowly lanceolate to lance-ovate, coarsely serrate to subentire, glabrous; heads nodding in age; outer involucre bracts 5–8, green, foliaceous, unequal, spreading or reflexed, the inner bracts erect, mostly 6–15 mm long; rays 6–8, yellow, or lacking; achenes mainly 5–7 mm long, tan, the 2–4 awns retrorsely barbed; 2n = 24. Wet meadows, bogs, stream banks, bars, and shores, at 1300 to 2380 m in Box Elder, Cache, Davis, Garfield, Juab, Kane, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, and Tooele counties; widely distributed in the Northern Hemisphere; 27 (iii).

Bidens comosa (Gray) Wiegand [*B. connata* var. *comosa* Gray]. Plants 1–6 dm tall, the stems sparingly spreading-hairy to glabrous; leaves simple, 1.5–10 cm long, 0.4–2.8 cm wide, elliptic to lanceolate or oblanceolate, serrate to shallowly lobed, glabrous or sparingly hairy; heads erect in age; outer involucre bracts 7–12, green, foliaceous, unequal, spreading-ascending, the inner bracts erect, mostly 6–18 mm long; rays typically lacking; achenes mainly 5–7 mm long, brown, with usually 3 retrorsely barbed awns. Wet meadows, bogs, and other moist sites in Box Elder, Cache, Salt Lake, and Utah counties; widely distributed in the U.S.; 5 (0).

Bidens frondosa L. Devil's Beggarticks. Plants 2–12 dm tall, the stems short-hairy to glabrous; leaves petiolate, pinnately compound with 3–5 leaflets, these 2–10 cm long, 0.5–3 cm wide, lanceolate, serrate; heads erect in age; outer involucre bracts 5–8, green, subfoliaceous, subequal, erect or spreading, the inner bracts erect, mostly 5–8 mm long; rays usually lacking; achenes 5–9 mm long, dark brown to black, the 2 awns barbed; 2n = 48. Marshes, pond and lake shores, bars, wet meadows, and irrigation canals at 1190 to 1650 m in Box Elder, Davis, Grand, Salt Lake, Uintah, Utah, Washington, and Weber counties; widespread in North America; 12 (ii). Note: The pan-boreal weed, *Bidens tripartita* L., might occur in our area. It is distinguished from *B. frondosa* in its simple but trifid leaves, and from *B. cernua* in its petiolate trifid leaves. *B. bigelovii* Gray was collected once in Utah, from a ditch near Panguitch. It differs from *B. frondosa* in having the first main lobes of the leaves again divided, parted, or lobed, and linear achenes with 2–4 awns.

Brickellia Ell.

Perennial herbs, subshrubs or shrubs; leaves alternate or opposite, simple; heads campanulate or cylindrical, cymose or paniculate, discoid; flowers all perfect, fertile; involucre bracts imbricate in several series, striate; receptacle almost flat, naked; style branches flattened, with long-papillate appendage; achenes 10-ribbed; pappus of barbellate, smooth, or subplumose bristles.

Robinson, B. L. 1917. A monograph of the genus *Brickellia*. Mem. Gray. Herb. 1: 1–151.

- 1. Leaves spinulose-serrate, or spinulose-tipped; low rounded shrubs of Washington, Kane, and San Juan counties *B. atractyloides*

- Leaves entire or toothed, not spinulose; herbs, subshrubs, or tall shrubs of various distribution 2
- 2(1). Plants herbaceous; heads reflexed, broadly campanulate; leaves sagittate- to cordate-ovate, longer than broad. *B. grandiflora*
- Plants, shrubs or subshrubs; heads narrowly cylindrical or, if campanulate, erect; leaves ovate to linear or, if cordate, about as broad as long or broader 3
- 3(2). Leaves petiolate, the blades cordate-ovate to ovate or suborbicular, 1–5 cm broad *B. californica*
- Leaves sessile or subsessile, linear to narrowly lanceolate or, if broader, mainly less than 1 cm broad 4
- 4(3). Leaves linear to lanceolate or narrowly elliptic; shrubs 6–15 dm tall or more; flowers 3–5 per head *B. longifolia*
- Leaves ovate to oval or oblong to linear; shrubs or subshrubs less than 5 dm tall; flowers many per head 5
- 5(4). Leaves 5–10 times longer than broad or more, entire or nearly so, sessile; involucre 10–20 mm high *B. oblongifolia*
- Leaves only somewhat longer than broad, often toothed or lobed, at least some evidently petiolate; involucre 8–12 mm high *B. microphylla*

Brickellia atractyloides Gray Spiny Brickellbush. Shrubs, much-branched, mostly 3–5 dm tall, the branchlets greenish to straw colored, soon gray; leaves alternate, short-petiolate, the blades 0.6–3.2 cm long, 0.3–2.2 cm wide, lance-ovate to ovate, obtuse to rounded basally, spinulose-serrate to entire, acuminate and spinulose-tipped, thick and prominently veined, glabrous or minutely glandular puberulent; heads solitary, terminating the branches; peduncles 1–5.2 cm long, glandular-puberulent; involucre 10–13.5 mm high, 8–16 mm wide, the outer bracts ovate-lanceolate, acuminate apically, many-veined, the inner narrower, glandular-puberulent dorsally; flowers 50–75 or more; achenes black, 3.8–4.2 mm long, hirtellous on the ribs; $n = 9$. Rock crevices and talus slopes, creosote bush, blackbrush, and indigo bush communities at 820 to 1130 m in Kane and San Juan (San Juan and Glen Canyon arms of Lake Powell), and Washington counties; Nevada and Arizona; 12 (ii). The type is from the Colorado River (Utah?), Palmer sn, 1870 (US).

Brickellia californica Gray California Brickellbush. [*Bulbostylis californica* T. & G.; *Coleosanthus californicus* (T. & G.) Kuntze]. Subshrubs, mainly 5–10 dm tall, the branchlets whitish to brownish; leaves alternate, petiolate, the blades 1.7–5.2 cm long, 1.3–4.5 cm wide, cordate-ovate to ovate or orbicular, truncate to cordate basally, crenate-serrate, rounded to obtuse apically, the veins not prominent, glandular-scabrous; heads clustered in a leafy-bracteate panicle, sessile or shortly pedunculate; involucre 5.5–8 mm high, 4–7 mm wide, the outer bracts very short, rounded apically, few-veined, the inner long and slender, often suffused with red or purple, glabrous; flowers 8–18; achenes straw colored, 2.5–3.5 mm long; $n = 9$. Canyons and rock outcrops at 825 to 2135 m in Beaver, Cache, Garfield, Juab, Kane, Millard, Salt Lake, San Juan, Sevier, Utah, and Washington counties; Colorado to California and south to Texas and Mexico; 15 (iii).

Brickellia grandiflora (Hook.) Nutt. Tasselflower. [*Eupatorium grandiflorum* Hook.; *Coleosanthus garrettii* A. Nels., type from City Creek Canyon, Salt Lake County]. Perennial herb, from a caudex and taproot, the stems

green to straw colored, 2.5–9.5 dm tall; leaves alternate, petiolate, the blades sagittate to cordate-ovate, 1.5–9 (11) cm long, 0.6–6.5 cm wide, cordate to truncate basally, serrate to doubly so, attenuate to acuminate apically, the veins not prominent, minutely puberulent or hirtellous; heads several to numerous in a short corymbose panicle, commonly reflexed; involucre 7–12 mm high, 6–10 mm wide, the outer bracts lance-acuminate, the inner abruptly acuminate, puberulent dorsally; flowers mostly 20–40 (70); achenes brown to black, 3.5–4.5 mm long, hirtellous; $n = 9$. Piñon-juniper, mountain brush, ponderosa pine, aspen, Douglas fir-white fir, spruce, and bristlecone pine communities at 1640 to 3200 m in Beaver, Cache, Daggett, Duchesne, Garfield, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Washington east to Missouri, south to Mexico; 34 (vii).

Brickellia longifolia Wats. Longleaf Brickellbush. [*Coleosanthus longifolia* (Wats.) Kuntze]. Shrubs, with erect stems and white to tan bark, mainly 10–15 dm tall; leaves alternate, sessile or subsessile, 1.2–13.5 cm long, 3–8 mm broad, lance-linear to lance-elliptic, obtuse to acute basally, attenuate apically, the veins not prominent, glabrous, glandular-resinous; heads numerous in panicles; involucre 3.4–6.2 mm high, 2.3–4 mm wide, the outer bracts ovate, acute, the inner, longer and slender, glabrous; flowers 3–5; achenes 1.8–2.4 mm long, brown, glabrous. Canyon bottoms, stream margins, seeps, and hanging gardens at 750 to 1590 m in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; California, Nevada, Arizona; 37 (xiii).

Brickellia microphylla (Nutt.) Gray Rough Brickellbush. [*Bulbostylis microphyllus* Nutt.]. Shrubs or subshrubs, with tan to whitish bark, mainly 2–7 dm tall; leaves alternate, shortly petiolate to subsessile or sessile, 3–14 (20) mm long, 1–9 (12) mm wide, ovate to suborbicular, toothed to entire, commonly glandular-villous or -hispidulose, the veins not especially prominent, rounded to acute apically; heads solitary or few at tips of branches, racemously arranged in leafy-bracteate panicles; involucre 7–10.3 mm high, 4–8.5 mm wide, the outer bracts oval to ovate, with thickened glandular tips, the inner often lacking glands and more or less 3-lobed or 3-veined; flowers 8–18; achenes 3.5–4.3 mm long, blackish, hirtellous or glabrous; $n = 9$. Two distinctive phases, which have been treated at specific level, are present in Utah. There is justification for treating them at specific rank, but they are similar in vegetative features and general aspect.

- Flowers 8–11 per head; involucre 7–10 mm long, 4–7.5 mm wide; plants of the Green, Colorado, and Virgin river systems *B. microphylla* var. *scabra*
- Flowers (12) 17–18 per head; involucre 8.5–10.3 mm long, 6.5–10 mm wide; plants of the Great Basin *B. microphylla* var. *watsonii*

Var. *scabra* Gray [*B. scabra* (Gray) A. Nels.]. Blackbrush, rabbitbrush, sagebrush, shadscale, Grayia, greasewood, juniper, and piñon-juniper communities mainly on sandstone outcrops at 885 to 2170 m in Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, and Washington counties; Colorado, Nevada, Arizona. Our material is uniformly hispidulose-glandular along upper stems at least, and has 8–11 flowers

per head; 35 (xi). Note: A peculiar specimen from San Juan County (Anderson A-6 BRY) has heads nearly all clustered at branch tips.

Var. watsonii (Robins.) Welsh [*B. watsonii* Robins., type from American Fork Canyon]. Sagebrush, shadscale, mountain brush, and juniper communities at 1525 to 2440 m in Juab, Millard, Salt Lake, Sevier, Tooele, and Utah counties; Nevada and California; 7 (ii). All modern floras distinguish *B. microphylla* by its heads "about 22-flowered". Our material fits well within the concept of *B. watsonii* Robins., which has heads "18-flowered". Specimens from the Great Basin of Utah are uniformly 18-flowered, except in depauperate heads which vary downwards to 12 flowers per head. Stems are villous to glandular-villous, with the type of *B. watsonii* Robins. (Watson 494 US) at the villous end of a cline.

Brickellia oblongifolia Nutt. Mohave Brickellbush. Subshrubs or subherbaceous, with green to tan branches, mainly 1-5.5 dm tall; leaves alternate, sessile or nearly so, 0.9-4 cm long, 1-11 (15) mm wide, elliptic to oblong, or lance-oblong, entire or essentially so, glandular-hispidulous, the veins not especially prominent, acute to attenuate or obtuse apically; heads solitary and terminating branches, or corymbosely arranged; involucre 10.8-15 mm long, 12-22 mm wide, the bracts all acute to acuminate, glabrous or glandular to glandular-puberulent; flowers (11) 26-40 (50); achenes 4.8-5.8 mm long, blackish, hispidulous; n = 9. Grayia, shadscale, rabbitbrush, blackbrush, desert almond, juniper, pinyon-juniper, and ponderosa pine communities at 1280 to 2500 m in Beaver, Box Elder, Duchesne, Emery, Garfield, Juab, Kane, Millard, San Juan, Sevier, Uintah, Utah, Wasatch, Wasatch, and Washington counties; British Columbia to Montana, south to California, Arizona, and New Mexico; 41 (x). Our material is assignable to var. *linifolia* (D. C. Eaton) Robins. [*B. linifolia* D. C. Eaton, type from Jordan Valley, American Fork], which is distinguished by its achenes being hispidulous, not glandular-hispidulous or glandular. The segregation is tenuous at best.

Calycoseris Gray

Annual subscapose or caulescent herbs, with milky juice, from taproots, beset with tacklike stipitate glands above; leaves mostly basal, pinnately parted; heads solitary or few on leafy-bracteate peduncles; involucre bracts in 2 series, herbaceous, the inner with hyaline margins; receptacle with capillary bristles; corollas all raylike, yellow or white tipped; achenes fusiform, 5- or 6-ribbed, tapering to a short beak, this produced apically into a low denticulate cup; pappus abundant, white, of barbellate capillary bristles falling attached.

- 1. Rays white, with pink or purple dots or streaks dorsally; stipitate glands pale *C. wrightii*
- Rays yellow; stipitate glands purple *C. parryi*

***Calycoseris parryi* Gray** Purple Tackplant. Annual herbs, mainly 0.7-3 dm tall, the stems simple or with spreading branches; leaves basal and alternate along stem, pinnately parted, the lobes linear, reduced and entire above, glabrous except for a few tangled long hairs on lower surface; peduncles mainly 0.5-4 cm long, clad with tacklike, long-stipitate, purple or purplish black glands; involucre 11-15 mm high, 8-14 mm wide (when pressed), the bracts linear-subulate to lance-subulate,

more or less stipitate-glandular, attenuate apically; rays yellow, 10-20 (25) mm long; pappus surpassing the achene; n = 7. Creosote bush and Joshua tree communities at 800 to 830 m in Washington County; California and Arizona; 2 (i).

***Calycoseris wrightii* Gray** Pale Tackplant. Annual herbs, mainly 1.4-4 dm tall, the stems commonly with spreading branches; leaves basal and alternate along the stem, pinnately parted, the lobes linear, reduced and subtire upwards, glabrous except for a few long tangled hairs on lower surface; peduncles mainly 0.3-5 cm long, clad with tacklike long-stipitate pale glands; involucre 12-17 mm long, 12-20 mm wide, the bracts linear-subulate to lance-subulate, more or less stipitate-glandular, attenuate apically, rays 10-25 mm long, white, with pink or purple markings dorsally; pappus shorter than achene; n = 7. Creosote bush and Joshua tree communities in Washington County; California, Nevada, Arizona; 6 (ii).

Carduus L.

Biennial or annual herbs with taproots, the juice watery; stems erect, simple or branched; leaves alternate simple, pinnatifid to bipinnatifid or merely pinnately lobed, often decurrent, spiny; heads solitary or few, borne in corymbosely cymes; involucre bracts imbricate in several series, spine-tipped; receptacle hemispheric, densely bristly; disk flowers only present, perfect, red purple, with long slender lobes; pappus of barbellate bristles; style branches connate, shortly hairy at base of branches; achenes compressed.

***Carduus nutans* L.** Nodding Thistle; Musk Thistle. Rank biennial or annual herbs, mostly 0.6-20 (25) dm tall; stems arachnoid-tomentose to glabrate; leaves alternate, decurrent, 3-40 cm long, 0.5-20 cm wide (or more), lance-linear to elliptic, glabrous, or tomentose along veins beneath; heads commonly solitary, nodding; involucre 20-30 mm long, 30-80 mm wide, the bracts 2-8 mm wide, ovate-lanceolate to lanceolate, glabrous or nearly so, spinose-tipped, at least the outermost reflexed near the middle, the midrib prominent; flowers red purple; achenes 3.5-4.5 mm long, smooth, marked with vertical lines, umbonate; n = 8, 20. Disturbed sites along roads and in fields and pastureland spreading into sagebrush, pinyon-juniper, and mountain brush communities, at 1340 to 2440 m in Cache, Daggett, Duchesne, Emery, Iron, Juab, Morgan, Salt Lake, Sanpete, and Utah counties, and probably universal; introduced Old World plants, now widely established in the United States; 15 (ii).

Centaurea L.

Annual, biennial, or perennial herbs with taproots or rhizomes, the juice watery; stems erect or ascending; leaves alternate, entire to pinnatifid; heads solitary, or few to numerous, discoid; involucre bracts imbricate in several series, spine-tipped or some of them enlarged and with scarious or hyaline erose to lacerate or pectinate appendages; receptacle bristly; flowers all tubular, perfect, or the marginal ones sterile and falsely subradiate; purple, blue, yellow, pink, or white; pappus of bristles, scales, or none; style branches more or less connate, with a thickened often hairy ring at the base; achenes obliquely or laterally attached to receptacle. Note: This is a large genus, mainly of the Mediterranean region of the Old World, but with some indigenous to North America,

Australia, and South America. All of ours are introduced, and the potential for other introductions in this remarkable genus is great. In Flora Europaea, our species are treated within three genera: *Amberboa* (Pers.) Less. (*C. moschata* L.), *Acroptilon* Cassini (*C. repens* L.) and *Centaurea* (for the others).

1. Involucral bracts definitely spine-tipped, at least some with spines 1–20 mm long 2
- Involucral bracts definitely not spine-tipped or, if shortly spinose as in *C. maculosa* and *C. scabiosa*, the heads 6–25 mm wide 5
- 2(1). Stem definitely winged, the leaf bases decurrent; pappus present (central flowers, at least) 3
- Stems angled, not winged; pappus none 4
- 3(2). Apical spine of involucral bract 5–9 mm long; plants arachnoid when young; flowers all with evident pappus *C. melitensis*
- Apical spine of involucral bract 11–20 mm long; plants persistently tomentose; flowers in center only with a pappus *C. solstitialis*
- 4(2). Apical spine of bracts 5–15 mm long or more *C. calcitrapa*
- Apical spine of bracts 1–4 mm long *C. virgata*
- 5(1). Leaves entire or merely toothed, not pinnatifid 6
- Leaves pinnatifid or deeply pinnately lobed 8
- 6(5). Leaves linear to lance-linear, entire or nearly so, less than 1 cm wide *C. cyanus*
- Leaves various but, if as above, the plants rhizomatous 7
- 7(6). Plants rhizomatous; leaves mainly 2–10 mm wide; pappus evident, 6–11 mm long *C. repens*
- Plants not rhizomatous; leaves 6–15 mm wide; pappus 2–5 mm long *C. jacea*
- 8(5). Leaves merely pinnately lobed; involucral bracts entire or nearly so *C. moschata*
- Leaves pinnately divided, the lobes linear to narrowly oblong; involucral bracts pectinately lobed 9
- 9(8). Involucres 15–25 mm wide; lobes of leaves often again toothed or lobed *C. scabiosa*
- Involucres mainly 6–10 mm wide; lobes of leaves usually entire *C. maculosa*

***Centaurea calcitrapa* L.** Star-thistle. Biennial herbs, from taproots, the stems usually branched, 1–8 dm tall, arachnoid-villous to glabrate; leaves 0.5–4.5 cm long, pinnatifid, the lobes linear to oblong, attenuate, or the upper ones entire; heads few to numerous; involucre urn-shaped, 10–18 mm high, mainly 8–12 mm wide, the bracts weakly spinose-ciliate, with a stout apical spine mainly 5–30 mm long; flowers few, purple; pappus none; $2n = 20$. Roadside weeds in Salt Lake and Utah counties; introduced from Eurasia; 2 (0).

***Centaurea cyanus* L.** Bachelors Button; Cornflower. Annual or biennial herbs from taproots, the stem usually branched, mostly 1–8 (12) dm tall, arachnoid-tomentose; leaves 2–10 (13) cm long, 1–8 mm wide, entire or some with slender lobes, attenuate; heads few to numerous; involucre hemispheric, 10–16 mm high, 10–23 mm wide, the bracts with a tapering pectinate or fringed tip, often purplish suffused, the central apical tooth not especially spinose; flowers several, blue, purple, pink, or white, the marginal ones enlarged, irregular; pappus 2–3 mm long; $2n = 20, 24$. Cultivated ornamental, now established in disturbed sites in Cache, Salt Lake, Tooele, Utah, Wasatch, and Washington counties; adventive from Europe; 6 (0).

***Centaurea jacea* L.** Brownscale Centaurea. Perennial herbs from taproots, the stems simple or branched from the middle, mostly 5–12 dm tall, glabrous or somewhat arachnoid; leaves entire or toothed to shallowly lobed, the basal ovate to lanceolate, petiolate, becoming smaller upwards; heads few to numerous; involucre 12–18 mm high, 12–15 mm wide, ovoid, the bracts with orbicular appendages, scarious, brown, darker in middle, the outer denticulate to pectinate-lacerate, the inner less so and often bifid; flowers purple or white, the outer more or less radiate; pappus none or very short; $2n = 22, 44$. Cultivated ornamental, now established in Salt Lake County; adventive from Europe; 0 (0). Note: the large headed *C. montana* L., is cultivated in Utah. It has wedge-shaped involucral bracts and decurrent large leaves.

***Centaurea maculosa* Lam.** Spotted Centaurea. Biennial or short-lived perennial, the stems simple or commonly branched above the middle, mainly 3–10 (15) dm tall, tomentose and sparingly scabrous-puberulent; leaves 1–9 cm long, pinnatifid, the lobes linear to lanceolate or oblong, entire or variously toothed or lobed, reduced and bracteate in the inflorescence; heads few to many, hemispheric to vase-shaped; involucre 10–13 mm high, 10–13 mm wide, the bracts with short dark pectinate tip, the central tooth produced as a spine to 0.5 mm long; flowers pink or purplish, rarely white, the marginal ones radiate; pappus to 2 mm long, rarely lacking; $2n = 18, 36$. Roadsides in Beaver, Cache, Juab, Tooele, and Uintah counties; adventive from Europe; 3 (i).

***Centaurea melitensis* L.** Annual or biennial, the stems sparingly branched from middle or below, 1.5–8 dm tall, winged by decurrent leaf bases; basal and lower cauline leaves oblanceolate, toothed to lyrate-pinnatifid or sinuately lobed, reduced upwards, finally entire; heads solitary, terminating branches, or 2 or 3 in clusters; involucre 8–15 mm high, 8–12 mm wide, tapering apically, the middle and outer bracts spine-tipped, the spines 5–8 mm long; flowers yellow, all alike; pappus 1.5–3 mm long; $2n = 24$. Adventive Old World species of disturbed sites in Salt Lake County (Without collector UT); 1 (0).

***Centaurea moschata* L.** [*Amberboa moschata* (L.) DC.]. Annual herbs; simple or sparingly branched, mainly 3–7 dm long, sparingly tomentose; leaves 1–9.5 cm long, 1–3 cm wide, pinnatifid, the lowermost petiolate, becoming sessile upwards; heads solitary, on peduncles 8–15 cm long or more; involucre vase-shaped, 12–14 mm high, 18–22 mm wide, the bracts oval, with purplish margins, only the inner with broad, reflexed, entire appendage; flowers pink; pappus shorter to about equaling the achenes; $2n = 28, 32$. Cultivated ornamental, escaping and persisting in Washington County; adventive from Asia; 1 (0).

***Centaurea repens* L.** Russian Knapweed. [*C. picris* Pallas ex Willd.; *Acroptilon repens* (L.) DC.]. Perennial rhizomatous herbs, mostly 3–8 dm tall, arachnoid-tomentose to glabrate; leaves in a basal rosette and cauline, the basal leaves often withered by flowering time, the cauline mainly 1–6 cm long, 2–12 mm wide, entire or serrate; heads few to numerous, terminating branches; involucre 9–15 mm high, 5–12 mm wide, more or less urn-shaped, middle and outer bracts broad, glabrous, with broader rounded, subentire hyaline tips, the inner bracts narrow, tapering, and with plumose hairy tips; flowers pink to purplish, all alike; pappus bristle sub-plumose, 6–11 mm long; $2n = 36$. Introduced Old World

primary noxious weed, now widely established at 1220 to 2380 m in Cache, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, and Washington counties; widespread in North America; adventive from Eurasia; 28 (ii).

Centaurea scabiosa L. Perennial herbs, mostly 5–15 dm tall, scabrous-puberulent; leaves 4–20 cm long or more, the lowermost long-petiolate, once to twice pinnatisect, the segments linear to oblong, entire or dentate-serrate to lobed, the upper pinnately divided, sessile; heads few to several, terminating branches; involucre 13–20 mm high, 18–25 mm wide, ovoid-globose; bracts ovate, glabrous or arachnoid, the appendages triangular-ovate, brown or black, with pale brown teeth; flowers purple, alike or nearly so; pappus 4–5 mm long; 2n = 20, 40. Cultivated ornamental, persisting and escaping, in Salt Lake and Uintah counties; adventive from Europe: 2 (0).

Centaurea solstitialis L. Yellow Starthistle. Annual or biennial, grayish-tomentose, the stems 1–6 (10) dm tall, evidently winged; leaves mainly 1–12 (20) cm long, 0.1–3 (5) cm wide, the basal ones lyrate to pinnatifid, the cauline ones progressively smaller and entire upwards, linear to linear-subulate; heads few to numerous, terminating branches; involucre 8–15 mm high, 7–15 mm wide, urn-shaped, the middle and outer bracts with central apical spines 10–20 (30) mm long, the inner with a small hyaline appendage; flowers yellow, all alike; pappus of marginal flowers none, that of the central ones 3–5 mm long; 2n = 16. Roadsides and abandoned fields at 915 to 1900 m in Box Elder, Wasatch, Washington, and Weber counties; adventive from Europe; 4 (i).

Centaurea virgata Lam. Perennial, from a caudex, more or less grayish tomentose, the stems 4–9 dm tall, branched above; leaves mainly 0.5–15 cm long, 0.1–6 cm wide, the basal ones petiolate, once to twice pinnately divided, the lobes linear, these often again toothed or lobed; cauline leaves smaller, sessile, and lobed to entire; heads several to numerous, terminating short branches; involucre 7–10 mm high, 3–5 mm wide, the bracts pale or suffused with red or purple, with a slender apical spine 1–4 mm long; flowers pink; pappus about 1.5 mm long. Roadsides and other disturbed sites in Grand, Juab, and Utah counties at 1525 to 1830 m; adventive from Eurasia; 5 (i).

Chaenactis DC.

Annual, biennial, or perennial herbs, from taproots; leaves alternate or mainly basal, pinnately dissected to entire; heads solitary or few to several, borne in corymbose cymes, discoid, the flowers white, or cream to pink, all perfect, the marginal ones sometimes enlarged and raylike; involucre bracts in 1–3 series, herbaceous; receptacle flat, naked; pappus of 4–20 hyaline scales; style branches slightly compressed; achenes clavate, terete or more or less compressed.

Stockwell, P. 1940. A revision of the genus *Chaenactis*. Contr. Dudley Herb. 3: 89–168.

- 1. Plants perennial from a simple or branching caudex, 2–9 cm tall; stemless or with few short internodes, of high elevations *C. alpina*
- Plants annual or biennial, rarely perennial, the caudex seldom developed; stems mainly 10–30 cm tall or, if less, the plants definitely not perennial, distribution usually of middle and lower elevations 2

- 2(1). Basal rosette well developed; plants biennial or short-lived perennials; pappus scales 10–16 *C. douglasii*
- Basal rosettes poorly if at all developed; plants annual; pappus scales 4 or 5 (rarely 8) 3
- 3(2). Lower and upper cauline leaves simple, the middle ones few-lobed; plants of Washington County *C. fremontii*
- Lower, middle, and upper leaves pinnately divided, or only the uppermost simple 4
- 4(3). Heads mostly 15–22 mm high; flowers pink, much surpassing the involucre; anthers included ... *C. macrantha*
- Heads mostly 8–10 mm high; flowers white or cream, only slightly surpassing the involucre; anthers exerted ... 5
- 5(4). Involucre bracts blunt or nearly acute apically; plants widely distributed *C. stevioides*
- Involucre bracts long-attenuate and bristle-tipped apically; plants of Washington and Millard counties *C. carphocloina*

Chaenactis alpina (Gray) Jones Alpine Dusty-maiden. [*C. douglasii* var. *alpina* Gray, type from Alta]. Perennial, from a simple or branched, sometimes soboliferous caudex, 3.5–9 cm tall; stems with few contracted internodes, very short, or not developed; leaves 1.3–5 cm long, pinnately divided, the lobes again toothed or lobed, 1–7 mm long, gray tomentose to glabrate; heads solitary or sometimes 2, the peduncles tomentose or glandular, 0.5–6 cm long; involucre (7.5) 10–13 mm long, (8) 10–17 mm wide, the bracts often suffused with purple, glandular or tomentose; corolla purplish to white, glandular or sparingly tomentose; pappus of 10 oblong-spatulate rounded hyaline scales, in 2 series; achenes 6–8 mm long, hairy. Boulder stripes and talus in alpine tundra or upper montane communities at 2980 to 3965 m in Cache, Duchesne, Salt Lake, Summit, and Utah counties.; Oregon to Montana, California and Colorado; 10 (i). Our materials are separable into two more or less distinctive phases; a glandular phase, with distribution mainly in the Wasatch Mts., which is var. *alpina* [including *C. rubella* Greene; *C. alpina* var. *rubella* (Greene) Stockwell], and a tomentose phase, mainly from the Uinta Mts. which might be assignable to var. *leucopsis* (Greene) Cockerell [*C. leucopsis* Greene]. More work is necessary, including evaluation of the type specimen of var. *leucopsis*.

Chaenactis carphocloina Gray Annual, from a taproot, 6–28 (40) cm tall; stems well developed, more or less flexuous; leaves 0.8–5.6 cm long, mealy-puberulent, 1- to 2-pinnatifid, the segments linear-filiform, 1–20 mm long; heads few to numerous, on slender farinose to glandular peduncles 0.4–3 cm long; involucre 6–9 mm high, 6–15 mm wide, the bracts lance-attenuate into slender bristlelike tips, glandular; flowers white to cream; pappus of central flowers usually of 4 lance-acuminate scales, those of marginal flowers sometimes shorter; achenes 3.5–4.5 mm long, hairy; n = 8. Creosote bush and cool desert shrub communities at 850 to 1000 m in Millard and Washington counties; California, Nevada, Arizona; 13 (i).

Chaenactis douglasii (Hook.) H. & A. Douglas Dusty-maiden. [*Hymenopappus douglasii* Hook.; *C. achilleifolia* H. & A.; *C. douglasii* var. *achilleifolia* (H. & A.) A. Nels.; *C. douglasii* var. *montana* Jones; *C. brachiata* Greene, type from Springdale; *C. brachiata* var. *stansburyi* Stockwell, type from Stansbury Island]. Biennial or short-lived perennial, from a taproot, seldom with a caudex, mainly 5–50 (60) cm tall, sparsely to densely

tomentose; stems with few to many well-developed internodes; leaves 0.6–12 (15) cm long, 1–3 pinnatifid, the lobes 1–3 cm long, tomentose to glabrate; heads solitary or several in a corymbose cyme; involucre 7–16 mm high, 8–25 mm wide, the bracts glandular to glandular-tomentose, oblong to narrowly oblanceolate or linear, blunt apically; flowers white to pink; pappus of 10–16 scales in 2 series; achenes 6–8 mm long, hairy; $2n = 12, 37$. Shadscale, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, white fir, Douglas fir, aspen, and limber pine communities at 1340 to 3050 m in all Utah counties; British Columbia to Montana, south to California, Arizona, and Colorado; 132(xx). It does not seem reasonable to attempt to segregate our materials into varieties. The variability apparently does not demonstrate geographic correlation.

Chaenactis fremontii Gray Fremont Dusty-maiden. Annual or winter annual, from a taproot, 10–25 (40) cm tall, glabrate or sparingly tomentose when young; leaves 0.6–6.5 cm long, the lower and upper simple, linear, the middle few-lobed, glabrous; heads solitary to several on tomentose to glabrate (glandular?); peduncles 1–5 cm long; involucre 8–10 mm high, 10–12 mm wide, glabrous or tomentose, attenuate but not caudate; flowers white to pinkish, the outer ones enlarged; pappus of central flowers of 4 scales; achenes hairy; $n = 5$. Creosote bush and Joshua tree communities at 670 to 885 m in Kane and Washington counties; Arizona, Nevada, California; 6 (i).

Chaenactis macrantha D. C. Eaton Showy Dusty-maiden. Annual or winter annual, from a taproot, mainly 6–25 cm tall, branching from the base or simple, floccose-tomentose to glabrate; leaves 0.5–5 cm long, 1– to 2-pinnatifid, the lobes to 1 cm long, broad, floccose to glabrate; heads solitary to several, on tomentose peduncles 0.5–5 cm long; involucre 12–17 mm high, 8–22 mm wide, the bracts oblong-lanceolate, rather abruptly short-acuminate, tomentose; corollas pink to white, all about alike; anthers included; pappus of 4 linear-oblong scales and 2–4 short outer ones or these lacking; achenes hairy; $n = 6$. Shadscale, pinyon-juniper, creosote bush, and blackbrush communities at 885 to 2135 m in Beaver, Box Elder, Juab, Kane, Millard, San Juan, Tooele, and Washington counties; California, Nevada, Arizona; 28 (v).

Chaenactis stevioides H. & A. Stevia Dusty-maiden. Annual or winter annual, from a taproot, mainly 4–42 cm tall, branching from the base or simple, more or less tomentose; leaves 0.3–10 cm long, 1–2 pinnatifid, the lobes to 2.5 cm long, linear to oblong, sometimes all or nearly all simple in depauperate specimens; heads solitary to several on glandular peduncles 0.3–3 cm long; involucre 6–11 mm high, 8–22 mm wide, the bracts oblong-lanceolate to linear, acute to shortly acuminate apically, glandular; corollas white to cream, the outer ones enlarged; pappus of 4 oblong-lanceolate scales; achenes hairy; $n = 5$. Creosote bush, blackbrush, matatriplex, shadscale, indigo bush, and juniper communities at 915 to 1891 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, San Juan, Tooele, Uintah, Washington, Wayne, and Weber counties; Wyoming south to Nevada, west to California; 63 (vi).

Chamaechaenactis Rydb.

Perennial scapose herbs from a long-pilose caudex, clothed with marcescent leaf bases, and taproot, with

watery juice; leaves all basal, petiolate, simple; heads solitary; involucre turbinate, the bracts subequal or the outer shorter; receptacle naked; rays none; disk flowers perfect, fertile, cream colored to pink; pappus of hyaline scales; style branches flattened, papillate; achenes 4-angled, hairy.

Chamaechaenactis scaposa (Eastw.) Rydb. Eastwood-plant. [*Chaenactis scaposa* Eastw.; *C. s.* var. *parva* Preese & Turner, type from 32 mi S of Green River]. Plants 2–9 cm tall, the scapes long-villous; leaves petiolate, the blades 0.4–1.8 cm long, 3–13 (15) mm wide, lance-oblong to ovate, to oval or orbicular, obtuse to rounded apically, obtuse to truncate basally, villous beneath, strigose to strigulous or villous above; heads solitary; involucre 7–17 mm high, 10–23 mm wide, the bracts oblong or linear-oblong, the outer densely villous, green or suffused with red purple, the margin hyaline; corollas cream to pink; pappus scales oblanceolate-spatulate, rounded; achenes black, hirsute-pilose. Shadscale, galleta, pygmy sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1580 to 2565 m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Uintah, and Wayne counties; Arizona and Colorado; 56 (v).

Chamomilla S. F. Gray

Annual herbs, aromatic in some; leaves alternate, bi- or tripinnatifid, with linear filiform ultimate segments; heads radiate or discoid, solitary or corymbose; involucre bracts greenish-chartaceous, the margins hyaline, in 2 or 3 series, subequal to imbricate; receptacle conic, hollow, naked; marginal flowers pistillate; rays (when present) white, the central disk flowers perfect and fertile, the style branches truncate, tufted-hairy apically; pappus a short crown of minute scales, or vestigial or lacking; achenes subcylindric, the ventral face with 3–5 narrow ribs, the dorsal face smooth and convex.

1. Heads radiate; disk corollas 5-lobed; involucre 11–25 mm in diameter *C. rescuita*
- Heads discoid; disk corollas 4-lobed; involucre 4–10 mm in diameter *C. suaveolens*

Chamomilla rescuita (L.) Rauschert Chamomile. [*Matricaria resutita* L.; *M. chamomilla* L.]. Annual herbs; stems 0.2–4 (6) dm tall, erect or ascending, branched above; herbage glabrous or puberulent; leaves 2–6 cm long; heads solitary or more commonly few to many and corymbosely arranged; involucre saucer-shaped, 3–4 mm high, 11–25 mm wide, the bracts subequal, the margins broadly hyaline, the midstripe greenish to brownish; rays 10–20, white, 4–10 mm long. Moist disturbed soils at low to moderate elevations in Cache, Salt Lake, Sanpete, and Wasatch counties; adventive from Europe; 2 (0).

Chamomilla suaveolens (Pursh) Rydb. Pineapple Weed. [*Santolina suaveolens* Pursh; *Matricaria matricarioides* (Less.) T. C. Porter]. Annual herbs; stems 0.4–4 dm tall, erect or ascending, branched from the base or simple; herbage glabrous or pubescent; leaves 1–5 (9) cm long; heads few to many, paniculately arranged; involucre saucer-shaped, 2–6 mm high, 4–10 mm wide, the bracts subequal to somewhat imbricate, the margins hyaline, the midstripe greenish; rays lacking; disk flowers 4-lobed; $n = 9$. Disturbed sites at 1310 to 2810 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Rich,

Salt Lake, Sevier, Summit, Utah, Wasatch, and Weber counties; adventive from Europe; 26 (0).

Chrysanthemum L.

Perennial herbs from a rhizome or a caudex, with watery juice; stems erect or nearly so; leaves alternate, serrate to pinnatifid; heads solitary or few to numerous in open corymbose clusters; involucre bracts imbricate, in 2-4 series, greenish or straw colored, the margins brownish scarious; receptacle naked; ray flowers white, numerous, pistillate, fertile, or lacking; disk flowers numerous, perfect, fertile, yellow; pappus lacking or a short crown; style branches flattened; achenes several-nerved, beakless, glabrous.

- 1. Leaves finely serrate; heads usually numerous, small, commonly rayless *C. balsamita*
- Leaves coarsely serrate or pinnatifid; heads larger, fewer, commonly with rays 2
- 2(1). Heads solitary or few; involucre 7-10 mm high; rays 1-2 cm long; leaves serrate to more or less once pinnatifid *C. leucanthemum*
- Heads several to numerous; involucre 3-4.5 mm high; rays 2-6 mm long *C. parthenium*

Chrysanthemum balsamita L. Costmary. [*Balsamita major* Desf.]. Perennial herbs, from a caudex, commonly 5-10 (12) dm tall; stems strigose, at least above; leaves petiolate below, sessile or subsessile above, the blades 0.9-10 (15) cm long, 0.6-5 (8) cm wide, elliptic to oblanceolate, finely serrate, strigose; heads numerous, corymbose; involucre 3.7-4.6 mm high, 6-8 mm wide, the bracts oblong, sparingly strigose, the tip hyaline; ray flowers (when present) 4-6 mm long. Fields, roadsides, and cemeteries at 1370 to 2135 m Cache, Salt Lake, Sanpete, Summit, Tooele, Uintah, and Utah counties; escaped from cultivation, now widely established in the U. S.; 5 (i).

Chrysanthemum leucanthemum L. Oxeye-daisy. [*Leucanthemum vulgare* Lam.]. Perennial rhizomatous or subrhizomatous herbs, commonly 2-8 (10) dm tall; stems glabrous or nearly so, mainly simple; leaves petiolate below, becoming smaller and sessile above, the blades 0.8-5 cm long, oblanceolate to obovate or linear, serrate, crenate, or pinnately lobed, glabrous or villosulose; heads solitary; involucre 7-10 mm high, 15-23 mm wide, the bracts lance-ovate to oblong-linear, with brown margins, hyaline apically; rays mainly 15-30, white, 10-22 mm long; pappus none; n = 9, 18. Roadsides, fields, and other disturbed sites at 1525 to 2820 m in Salt Lake, Sanpete, Uintah, Utah, Wasatch, and Weber counties; widespread in North America; adventive from Eurasia; 6 (0).

Chrysanthemum parthenium (L.) Bernh. [*Matricaria parthenium* L.; *Leucanthemum parthenium* (L.) Gren. & Godron; *Pyrethrum parthenium* (L.) Sm.; *Tanacetum parthenium* (L.) Schultz-Bip.]. Perennial herbs with caudex and taproot; commonly 3-9 dm tall; stems glabrous, or puberulent above; leaves petiolate, becoming smaller, but still petiolate above, the blades 0.5-5 cm long, 0.6-4.5 (6) cm wide, pinnatifid or doubly so; heads several to numerous, the inflorescence corymbose; involucre 3-4.5 mm high, 7-10 mm wide, the bracts oblong, with a dark center, otherwise scarious except the tip hyaline; rays 10-20, white, 4-8 mm long; pappus a crown or none; 2n = 18. Cultivated ornamental, escaping

and persisting at 1525 to 1950 m in Carbon, Salt Lake, Utah, and Weber counties; widely established in the United States; adventive from Europe; 5 (0).

Chrysothamnus Nutt.

Shrubs with white bark, or the surface obscured by a tomentum, this often glandular-resinous; leaves alternate, linear to oblong, or lanceolate, sessile, entire; heads white or yellow, discoid, narrow, in contracted to open paniculate inflorescences; flowers perfect, fertile; involucre bracts imbricate, more or less keeled, in 4 or 5 vertical or obscure ranks, chartaceous or coriaceous, or the tip herbaceous; receptacle naked; style branches flattened; achenes slender, flattened, angled, or terete, hairy or glabrous; pappus of numerous capillary bristles.

- 1. Flowers white; leaves terete; plants of western tier of counties (except Iron and Washington) *C. albidus*
- Flowers yellow; leaves various but, if terete, plants of Washington County or rarely elsewhere 2
- 2(1). Leaves terete, resinous punctate; stems more or less fastigiate; plants of Washington County *C. paniculatus*
- Leaves commonly more or less flattened, resinous-punctate or not; stems not especially fastigiate; plants of broad or other distribution 3
- 3(2). Stems obscured by a tomentum, this often impregnated with resinous-glandular material 4
- Stems glabrous or puberulent, the surface readily apparent 5
- 4(3). Involucre bracts long-attenuate, membranous; inflorescence more or less racemose *C. parryi*
- Involucre bracts obtuse to acute, rarely attenuate but, if so, chartaceous; inflorescence cymose *C. nauseosus*
- 5(3). Leaves lanceolate to lance-oblong, not contorted; shrubs mainly 6-20 dm tall; plants of the Green and Colorado river basins *C. linifolius*
- Leaves linear, oblong, or lanceolate but, if lanceolate, twisted and shrubs mainly less than 6 dm tall; distribution various 6
- 6(5). Achenes hairy 7
- Achenes lacking hairs, sometimes glandular or, if sparingly hairy, the involucre over 10 mm long 8
- 7(6). Involucre bracts acuminate-cuspidate; leaves 1-2 mm wide *C. greenei*
- Involucre bracts acute to obtuse; leaves various *C. viscidiflorus*
- 8(6). Flowers 10-12 mm long, surpassed by the pappus; plants of Emery, Wayne, and San Juan counties *C. pulchellus*
- Flowers 7-9 mm long, surpassing or subequal to the pappus; distribution various 9
- 9(8). Involucre bracts strongly ranked; involucre 9.2-13 mm long *C. depressus*
- Involucre bracts not strongly ranked; involucre 6.2-7.5 mm long *C. vaseyi*

Chrysothamnus albidus (Jones) Greene Alkali Rabbitbrush; White Rabbitbrush. [*Bigelovia albida* Jones]. Shrubs, mainly 5-10 dm tall, more or less fastigiate branched, white-barked, glabrous, resinous-viscid, aromatic; leaves 0.5-3.5 cm long, terete, 0.5-1 mm thick, glandular-punctate, mucronate, crowded, often with axillary fascicles; heads clustered at branchlet apices; involucre 6.8-9 mm high, 3-7 mm wide, the bracts obscurely

4- to 5-ranked, the outer ones lance-ovate, thickened in lower half, abruptly subulate-attenuate, the inner oblong, acuminate to acute, the margin hyaline, glandular to tomentose; corollas white, 6-7.5 mm long; achenes 4-4.5 mm long, pilose and glandular; pappus abundant; 2n = 18. Local in salt grass, pickleweed, and alkali-sacaton communities at 1450 to 1650 m in Beaver, Box Elder, Juab, Millard, and Tooele counties; California, Nevada; 11 (v).

***Chrysothamnus depressus* Nutt.** Dwarf Rabbitbrush. Low, spreading shrubs, the ascending to erect, subherbaceous stems 0.6-3 dm tall, white-barked, scabrous-puberulent or glandular-puberulent; leaves 0.4-2 cm long, 1-4 (5) mm wide, flat, narrowly lanceolate to oblanceolate or spatulate, flat, scabrous-puberulent, obtuse, rounded or sharply apiculate; heads clustered at branch apices; involucre 9.2-13 mm high, 4.5-7 mm wide, the bracts in 4 or 5 definite vertical ranks, keeled, lance-attenuate, the subulate tip soft, the outer more or less herbaceous (sometimes suffused with purple) and the inner with broad hyaline margins; corollas yellow, 7.5-9 mm long; achenes (5) 6-7 mm long, glabrous or sparingly stipitate-glandular; pappus off-white to brownish, abundant. Sagebrush, salt desert shrub, juniper, pinyon-juniper, mountain brush, ponderosa pine and alpine fir communities at 1550 to 2900 m in Carbon, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; Colorado, New Mexico, Arizona, and Nevada; 34 (iv).

***Chrysothamnus greenei* (Gray) Greene** Greene Rabbitbrush. [*Bigelovia greenei* Gray]. Low, ascending to erect shrubs, with subherbaceous stems from a woody crown, mainly 1-3.5 dm tall, white-barked, glabrous; leaves 0.3-3.5 cm long, 0.8-1.2 mm wide, flat, linear, glabrous or scabrous-ciliate; heads numerous, corymbosely clustered at branch tips; involucre 5-7.1 mm high, 2.5-4 mm wide, the bracts obscurely ranked, the outer ones herbaceous-thickened near the tip, gradually acuminate-cuspidate, the inner ones abruptly narrowed, glabrous or more or less tomentose, narrowly if at all hyaline-margined; corollas yellow, 3.5-4.8 mm long; achenes 3.3-4 mm long, pilose. Rabbitbrush, black sagebrush, shadscale, winterfat, sagebrush, and pinyon-juniper communities at 1280 to 2745 m in Carbon, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, Tooele, Uintah, Utah, and Wayne counties; Colorado, New Mexico, Arizona, and Nevada; 53 (vi). This entity forms intermediates with phases of *C. viscidiflorus*.

***Chrysothamnus linifolius* Greene** Spreading Rabbitbrush. Tall shrubs, the branches erect-ascending, mainly 8-20 (35) dm tall, white-barked, glabrous; leaves 0.9-7.7 cm long, 1-9 mm wide, flat, plane (not contorted or rarely somewhat so), thick, oblong to elliptic or narrowly lanceolate, glabrous, scabrous-ciliate, attenuate to acute; heads numerous, corymbosely arranged at branch tips; involucre 4.3-7.2 mm long, 1.8-3 mm wide, the bracts indistinctly ranked, the outer distinctly herbaceous at tip, the inner often merely glandular thickened at midrib, all obtuse to rounded, glabrous; corollas yellow, 4.5-5.8 mm long; achenes 2.1-2.8 mm long, pilose; 2n = 18. Stream banks and terraces, irrigation canals, seeps and springs in riparian communities at 1130 to 2535 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San

Juan, Sanpete, Sevier, Uintah, and Wayne counties; Montana to Arizona and New Mexico; 54 (xvii).

***Chrysothamnus nauseosus* (Pallas) Britt.** Rubber Rabbitbrush. Low to tall shrubs, the branches erect-ascending, mainly 2-20 (30) dm tall, the bark obscured by a tomentum, this often resinous-glandular impregnated; leaves 0.6-7 (10) cm long, 0.5-5 (10) mm wide, 1- to 3-nerved, tomentose to glabrate or glabrous, subcylindric to flat, if the latter then commonly plane, linear to narrowly oblong, acute to apiculate apically; heads numerous, in terminal paniculate cymes; involucre (6) 6.5-11.5 (13) mm high, 1.5-7.2 mm wide, the bracts obscurely to definitely ranked, the outer ones sparingly tomentose to glabrous, the inner commonly glabrous, oblong, chartaceous to more or less herbaceous-thickened, obtuse to acute or shortly acuminate apically; corollas yellow or yellow-orange, 6-10.3 (12) mm long; achenes 2.5-5.5 mm long, glabrous or hairy; 2n = 18. The *nauseosus* complex in Utah is represented by a diverse assemblage of more or less geographically and ecologically segregated races, which are placed in some 14 varieties. The following arbitrary key will serve to identify most specimens.

1. Shrubs usually 3 dm tall or lower, local endemics in Piute, Sanpete, Sevier, Carbon, Emery, Daggett, and Duchesne counties 2
- Shrubs usually more than 3 dm tall, seldom lower, but then of different distribution 5
- 2(1). Branchlets white-pannose; achenes pilose; plants known from Daggett and Uintah counties *C. nauseosus* var. *uintahensis*
- Branchlets various, but not otherwise as above; achenes glabrous; plants not from Uintah or Daggett counties 3
- 3(2). Involucre glabrous, 8.5-9.5 mm high; plants of Emery, Carbon, Wasatch, and Duchesne counties *C. nauseosus* var. *psilocarpus*
- Involucre tomentose or glabrous, 10-12 (13.5) mm high; plants of Sanpete, Sevier, and Piute counties ... 4
- 4(3). Involucre glabrous; corollas 7.8-9 mm long; plants local on Arapien shale in Sanpete and Sevier counties *C. nauseosus* var. *iridis*
- Involucre tomentose; corollas 10-12 mm high; plants local in Piute County *C. nauseosus* var. *glareosus*
- 5(1). Achenes and ovaries glabrous 6
- Achenes and ovaries pilose 9
- 6(5). Flowers 5-8 mm long; involucre 7-8.5 (9) mm long, 1.5-3 mm wide (when pressed) *C. nauseosus* var. *leiospermus*
- Flowers 8.3-10 mm long; involucre 9-11 mm long, 3.7-7 mm wide (when pressed) 7
- 7(6). Involucre subcylindric; plants of dunes and deep sands of western Utah and in the Uinta Basin *C. nauseosus* var. *turbinatus*
- Involucre tapering to the base; plants of south-central and southeastern Utah 8
- 8(7). Achenes 5-5.5 mm long; plants low, commonly less than 5 dm tall, of San Juan and Emery counties *C. nauseosus* var. *bigelovii*
- Achenes 2.5-4 mm long; plants taller, commonly over 5 dm tall, known from Kane County *C. nauseosus* var. *nitidus*

- 9(5). Involucres over 10 mm long, corollas 9.5–10.5 mm long 10
 — Involucres 6.5–8.6 (9.5) mm long (to 11 mm long in var. *junceus*); corollas 5–8.6 (10) mm long 11
- 10(9). Involucres cylindric, the bracts neither strongly keeled nor ranked; plants of dune areas in western and northeastern Utah ... *C. nauseosus* var. *turbinateus*
 — Involucres tapering, clavate, the bracts strongly keeled and aligned, plants of southeastern Utah ... *C. nauseosus* var. *arenarius* 12
- 11(9). Leaves 3–5 (10) mm wide; plants of central to north-central Utah *C. nauseosus* var. *salicifolius*
 — Leaves 0.5–3 mm wide; plants of various distribution 12
- 12(11). Corolla lobes commonly long-pilose (glabrate in age); leaves often deciduous by anthesis; plants of southeastern Utah *C. nauseosus* var. *junceus*
 — Corolla lobes glabrous; leaves present or absent at anthesis; distribution various 13
- 13(12). Corolla lobes 0.4–0.9 mm long *C. nauseosus* var. *gnaphaloides*
 — Corolla lobes 1–2 mm long 14
- 14(13). Leaves (1) 3– to 5-nerved, commonly 1–3 mm wide *C. nauseosus* var. *glabratus*
 — Leaves 1-nerved, commonly 0.5–1.5 mm wide 15
- 15(14). Leaves and/or stems usually grayish or whitish tomentose or green, not especially yellow green; involucres more or less tomentose *C. nauseosus* var. *albicaulis*
 — Leaves and/or stems usually yellowish green, the tomentum commonly resinous-matted; involucres glabrous *C. nauseosus* var. *consimilis*

Var. *albicaulis* (Nutt.) Rydb. [*C. speciosus* var. *albicaulis* Nutt.; *C. nauseosus* ssp. *albicaulis* (Nutt.) H. & C.]. Saltgrass, sagebrush, pinyon-juniper, and ponderosa pine communities at 1310 to 2290 m in Box Elder, Cache, Carbon, Iron, Juab, Kane, Millard, Morgan, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Wasatch, and Weber counties; Oregon to Wyoming, south to California, Nevada, and New Mexico; 24 (i). This taxon forms intermediates with var. *glabratus*. In low elevation phases of saline substrates the stems are white-pannosa.

Var. *arenarius* (L. C. Anderson) Welsh [*C. nauseosus* ssp. *arenarius* L. C. Anderson]. Sagebrush, juniper, and pinyon-juniper communities at 1675 to 1830 m in Grand, Kane, San Juan, and Washington counties; Arizona; 12 (v). This is a plant of deep sandy alluvium.

Var. *bigelovii* (Gray) Hall [*C. nauseosus* ssp. *bigelovii* (Gray) H. & C.; *Linosyris* (*Chrysothamnus*) *bigelovii* Gray]. Grayia and pinyon-juniper communities 1460 to 1950 m in Emery, Garfield, and San Juan counties; Arizona, Colorado, New Mexico; 6 (v). More collections of this entity are required.

Var. *consimilis* (Greene) Hall [*C. nauseosus* ssp. *consimilis* (Greene) H. & C.; *C. consimilis* Greene]. Saline meadows, riparian zones, and terraces in saltgrass-alkali saccaton, shadscale, sagebrush, rabbitbrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1280 to 3000 m in all Utah counties except Grand and San Juan; Oregon to Wyoming, south to California, Arizona and New Mexico; 100 (xxv). This is the common narrow-leaved phase with cone-shaped panicles. They occur frequently in saline moist sites, such as the travertine mounds at Monroe Hot Springs.

Var. *glabratus* (Gray) Cronq. [*Bigelovia graveolens* var. *glabrata* Gray; *C. nauseosus* ssp. *graveolens* (Gray) Piper; *C. nauseosus* var. *graveolens* (Gray) Hall]. Desert willow-baccharis, willow-cottonwood, greasewood-tamarix, sagebrush, shadscale, mountain brush, and ponderosa pine communities at 750 to 2475 m in Iron, Piute, Sanpete, Sevier, Summit, Utah, Wasatch, and Washington counties, and in all counties east of those; Idaho to North Dakota, south to Arizona, and New Mexico; 88 (xxiii).

Var. *glareosus* (Jones) Welsh [*Bigelovia glareosa* Jones, type from Marysvale; *C. nauseosus* ssp. *glareosa* (Jones) H. & C.]. The type specimen is lost, and the ultimate disposition of this taxon is uncertain; it should be sought in the canyon north of Marysvale, on Tertiary igneous substrates; endemic; 0 (0).

Var. *gnaphaloides* (Greene) Hall [*C. speciosus* var. *gnaphaloides* Greene; *C. nauseosus* ssp. *hololeucus* (Gray) H. & C., in part; *C. zionis* A. Nels., type from 20 mi N of St. George]. Shadscale, pigmy sagebrush, rabbitbrush, sagebrush, and pinyon-juniper communities at 1070 to 2380 m; known in all Utah counties except Daggett, Kane, Morgan, Rich, Summit, and Wayne, and likely in them also; California, Nevada, and Arizona (?); 73 (vii). This taxon is a near ally of ssp. *hololeucus* (Gray) H. & C., and should that taxon be placed within a quadrinomial, then the var. *gnaphaloides* would be placed within it. However, no such combination is implied or proposed herein.

Var. *iridis* (L. C. Anderson) Welsh [*C. nauseosus* ssp. *iridis* L. C. Anderson, type from Rainbow Hills, Sevier County]. Rabbitbrush-sagebrush community on an incipient seep in Arapien shale at ca 1980 m in Sanpete and Sevier counties; endemic; 2 (i).

Var. *junceus* (Greene) Hall [*C. nauseosus* ssp. *junceus* (Greene) H. & C.; *Bigelovia juncea* Greene]. Blackbrush, shadscale, rabbitbrush, matchweed, and pinyon-juniper communities at 1220 to 1800 m in Emery, Garfield, Grand, Kane, San Juan and Wayne counties; Arizona; 18 (iv). The non-glandular, clear straw colored, long involucres with bracts usually aligned are distinctive of this variety.

Var. *leiospermus* (Gray) Hall [*Bigelovia leiosperma* Gray, type from St. George; *C. nauseosus* ssp. *leiospermus* (Gray) H. & C.; *B. leiosperma* var. *abbreviata* Jones, type from Clear Creek Canyon, Sevier County; *C. nauseosus* var. *abbreviata* (Jones) Welsh; *C. oliganthus* A. Nels, type from Zion Canyon]. Blackbrush, Grayia, shadscale, black sagebrush, Vanclevea, pinyon-juniper, and ponderosa pine communities at 1070 to 2745 m in Box Elder, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, Sevier and Washington counties; Nevada, California; 15 (v). The materials from Emery and Grand counties have leaves which are very slender and subterete. The condition is presumably derived from introgression with var. *bigelovii*.

Var. *nitidus* (L. C. Anderson) Welsh [*C. nauseosus* ssp. *nitidus* L. C. Anderson]. Vanclevea-ephedra community at about 1250 m in Garfield and Kane counties; Arizona; 1 (0). This variety has the general aspect of vars. *bigelovii* and *leiospermus*. It is a taller plant than either, and differs otherwise as set forth in the key.

Var. *psilocarpus* Blake [*C. nauseosus* ssp. *psilocarpus* (Blake) L. C. Anderson]. Sagebrush and salina wildrye communities at 1925 to 2290 m in Carbon, Duchesne,

Emery (type from Huntington Canyon), and Wasatch counties; endemic; 5 (0). These peculiar low shrubs occasionally produce taller intermediates with var. *glabratus* (q.v.).

Var. *salicifolius* (Rydb.) Hall [*C. salicifolius* Rydb., type from Strawberry Valley; *C. nauseosus* ssp. *salicifolius* (Rydb.) H. & C.]. Sagebrush, pinyon-juniper, mountain brush, and aspen communities at 1310 to 2870 m in Box Elder, Cache, Carbon, Duchesne, Emery, Juab, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, and Wasatch counties; endemic; 19 (iii). This entity forms intermediates with var. *glabratus*, and might represent nothing more than a broad-leaved extension of that taxon.

Var. *turbinatus* (Jones) Blake [*Bigelovia turbinata* Jones, type from Canaan Ranch, Kane County; *C. nauseosus* ssp. *turbinatus* (Jones) H. & C.]. Rabbitbrush, saltbush, ephedra, juniper, and greasewood communities at 1370 to 1710 m in Beaver, Duchesne, Iron, Juab, Kane, Millard, and Uintah counties; Nevada (?); 48 (v). Both glabrous and pilose achenes occur in this distinctive taxon. It shares the feature of villous corolla lobes with the sand-loving var. *junceus* of the Navajo Basin. The Uintah Basin materials differ in the more keeled and attenuate involucre and flowers that are more exerted from the involucre.

Var. *uintahensis* (L. C. Anderson) Welsh stat. nov. [based on: *Chrysothamnus nauseosus* ssp. *uintahensis* L. C. Anderson Great Basin Naturalist 44: 416. 1984]. Rabbitbrush and juniper communities at 1675 to 2015 m in Daggett and Uintah counties; endemic; 12 (i). This is a peculiar dwarf white-pannose phase with heads clustered at branch ends, simulating *Tetradymia canescens* in habit and aspect. The plant appears to be a stabilized hybrid involving *C. nauseosus* and *C. parryi*.

***Chrysothamnus paniculatus* (Gray) Greene** Mohave Rabbitbrush. [*Bigelovia paniculata* Gray]. Tall shrubs, the branches subfastigate, mainly 6–20 dm tall, the bark green, becoming tan to gray in age, resinous-punctate; leaves 0.4–3 cm long, about 0.5 mm wide, linear-filiform, terete, mucronate apically; heads numerous, in usually conic panicles; involucre 4.8–6.5 mm high, 2–3 mm wide, the bracts indistinctly ranked, chartaceous-indurate, scarcely if at all glandular, thickened at midrib, obtuse, glandular; corollas yellow, 5.5–6 mm long; achenes 1.8–3.4 mm long, pilose; $n = 9$. Roadsides, stream banks, terraces, and slopes in creosote bush, Joshua tree, and baccharis communities at 670 to 1220 m in Washington County; Nevada, Arizona, California; 15 (iv). The plants begin to flower in October and continue into November.

***Chrysothamnus parryi* (Gray) Greene** Parry Rabbitbrush. Low to moderate shrubs, the branches not especially fastigate, mainly 2–6 dm tall, the bark pannose-tomentose or the tomentum glandular-resinous; leaves 0.6–6 (8) cm long, 1–2 mm wide, 1- to 3-nerved, green, viscid or sometimes tomentulose, flat, usually plane, linear to narrowly oblong; heads several to many, the inflorescences tending to be elongate and subracemose; involucre 9–14.5 mm high, 4–8 mm wide, the bracts obscurely to definitely ranked, puberulent to glabrous, the outer usually with elongate herbaceous tips, the inner chartaceous, with glandular-thickened midrib, abruptly to gradually acuminate-attenuate or attenuate; corollas yellow or creamy yellow, 8–10 mm long; achenes 3.3–7.5 mm long, pilose; $2n = 18$. Plants of the *parryi* complex

form hybrid derivatives with phases of *C. nauseosus*, and with other named segregates within the complex. Except for varieties *parryi* and *nevadensis*, only arbitrary segregation appears possible. Thus, the conservative treatment as outlined below seems to best reflect the nature of *C. parryi* in Utah.

1. Flowers usually more than 10 per head *C. parryi* var. *parryi*
- Flowers commonly 5–9 per head 2
- 2(1). Involucral bracts mainly 24–28; plants of southwestern Utah *C. parryi* var. *nevadensis*
- Involucral bracts mainly 12–22; plants of south central, central, and northeastern Utah *C. parryi* var. *attenuatus*

Var. *attenuatus* (Jones) Kittell in Tidestr. & Kittell [*Bigelovia howardii* var. *attenuata* Jones, type from near Marysvale; *C. parryi* ssp. *attenuatus* (Jones) H. & C.; *C. affinis*. A. Nels.; *C. parryi* ssp. *affinis* (A. Nels.) L. C. Anderson; *Linosyris howardii* Parry in Gray; *C. parryi* ssp. *howardii* (Parry) H. & C.; *C. parryi* var. *howardii* (Parry) Kittell in Tidestr. & Kittell]. Meadows, sagebrush, juniper, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities at 1740 to 2930 m in Beaver, Carbon, Daggett, Duchesne, Garfield, Grand, Iron, Kane, Piute, Sanpete, Sevier, Uintah, Utah, Wasatch, and Wayne counties; Wyoming and Nebraska, south to Arizona and New Mexico; 55 (xv). The *howardii* phase differs supposedly in the bracteate leaves overtopping the inflorescence and in the pale colored flowers; both characters fail as diagnostic features.

Var. *nevadensis* (Gray) Kittell in Tidestr. & Kittell [*Linosyris howardii* var. *nevadensis* Gray; *C. parryi* ssp. *nevadensis* (Gray) H. & C.]. Sagebrush, juniper, pinyon-juniper, mountain brush, and ponderosa pine communities at 1830 to 2565 m in Beaver, Iron, Millard, and Washington counties; Arizona; 10 (ii). The var. *nevadensis* differs only in degree from var. *attenuatus*, with which it is contiguous, if not partially sympatric, to the east. Should the two be combined, then the correct name will be var. *nevadensis*, since that name has priority in rank. Plants with leaves overtopping the inflorescence occur; technically they would key to the *howardii* phase of var. *attenuatus*.

Var. *parryi* [*Linosyris parryi* Gray]. Ponderosa pine and spruce-fir communities at 2075 to 2625 m in Beaver, Emery, Garfield, Kane, Millard, and Washington counties; Wyoming, Colorado, New Mexico, and Nevada; 9 (ii).

***Chrysothamnus pulchellus* (Gray) Greene** Southwest Rabbitbrush. [*Bigelovia pulchella* Gray]. Low to moderately tall shrubs, the branches not fastigate, mainly 5–10 dm tall, the bark white, becoming tan or brown in age, glabrous or puberulent above; leaves 0.4–3 cm long, 1–2 mm wide, linear to narrowly oblanceolate, glabrous or puberulent, flat or revolute, mucronate; heads few to many, in corymbose panicles; involucre 11.5–15 mm high, 4.5–6 mm wide, the bracts distinctly aligned, more or less herbaceous towards the apex, glandular, attenuate to sharply acute; corollas yellow, 9–10 (14) mm long; achenes 3.8–4.5 mm long, sparingly hirsute and glandular; $2n = 18$. Shadscale, blackbrush, ephedra, pinyon-juniper, and ponderosa pine communities at 1370 to 2350 m in Emery, Wayne, and San Juan counties; Arizona to Kansas, south to Mexico; 4 (i). Our material belongs to var. *baileyi* (Woot. & Standl.) Blake [ssp. *baileyi* (Woot. & Standl.) H. & C.].

Chrysothamnus vaseyi (Gray) Greene Vasey Rabbitbrush. [*Bigelovia vaseyi* Gray]. Low shrubs, mainly 1–3 dm tall, the branches not especially fastigiate, the bark green, becoming whitish tan or finally gray in age, puberulent; leaves 0.3–3.7 cm long, 0.8–3 mm wide, linear to oblong or narrowly oblanceolate, glabrous or glandular, flat, plane, mucronate; heads numerous in compact terminal cymes; involucre 6.2–7.5 mm high, 3–6 mm wide, the bracts more or less aligned, commonly herbaceous or thickened near the apex, glandular, obtuse, the margins fimbriate-hyaline; corolla yellow, 4.8–7 mm long; achenes 2.6–4 mm long, glabrous. Meadows, sagebrush, rabbitbrush, juniper, mountain brush, and ponderosa pine communities at 1675 to 2900 m in Beaver, Carbon, Emery, Garfield, Juab, Kane, Iron, Piute, San Juan, Sanpete, Sevier, Utah, and Wasatch counties; Nevada, Wyoming, Colorado, New Mexico; 21 (ii).

Chrysothamnus viscidiflorus (Hook.) Nutt. Viscid Rabbitbrush. Low to moderate shrubs, mainly 2–10 dm tall, the branches fastigiate or not, the bark green to tan or white, finally gray in age, glabrous or puberulent; leaves 0.3–4.5 (6) cm long, 0.5–4 (10) mm wide, 1– to 5–nerved, linear to oblong, elliptic or oblanceolate, often twisted, mucronate; heads numerous, in compact to open terminal cymes; involucre 5–7.5 mm high, 2–4 mm wide, the bracts not well-aligned, commonly herbaceous or thickened near the apex (at least the outer), glandular or puberulent, obtuse, or abruptly acute, the margin narrow, hyaline; corollas yellow, 3.8–6 mm long; achenes 3–4 mm long, pilose; 2n = 18, 36. The *viscidiflorus* complex is separable into two groups on the basis of pubescence of upper stems or the lack of pubescence. The segregation is not complete, because pubescence or its absence is not an absolute criterion. There is a cline in the amount of pubescence from abundant to little (or none), and the adoption of a position that one hair equals pubescence and, therefore one part of the complex and not the other, will lead to absurdity. Within the hairy phase of the complex are two more or less distinctive but largely sympatric varieties. The “glabrous” portion of the species is more difficult to separate into its constituent entities. Anderson (Great Basin Naturalist 40: 117–20, 1980) reviewed this portion of the complex; concluding that there are three taxa involved, i.e. ssp. *axillaris* (ssp. *viscidiflorus* var. *viscidiflorus*, and ssp. *viscidiflorus* var. *stenophyllus*. Only arbitrary separation of the three is possible, and segregation of the *axillaris* phase is problematical. In my view it is not practical to attempt recognition of more than two taxa, i.e. var. *stenophyllus* (including *axillaris*) and var. *viscidiflorus*. They are all recognized herein at varietal level, but probably would best fit within an expanded ssp. *viscidiflorus* as varieties (a course not intended or implied herein). The following key will allow for identification of most specimens.

- 1. Stems (at least above) and/or leaves puberulent to hispidulous 2
- Stems and leaves glabrous, or the leaves ciliate, or rarely with a few short hairs on stems or with glandular excrescences in the inflorescence 3
- 2(1). Leaves 0.5–2 mm wide; stems finely puberulent above *C. viscidiflorus* var. *puberulus*
- Leaves 2–5 mm wide; stems hispidulous-puberulent above *C. viscidiflorus* var. *lanceolatus*
- 3(1). Leaves 0.5–1.5 mm wide; plants mainly 2–3 dm tall *C. viscidiflorus* var. *stenophyllus*

- Leaves mainly 1–4 mm wide (or more); plants mainly 3–10 dm tall *C. viscidiflorus* var. *viscidiflorus*

Var. *lanceolatus* (Nutt.) Greene [*C. lanceolatus* Nutt.; *C. viscidiflorus* ssp. *lanceolatus* (Nutt.) H. & C.]. Sagebrush, pinyon-juniper, mountain brush, aspen, Douglas fir, lodgepole pine, spruce-fir, and alpine meadow communities at 1375 to 3200 m in all Utah counties except Kane and Washington, and likely there also; British Columbia to South Dakota, and south to California, Nevada, Arizona, and New Mexico; 112 (xii).

Var. *puberulus* (D. C. Eaton) Jepson [*Linosyris viscidiflora* var. *puberula* D. C. Eaton; *C. viscidiflorus* ssp. *puberulus* (D. C. Eaton) H. & C.; *C. marianus* Rydb., type from near Marysville, Piute County]. Rabbitbrush, black sagebrush, shadscale, sagebrush, pinyon-juniper and ponderosa pine communities at 1460 to 2200 m in the western tier of counties, east to Carbon, Emery, Piute, Sevier, Utah, and Salt Lake counties; Oregon and Idaho south to California, Nevada, and Arizona; 44 (vii).

Var. *stenophyllus* (Gray) Hall [*Bigelovia douglasii* var. *stenophylla* Gray; *C. viscidiflorus* ssp. *stenophylla* (Gray) H. & C.; *C. axillaris* Keck; *C. viscidiflorus* ssp. *axillaris* (Keck) L. C. Anderson]. Ephedra, blackbrush, rabbitbrush, sagebrush, galleta, shadscale, and pinyon-juniper communities at 1280 to 2075 m in all Utah counties except Cache, Carbon, Davis, Duchesne, Morgan, Piute, Salt Lake, Sanpete, Sevier, Summit, Utah, Wasatch, and Weber; Oregon to Wyoming and south to California, Nevada, Arizona, and Colorado; 34 (vii).

Var. *viscidiflorus* [*Crinitaria viscidiflora* Hook.; *C. viscidiflorus* var. *pumilus* authors, not (Nutt.) Jepson (?); *B. douglasii* var. *spatulata* Jones, type from Fish Lake, Sevier County; *Linosyris serrulata* Torr. in Stansb., type from Salt Lake Valley]. Rabbitbrush, shadscale, sagebrush, pinyon-juniper, mountain brush, white fir, ponderosa pine, and aspen communities at 1460 to 2900 m in all or nearly all Utah counties; Washington to Nebraska, south to California, Nevada, Arizona, and Colorado; 100 (xx). The var. *viscidiflorus* forms intermediates with all other taxa in the species, and with *C. greenei* also.

Cichorium L.

Perennial herbs, with milky juice, from taproots; leaves alternate, toothed to pinnatifid; heads sessile or subsessile, numerous, borne in clusters at nodes of a spicate, simple, or branched inflorescence; involucre bracts biserrate, the outer shorter; corollas all raylike, perfect; pappus of 2 or 3 series of scales, sometimes minute; achenes angular or somewhat compressed, glabrous.

Cichorium intybus L. Chickory. Plants 3–10 dm tall or more, hirsute or glabrous; lower leaves petiolate, the blades 6–20 cm long, 1–5 (7) cm wide, sinuate-dentate to runcinate-pinnatifid, becoming smaller and sessile upwards, some finally subentire; heads large and showy, 1–3 per node of inflorescence; flowers pure blue, rarely white; involucre 9–15 mm high, the outer bracts chartaceous at base, herbaceous apically; achenes 2–3 mm long; 2n = 16, 18, 20. Roadsides and disturbed sites at 1340 to 2135 m in Cache, Duchesne, Iron, Kane, Salt Lake, Tooele, Utah, and Washington counties; widespread in North America; native of Eurasia; 8 (i). The herb *C. endiva* L. is grown in Utah; the extent is not known.

Cirsium Miller

Annual, biennial, or perennial, caulescent or acaulescent, spiny herbs from taproots, with caudices or rhizomes in some, the juice watery; leaves basal and cauline, alternate; heads solitary to several; involucre bracts in several series, subequal to imbricate, some or most of them spine-tipped; receptacle densely bristly; corollas all discoid, pink, purple, red, or creamy white, perfect or imperfect; pappus of plumose bristles (or those of the outermost flowers merely barbellate); style with a thickened minutely hairy ring below the nearly connate lobes; achenes glabrous, flattened or 4-angled, 4- to many-nerved. Note: This is a particularly complex genus taxonomically, with both introduced and indigenous species. The indigenous members are especially difficult, due in part to hybridization, mainly within species groups. The following treatment is tentative, but represents an attempt to categorize the variation present in Utah plants and to provide a legitimate name for each. Several taxa previously reported from the state are excluded, or they are treated within the constituent taxa. All involucre measurements are from pressed plants.

1. Flowers mainly imperfect; heads unisexual; plants perennial, from rhizomes; introduced weed of consequence *C. arvense*
- Flowers perfect; plants biennial or perennial, seldom if ever with rhizomes 2
- 2(1). Leaves roughly hispid above, green; stems conspicuously winged decurrent; plants biennial, introduced *C. vulgare*
- Leaves villous, floccose, arachnoid, tomentose, or glabrous, white to gray or green; stems not winged-decurrent, except in some species; plants indigenous biennials or perennials 3
- 3(2). Basal rosettes to 10 dm across, the mature leaves commonly 10-30 cm wide, green, glabrate or glabrous on both sides; heads small, with long, tapering, recurved spines; plants of hanging gardens in southeastern Utah, rarely in drainages below them *C. rydbergii*
- Basal rosettes rarely to 5 dm across, the mature leaves usually less than 8 cm wide, floccose, tomentose, arachnoid, or glabrous on one or both sides; plants seldom of hanging gardens in southeastern Utah 4
- 4(3). Bracts, at least the innermost, conspicuously dilated (but not lacerate), or definitely tan to silvery in appearance, contrasting with the overall aspect of the bracts; plants commonly of meadows *C. scariosum*
- Bracts all spinose, or the innermost occasionally twisted to contorted at the tips, but not especially dilated or conspicuously different in color or texture from the overall aspect of bracts (see *C. centaureae*); plants of various habitats 5
- 5(4). Involucre bracts (at least the outer) pinnately spinose; plants green, with yellowish spines, of high elevations in the Wasatch, Tushar, and Uinta mts. *C. eatonii*

- Involucre bracts not, or rarely, pinnately spinose (except in *C. clavatum*, *C. scopulorum*, and *C. ownbeyi* and the plants then of low elevations) 6
- 6(5). Heads 1.8-2.7 cm high, and about as wide; inner bracts with coarsely lacerate margins; plants of lower middle elevation meadows *C. centaureae*
- Heads 1.5-3 cm high, 1.5-4.5 (6) cm wide; inner bracts not lacerate; leaves thinly textured, finely to coarsely spined, definitely tomentose or glabrous; plants of various distribution 7
- 7(6). Herbage definitely white- to gray-tomentose (rarely green); involucre 1.5-2 cm high, 1.5-2.5 cm wide; plants of white shale outcrops in the Uinta Basin *C. barnebyi*
- Herbage green, or white- to gray-tomentose; involucre mainly longer and broader but, if not, of different distribution 8
- 8(7). Stems definitely winged-decurrent; heads mainly 1.3-2 cm high, 1.2-3.2 cm wide; herbage white- to gray-tomentose; plants of Sanpete and Washington counties 9
- Stems not winged, or if so, the herbage green and glabrous or nearly so, or the heads commonly larger; plants of various distribution 10
- 9(8). Leaves of upper stem merely spinose-toothed, tapering from base to apex; plants of Washington County only *C. virginensis*
- Leaves of upper stem definitely lobed, the lobes spinose-toothed, with parallel sides from base to near apex; plants not of Washington County *C. subniveum*
- 10(8). Herbage glabrous or glabrate, green 11
- Herbage tomentose, floccose-tomentose, gray or white, or only the upper leaf surfaces green 16
- 11(10). Flowers bright red or carmine; corolla lobes 15-18 mm long; spines of middle involucre bracts 7-11 mm long or more; plants of San Juan County *C. rothrockii*
- Flowers pink, pink purple, or white; corolla lobes less than 15 mm long; spines of middle involucre bracts 1-6 mm long; plants of various distribution 12
- 12(11). Outer bracts not pinnately spinose; mainly low elevation plants, usually in gypsiferous soils, in the Navajo Basin *C. calcareum*
- Outer bracts more or less pinnately spinose; plants of the Navajo and Uinta basins 13
- 13(12). Stems strongly winged almost or quite the length of upper internodes; main upper leaves tripinnatifid; plants of lower elevations in northern Uintah and Daggett counties *C. ownbeyi*
- Stems not winged, or rarely some internodes with incipient wings; main upper leaves pinnatifid to bipinnatifid; plants of moderate to high elevations in the southern end of the Uinta Basin and southward 14
- 14(13). Involucre bracts ciliate with long yellowish or brownish multicellular hairs; spines of bracts 6-15 mm long or more; plants of the east Tavaputs Plateau and La Sal Mts. *C. scopulorum*
- Involucre bracts more or less ciliate with whitish hairs or a tomentum; spines of bracts mainly 3-7 mm long; plants from the Tavaputs Plateau and southwestward 15
- 15(14). Involucre bracts scabrous dorsally, at least the innermost; herbage not at all tomentose; plants of the Henry Mts. *C. calcareum*
- Involucre bracts not scabrous dorsally; herbage more or less tomentose; plants not of the Henry Mts. *C. clavatum*

- 16(10). Heads campanulate, mainly 3.5–6.5 cm wide at anthesis or, if narrower, the bracts commonly glandular-thickened dorsally 17
- Heads turbinate to subcylindric, mainly 2–3.5 cm wide at anthesis; involucre bracts seldom glandular-thickened dorsally 18
- 17(16). Involucral bracts appearing brown to gray brown, the spines arising from the body of the bract, not from spreading long-attenuate herbaceous terminal portions; bracts of inflorescence usually prominent; plants of broad distribution *C. undulatum*
- Involucral bracts appearing green or fresh green or at least herbaceous, the spines arising from the apex of spreading long-attenuate terminal portions; bracts of inflorescence much reduced; plants of various distribution *C. neomexicanum*
- 18(16). Corollas bright red or carmine; plants from Garfield and Iron counties southward *C. arizonicum*
- Corollas pale pink, pink, rose purple, or white; plants mainly from Garfield and Iron counties northward .. 19
- 19(18). Involucral bracts (at least the inner) tapering, wedge-shaped, definitely scabrous roughened on dorsal surface, often suffused with reddish or purplish *C. calcareum*
- Involucral bracts smooth dorsally, seldom only somewhat scabrous, not conspicuously tapering, and seldom conspicuously suffused with reddish or purplish *C. wheeleri*

Cirsium arizonicum (Gray) Petrak Arizona Thistle. [*Cnicus arizonicus* Gray]. Biennial or short-lived perennial herbs from a taproot, the caudex sometimes developed; leaves of basal rosettes 7–36 cm long, bipinnately lobed or parted, the lobes again lobed or toothed, the main spines 1–6 mm long, white to grayish tomentose below, more or less tomentose and greenish to green above; stems 4–7.5 dm tall, more or less floccose-tomentose; cauline leaves 3–35 cm long, 1–8 cm wide, with lobing and vesture similar to the basal, reduced and less deeply lobed upwards; involucre 22–30 mm high, 20–50 mm wide, subcylindric to turbinate, the bracts tomentose at margins, and over back, smooth and often shiny medially, rarely glandular-thickened, the apical portions, especially of the inner definitely scabrous; spines yellowish, 3–10 (15) mm long; corollas crimson to carmine, 25–34 mm long, the tube 8–13 mm long, throat 1.5–11 mm long, the lobes 10–19 mm long. Two more or less distinctive but intergrading phases are present.

- 1. Heads subcylindric to turbinate; spines 3–10 mm long; plants mainly of the Colorado drainage system (also in western Garfield, and in Iron counties) *C. arizonicum* var. *arizonicum*
- Heads turbinate to broadly so; spines 3–15 mm long or more; plants mainly of the Great Basin and Virgin drainages (also in eastern Iron and western Garfield counties) *C. arizonicum* var. *nidulum*

Var. arizonicum 2n = 30, 32, 34. Salt desert shrub, pinyon-juniper, ponderosa pine, spruce-fir, and hanging garden communities at 1220 to 3050 m in Garfield, Grand, Iron, Kane, Piute, San Juan, and Washington counties; Arizona; 26 (iv).

Var. nidulum (Jones) Welsh [*Cnicus nidulus* Jones, type from Paria, Garfield County]. 2n = 32, 34. Pinyon-juniper, mountain brush, aspen, ponderosa pine, Douglas fir, white fir, and spruce-fir communities at 1890 to

3200 m in Beaver, Garfield, Iron, Kane, Millard, Piute, San Juan, and Washington counties; Arizona, Nevada; 37 (iii). Relationships apparently lie with *C. rothrockii*, *C. calcareum*, and to a lesser extent, with *C. wheeleri*.

Cirsium arvense (L.) Scop. Creeping or Canada Thistle. [*Serratula arvensis* L.]. Perennial rhizomatous herbs, the stems mostly 5–10 dm tall, glabrous or sparingly tomentose; leaves 3–15 cm long, 1–6 cm broad, deeply pinnatifid or lobed to merely toothed, glabrous to tomentose above and beneath; heads several to many, mainly unisexual; involucre 10–20 (25) mm high, 10–25 mm wide, the bracts lance-ovate, at least the outer ones and often all of them spine-tipped, tomentose to glabrous; corollas pink purple to white; pappus of pistillate heads longer than the corollas, that of staminate heads shorter than the corollas; achenes 3–5 mm long; n = 17, 18. Roadsides, fields, and other disturbed sites, but also invading native plant communities, at 1280 to 2535 m, probably in all Utah counties; widespread in North America; adventive from Eurasia; 42 (iii). We have two phases of creeping thistle in Utah; the one with merely toothed (unlobed) leaves is var. *mite* Wimmer & Grab., and the common one with deeply lobed leaves is var. *horridum* Wimmer & Grab. This common weed and the bull thistle are our only two introduced thistles in the genus *Cirsium*, which makes up a huge assemblage in the Old World. We can expect more introductions.

Cirsium barnebyi Welsh & Neese Barneby Thistle. Perennial herbs from a caudex and taproot, the caudex clothed with black marcescent leaf bases; leaves of basal rosettes 11–25 cm long, bipinnately lobed or parted, the lobes again lobed or toothed, the main spines 3–5 mm long, whitish to grayish tomentose on both sides; stems 3–5 dm tall, whitish tomentose (rarely green); cauline leaves 2–30 cm long, 1–8 cm wide, with lobing and vesture similar to the basal, reduced and less deeply lobed upwards; involucre 15–22 mm high, 20–30 mm wide, turbinate, the bracts glabrate or sparingly arachnoid on margins, glutinous dorsal ridge inconspicuous, smooth medially, the apical portions of the inner often contorted, not scabrous dorsally; spines 2–7 mm long, flattened apically, more or less spreading; corollas bluish pink. Sagebrush, juniper, cryptantha, ephedra, wildrye, and rabbitbrush communities at 1525 to 2257 m in Uintah (type from near Ignacio) County; endemic; 7 (iii). The Barneby thistle is apparently related to the *undulatum* complex.

Cirsium calcareum (Jones) Woot. & Standl. Cainville Thistle. [*Cnicus calcareus* Jones, type from Cainville]. Perennial herbs from a caudex and taproot, the caudex with brownish black to castaneous marcescent leaf bases; leaves of basal rosettes 6–35 cm long, pinnatifid to bipinnatifid, glabrous and green or tomentose on one or both surfaces, the main spines 3–8 mm long; stems mainly 2–5 dm tall, glabrous or more or less floccose-tomentose, winged-decurrent or not; cauline leaves 3–28 cm long, 0.8–7 cm wide, bipinnatifid, with lobing and vesture like the basal, reduced upwards, the main spines 3–8 mm long; involucre 19–34 mm long, 15–45 mm wide, the bracts ovate-lanceolate to linear, more or less tomentose at the margins, smooth and often shiny medially, the dorsal ridge glandular-thickened or not, the apical portions of at least the inner scabrous; spines straw colored, 1.5–6 mm long; corollas pink to blue pink. The *calcareum* complex is a portion of the *arizonicum* group of thistles,

and has long been misinterpreted. There are three more or less confluent varieties present in Utah. Specimens collected are few, especially in the critical southeastern portion of the state. More work is indicated.

1. Herbage permanently tomentose, the leaves grayish tomentose beneath *C. calcareum* var. *pulchellum*
- Herbage green, the leaves rarely sparingly tomentose along the midveins beneath 2
- 2(1). Leaves definitely decurrent, the stems winged 2–6 cm below leaf base; plants of San Juan and Wayne counties *C. calcareum* var. *calcareum*
- Leaves not or scarcely decurrent; plants of other distribution *C. calcareum* var. *bipinnatum*

Var. *bipinnatum* (Eastw.) Welsh [*Cnicus drummondii* var. *bipinnatum* Eastw.]. Aspen, Douglas fir, and riparian communities at 1130 to 3150 m in Garfield, Kane, and San Juan counties; Colorado, New Mexico, and Arizona; 8 (i).

Var. *calcareum* [*Cirsium pulchellum* var. *glabrescens* Petrak type from Elk Mts., San Juan County]. Riparian communities at 1460 to 2200 m in Carbon, San Juan, and Wayne counties; endemic (?); 4 (i). A peculiar plant with thin leaves that are glabrous on both sides and subtentire is known from Cedar Canyon (Atwood and Higgins 5918 BRY). How it fits into the scheme of Utah thistles is not known, but the plant appears to be intermediate between this and some other thistles. The status of the Cainville thistle, as strictly interpreted, beyond Utah is unknown; it seems likely that it does not occur outside the state.

Var. *pulchellum* (Greene) Welsh [*Carduus pulchellus* Greene ex Rydb.]. Rabbitbrush, sagebrush, tamarix, pinyon-juniper, and aspen communities at 1340 to 2745 m in Carbon, Emery, Garfield, Grand, Kane, San Juan, Uintah, Utah, and Wayne counties; Colorado, New Mexico, Arizona; 41 (vii). Both winged and wingless stems are present within our material. There are plants from the San Rafael Swell with winged stems and they are similar to *C. ochrocentrum* Gray of New Mexico, but they appear to be transitional in every way with the wingless plants. And it seems probable that they are not conspecific with that plant as it occurs beyond Utah. Possibly they do warrant taxonomic recognition. Further collections are necessary.

***Cirsium centaureae* (Rydb.) K. Schum.** Fringed Thistle. Perennial herbs from a simple caudex and taproot, the caudex with chestnut leaf bases; leaves of basal rosette 2–28 cm long, 1–8 cm wide, pinnatifid, the lobes often again toothed, tomentose below, thinly tomentose to glabrous above, the main spines 1–5 mm long; stems 3–12 dm tall, not succulent, arachnoid or glabrous; cauline leaves with lobing and vestiture like the basal, the spines 3–8 mm long; involucre 18–27 mm high, and about as wide, the outer bracts lance-ovate, the inner with coarsely lacerate margins, usually dilated in the upper half, tomentose to glabrous on the margins, the dorsal ridge not well developed, the longest spines 2–5 mm long, straw colored; flowers white to pink or purple; $n = 17, 18$. Montane communities at 3355 m in San Juan County; Wyoming and Colorado; 2 (0).

***Cirsium clavatum* (Jones) Petrak** Fish Lake Thistle. [*Cnicus clavatus* Jones, type from Fish Lake]. Perennial or biennial herbs from a taproot, and often with a caudex, the caudex clothed with marcescent chestnut brown leaf bases; leaves of basal rosettes 2.5–22 cm long, bipinnately

parted to merely toothed, green on both sides or more or less tomentose below, the main spines 1–6 mm long; stems 3–10 dm tall, glabrous or thinly tomentose; cauline leaves 3–26 cm long, 0.5–7 cm wide, with lobing and vestiture like the basal, reduced and less lobed above; involucre 18–23 (32) mm high, 22–30 (55) mm wide, the bracts more or less villous-tomentose on margins, the outer ones usually pinnately spiny, smooth medially, the dorsal ridge not especially glandular, apical portions of the inner ones often scabrous, sometimes slightly dilated-erose; spines yellowish, 3–8 (18) mm long; corollas white or less commonly pink. Sagebrush, meadow, aspen, Douglas fir, and spruce-fir communities at 2135 to 3200 m in Beaver, Carbon, Emery, Garfield, Grand, Kane, Piute, San Juan, Sanpete, Sevier, Uintah, and Wayne counties; endemic; 27 (viii). The Fish Lake thistle is apparently related to the allopatric *C. eatonii*. It is more or less transitional to *C. wheeleri*, and probably other taxa, especially those with scabrous inner bracts. Rarely some have decurrent leaf bases, and when the pinnately spinose bracts are poorly developed, this thistle approaches *C. calcareum*. Moore and Frankton (1965) proposed that *C. clavatum* was a hybrid between *C. eatonii* and *C. centaureae*. However, despite its possible origin from hybridization, the taxon seems to be organized on about the same basis as other thistles. Further, its distribution is distinct from that of the putative parents. There does not seem to be justification for recognition of this entity as a hybrid.

***Cirsium eatonii* (Gray) Robins.** Eaton Thistle. [*Carduus eatonii* Gray]. Perennial herbs from a simple or rarely branched caudex and taproot, the caudex clothed with brownish black to brown marcescent leaf bases; leaves of basal rosette 4–20 cm long, more or less bipinnatifid, green and glabrous or nearly so on both sides, the main spines 1.5–4 mm long; stems 1.5–5 dm tall, glabrous or nearly so; cauline leaves 3–25 cm long, 0.6–5.5 cm wide, with lobing like the basal, reduced upwards; involucre 20–37 mm high, 25–50 mm wide, the bracts ovate-lanceolate to lance-linear, tomentose to long-villous marginally (rarely overall), the outer ones usually pinnately spiny, smooth to roughened medially, the dorsal ridge not developed, the apical portions of the inner ones sometimes contorted; spines 5–18 mm long, straw colored; corollas pink to white. Three more or less distinctive varieties are present.

1. Involucral bracts copiously gray to brown villous with multicellular hairs; corollas ocreoleucous; plants of the Uinta Mts. from Lake Fork eastward *C. eatonii* var. *murdockii*
- Involucral bracts merely white-tomentose or rarely with short multicellular hairs; corollas mainly pink or rose; plants of western Uinta Mts., and elsewhere 2
- 2(1). Involucral bracts commonly suffused with dark purple; involucre not obscured by outer spinose bracts; plants of the Tushar Mts. *C. eatonii* var. *harrisonii*
- Involucral bracts green or variously purplish; involucre with copious pinnate spines, mainly obscuring the surface of inner bractlets; plants of western Uinta and Wasatch mountains and Great Basin ranges *C. eatonii* var. *eatonii*

Var. *eatonii* [*C. eriocephalum* var. *leiocephalum* D. C. Eaton; this is the basionym for *C. eatonii* in a strict sense, which was renamed by Gray in honor of D. C. Eaton who collected with Sereno Watson in 1869]. The lectotype

came from the head of the Bear River, in Summit County (Watson 691, 1869 US), with syntypical material being taken under the same number in Cottonwood Canyon (now Salt Lake County). Lodgepole pine and spruce communities upwards into alpine tundra at 2375 to 3420 m in Duchesne, Juab, Salt Lake, Summit, Tooele, and Weber counties; Nevada and Colorado: 31 (iv). Specimens from the Deep Creek Mts. have few lateral spines on the outer bracts, and approach *C. clavatum* in technical features. More material is needed to determine their status and relationships.

Var. harrisonii Welsh Talus slopes and alpine meadows at 2975 to 3450 m in Beaver and Piute counties; endemic; 6 (v). This low phase of the Eaton thistle stands geographically apart from the remainder of the species, isolated on the islandlike Tushar Mts.

Var. murdockii Welsh The plants grow in talus slopes and on rock stripes at 3230 to 3660 m in Daggett, Duchesne, and Uintah counties; endemic; 7 (iii). This variety has been regarded as constituting a portion of *C. tweedyi* (Rydb.) Petrak. That entity was reviewed by Moore and Frankton (1965) and was mapped to include northeastern Utah in its range. However, no specimens were cited from Utah. I have seen the type of *C. tweedyi* and other material within its range in northeastern Wyoming, and they differ in pubescence of involucre bracts being merely white-tomentose along the margins.

Cirsium neomexicanum Gray New Mexico Thistle. Biennial herbs from taproots; leaves of basal rosette 5–25 cm long (or more), pinnatifid, the lobes again toothed or lobed, white-tomentose below and less so above, the main spines 1–6 mm long; stems 6–15 dm tall, whitish-tomentose; cauline leaves 1.5–35 cm long, 0.5–7 cm wide, tomentose, appearing filmy greenish white, lobed like the basal ones, rather abruptly reduced upwards, finally minute spiny bracts; involucre 20–30 mm high, 40–65 mm wide, the bracts green or greenish, narrowly lanceolate, tomentose marginally (or overall), the outer ones often reflexed, the inner minutely serrulate-ciliate, long-attenuate apically, the spine a continuation of the attenuation, smooth medially, the glandular dorsal ridge more or less well developed, the apical portions of the inner often contorted; spines 1–9 mm long, yellowish; corollas creamy white.

1. Involucre bracts green throughout, the attenuate apex not differing in texture from the body of the bract
 *C. neomexicanum* var. *neomexicanum*
- Involucre bracts not green throughout, the attenuate apex differing in texture from the body of the bract
 *C. neomexicanum* var. *utahense*

Var. neomexicanum $2n = 30$. Creosote bush, Joshua tree, blackbrush, shadscale, sagebrush, and pinyon-juniper communities at 915 to 2050 m in Beaver, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, and Washington counties; Nevada, Arizona, and New Mexico; 26 (vii). This is one of the most distinctive species of thistle in Utah. The tall slender stems, with one or few large heads with creamy white flowers, stand in candelabra form in the arid portions of western and southern Utah. Ghostlike stalks of previous years persist for a time, reminding one of the regime that allowed their growth.

Var. utahense (Petrak) Welsh [*C. utahense* Petrak, type from Silver Reef, Washington County]. $2n = 30, 32, 34$. Salt desert shrub, sagebrush, pinyon-juniper, and

mountain brush communities at 1220 to 2300 m in Cache, Carbon, Emery, Millard, Rich, Salt Lake, Tooele, and Utah counties; Colorado (?); 24 (ii). This taxon has long been confused with *C. undulatum* with which it shares the grayish tomentum, large heads, and tall stature. They have been separated previously on the basis of glandular development of the dorsal ridge; a feature which is, unfortunately, not diagnostic. The long-attenuate bract apices from which the spines arise are apparently distinctive for this taxon. It is essentially intermediate between *undulatum* and *neomexicanum* in a strict sense. The type is from Silver Reef, Washington County, but the main area of distribution for this variety is apparently along the Wasatch Mountains in northern Utah. The more finely bracted plant occasional in northern Utah seems identical with *C. davisii* Cronq., from adjacent Idaho, but is recognizable mainly on intangible characters. Probably it belongs within the concept of var. *utahense*.

Cirsium ownbeyi Welsh Ownbey Thistle. Perennial herbs from caudex and taproot, the caudex with marcescent dark brown leaf bases; leaves of basal rosettes 5–13 cm long, 1.5–3 cm wide, tripinnatifid, green on both sides, sparingly tomentose along lower side of midrib; cauline leaves with vestiture and lobing like the basal; stems 5–7 dm tall, winged-decurrent, sparingly tomentose; involucre 1.8–2.5 cm high, 1.5–2.5 cm wide, the outermost bracts more or less pinnately spinose, lance-attenuate, smooth medially, the dorsal ridge not well developed, not scabrous, sparingly tomentose along margins, the inner more or less contorted apically; spines 3–8 mm long; corollas rose pink. Juniper, sagebrush, and riparian communities at 1678 to 1891 m in Daggett and Uintah counties; Colorado; an eastern Uinta Mts. endemic; 2 (i). Relationships of the Ownbey thistle apparently belong with *C. eatonii*.

Cirsium rothrockii (Gray) Petrak Rothrock Thistle. [*Cnicus rothrockii* Gray; *Cn. rothrockii* var. *diffusus* Eastw., type from Willow Creek, San Juan County]. Perennial or biennial herbs from a caudex and taproot, the stems 5–8 dm tall, sparingly tomentose or glabrate to glabrous; cauline leaves 3.5–30 cm long, 2–9 cm wide, bipinnatifid, green and glabrous or nearly so on both sides, carried well to the inflorescence; involucre (19) 23–28 (34) mm long, 20–35 mm wide, the bracts lanceolate to lance-linear, more or less tomentose along the margins, smooth medially, the dorsal ridge not or only somewhat glandular, sometimes purplish apically, the apical portions of the inner definitely scabrous, the spines 7–17 mm long; corollas red to carmine; $2n = 30$. Mixed shrubs and ponderosa pine woods at 1830 to 2560 m in San Juan County; Arizona; 3 (0). This entity is poorly known in Utah; its relationship is with both *C. calcareum* and *C. arizonicum*. It is a green subglabrous plant with red flowers and long involucre spines.

Cirsium rydbergii Petrak Rydberg Thistle. [*Cirsium lactucinum* Rydb., type from Bluff]. Perennial herbs from a definite caudex and taproot, the caudex clothed with blackish brown leaf bases; leaves of basal rosette mainly 30–90 cm long, 15–40 cm wide, bipinnatifid, the lobes narrow to very broad, glabrous to glabrate on both surfaces, the main spines 2–11 mm long; stems 6–12 dm tall or more, glabrous; cauline leaves glabrous, less lobed and much reduced upwards; involucre 10–17 mm high (not measuring the reflexed outer bracts), 13–26 mm wide, the outer bracts lance-ovate, rather abruptly contracted

into recurved spines 3–25 mm long, sparingly tomentose marginally; dorsal glandular ridge lacking, the inner attenuate, not scabrous; flowers pink; $2n = 34$. Hanging gardens, or rarely in canyons below them, at 1125 to 1525 m in Garfield, Grand, Kane, San Juan, Wayne counties; Arizona (?); 18 (v). Both *C. rydbergii* Petrak and *C. lactucinum* Rydberg are based on the same type collection from the hanging gardens near Bluff. The Rydberg thistle is a plant with huge basal rosettes, tall slender flowering stems, and small heads.

Cirsium scariosum Nutt. Meadow Thistle. [*Carduus lacerus* Rydb., type from near Midway; *Carduus olivescens* Rydb., type from the Aquarius Plateau; *Cnicus drummondii* var. *acaulescens* Gray; *C. foliosum* authors, not T. & G.; *C. drummondii* authors, not T. & G.]. Perennial herbs from a simple caudex and taproot, the caudex with chestnut leaf bases; leaves of basal rosette 2–28 cm long, 1–8 cm wide, merely spiny-toothed to bipinnatifid, the lobes often again toothed, tomentose to glabrate below, thinly tomentose to glabrous above, the main spines 1–5 mm long; stems lacking, or 1–12 dm tall or more, often succulent and edible, arachnoid to glabrous; cauline leaves (when stems present) bipinnatifid or merely pinnatifid, the spines 3–35 mm long, with vesture like the basal; involucre 22–35 mm high, 20–65 mm wide, the outer bracts lance-ovate, the inner progressively more lance-attenuate, smooth medially, the margins smooth to minutely scabrous, tomentose to glabrous on margins, the dorsal ridge not well developed, the longest spines mainly 2–5 mm long, straw colored, the inner with tips more or less contorted, dilated, or fimbriate, usually whitish or silvery; flowers white to pink or pink purple; $2n = 32, 34, 36$. Our specimens fall into two rather distinctive varieties.

1. Heads 25–35 mm high, 35–80 mm wide; inner bracts slender, sometimes contorted, not especially dilated, plants mainly 6–12 dm tall *C. scariosum* var. *thorneae*
- Heads 22–30 mm high, 20–40 mm wide; inner bracts often dilated or contorted, sometimes fimbriate; plants 0–6 dm tall *C. scariosum* var. *scariosum*

Var. *scariosum* [*Cirsium acaule* var. *americanum* Gray]. This taxon, as here interpreted consists of an amazingly diverse assemblage which has passed under a series of names including those cited above; and, if it is demonstrated that *C. foliosum* (Hook.) DC. is actually conspecific, that name has priority. Saline seeps and salt marshes, stream-sides, terraces, and other meadowlands at 1310 to 3175 m in Cache, Carbon, Duchesne, Emery, Garfield, Juab, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, and Washington counties; British Columbia to Montana, south to California, Arizona, and Colorado; 43 (x). This phase of *C. scariosum* has passed under the names *C. acaulescens* (Gray) K. Schum., *C. coloradoense* (Rydb.) Cockerell; *C. tioganum* (Congdon) Petrak, *C. drummondii* T. & G., and *C. foliosum*. Nomenclature is still unclear, and more work is indicated. Our highly variable material is transitional from acaulescent to caulescent within populations, with stems, when present, fleshy and edible. This is our common thistle of meadowlands, and it is unfortunate that nomenclatural entanglements have not allowed selection of an unequivocal name. Reported for the state is *C. parryi* (Gray) Petrak (Harrington, Flora of Colorado, 1952), but I have seen no specimens of that entity from Utah. It would key

to *C. scariosum* in the present work. It has densely arachnoid involucre bracts, with at least the innermost dilated-fringed at the tips; flowers are greenish yellow and the leaves are glabrate on both surfaces.

Var. *thorneae* Welsh Stream terraces and seeps or springs at 1650 to 2475 m in Beaver, Garfield, Iron, Kane, Millard, and Piute counties; endemic (?); 10 (vi). In addition to the features noted above, the cauline leaves are thick, with coarse veins, and spines 8–35 mm long.

Cirsium scopulorum (Greene) Cockerell in Daniels Carmine Thistle. [*Carduus scopulorum* Greene]. Perennial herbs from taproots; leaves of basal rosettes 3–28 cm long, 0.8–8 cm wide, with spines 2–6 mm long, unlobed to bipinnatifid, tomentose below, glabrate to glabrous and green above; stems mainly 3–7 dm tall, sparingly arachnoid, not winged-decurrent; cauline leaves mainly bipinnatifid, or the upper ones merely pinnatifid, green above, glabrous to sparingly tomentose below, rather gradually reduced upwards; heads in a compact subglobose terminal cluster; involucre 30–35 mm high, 30–55 mm wide, the bracts lance-attenuate, abundantly villous marginally, with long yellowish to brownish multicellular hairs, the outer ones usually pinnately spiny, the dorsal crest not glandular, smooth medially, the apical portions of the inner ones often contorted; spines 10–18 mm long, yellowish; corollas pale yellow to cream; $2n = 34, 37$. Sagebrush, aspen, and spruce-fir communities at 2135 to 3000 m in Grand, San Juan (?), and Uintah counties; Colorado; 3 (0).

Cirsium subniveum Rydb. Perennial herbs from taproots; basal rosettes not seen; stems mainly 6–10 (13) dm tall, tomentose, winged-decurrent; cauline leaves 3–25 cm long or more, 1–6 cm wide, pinnatifid, tomentose on both sides, or less so above, the bases decurrent; involucre 17–25 mm high, 20–30 mm wide, the bracts ovate-lanceolate, smooth medially, the glandular dorsal ridge more or less developed, none scabrous, tomentose marginally; spines 3–5 mm long; corollas apparently white to cream; $2n = 34–36$. Pinyon-juniper community at 1890 m in Box Elder, Cache, Rich, and Sanpete counties; Oregon to Montana; 6 (0).

Cirsium undulatum (Nutt.) Sprengel Gray Thistle. [*Carduus undulatus* Nutt.]. Perennial herbs from a simple caudex and taproot, the caudex more or less clothed with persistent leaf bases; leaves of basal rosette mainly 7–25 cm long, 1.5–6 cm wide, merely toothed to bipinnatifid, tomentose on both sides, white-tomentose below, white to greenish above, the main spines 1–6 mm long; stems 2–10 (12) dm tall, tomentose; cauline leaves bipinnatifid or the upper ones merely pinnatifid, with vesture as in the basal ones, rather gradually reduced upwards; involucre (15) 20–30 mm high, 20–60 mm wide, the bracts brown or brownish, lance-ovate to lanceolate, tomentose on margins or overall, the dorsal ridge strongly glutinous to undeveloped, the spinose tips spreading, with yellowish spines mainly 2–5 (10) mm long, smooth medially, the apical portion of the innermost more or less contorted; corollas pink, pink purple, or creamy white.

1. Heads mainly less than 2.5 cm wide, even the largest, commonly (1) 3–10 or more per stem *C. undulatum* var. *tracyi*
- Heads mainly more than 2.5 cm wide, at least the largest, commonly 1–3 per stem *C. undulatum* var. *undulatum*

Var. *tracyi* (Rydb.) Welsh [*Carduus tracyi* Rydb.]. $2n = 24$. Sagebrush, mountain brush, juniper, aspen, and

Douglas fir communities at 1525 to 2900 m in Duchesne, Emery, Grand, Juab, Summit, and Uintah counties; Colorado; 26 (iii). This variety grades with the type variety, and separation is at least partially arbitrary.

Var. undulatum n = 12, 13. [*C. undulatum* var. *albescens* D. C. Eaton, type from Stansbury Island, Tooele County]. Desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities at 1400 to 2600 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Juab, Grand, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; British Columbia to Minnesota, south to Arizona, New Mexico, and Missouri; 59 (vi).

***Cirsium virginensis* Welsh** Virgin Thistle. Perennial (?) herbs from taproots; leaves of basal rosettes 6–35 cm long, 1–5 cm wide, unlobed, pubescent like the cauline ones, with spines 1–4 mm long; stems 6–15 dm tall, tomentose, winged by definitely decurrent leaf bases; cauline leaves 1.5–15 cm long or more, sinuate-dentate to pinnatifid, whitish tomentose on both sides, or greenish above, often reduced to spiny bracts upwards; involucre 13–20 mm tall, 12–32 mm wide, the bracts ovate-lanceolate to narrowly lanceolate, brownish to straw colored, or often suffused with purple, tomentose marginally (or overall), the outer not especially reflexed, the inner serrulate or entire, smooth medially, the glandular dorsal ridge more or less developed, the apical portions of the inner often contorted; spines 2–6 (8) mm long, yellowish; corollas pink to lavender (or white?). Saline seeps and stream terraces at 850 to 1270 m in Washington County; Arizona; 9 (i). The small heads and long decurrent leaf bases are diagnostic. The relationships of the Virgin thistle are unknown. It does not appear to be closely related to other species groups represented in our area.

***Cirsium vulgare* (Savi) Ten.** Bull Thistle. [*Carduus vulgaris* Savi]. Biennial herbs from taproots; leaves of basal rosette mainly 5–25 cm long, 2–8 cm wide, merely doubly serrate-dentate to doubly pinnatifid, tomentose beneath, coarsely hispid above; stems mainly 3–12 (15) dm tall, spiny-winged by decurrent leaf bases; cauline leaves mainly bipinnatifid, with vestiture as in the basal ones; involucre 28–40 mm high, 35–70 mm wide, the bracts narrowly lanceolate, with spreading spine-tips, tomentose marginally, the dorsal ridge not developed, the inner sometimes contorted apically; spines 1–4 mm long, yellowish; corollas rose purple; 2n = 68. Meadows, fields, roadsides, and other disturbed sites from 1340 to 2745 m in most, if not all, Utah counties; widespread in North America; 52 (i).

***Cirsium wheeleri* (Gray) Petrak** Wheeler Thistle. [*Cnicus wheeleri* Gray]. Perennial or biennial herbs from a simple or branched caudex and taproot, the caudex clothed with persistent brown to dark brown leaf bases; leaves of basal rosettes mainly 7–20 cm long, 1–5 cm wide, once to twice pinnatifid, or merely toothed or spinose-serrate, grayish or whitish tomentose below, thinly so to glabrous and green above, the main spines 0.5–4 mm long; stems 2.5–7 dm tall; cauline leaves 2–25 (32) cm long, 0.5–5 (7) cm wide, with lobing and vestiture similar to the basal, carried well to the inflorescence, though reduced above; involucre 20–27 mm high, 20–35 mm wide, the bracts lance-ovate to lance-linear, more or less tomentose along the margins, smooth medially, the dorsal ridge not or only somewhat glandular,

sometimes purplish-tipped, the apical portions of at least the inner more or less scabrous; corollas pink to pink purple, or less commonly white; 2n = 22. Mountain brush, pinyon-juniper, white fir, aspen, and spruce-fir communities at (1980) 2165 to 3150 m in Beaver, Emery, Garfield, Iron, Juab, Kane, Millard, San Juan, Sanpete, Sevier, and Washington counties; Colorado, New Mexico, and Arizona. Our materials apparently intergrade with *C. undulatum*, *C. nidulum*, and possibly *C. scariosum*. The moderate sized heads, usually pink or pink purple flowers, low stature, essentially non-glandular bracts, and usually green upper leaf surface appear to be diagnostic. The phases from Cedar Canyon (Iron County), with merely spinose unlobed leaves, are striking, but probably not more than minor variants; 39 (iv).

***Cnicus* L.**

Annual caulescent spiny herbs from taproots, the juice watery; leaves alternate; heads solitary, terminating branches; involucrel bracts in several series, spine-tipped, the inner ones pinnately spiny; receptacle densely bristly; corollas all discoid, yellow, perfect; pappus in 2 series, the outer smooth, long, alternating with short sparingly pectinate ones; style with a ring of hairs at base of divergent branches; achenes terete, strongly ribbed, glabrous.

***Cnicus benedictus* L.** Blessed Thistle. Plants 1–5 dm tall or more, branching from near the base; stems villous; leaves mainly 8–15 cm long, pinnatifid, more or less glandular and sparingly villous, the spines 0.5–1.5 mm long, the lower ones petiolate, becoming sessile above; involucre 3–4 cm high, closely subtended and obscured by the foliose bracteate upper leaves; corollas yellow; 2n = 22. Waste places and gardens at 885 m in Washington County; widespread in the U.S.; adventive from Europe; 2 (0).

***Conyza* Less.**

Annual herbs from taproots, with watery juice; stems erect, commonly branched; leaves alternate, simple; heads numerous, in cylindrical to conic panicles; involucrel bracts more or less imbricate, herbaceous medially; receptacle flat or nearly so, naked; rays minute, white or purplish, scarcely surpassing the pappus; disk flowers seldom more than 20, perfect, fertile; pappus of capillary bristles; achenes 1- or 2-nerved or nerveless.

- 1. Leaves more or less lobed or pinnatifid, narrowed to a clasping base; plants rare in Washington County *C. coulteri*
- Leaves typically entire, not narrowed to a clasping base; plants variously distributed 2
- 2(1). Involucre (and typically the stem) copiously hirsute; achenes more than 1 mm long; plants rare in Washington County *C. bonariensis*
- Involucre (and typically the stem) glabrous or nearly so; achenes less than 1 mm long *C. canadensis*

***Conyza bonariensis* (L.) Cronq.** [*Erigeron bonariensis* L.]. Annuals, mainly 3–10 dm tall, simple or with erect leafy branches often overtopping the main stem, the herbage hirsute with spreading hairs and strigose, grayish green; leaves 1.5–6 (10) cm long, 2–8 mm wide, linear to oblanceolate, saliently toothed, often deciduous in lower stem region by anthesis; heads numerous, rather incon-

spicuous; involucre 4–5 mm high, at least some more than 10 mm wide when pressed, the bracts densely hirsute to hirsutulous, whitish on the inner face when reflexed; ray flowers in 2 or 3 rows, their corollas usually shorter than the pappus. Stream banks and irrigation canals in riparian plant communities at ca 850 m in Washington County; widespread in the warmer parts of North America; adventive from South America; 3 (i).

Conyza canadensis (L.) Cronq. Horseweed. [*Erigeron canadensis* L.]. Annuals, mainly 0.5–10 dm tall, glabrous or spreading-hairy; leaves 2–8 (10) cm long, 2–8 mm wide, linear to oblanceolate, ciliate-serrate, often deciduous by late anthesis; heads numerous, inconspicuous; involucre 2–3.5 (4) mm high, (2.5) 3–7 mm wide, the bracts lance-subulate, the midvein glandular-thickened, herbaceous medially, glabrous or strigose, green on the inner face when reflexed; rays white or purplish; 2n = 9, 18, 54. Weedy species, often in riparian or other moist disturbed sites at 850 to 2135 m in all (?) Utah counties; widespread in North America; Europe; 30 (vi). Our material belongs to var. *glabrata* (Gray) Cronq. [*Erigeron canadensis* var. *glabrata* Gray].

Conyza coulteri Gray Annuals, mainly 2–10 dm tall, glandular-pubescent and villous or hirsute; stems leafy, erect, usually simple at the base, the inflorescence paniculate; leaves 2–6 cm long, 3–10 mm wide, oblong or narrowly obovate, with a few teeth or hollow lobes, rounded apically, rounded or usually ariculate and somewhat clasping basally; heads ca 4 mm high; ray flowers in 2 or 3 peripheral rows. Braided gravels in the creosote bush and Joshua tree community at ca 825 to 855 m in Beaver Dam Wash, Washington County; widely distributed in the Southwest; Mexico; 2 (i).

Crepis L.

Annual, biennial, or perennial caulescent or subcaulescent herbs, from taproots, with milky juice; leaves basal and cauline, alternate, pinnatifid to toothed or entire; heads few to numerous, in corymbose or paniculate clusters; involucre bracts in 1 or 2 series, herbaceous; receptacle naked; corollas all raylike, perfect, yellow or yellowish; pappus of numerous white capillary bristles; achenes terete or nearly so, 10– to 20–ribbed, often beaked.

- 1. Plants annual, adventive, of disturbed sites . . . *C. capillaris*
 - Plants perennial, indigenous, neither weedy nor of disturbed sites 2
- 2(1). Leaves and stems glabrous (or glandular-hispid only above); plants subcaulescent or subscapose 3
 - Leaves and stems more or less tomentose or puberulent to setose or glandular hispid; plants caulescent 4
- 3(2). Plants less than 10 cm tall, soboliferous, of high elevations *C. nana*
 - Plants mainly 15–40 cm tall, never soboliferous, of lower elevation meadows *C. runcinata*
- 4(2). Heads narrowly cylindrical; involucre bracts 5–7 (8), the inner commonly glabrous; flowers mostly 5–10 *C. acuminata*
 - Heads narrowly to broadly campanulate; involucre bracts 8–15, tomentose and often setose-hispid; flowers mostly 8–60 5
- 5(4). Leaf segments linear to narrowly lanceolate, entire or nearly so, the terminal lobe more than 5 cm long; achenes commonly green *C. atrabarba*

- Leaf segments narrowly lanceolate to triangular, some usually toothed, the terminal lobe less than 5 cm long; achenes mainly yellowish to brownish 6
- 6(5). Involucres more than twice longer than broad; leaves usually green, runcinate-pinnatifid *C. internedia*
 - Involucres less than twice longer than broad, or leaves not green or not runcinate-pinnatifid 7
- 7(6). Involucre and stems not or sparingly setose, but if setose, the setae gland-tipped *C. occidentalis*
 - Involucre and/or stems conspicuously setose, the setae not glandular *C. modocensis*

Crepis acuminata Nutt. Mountain Hawksbeard. Perennial herbs, 2.5–8.5 dm tall, with 1 to several stems from a caudex, the caudex clothed with dark brown marcescent leaf bases; herbage more or less tomentose to glabrate; basal and lowermost cauline leaves 8–33 (40) cm long, 2–12 cm wide, petiolate, the blade elliptic to oblanceolate in outline, pinnatifid to runcinate-pinnatifid, the lobes triangular to narrowly subulate, sometimes toothed or lobed; heads mainly 20–75 or more, cylindrical, 5– to 10–flowered; involucre (8) 9–13.5 (16) mm high, 3–7 mm wide, the inner ones 5–8, glabrous or sometimes shortly villous-tomentose, the outer bracts much shorter, commonly tomentose; corollas 10–18 mm long, yellow; achenes yellow to brown, narrowed above. Sagebrush, mountain brush, white fir, aspen, and spruce-fir communities at 1430 to 2900 m in most if not all Utah counties; Washington to Montana, south to California, Arizona, and New Mexico; 69 (viii).

Crepis atrabarba Heller Slender Hawksbeard. [*C. occidentalis* var. *gracilis* D. C. Eaton]. Perennial herbs, 2–4.5 dm tall, with 1 to several stems from a caudex, the caudex with dark brown to purplish marcescent leaf bases; herbage gray villous-tomentose to glabrate, basal and lowermost cauline leaves 6–22 cm long, 1.5–4 cm wide, petiolate, the blade lance-elliptic in outline, pinnatifid, the lobes linear or linear-subulate, the terminal lobe 5–9 cm long, entire; heads mainly 2–15, campanulate, commonly 10– to 40–flowered; involucre 9–15 mm long, 7–13 mm wide, the inner ones 8–10, usually grayish tomentulose and often with few glandless black setae; corollas 10–18 mm long, yellow; achenes usually greenish, attenuate at the apex. Sagebrush, ponderosa pine, Douglas fir, and white fir communities at 1890 to 2870 m in Cache, Daggett, Garfield, Salt Lake, Summit, Tooele, Uintah, and Utah counties; British Columbia and Alberta, south to Nevada and Colorado; 8 (i). The species is evidently uncommon in Utah. It is known to form apparent hybrids with *C. acuminata*, and probably with other taxa as well.

Crepis capillaris (L.) Wallr. Thread Hawksbeard. Annual or biennial herbs, the stems erect, simple or branched, mostly 1–6 dm tall, sparingly spreading-hairy; basal leaves 3–20 cm long, 0.5–3 cm broad, lanceolate to oblanceolate, denticulate to pinnatifid or bipinnatifid, glabrous or pubescent with stiff spreading hairs, especially along the lower midvein. Petiolate; cauline leaves reduced upwards, sessile and auriculate-clasping; heads (1) several to numerous, mostly 20– to 60–flowered, borne in an open inflorescence; involucre 5–8 mm high, 5–14 mm wide, the inner bracts lance-attenuate, 8–16, tomentose, often glandular-hairy, glabrous within, the outer bracts lance-linear; achenes 2–5 mm long, pale brown to straw colored, not beaked; 2n = 6, 12, 24.

Ruderal weed of Salt Lake County; widely scattered in North America; adventive from Europe; 1 (0).

***Crepis intermedia* Gray** Gray Hawksbeard. [*C. barbiger* Leiberg, in part]. Perennial herbs, 2.5–7 dm tall, with 1–several stems from a caudex, the caudex clothed with pale to dark brown marcescent leaf bases; herbage more or less tomentose or villous; basal and lowermost cauline leaves 15–30 cm long, 2–10 cm wide, petiolate, the blade elliptic to oblanceolate in outline, pinnatifid to runcinate-pinnatifid, the lobes triangular to linear-subulate, sometimes toothed or lobed, the terminal lobe less than 5 cm long; heads mainly 10–60, campanulate, 7– to 16-flowered; involucre 11–20 mm high, 6–12 mm wide, the inner ones 7–12, tomentulose (rarely glabrate), sometimes setose with non-glandular setae, the outer bracts much shorter; corollas 13–20 mm long, yellow; achenes mainly yellowish or brownish, narrowed above. Sagebrush, pinyon-juniper, and mountain brush communities at 1525 to 2575 m in Beaver, Cache, Duchesne, Garfield, Grand, Iron, Kane, Salt Lake, Sevier, Tooele, Uintah, Utah, Wasatch, and Washington counties; Washington to Alberta, south to California, Nevada, and Colorado; 16 (iii). The *intermedia* assemblage consists of a series of apomictic intermediates involving *C. acuminata* as one of the parental types, and one or more of the other taxa (i.e., *occidentalis* or *modocensis*) to complete the complex. Included here is the concept of *C. barbiger* as it has been applied in Utah; it consists of a similar hybrid sequence of polyploid apomicts from outside our area.

***Crepis modocensis* Greene** Modoc Hawksbeard. Perennial herbs, 1.5–3.7 dm tall, with 1–several stems from a caudex, the caudex clothed with pale to brown marcescent leaf bases (the stem base often yellow); herbage more or less tomentose; basal and lowermost cauline leaves 9–25 cm long, 2–5 cm wide, petiolate, the blade elliptic to oblanceolate in outline, bipinnatifid, the lobes linear to lance-subulate, again toothed or lobed, the terminal lobe less than 5 cm long; heads 1–9, 10– to 60-flowered; involucre 11–16 mm high, 11–23 mm wide, the inner bracts 10–15, tomentulose, commonly setose, the setae not glandular, the outer bracts much shorter; corollas 13–22 mm long, yellow; achenes greenish black to reddish brown, attenuate. Sagebrush, pinyon-juniper, and mountain brush communities at 1640 to 3175 m in Beaver, Box Elder, Cache, Daggett, Juab, Millard, Rich, Salt Lake, Sanpete, Sevier, Tooele, Uintah, and Utah counties; British Columbia to California, Nevada, and Colorado; 24 (0). The peculiar numerous slender lateral lobes of the deeply dissected or parted leaf blades are diagnostic.

***Crepis nana* Richards**. Dwarf Hawksbeard. Perennial caespitose herbs, the stems much branched, often soboliferous, mostly 0.2–1.1 dm tall, contracted, usually obscured by the leaves, glabrous; basal leaves mainly 1–7.5 cm long, 0.2–1.8 cm wide, the blades spatulate to orbicular, elliptic, or ovate, glabrous, petiolate; cauline leaves similar to the basal, not clasping; heads few to numerous, mostly 4– to 12-flowered, borne in a compact cushion-like inflorescence; involucre 7–12 mm high, 3–6 mm wide, the inner bracts narrowly oblong, 8–12, greenish or blackish, glabrous, the outer much shorter; achenes brownish, ribbed, shortly beaked; $2n = 14$. Alpine communities, mainly in talus, at 3050 to 3425 m in Beaver, Garfield, Juab, Piute, San Juan, and Utah or Salt Lake counties; Alaska to Labrador, south to California and Utah; 10 (iii).

***Crepis occidentalis* Nutt.** Western Hawksbeard. Perennial herbs, 1–4 dm tall, with 1–several stems from a caudex, the caudex clothed with brown marcescent leaf bases (the stem base often yellow); herbage tomentose; basal leaves mainly 6–30 cm long, 1–5 cm wide, petiolate, the blade lanceolate to elliptic in outline, pinnatifid to bipinnatifid, the lobes triangular to oblong or linear-subulate, usually again toothed or lobed, the terminal lobe less than 5 cm long; heads 2–25, 12– to 30-flowered; involucre 10–20 mm high, 6–15 mm wide, the inner bracts (7) 8–13 (18), tomentose, the outer ones much shorter; corollas 10–22 mm long, yellow; achenes pale to dark brown, not much attenuate apically. There are three rather weak and arbitrarily recognizable varieties of this species, with some geographical correlation, in Utah. Intermediates occur between the varieties and with other taxa as well.

1. Largest heads 12– to 14-flowered, with 8 or 9 involucre bracts; plants mainly of the Great Basin *C. occidentalis* var. *costata*
- Largest heads with more than 15 flowers, with 10–13 involucre bracts; plants of various distribution 2
- 2(1). Involucre with few glandular setae, or none; plants mainly 2–3 dm tall, of the Great Basin *C. occidentalis* var. *pumila*
- Involucre with few to numerous glandular setae; plants mainly 1–2 dm tall, of the Colorado drainage system, less commonly in the Great Basin *C. occidentalis* var. *occidentalis*

Var. *costata* Gray Sagebrush, pinyon-juniper, mountain brush, and aspen communities at 1525 to 2200 m in Box Elder, Cache, Juab, Millard, Salt Lake, Tooele (type from Stansbury Island), Utah, and Washington counties; British Columbia to California and Colorado; 23 (0).

Var. *occidentalis* Shadscale, rabbitbrush, sagebrush, pinyon-juniper, and ponderosa pine communities at 1280 to 2565 m in Beaver, Daggett, Duchesne, Garfield, Kane, Piute, San Juan, Sanpete, Sevier, and Washington counties; Oregon to Wyoming, south to California and New Mexico; 25 (v).

Var. *pumila* (Rydb.) Babc. & Stebbins [*Crepis pumila* Rydb.]. Sagebrush, pinyon-juniper, and mountain brush communities at 1700 to 2100 m in Millard and Tooele counties; Oregon to Montana, south to California and Nevada; 7 (0).

***Crepis runcinata* (James) T. & G.** Meadow Hawksbeard. [*Hieracium runcinatum* James]. Perennial herbs, 1.5–5 (7) dm tall, with 1–several stems from a caudex, the short caudex clothed with brown marcescent leaf bases; herbage glabrous or hispid above (puberulent in some), not tomentose; basal leaves mainly 2–25 cm long, 1–6 (8) cm wide, petiolate or not, spatulate to oblanceolate, or the blades ovate to oval, oblong, or oblanceolate, more or less pinnatifid to lobed or entire, commonly glaucous; heads 1–30, with 20–50 flowers; involucre campanulate, 8–16 mm high, 6–15 mm wide or more, the inner bracts mainly 10–16, puberulent or hispid, the outer ones much shorter; corollas 9–18 mm long, yellow; achenes light to dark brown, attenuate, or shortly beaked; $n = 11$. Three distinctive varieties are present.

1. Involucre merely puberulent; plants mainly of saline meadows *C. runcinata* var. *glauca*
- Involucre hispid with black hairs (resembling species of *Hieracium*); plants of saline or non-saline sites 2

- 2(1). Basal leaves definitely petiolate, the blade 2–4 times longer than broad *C. runcinata* var. *hispidulosa*
- Basal leaves broadly winged-petiolate, the blade 4–8 times longer than broad *C. runcinata* var. *runcinata*

Var. *glauca* (Nutt.) Welsh [*Crepidium glaucum* Nutt.]. Meadows, lake shores, seeps, and hot springs in salt grass, rush, alkali saccaton, and common reed communities at 1220 to 2200 m in Carbon, Daggett, Duchesne, Emery, Grand, Juab, Kane, Millard, Piute, San Juan, Sevier, Tooele, Uintah, Utah, and Wayne counties; Idaho to Saskatchewan, south to Arizona and New Mexico; 34 (xii). This variety has been collected in full flower on 27 April at Monroe Hot Springs.

Var. *hispidulosa* Howell ex Rydb. Sedge-willow and meadow communities at 1370 to 2535 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Kane, Piute, Rich, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Washington to Montana, south to California and Colorado; 18 (ii). The meadows are seldom saline where this plant occurs.

Var. *runcinata* [*C. runcinata* var. *alpicola* Rydb.; *C. aculeolata* Greene, type from Utah]. Bogs in Salt Lake and Utah counties; Manitoba to Minnesota, south to Idaho and New Mexico; 1 (0). This variety is evidently uncommon in Utah.

Dicoria T. & G.

Annual herbs; leaves alternate or the lower ones opposite, simple, entire or toothed; heads unisexual or perfect, discoid; involucre bracts strongly dimorphic, the usually 5 outer ones small, herbaceous, the inner subtending the 1 or 2 pistillate flowers, subscarious, accrescent, much larger than the outer at maturity; chaff narrow, tardily deciduous; pistillate flowers without corolla; staminate flowers with funnellform corolla, the anthers distinct; achenes plano-convex, black, toothed to pectinately wing-margined; pappus lacking.

- 1. Foliose bracts of inflorescence orbicular to broadly ovate; plants of Washington County *D. canescens*
- Foliose bracts of inflorescence lance-ovate to lanceolate; plants of southeastern Utah *D. brandegei*

Dicoria brandegei Gray Brandegees Sandplant. [*D. paniculata* Eastw., type from between McElmo and Recapture, San Juan County; *D. wetherillii* Eastw., type from the San Juan River, a monstrosous form]. Plants branched from the base upwards, 1.5–5.5 dm tall, the herbage white-pilosulose to strigose, the hairs multicellular; lower cauline leaves linear to lanceolate, more or less hastately lobed, toothed, or subtentire, 1–7 cm long (including petiole), 0.2–1.5 cm wide; foliose bracts linear to oblong, lanceolate or ovate, rarely if ever orbicular, the blades 0.6–4 cm long; outer involucre bracts oblong, 1.5–3 mm long, the inner ones suborbicular, glandular-puberulent, accrescent in fruit; achenes 5–8 mm long, the winged margin toothed to pectinate, black like the body or pale. In dunes and other sandy sites, in wavy-leaf oak, eriogonum, amsonia, old-man sagebrush, rabbitbrush, ephedra, and vancouveria communities at 1130 to 1830 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona, New Mexico, and Colorado (?); 21 (v).

Dicoria canescens Gray in Torr. Gray Sandplant. Plants branched from base upwards, 2.5–9 dm high, the

herbage white-pilosulose to strigose and glandular, the hairs multicellular; lower cauline leaves deltoid-lanceolate, dentate, 1–5 cm long; foliose bracts ovate to orbicular, the blades 0.6–1.5 cm long; outer involucre bracts oblong, 2–3 mm long, the inner ones suborbicular, glandular-puberulent, accrescent in fruit, to 10 mm long or more; achenes 5–6 mm long, the winged margin toothed to pectinate, black like the body, or pale; n = 18. Dunes and other sandy sites in blackbrush and creosote bush communities at 825 to 1000 m in Washington County; Arizona, Nevada, and California; 4 (i). Our material belongs to ssp. *clarkae* (Kennedy) Keck [*D. clarkae* Kennedy].

Dyssodia Cav.

Annual or perennial herbs or subshrubs from taproots, the juice watery; herbage with conspicuous translucent oil glands; stems striate, numerous; leaves opposite or alternate, entire to pinnatisect; heads solitary at branch ends, or few to several in cymose clusters; involucre bracts in 2 series, distinct or united, and usually with a much shorter outer set; receptacle flat or convex, puberulent; ray flowers yellow, pistillate, fertile; disk flowers fertile; pappus of 10–15 bristle-tipped scales, or these dissected into 3 or more bristles; style branches with a short, conic appendage.

Strother J. L. 1969. Systematics of *Dyssodia* Cavanilles (Compositae: Tageteae). Univ. Calif. Publ. Bot. 48: 1–88.

- 1. Plants annual; leaves bipinnatisect; stems villosulous *D. papposa*
- Plants perennial, herbs or subshrubs, leaves simple or merely pinnatisect; stems hispidulous 2
- 2(1). Heads 1.2–2 cm tall or more; pappus of 10–15 scales, each dissected into numerous bristles *D. cooperi*
- Heads less than 1 cm tall; pappus not as above 3
- 3(2). Heads borne on elongate merely bracteate peduncles; leaves pinnately 5–lobed, shortly hispid; pappus scales tipped with usually a solitary bristle *D. pentachaeta*
- Heads sessile or essentially so; leaves simple, entire or rarely irregularly few-lobed, glabrous or merely ciliate; pappus scales with 3–5 bristles *D. acerosa*

Dyssodia acerosa DC. Dogweed. [*Thymophylla acerosa* (DC.) Strother; *Aciphylloa acerosa* (DC.) Gray; *Hymenatherum acerosum* (DC.) Gray]. Plants suffruticose, 10–25 cm tall, forming compact clumps, from taproots; herbage glabrous or villosulous; leaves opposite (or alternate above), simple or irregularly lobed, 3–18 mm long, 0.5–1 (2) mm wide, glandular, ciliate or glabrous; heads sessile or subsessile; involucre turbinate-cylindrical, 5–7 mm high, 3–4 mm wide; involucre bracts ca 13, connate, each bract with conspicuous orange glands; ray flowers 7–8, lemon yellow; disk flowers 18–25, pale yellow; pappus of ca 20 scales, each dissected into 3–5 bristles; achenes dark brown, 3–3.5 mm long, strigose; n = 8, 13. Blackbrush communities at 1130 to 1350 m in Garfield, San Juan, and Washington counties; Arizona and New Mexico, south to Mexico; 5 (ii).

Dyssodia cooperi Gray Cooper Glandweed. [*Adenophyllum cooperi* (Gray) Strother; *Clomenocoma cooperi* (Gray) Rydb.]. Plants woody only at the base, 3–5 dm tall, forming rounded clumps, from taproots; herbage puberulous to hispidulous; leaves alternate, simple, lanceolate, spinulose-dentate, attenuate apically; heads pedunculate; involucre turbinate, 12–22 mm high,

15–30 mm wide when pressed; involucre bracts 20–30, strongly nerved, linear-lanceolate, with subulate-acuminate tips, each bract with a conspicuous subterminal orange gland; ray flowers 8–12, orange to yellow, often drying saffron, ca 1 cm long; disk flowers numerous, yellowish; pappus of 10–15 scales, each dissected into numerous bristles; achenes dark brown, ca 5 mm long; n = 13. Joshua tree and creosote bush communities at 760 to 1185 m in Washington County; California, Nevada, and Arizona; 4 (0).

Dyssodia papposa (Vent.) A. S. Hitchc. Pappose Glandweed. [*Tagetes papposa* Vent.]. Plants annual, 1.5–4 dm tall; herbage glabrous to sparingly puberulent; leaves opposite below, alternate above, 1.5–3 (5) cm long, pinnatisect into 11–15 lobes, these sometimes again lobed; heads shortly pedunculate to subsessile; involucre turbinate to campanulate, 6–10 mm high, and about as wide; involucre bracts 6–12, oblanceolate, with yellowish oil glands, connate only at the base; ray flowers 8 or fewer, yellow orange; disk flowers mainly 20–40, dull yellow; pappus of ca 20 scales, each dissected into 5–10 bristles; achenes black, 8–35 mm long; n = 13. Sandy roadsides at 1450 to 1500 m in Carbon, Duchesne, Sanpete, and Tooele counties; through much of the U. S. and Mexico; 4 (0).

Dyssodia pentachaeta (DC.) Robins. Scale Glandweed. [*Hymenatherum pentachaetum* DC.; *H. thurberi* Gray; *Thymophylla pentachaeta* (DC.) Small; *D. thurberi* (Gray) Robins.]. Plants suffruticose, 8–28 cm tall, forming rounded clumps, from taproots; leaves opposite, pinnately parted into 3–5 rigid linear lobes, 0.5–2 cm long, sparingly hirtellous; peduncles 1–8 cm long; involucre turbinate, 4.8–6 mm high, 5–10 mm wide; involucre bracts in 2 series, connate for much of their length, with distinctive yellow oil glands; ray flowers usually 13, bright yellow; disk flowers 50–70, dull yellow; pappus usually of 10 scales, these awnless or with 1–3 awns; achenes brown, 2.2–3 mm long, hispid to glabrous; n = 8, 13. Blackbrush, ephedra, shadscale, creosote bush, and Joshua tree communities at 700 to 1220 m in Garfield, Kane, San Juan, and Washington counties; Nevada and California to Texas and Mexico; South America; 30 (vi). Our material has been assigned to var. *belinidium* (DC.) Strother [*Hymenatherum belinidium* DC.; *Thymophylla pentachaeta* var. *belinidium* (DC.) Strother].

Encelia Adams

Shrubs; stems ascending to erect, grayish or whitish, the branchlets commonly pubescent; leaves alternate, simple, petiolate, entire or toothed; heads solitary or in cymose clusters, radiate or discoid; involucre bracts in 2 or 3 series; receptacle convex to flat, chaffy, the scales clasping the achenes and falling with them; ray flowers (when present) sterile, yellow; disk flowers perfect, yellow; pappus lacking (or of 2 awns); achenes flat, obovate, villous-ciliate and pubescent on the surfaces.

Blake, S. F. 1913. A revision of *Encelia* and some related genera. Proc. Amer. Acad. 49: 358–376.

- 1. Leaves white-tomentulose; peduncles glabrous; heads in branching cymes; plants rare in Washington County *E. farinosa*
- Leaves strigose to hispid, green; peduncles scabrous to strigose; heads solitary at branch ends; plants of Washington County and elsewhere *E. frutescens*

Encelia farinosa Gray Incienso. Plants mainly 3–10 dm tall, aromatic; leaves clustered at apex of current stems, 2–8 cm long, ovate, entire or toothed, silvery tomentose, petiolate; peduncles elongate, cymosely branched or simple; heads showy, the disk 1–1.5 cm wide; involucre 4–7 mm high, villous and glandular dotted; rays 8–12 mm long, orange yellow; achenes narrowly obovate; n = 18. Blackbrush community at 1280 m in Washington County; Nevada, Arizona, and California; Mexico; 1 (0).

Encelia frutescens (Gray) Gray Bush Encelia. [*Simsia frutescens* Gray]. Plants mainly 3–12 (15) dm tall, leaves scattered along current stems, the blades commonly 0.5–2.5 cm long, 0.3–2 dm wide, ovate to orbicular or lanceolate, entire or toothed, strigose to hispid with pustular-based hairs; heads showy or not, the disk 1–3 cm wide; involucre 6–10 mm high, strigose or glandular; rays lacking or 1–16 (or more), 2–12 mm long, yellow; achenes obovate; n = 18. Two distinctive varieties are present in Utah.

- 1. Herbage strigose, also with some pustular-based hairs; involucre bracts abruptly caudate-acuminate, strigose; plants of Washington County. . . *E. frutescens* var. *virginensis*
- Herbage hispid with pustular-based hairs; involucre bracts gradually attenuate, more or less glandular (sometimes strigose); plants of the Colorado Basin *E. frutescens* var. *frutescens*

Var. *frutescens* [*E. frutescens* var. *resinosa* Jones in Blake]. Talus and slickrock in blackbrush and shadscale communities at 1130 to 1830 m in Emery, Grand, Kane, and San Juan counties; Arizona, California; 15 (vii). There is a cline of glandularity in leaves from definitely glandular in the southern portion of the range to no glands at all in the northern material. Also, our plants vary from discoid to radiate.

Var. *virginensis* (A. Nels.) Blake [*E. virginensis* A. Nels.]. Creosote bush, Joshua tree, and blackbrush communities at 760 to 1325 m in Washington County; Nevada, Arizona, and California; 23 (i).

Enceliopsis (Gray) A. Nels.

Perennial scapose or subscapose herbs, from tuberous roots or taproots and subterranean to superficial caudex; herbage pilosulose to velutinous; leaves all basal (rarely some reduced bracteate ones along the scape), the blades spatulate, lanceolate, oblanceolate, ovate, or orbicular; heads solitary; involucre bracts in 2 or 3 series, herbaceous throughout; receptacle flat to convex, chaffy, the scales clasping the achenes; rays yellow, sterile (but apparently pistillate), or lacking; disk flowers numerous, perfect, fertile, yellow; pappus of 2 awns and with or without small scales between, or none; achenes flattened, blackish.

- 1. Heads discoid; herbage pilose-hirsutulose; plants arising from a subterranean tuberous root *E. nutans*
- Heads radiate; herbage tomentulose; plants arising from a superficial caudex 2
- 2(1). Petioles broadly winged, mainly shorter than the blades; plants reported from the Virgin Narrows section of Washington County, but none have been seen by me [*Tithonia argophylla* D. C. Eaton, type from near St. George, or more likely from southern Nevada] *E. argophyllus* (D. C. Eaton) A. Nels.

- Petioles slender, not or only narrowly winged, mainly longer than the blades; plants commonly in eastern and west-central portions of Utah, but also in Washington County *E. nudicaulis*

***Enceliopsis nudicaulis* (Gray) A. Nels.** Nakedstem. [*Encelia nudicaulis* Gray, type from Utah]. Scapose, caespitose perennials from a superficial, branching caudex, 10–43 (60) cm tall, the herbage tomentulose, silvery white; petioles 0.7–17 cm long, narrowly if at all winged; leaf blades 2–9 cm long, 1.3–10 cm wide, ovate to elliptic, orbicular or spatulate, cuneate to subcordate basally, obtuse to rounded apically; scapes often with a reduced foliose bract; involucre 1.3–2.2 cm high, 3–5.6 cm wide, the bracts ovate-lanceolate to lanceolate or linear-lanceolate, attenuate to acuminate; rays 13–21, yellow, 22–38 mm long; achenes 10–12 mm long, long silky-pilose, cuneate, black or dark brown; pappus commonly of 2 awns connected by a crown of short connate scales (or none); n = 17, 18. Commonly on gypsiferous semibarren knolls in blackbrush, rabbitbrush, ephedra, shadscale, grayia, and pinyon-juniper communities in Beaver, Box Elder, Emery, Garfield, Grand, Millard, Piute, San Juan, Sevier, Uintah, Washington, and Wayne counties; Idaho, Nevada, Arizona, and California; 70 (xiii). Specimens of *E. nudicaulis* from Washington County tend to have less well defined blades than for the species as a whole. However, they lack the broadly winged petioles of *E. argophylla* and are mostly in the size range of *E. nudicaulis*. The type of *Tithonia argophylla* D. C. Eaton (basonym of *E. argophylla*) was taken by Dr. Edward Palmer either near St. George (in 1870) or more likely in nearby southern Nevada. The specimen at US consists of basal leaves and a flower head, with the plant (Rep. Explor. 40th Parallel 5: 423. 1871) reputed to be 2 to 3 feet high (ca 60 to 90 cm), well within the size of the material of *E. argophylla* from southern Nevada but not exclusive of all material from the south end of the Beaver Dam Mts. in Utah.

***Enceliopsis nutans* (Eastw.) A. Nels.** Noddinghead. [*Encelia nutans* Eastw.; *Verbesina scaposa* Jones, type from near Cisco, Grand County]. Scapose, discoid perennials, 10–25 cm tall, from a subterranean caudex (2–15 cm long) and tuberous root to 4 cm thick, the herbage strigose to pilosulose (antrorsely on the upper surface, retrorsely so below), green; petioles 2–6.5 cm long, often narrowly winged; leaf blades 2–7.5 cm long, 1.4–6 cm wide, ovate to orbicular or spatulate, cuneate basally, obtuse to rounded apically; scapes not bracteate; involucre 0.9–1.5 cm high, 2.5–4 cm wide, the bracts lance-attenuate; rays lacking; achenes 9–11 mm long, oblanceolate, long silky-pilose, brown; pappus lacking; n = 18. Mainly in finely textured soils in shadscale, budsage, galleta, and ephedra communities at 1310 to 1830 m in Carbon, Duchesne, Emery, Grand, Uintah, and Wayne counties; Colorado (a Colorado Basin endemic); 35 (iii).

***Erigeron* L.**

Annual, biennial, or perennial herbs from caudices, rhizomes, stolons, or taproots, with watery juice; stems decumbent to ascending or erect, rarely prostrate; leaves alternate, simple, entire, toothed, or pinnatifid to palmatifid; heads solitary or few to numerous in corymbose or paniculate inflorescences; involucre bracts equal, or slightly to definitely imbricate, slender, herbaceous (or scarcely herbaceous) throughout; receptacle flat, naked;

rays white, pink, purple, bluish, or yellow, pistillate, numerous or lacking; disk flowers numerous, yellow or tinged reddish; pappus of capillary bristles, sometimes with an outer series of short bristles or scales; style branches with lanceolate and acute or triangular and obtuse appendages; achenes flattened, 2 (rarely 4–14)–nerved. Note: This is a large and complex genus. The species, although mainly distinctive, are distinguished by minute features that can be interpreted variously. The genus is a near congener of both *Aster* and *Conyza*, and is not always separable from either.

Cronquist, A. C. 1947. Revision of the North American species of *Erigeron* north of Mexico. *Brittonia* 6: 121–302.

- 1. Plants with yellow ray flowers, known from Box Elder County *E. linearis*
- Plants with ray flowers pink, pink purple, blue, blue purple, or white, but not yellow, of various distribution . . . 2
- 2(1). Plants annual, biennial, or short-lived perennials from usually slender taproots, lacking rhizomes (except in some specimens of *E. proselyticus*) or woody caudices Key 1
- Plants definitely perennial, often from rhizomes or caudices 3
- 3(2). Plants silvery pubescent; achenes with 4 or more nerves; involucre bracts definitely imbricate Key 2
- Plants green, or less commonly silvery pubescent; achenes with 2 nerves, or, if with more nerves; involucre bracts subequal 4
- 4(3). Involucre woolly-villous to spreading villous, or villous-hirsute with at least some long spreading multicellular hairs Key 3
- Involucre merely glandular, glabrous, puberulent, or with appressed simple or multicellular hairs, rarely with some spreading long hairs near the base Key 4

Key 1.

Plants annual, biennial, or short-lived perennials from slender taproots, lacking rhizomes or woody caudices.

- 1. Pistillate corollas very numerous, filiform, the rays short, erect, not exceeding the disk, or the inner ones tubular and lacking rays 2
- Pistillate corollas few to numerous (rarely lacking), the tube generally cylindric, the rays well developed and spreading, rarely reduced or absent 3
- 2(1). Cauline leaves narrowly lanceolate to oblong, or less commonly linear; rayless pistillate flowers present between the ray and disk flowers; inflorescence corymbose, the peduncles curved-ascending, or the heads solitary *E. acris*
- Cauline leaves linear to oblong; rayless pistillate flowers lacking; inflorescence racemose, the peduncles erect or nearly so, or the heads solitary . *E. lonchophyllus*
- 3(1). Pappus of ray and disk flowers unlike, that of the disk flowers composed of bristles and short outer setae, that of the ray flowers lacking bristles; plants tall adventive weedy species 4
- Pappus of ray and disk flowers alike, consisting of bristles, sometimes also with outer setae or scales; plants indigenous, low to tall 5
- 4(3). Foliage ample; plants mainly 6–12 (15) dm tall; pubescence of stem long and spreading (at least below); plants adventive, weedy *E. annuus*
- Foliage sparse; plants mainly 3–7 dm tall; pubescence various; plants to be sought in Utah . *E. strigosus* Muhl.

- 5(3). Plants diffusely branched, annual; leaves linear to linear-oblong; hairs of stem short and incurved; pappus simple *E. bellidiastrum*
- Plants various, but seldom as above or, if so, the pappus double 6
- 6(5). Disks mainly over 1 cm wide; stems commonly simple, with solitary or few heads, and broad cauline leaves *E. glabellus*
- Disks mostly less than 1 cm wide; stems commonly branched, often with several to many heads 7
- 7(6). Stems with hairs all spreading *E. divergens*
- Stems with hairs appressed or ascending, or glabrous 8
- 8(7). Leaves entire; plants with sterile flagellate branches *E. flagellaris*
- Leaves pinnately lobate or toothed or, if entire, the plants lacking sterile flagellate branches 9
- 9(8). Ray flowers commonly 40–80; plants psammophytes of eastern Washington and western Kane counties *E. religiosus*
- Ray flowers commonly 25–40; plants of various substrates in eastern Washington and Kane counties 10
- 10(9). Involucres 2.5 mm high or less; stems 1–11 cm tall; peduncles sparingly villous; plants known from seeps and moist sandstone in Zion National Park *E. sionis*
- Involucres 2.5–3 mm high; stems 14–25 cm long, peduncles hirsute; plants from limestone and sandstone outcrops in eastern Iron and adjacent Kane counties *E. proselyticus*

Key 2.

Plants perennial, silvery pubescent; achenes 4 (or more) -nerved; involucre bracts imbricate.

1. Achenes glabrous, with 8–14 nerves; caudex clothed with marcescent leaf bases, the midribs evident in age; plants of higher elevations in southern Utah *E. canus*
- Achenes more or less hairy, with 3–8 nerves; caudex lacking marcescent leaf bases, or, if these present, the midribs not evident; plants of low to moderate elevations, more widely or otherwise distributed 2
- 2(1). Involucres villous-hirsute with multicellular spreading hairs, the bracts more or less glandular apically; achenes with 3–5 nerves *E. pulcherrimus*
- Involucres more or less strigose with simple hairs; achenes 4- to 8-nerved 3
- 3(2). Basal leaves evident, tufted, persistent; heads one per stem; plants through much of Utah *E. argentatus*
- Basal leaves mostly withered at anthesis, not forming a conspicuous tuft; plants mainly of southeastern Utah *E. utahensis*

Key 3.

Plants perennial; achenes mostly 2-nerved; bracts mostly subequal, villous with woolly or spreading multicellular hairs.

1. Plants with pinnatifid or palmatifid or merely lobed leaves, low-spreading, more or less mat or clump forming, of high elevations 2
- Plants with entire leaves or, if some of them lobed, otherwise differing; low to tall, of various elevations 4
- 2(1). Plants soboliferous, the caudex divided into elongate spreading branches; leaves merely toothed, or, if lobed, not as below *E. vagus*
- Plants not soboliferous, the caudex branches short; leaves pinnately to palmately lobed or divided 3

- 3(2). Leaves pinnately lobed; plants of the La Sal Mts. *E. mancus*
- Leaves palmately lobed or divided; plants wide-spread *E. compositus*
- 4(1). Involucres long- and shaggy-villous, the hairs sometimes obscuring the bract surface from middle to base. . . 5
- Involucres hirsute to shortly villous, or, if long and shaggy-villous, the hairs not obscuring the bract surface even in the lower portion 7
- 5(4). Plants 4–7 dm tall or more, known from southeastern Utah *E. elatior*
- Plants mainly 0.3–1 dm tall, the distribution various 6
- 6(5). Hairs of involucre with black or dark purple cross-walls; basal leaves rounded to retuse apically; plants of the La Sal Mts. *E. melanocephalus*
- Hairs of involucre with pale cross-walls or some with bright reddish purple to dark purple cross-walls; basal leaves acute to abruptly obtuse apically; plants of the Uinta, Deep Creek, Tushar, and La Sal mts. *E. simplex*
- 7(4). Cauline leaves ample, usually lanceolate or broader; plants tall, erect (more or less asterlike) 8
- Cauline leaves usually much reduced, subulate, linear, oblong oblanceolate or, if broader, the plants not tall or not erect 11
- 8(7). Hairs of involucre with black cross-walls near their bases; rays white; plants of the western Uinta and Wasatch mts. *E. coulteri*
- Hairs of involucre with pale cross-walls; rays white, pink, or purple; plants with abundance and distribution various 9
- 9(8). Plants with cauline leaves well developed and equably distributed, only gradually reduced upward, the middle ones as large as or larger than the lower ones *E. speciosus*
- Plants with cauline leaves rather abruptly reduced upward, those of the middle smaller than the lower ones 10
- 10(9). Involucres glandular or viscid towards the apex; stems curved at base *E. formosissimus*
- Involucres seldom if at all glandular or viscid; stems erect *E. glabellus*
- 11(7). Ray flowers lacking *E. aphanactis*
- Ray flowers present 12
- 12(11). Plants subscape, the bracteate leaves very small; caudex branches with persistent leaf bases 13
- Plants not subscape, the leaves merely reduced upward; caudex branches with or without persistent leaf bases 16
- 13(12). Stems and involucres with long contorted villous hairs; plants of Box Elder and Daggett counties *E. nanus*
- Stems and involucres strigose, pilosulose, or hispidulous, the hairs appressed or ascending to spreading; distribution various 14
- 14(13). Leaves linear; herbage strigose; rays 7–11 mm long; plants mainly of lower elevations in the Navajo and Great basins *E. compactus*
- Leaves narrowly oblanceolate to spatulate; herbage strigose to pilosulose or hispidulous; rays 4–8.2 mm long; plants of the Uinta Basin and Wasatch Plateau . . . 15
- 15(14). Involucres long-villous with spreading multicellular hairs; rays 6.8–8.2 mm long; plants of the Wasatch Plateau *E. carringtonae*

- Involucres short-hispidulous; rays 4–6.5 mm long; plants of the Uinta Basin *E. untermannii* 2(1). Cauline leaves ample, usually lanceolate or broader; plants tall and erect (more or less asterlike) 3
- 16(12). Caudex branches robust, 1–2.5 cm thick; plants of western Beaver and Washington counties *E. wahwahensis* — Cauline leaves definitely reduced upward, mostly linear to oblanceolate, or broader in some low species; stems often spreading or decumbent 5
- Caudex branches mainly less than 1.5 cm thick or, if thicker, plants of different distribution 17
- 17(16). Stems spreading-hairy 18
- Stems strigose, or with ascending hairs 21
- 18(17). Leaves linear to linear-oblanceolate; plants without a prominent caudex, mainly of lower elevations *E. pumilus* — Cauline leaves ciliate or otherwise pubescent, sometimes also glandular, usually longer than the internodes *E. speciosus*
- Leaves oblanceolate to spatulate; plants with prominent caudex, of low to middle or higher elevations . . . 19
- 19(18). Stems glandular, with sand grains adhering; plants of lower elevations in Emery and Wayne counties *E. maguirei* — Pubescence of the stem widely spreading or glandular-scabrous 6
- Stems lacking glands; plants of moderate and higher elevations 20
- 20(19). Stems commonly purplish at the base; leaves thin; plants of broad or other distribution *E. eatonii* — Pubescence of the stem appressed, ascending, or lacking 9
- Stems green throughout; leaves thickish; plants of the Uinta and Wasatch mts. *E. goodrichii* 6(5). Involucre canescent with fine, white, appressed to ascending hairs, sometimes also glandular 7
- 21(17). Caudex with spreading subrhizomatous branches, with numerous fibrous roots; stems and lower leaf bases purplish; plants sod-forming, of higher elevations *E. ursinus* — Involucre glandular and more or less spreading-hairy or strigose 8
- Caudex not subrhizomatous, seldom if ever with roots; stem and leaf bases not purple; plants of various elevations 22
- 22(21). Stems decumbent, sharply bent from apex of caudex 23
- Stems ascending to erect, not sharply bent from caudex apex 24
- 23(22). Herbage glaucous, sparingly hairy; rays 15–22; basal leaf bases greatly expanded, long-ciliate; plants of eastern Washington County *E. canaani* 7(6). Involucral bracts evidently thickened on the back; basal leaves typically obtuse to rounded apically; stems rarely purplish at the base *E. caespitosus*
- Involucral bracts slightly if at all thickened on the back; basal leaves acute apically; stems often purplish at the base *E. corymbosus*
- Herbage green, not especially glaucous, sparingly to moderately hairy; basal leaf bases not greatly expanded, short-ciliate; plants of broad distribution *E. eatonii* 8(6). Stems hirsute with short spreading hairs, conspicuously decumbent; involucres glandular and spreading hairy *E. jonesii*
- 24(22). Cauline leaves moderately well developed, the basal ones linear-oblanceolate; involucres 9–12 mm wide; plants of lower elevations *E. engelmannii* — Stems glandular-scabrous, ascending or erect; involucres glandular (rarely sparingly strigose) *E. nauseosus*
- Cauline leaves much reduced, the basal ones spatulate; involucres less than 8 mm wide 25
- 25(24). Basal leaves acute or acutish; rays blue to red-purple; pappus subequal to disk corollas; plants widely distributed *E. tener* 9(5). Basal leaves broadly oblanceolate or usually broader, the blade well developed, usually abruptly contracted to the petiole 10
- Basal leaves linear to oblanceolate or spatulate, tapering gradually to the petiole 12
- Basal leaves obtuse to rounded; rays white to pink; pappus shorter than disk corollas; plants of the Bear River Range, Cache County *E. cronquistii* 10(9). Rays purple; achenes 4– to 7-nerved; pappus simple *E. peregrinus*
- Rays various; achenes 2-nerved (occasionally more, but rays then pale and pappus double) 11
- 11(10). Stems essentially scapose, the upper bracts linear; plants known from the Wasatch Mts. *E. garrettii*
- Stems subscapose, the upper bracts oblong; plants rather broadly distributed *E. leiomeris* 12(9). Peduncles and involucres densely glandular, not hairy; stems glabrous or essentially so; plants of the Wasatch Mts. *E. arenarioides*
- Peduncles not glandular, or, if so, the stem more or less hairy; involucres and distribution various 13
- 13(12). Bases of basal leaves neither enlarged nor of different texture than the blades; blades linear or linear-filiform; plants known from Cache and Daggett counties *E. filifolius*
- Bases of basal leaves somewhat enlarged, membranous or thickened, or otherwise different from above; blades not or only some linear 14
- 14(13). Leaves glabrous or nearly so, the hairs, if present, short and appressed *E. leiomeris*
- Leaves hairy, the hairs spreading or curved-ascending 15

Key 4.

Plants perennial, green; achenes mostly 2-nerved; involucres mostly without long, spreading, multicellular hairs.

1. Plants substoloniferous; leaves spatulate; involucres mainly less than 8 mm wide; plants of hanging gardens and moist canyon bottoms in San Juan County *E. kachinensis*
- Plants not substoloniferous; leaves various; involucres mainly over 8 mm wide; plants not or seldom of hanging gardens, variously distributed 2

- 15(14). Plants subscapose; cauline leaves reduced to acicular bracts; plants of the Uinta Basin and West Tavaputs Plateau *E. nematophyllus*
- Plants caulescent; cauline leaves well developed 16
- 16(15). Basal leaves linear to narrowly oblanceolate, less than 4 mm wide; cauline leaves mostly linear; inner pappus bristles mainly 5–8; plants of moist alcoves along Lake Powell *E. zothecinus*
- Basal leaves oblanceolate to spatulate, more than 4 mm wide; cauline leaves oblong to oblanceolate; inner pappus bristles mainly more than 8; plants not of moist alcoves 17
- 17(16). Stems decumbent-ascending, commonly curved at the base; basal leaves sheathing basally; heads mainly solitary *E. abajoensis*
- Stems erect or nearly so; basal leaves not especially sheathing; heads mainly 2–4 *E. awapensis*

Erigeron abajoensis Cronq. Abajo Daisy. Perennial herb, with a taproot and stout caudex, the caudex branches clothed with brown marcescent leaf bases; stems decumbent to spreading at the base, 5–20 cm long, strigose to strigulose, the hairs ascending; basal leaves oblanceolate, 2–7 cm long, 2–6 mm wide, more or less sheathing basally; cauline leaves several to many, oblong to lance-oblong, mostly 0.6–2.5 cm long, 1.5–4 mm wide; heads solitary, less commonly 2–4; involucre 4–5.2 mm high, 7–12 mm wide, the bracts subequal or slightly imbricate, somewhat thickened dorsally, greenish brown, strigose to strigulose, the hairs multicellular; rays about 40–60, pink purple to blue (or white), 3–8 mm long, 1–1.8 mm wide; pappus double, the inner of 12–20 bristles, the outer of setae or scales; achenes 2-nerved, hairy. Pinyon-juniper, ponderosa pine, and spruce-fir communities at 2135 to 3450 m in Garfield, Piute, San Juan (type from the Abajo Mts.), and Wayne counties; endemic; 4 (i).

Erigeron acris L. Bitter Fleabane. Short-lived perennial, with a slender taproot and poorly developed caudex; stems erect or decumbent at the base, 8–32 cm tall, spreading-hairy and more or less glandular; basal leaves spatulate-oblanceolate, 0.5–6.5 cm long, 2–10 mm wide, entire or sparingly toothed; cauline leaves several to many, oblong to narrowly oblanceolate, lanceolate, or linear, mostly 0.8–7 cm long, 1–8 mm wide; heads solitary, or more commonly few to numerous, on short to elongate peduncles; involucre 4.5–8 mm high, 9–17 mm wide, the bracts imbricate, not especially thickened, green or tinged pink apically in some, sparingly hairy with spreading to ascending stiff multicellular hairs and beset with short glandular processes; rays numerous, pink or white, erect, ca 2–4.5 mm long, the inner pistillate flowers eligulate, with corolla tubular; pappus of ca 25–35 slender barbellate white to reddish bristles, surpassing the disk corollas; achenes 2-nerved, sparingly hairy; $n = 9$. Lodgepole pine, spruce, and fir communities at 2800 to 3500 m in Duchesne, Summit, and Uintah counties; Alaska to Labrador, south to California, Colorado, Michigan, and Maine; circumboreal; 11 (ix). Varietal status of our few specimens is unclear. One of the specimens has few heads and essentially eglandular bracts, one is monocephalus and has glandular involucre, and the others are polyccephalus and have glandular involucre. Names available are var. *asteroides* (Andrz.) DC. and var. *debilis* Gray, but there appear to be three rather poorly differentiated taxa involved. Decisions as to proper names must await further study.

Erigeron annuus (L.) Pers. Annual Fleabane. Plants annual, with slender taproots; stems erect, 6–12 (15) dm tall, sparingly to densely hirsute with long spreading hairs, becoming appressed upward; basal leaves commonly withered at anthesis, ovate to suborbicular, petiolate; cauline leaves numerous, lanceolate to oblong, mainly 1.5–8 cm long, 3–20 mm wide, serrate to entire; heads several to numerous, in a leafy inflorescence; involucre 7.5–12 mm wide, 3–5 mm high, the bracts subequal or the outer somewhat shorter, greenish to brownish, acuminate-attenuate, glandular and sparingly villous-hirsute with multicellular hairs; rays ca 80–125, white (rarely bluish), 4–10 mm long, 0.5–1 mm wide; pappus double; achenes 2-nerved, hairy; $2n = 54$. Roadsides, fields, and other disturbed sites at 1370 to 1830 m in Utah and Wasatch counties; widespread in the U. S.; adventive from Europe; 8 (ii).

Erigeron aphanactis (Gray) Greene Hairy Daisy. [*E. concinnus* var. *aphanactis* Gray]. Perennials with definite branching caudex; stems decumbent to ascending or erect, 5–20 (30) cm tall, sparingly to copiously spreading-hirsute with multicellular hairs; basal leaves narrowly oblanceolate to spatulate, 0.5–8 cm long, 1–6 mm wide, petiolate; cauline leaves well developed or essentially lacking; heads solitary or several; involucre 7–15 mm wide, 3.5–6 mm high, finely to coarsely spreading-hirsute and sometimes also finely glandular; bracts subequal or somewhat imbricate, slender, acuminate, green or greenish brown, the midrib thickened; pistillate flowers present, tubular, eligulate, or sometimes with rays shorter than the disk; pappus double; achenes 2-nerved, sparsely hairy. This species is represented in Utah by two rather weak varieties.

1. Plants essentially scapose; corolla lobes sometimes becoming reddish or purplish *E. aphanactis* var. *congestus*
- Plants with leafy stems; corolla lobes commonly yellowish *E. aphanactis* var. *aphanactis*

Var. *aphanactis* Salt desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1300 to 2700 m in Beaver, Garfield, Juab, Piute, Sanpete, Sevier, Washington, and Wayne counties; Oregon and Idaho south to California, Arizona, and Colorado; 21 (iii).

Var. *congestus* (Greene) Cronq. [*E. congestus* Greene]. Juniper-black sagebrush, sagebrush, and aspen communities at 1830 to 2600 m in Garfield and Sevier counties; California; 3 (0).

Erigeron arenarioides (D. C. Eaton) Gray Wasatch Daisy. [*E. stenophyllus* D. C. Eaton, not H. & A., type from Cottonwood Canyon, Salt Lake County; *Aster arenarioides* D. C. Eaton ex Gray]. Perennial herbs, with definite branching caudex, the caudex branches clothed with brownish marcescent leaf bases; stems ascending to erect, 6–25 (30) cm tall, slender, glabrous or glandular below the heads; leaves glabrous or sparingly strigose, the basal ones linear-filiform to linear-oblanceolate, 1.5–6 (8) cm long, 0.5–2 (4) mm wide, entire; heads solitary or 2 or 3 (rarely more); involucre 7–9 mm wide, 3.7–5 mm high, the bracts imbricate in several series, greenish brown, finely glandular, the tips often purplish; rays 10–25, blue, 4–8 mm long, 0.8–1.8 mm wide; pappus of ca 10–16 bristles, and with a few short setae; achenes 2-nerved, sparsely strigose. Crevices in limestone and quartzite outcrops, rarely in beach sand, at 1300 to 2440 m in Salt Lake, Tooele, Utah, and Weber counties; endemic; 8 (0).

Erigeron argentatus Gray Silver Daisy. [*Wyomingia argentata* (Gray) A. Nels.]. Perennial herbs, with definite branching caudex, the caudex branches more or less clothed with brown marcescent leaf bases, the midribs not especially persistent; stems erect, 9–28 (40) cm tall, finely strigose and silvery to gray-green; basal leaves tufted, spatulate to oblanceolate, 1.5–7 cm long, 1–4 (6) mm wide, petiolate, entire; cauline leaves reduced upward; heads solitary; involucre 10–18 mm wide, 5.5–9 mm high, the bracts strongly imbricate, silvery strigose with appressed antrorse hairs; rays ca 20–50, blue, lavender, or pink to white, 9–15 mm long, 1.6–2.8 mm wide; pappus double; achenes pilose; $n = 9$. Salt desert shrub, sagebrush, piñon-juniper, and mountain brush communities at 1600 to 2440 m in Beaver, Box Elder, Emery, Garfield, Iron, Juab, Millard, Piute, Sanpete, Sevier, Tooele, and Utah counties; Nevada, California; 29 (iii).

Erigeron awapensis Welsh Awapa Daisy. Perennial herbs from a branching caudex, the caudex branches clothed with ragged brown marcescent leaf bases; stems erect or nearly so, 10–24 cm long, strigose, the hairs ascending; basal leaves 1.5–7 cm long, 2–8 mm wide, not especially sheathing; cauline leaves well developed, oblong to linear, mostly 1–4 cm long, 2–4 mm wide; heads 2–4, rarely solitary; involucre 3–9 mm wide, 3.7–4.5 mm high, the bracts more or less imbricate, thickened near the base dorsally, greenish, strigulose, the hairs multicellular; rays 35–45, pink purple to pink (or white?), 5–6 mm long, 0.9–1.8 mm wide; pappus apparently simple, of 15–20 slender bristles, and with a few inconspicuous shorter setae in some; achenes 2-nerved, hairy. Piñon-juniper and sagebrush communities at 2135 to 2260 m in Garfield and Wayne (type from 26.5 mi S. of Antimony) counties; endemic; 2 (i).

Erigeron bellidiastrum Nutt. Pretty Daisy. Plants annual (or biennial), the stems 3.5–32 (50) cm tall, erect or ascending, often intricately branched; herbage strigulose with incurved multicellular hairs; leaves mainly cauline, 0.5–4 cm long, 1–3 (6) mm wide, linear to oblanceolate, entire (or sparingly toothed to pinnatifid), petiolate, becoming sessile upward; heads solitary to numerous; involucre 5–11 mm wide, 3–5 mm high, the bracts hirtellous with spreading curved multicellular hairs, thick, greenish, subequal, or the outermost shorter; rays ca 30–70, pink or white, 4–6 mm long, ca 1 mm wide; pappus of ca 15 deciduous bristles; achenes 2-nerved, hairy; $n = 9$. Vanclevea-ephedra, blackbrush, and piñon-juniper communities at 1125 to 1830 m in Garfield, Grand, Kane, San Juan, and Washington counties; Wyoming and South Dakota to New Mexico and Texas; 23 (ii).

Erigeron caespitosus Nutt. Tufted Daisy. [*E. caespitosus* var. *lacoliticus* Jones, type from the Henry Mts.]. Perennial herbs with a branching caudex, the caudex branches clothed with brown or blackish marcescent leaf bases; stems decumbent at the base, 4–25 (30) cm tall, hirtellous with short spreading hairs (especially above); basal leaves oblanceolate to spatulate, generally rounded to obtuse apically, 1–9 cm long, 2–13 mm wide, 1- to 3-nerved; cauline leaves reduced upward; heads solitary or few to several; involucre 9–18 mm wide, 4–7 mm high, the bracts subequal to imbricate, thickened on the back, green, strigose to pilose with multicellular hairs spreading laterally from the midrib; rays ca 30–100, blue, pink, or white, 5–15 mm long, 1–2 mm wide; pappus

double; achenes 2-nerved, hairy; $2n = 18$. Sagebrush, piñon-juniper, aspen, lodgepole pine, spruce, and tundra communities at 2135 to 3570 m in Daggett, Duchesne, Emery, Garfield, Salt Lake, Sevier, Summit, Uintah, Utah, Wasatch, and Wayne counties; Alaska and Yukon south to Arizona, New Mexico, and Nebraska; 40 (viii). This is a variable species with many phases in Utah, each differing in stature, nature of vestiture, size of heads, and other features that fail singly and in combination as diagnostic criteria. The species interfaces with *E. nauseosus*, *E. abajoensis*, and probably with other taxa.

Erigeron canaani Welsh Canaan Daisy. Perennial herbs from a simple (or branched?) caudex, this clothed with brown marcescent leaf bases, the taproot prominent; stems 7–20 cm tall, decumbent to ascending, sometimes purplish at the base, sparingly pubescent with ascending hairs; leaves pubescent like the stem, the basal ones tufted, 1-nerved, 1.4–9 cm long, 0.7–1 mm wide, linear, involute, sharply acute, conspicuously expanded and long-ciliate basally; cauline leaves numerous, reduced upward; heads 1–3; involucre 9–13 mm wide, 5.3–6.5 mm high; bracts imbricate, conspicuously glandular and sparingly to moderately villous-pilose with multicellular hairs, green or variously suffused with purple; rays 15–22, white or pinkish, 3.5–5 mm long, 1.8–2.1 mm wide; pappus single, of ca 20 slender bristles; achenes 2-nerved, hairy. Ponderosa pine community at 1585 to 2075 m in Washington (type from Canaan Mt.) County; endemic; 5 (ii). The Canaan daisy is similar in general aspect to *E. eatonii* (q.v.). The involute linear glaucous leaves and few ray flowers appear to be diagnostic.

Erigeron canus Gray Hoary Daisy. Perennial herbs, with branching caudex, the caudex branches clothed with persistent leaf bases, the marcescent midribs prominent; stems erect or nearly so, 5–30 (35) cm tall, appressed strigose; basal leaves oblanceolate, mostly 1–6 cm long and 1–5 (7) mm wide, hairy like the stems; cauline leaves reduced upward; heads solitary (rarely up to 4); involucre 9–16 mm wide, 5–7 mm high, the bracts strigulose with ascending to spreading multicellular hairs and more or less glandular, imbricate; rays ca 30–40, blue or white, 7–12 mm long, 0.8–1.4 mm wide; pappus double; achenes ca 8- to 14-nerved. Gravelly substrates of the Pink Limestone member of the Wasatch Formation in ponderosa pine and sagebrush communities at 2300 to 2500 m in Garfield County; Wyoming and South Dakota to Arizona and New Mexico; 3 (i).

Erigeron carringtonae Welsh Carrington Daisy. Pulvinate perennial herbs with a pluricipital caudex, the branches clothed with conspicuous brown to straw colored or ashy marcescent leaf bases; leaves mainly basal, thickish, 0.6–3.5 cm long, 1–5 mm wide, spatulate to oblanceolate, strigose to pilosulose, obtuse to rounded apically; scapes 2.5–8 cm tall; heads solitary; involucre 9.8–15 mm wide, 5.8–7 mm high, the bracts imbricate, suffused with purple or green, the inner greenish with scarious margins, spreading-villous with long multicellular hairs; rays 18–30, pink to pink purple, 6.8–8.2 mm long, 1.4–2.3 mm wide; pappus double, the inner of 25–35 barbellate bristles, the outer of short setae; achenes 2-nerved, pilose. Meadows and escarpment margins, commonly on Flagstaff Limestone at 3050 to 3355 m in Emery and Sanpete (type from Wasatch Plateau) counties; endemic; 6 (i).

Erigeron compactus Blake Mound Daisy. [*E. pulvinatus* Rydb., type from the Deep Creek Mts.]. Perennial

pulvinate herbs with a branching caudex, the caudex branches clothed with marcescent leaf bases; leaves mainly basal, 4–20 mm long, 0.6–1.4 mm wide, linear, finely strigose; scapes 2–10 cm tall; heads solitary; involucre 7–17 mm wide, 5–8.5 mm high, the bracts more or less imbricate, straw colored or greenish brown to green, hispidulous with short spreading hairs; rays mainly 15–50, white or pink, 7–11 mm long, 1.4–2.5 mm wide; pappus double; achenes 2-nerved. Two geographically segregated races are recognizable as varieties.

1. Leaves yellowish green; involucre bracts appressed strigose; plants of the Great Basin *E. compactus* var. *compactus*
- Leaves grayish green; involucre bracts spreading-hispidulous; plants of the Colorado Drainage system *E. compactus* var. *consimilis*

Var. *compactus* Pinyon-juniper community at 1830 to 2135 m in Beaver, Box Elder, Millard, and Tooele counties; Nevada and California; 4 (0).

Var. *consimilis* (Cronq.) Blake [*E. consimilis* Cronq.]. Salt desert shrub and pinyon-juniper communities in Daggett, Duchesne, Emery, and Wayne counties; Arizona; 11 (i). The general aspect of this variety is similar to that of *E. pulcherrimus* (q.v.), with which it is sympatric in much of its range; the 2-nerved achenes and low subscapose stems are diagnostic.

Erigeron compositus Pursh Fern-leaf Daisy. Perennial caespitose cushion plants, with a shortened much-branched caudex, the caudex branches densely clothed with brown marcescent leaf bases; herbage glandular and more or less spreading-hairy; leaves mainly basal, mostly 2- or 3-ternately lobed or dissected, 0.5–7 cm long; cauline leaves few and reduced upward, simple or ternate; stems subscapose, 2–20 (25) cm tall; heads solitary; involucre 8–20 mm wide, 5–10 mm high, the bracts glandular and spreading-hairy, commonly purplish at the tips; rays lacking, or developed and 20–60, blue, pink, or white, to 12 mm long and 2 mm wide; pappus simple; achenes 2-nerved, villous-hirsute; $2n = 36, 54$. Sagebrush, rabbitbrush, aspen, aspen-fir, lodgepole pine, spruce-fir, and alpine tundra communities at 2375 to 3965 m in Beaver, Box Elder, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Millard, Piute, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; Alaska to Greenland, south to California, Arizona, Colorado, South Dakota, and Quebec; 77 (xvi). This is an extremely variable apomictic species, with rare sexual individuals. Our material has been assigned to **var. *glabratus*** Macoun, which is separable from the type variety only problematically.

Erigeron corymbosus Nutt. Mountain Daisy. [*E. Nelsonii* Greene]. Perennial herbs from a simple or branched caudex; stem short hirsute with spreading hairs and sometimes with longer ones intermixed, purplish and often curved at the base, 1–5 dm tall; leaves pubescent like the stem, often ciliate with longer hairs; basal leaves 3-nerved, linear-oblongate, acute apically, tapering to a petiole, 1.5–15 cm long, 3–14 mm wide; cauline leaves reduced upward; heads 1–10 (16); involucre 7–13 mm wide, 5–7 mm high, villous-hirsute with ascending multicellular stiff hairs and more or less glandular; bracts only somewhat if at all thickened on the back, green to tan, with darker midrib and usually close tips; rays ca 35–65, blue or pink, 7–13 mm long, 1.2–2 mm wide; disc corollas

(3) 4–5.3 mm long; pappus double, the inner or 20–30 firm bristles, the outer of evident setae or narrow scales; achenes 2-nerved, pubescent; $2n = 18$. Sagebrush, rabbitbrush, grassland community at ca 2227 m in Rich County; British Columbia to Montana, south to Oregon, Idaho, and Wyoming; 1 (0).

Erigeron coulteri T. C. Porter in Port. & Coult. Coulter Daisy. Perennial herbs from a rhizome or caudex; stems more or less spreading-hairy, mainly 1–6 dm tall; basal and cauline leaves ample or the cauline ones somewhat reduced, entire or toothed, the largest 6–15 cm long, 1–2.5 cm wide, oblanceolate to elliptic, lanceolate, oblong, or ovate; heads solitary or 2 or 3; involucre 10–15 mm wide, 6–10 mm high, the bracts densely white hirsute below with hairs having purplish black cross-walls, at least near the base, glandular to the tips; rays 40–80, ca 10–15 mm long, white to pink purple; pappus simple; achenes sparsely hairy; $2n = 18$. Aspen and spruce-fir communities at 2235 to 2745 m in Salt Lake, Summit, and Utah counties; Oregon to Wyoming, south to California, Nevada, and New Mexico; 9 (0).

Erigeron cronquistii Maguire Cronquist Daisy. Perennial herb, with short caudex branches clothed with brown leaf bases; stems 1.5–7 cm long, sparingly strigose; basal leaves 0.5–4 cm long, spatulate to oblanceolate or elliptic, petiolate, sparingly strigose; cauline leaves few or wanting; heads solitary, sometimes 2; involucre 5–8 mm wide, 3–5 mm high, glandular and spreading-hirsute, the bracts imbricate, green, often suffused with purple; rays 10–25, white or pale pink, 5–6 mm long, 1.3–2.1 mm wide; pappus single, or with a few shorter outer ones; achenes 2-nerved, sparingly hairy. Limestone cliffs at 1750 to 2600 m in the Bear River Range (type from Logan Canyon), Cache County; endemic; 2 (0). This beautiful, tiny plant is a near congener of *E. tener* (q.v.).

Erigeron divergens T. & G. Spreading Daisy. [*E. divaricatus* Nutt., not Michx.; *E. cinereus* var. *aridus* Jones, type from Silver Reef, Washington County]. Annual, biennial, or short-lived perennial herbs from tap-roots; stems branched from the base and above, pubescent with spreading hairs, 0.5–5 (7) dm tall; basal leaves oblanceolate to spatulate, entire or sometimes lobed, mainly 1–7 cm long, 2–10 mm wide, spreading-hairy, petiolate, usually lacking at anthesis; cauline leaves reduced upward; heads several to numerous; involucre 7–11 mm wide, 4–5 mm high, finely glandular and hirsute with long, spreading hairs, the bracts green, attenuate; rays ca 75–150, blue, pink, or white, ca 5–10 mm long, 0.5–1.2 mm wide, sometimes scarcely developed; pappus double; achenes 2(4)-nerved, sparsely hairy; $n = 9, 18, 27, 36$. Riparian, rabbitbrush, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen-spruce communities at 975 to 2900 m in all Utah counties, except Box Elder, Carbon, Morgan, Rich, Sanpete, Summit, and Wayne; British Columbia to South Dakota, south to California, Arizona, and Mexico; 109 (xiii). Our materials have been segregated into two weak varieties differentiated as follows: **var. *cinereus*** Gray, with earliest flowers borne on long naked peduncles and plants later with long leafy stolons; and **var. *divergens***, with earliest heads on leafy peduncles and plants not developing leafy stolons. The var. *cinereus* is evidently rare in Utah; 5 (ii).

Erigeron eatonii Gray Eaton Daisy. [*E. eatonii* f. *mollestus* Cronq., type from the Stansbury Mountains]. Perennial herbs, from a short simple or branched caudex,

this clothed with brown marcescent leaf bases, the taproot prominent; stems 5–38 cm tall, decumbent to ascending, usually purplish at the base, strigose or rarely more or less hirsute; leaves pubescent like the stem, the basal ones tufted, 1– (or more commonly) 3–nerved, acute, mainly 1.2–12 (15) cm long, 1–10 mm wide; cauline leaves numerous, reduced upward; heads 1–3 (7); involucre 8–15 mm wide, 5–8 mm high, the bracts imbricate, conspicuously glandular and more or less hirsute with spreading-ascending multicellular hairs, green or the tips purplish; rays ca 20–50, white to blue or pink, mainly 4–10 mm long, 1–2.5 mm wide; pappus single or with a few short outer setae; achenes 2 (3)-nerved; $n = 9$, 18. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, spruce-fir, and alpine tundra communities at 1890 to 3630 m in all Utah counties except for Box Elder and Morgan; Oregon to Wyoming, south to California, Arizona, and Colorado; 171 (xxv). The type is from the Uinta Mts., Summit County. This is a widespread and variable species, with variants differing in size, in head dimensions, and in nature of the pubescence. The hirsute phase from the Stansbury Mountains has been designated as *f. molestus* Cronq.

Erigeron elatior (Gray) Greene Tall Daisy. [*E. grandiflorus* var. *elatior* Gray]. Perennial herbs, from a short caudex (seldom collected); stems mainly 4–7 dm tall, often purplish below, leafy throughout, spreading-hairy and more or less glandular above; leaves mainly 2.2–10 cm long, 6–28 mm wide, the lowermost smaller than the middle ones and commonly withered at anthesis, ovate-lanceolate to lanceolate, entire, the lower petiole, becoming sessile and somewhat clasping upward; heads 1–3 (6); involucre 12–20 mm wide, 7–11 mm high, the bracts densely woolly-villous with long, flattened, shiny, multicellular hairs, some of which may have reddish purple cross-walls, subequal, long-attenuate apically, the tips glandular, purple, and reflexed; rays ca 75–150, pink or pink purple (white), 12–20 mm long, 0.8–1.6 mm wide; pappus double; achenes 2-nerved, hairy; $n = 9$. Meadows and openings in mountain brush and spruce-fir communities at 2440 to 3050 m in the La Sal Mts. of Grand and San Juan counties; Colorado and Wyoming. This is a beautiful asterlike plant with equally leafy stems and densely villous involucre; 4 (0).

Erigeron engelmannii A. Nels. Engelmann Daisy. Perennial herbs, with short branching caudex, this clothed with straw colored to brown marcescent leaf bases; taproot definite; stems 3–24 (30) cm tall, decumbent to erect, strigose or the hairs ascending and multicellular; basal leaves 1–6 (10) cm long, 1.5–5 mm wide, linear-oblongate, the blades hairy like the stems, the basal margins long and coarsely ciliate; cauline leaves reduced but well distributed upward; heads 1–4; involucre 7–12 mm wide, 4–7 mm high, the bracts hirsute and more or less glandular, subequal, green, with brownish midrib and scarious apices; rays ca 35–100, white (rarely pink or blue), 5–12 mm long, 0.6–2 mm wide; pappus double; achenes 2-nerved, hairy. Salt desert shrub, sagebrush, rabbitbrush, and pinyon-juniper communities at 1370 to 2200 m in Box Elder, Cache, Daggett, Duchesne, Grand, Juab, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, and Utah counties; Oregon to Wyoming and Colorado; 28 (iii).

Erigeron filifolius Nutt. Thread-leaf Daisy. Perennial herbs, with branching woody caudex, the caudex

branches clothed with brownish marcescent leaf bases; stems 10–30 (50) cm tall, more or less strigose; leaves 1–8 cm long, 0.3–3 mm wide, linear or filiform, strigose, the cauline ones distributed along the stem but smaller than the basal ones; heads 1 to several; involucre 5–15 mm wide, 4–6 mm high, the bracts villous to strigose and commonly glandular as well, subequal or somewhat imbricate, greenish; rays ca 15–75, blue to pink or white, 3–12 mm long, 1–2 mm wide; pappus single or with a few outer setae; achenes 2-nerved, more or less hairy; $n = 9$, 18. Sagebrush, aspen, and mixed conifer communities at ca 2380 m in Cache (C. P. Smith 1737 RM) and Daggett counties; British Columbia and Montana to California and Nevada; 1 (0).

Erigeron flagellaris Gray Trailing Daisy. Biennial or short-lived perennials, with a poorly developed caudex (if at all) and slender taproot; herbage strigose or with spreading hairs at stem base; stems 3–25 (40) cm tall, the fertile ones terminated by a solitary head, the sterile ones developed as leafy stolons; basal leaves 1–5 cm long, 1.5–8 mm wide, oblanceolate to spatulate; cauline leaves smaller upward, linear to oblanceolate; heads solitary; involucre 7–13 mm wide, 3.5–5 mm high, the bracts with appressed or spreading hairs, glandular, green to purplish; rays mostly ca 50–100, white, pink, or blue, 5–10 mm long, 0.8–1 mm wide; pappus double; achenes 2-nerved, hairy to almost glabrous; $2n = 27$, 36, 45. Sagebrush, juniper, ponderosa pine, aspen, spruce-fir, and alpine meadow communities at 1980 to 3180 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Summit, Uintah, Wasatch, Washington, and Wayne counties; British Columbia to Nevada, Arizona, and Texas; 63 (xi).

Erigeron formosissimus Greene Pretty Daisy. [*E. fructorum* Rydb., type from the La Sal Mts.]. Perennial herbs, with a simple or sparingly branched subrhizomatous caudex; herbage variously hirsute, glandular, or glabrous, the stems more or less glandular above, mainly 1.5–3 (4.5) dm tall; basal leaves the largest, mainly 2–10 (15) cm long, 4–10 (15) mm wide, oblanceolate to spatulate; cauline leaves commonly much reduced upward, lanceolate to oblong or ovate; heads 1–6; involucre 10–20 mm wide, 5–8 mm high, the bracts subequal, linear, acuminate, glandular, and more or less hirsute; rays ca 75–150, 8–15 mm long, ca 1 mm wide, blue, pink, or white; pappus double; achenes 2-nerved, hairy; $n = 9$. Meadows in aspen and mountain brush communities at 2440 to 2840 m in Grand, Iron, Salt Lake, San Juan, and Sevier counties; Alberta south to Arizona and New Mexico; 5 (i). The species is poorly known in Utah (reports of the species in Iron County are from Cronquist 1947).

Erigeron garrettii A. Nels. Garrett Daisy. [*E. controversus* Greene, type from Alta]. Perennial subscapose herbs, with branching caudex, the caudex branches clothed with brown leaf bases; stems 3–23 cm tall, sparingly strigose; basal leaves 1.2–12 cm long, 3–13 mm wide, oblanceolate to spatulate, glabrous, sparingly ciliate; cauline leaves lacking or greatly reduced; heads solitary; involucre 8–17 mm wide, 5–8 mm high, the bracts finely strigose and obscurely glandular, moderately imbricate; rays ca 20–35, white to pink, 7–13 mm long, 1.4–2.7 mm wide; pappus double; achenes 2-nerved, hairy. Moist cliff faces and crevices at 2750 to 3570 m in Salt Lake (type from Big Cottonwood Canyon), Utah, and Wasatch counties; endemic; 17 (0).

Erigeron glabellus Nutt. Smooth Daisy. Perennial or biennial herbs with simple or branched caudices, the caudex, when present, clothed with brown to blackish leaf bases; herbage strigose to hirsute; stems 1–6.5 dm tall, erect or nearly so; basal and lower leaves mainly 3–15 cm long, 3–18 mm wide, oblanceolate, entire or toothed, petiolate; middle cauline leaves lanceolate to linear, reduced upward; heads 1–12 (15), borne on bracteate peduncles; involucre 10–20 mm wide, 5–9 mm high, the bracts subequal to slightly imbricate, acuminate, strigose to strigulose; rays ca 125–175, blue to pink, or white; pappus double; achenes 2-nerved, hairy; $n = 9, 18$. Meadows and stream sides at 1370 to 1770 m in Beaver, Cache, Daggett, Davis, Duchesne, Salt Lake, Uintah, Utah, and Wasatch counties; Alaska and Yukon, south to Colorado, South Dakota, and Wisconsin; 12 (0). This is a tall handsome daisy of lower elevations in Utah.

Erigeron goodrichii Welsh Goodrich Daisy. Perennial herbs from a stout taproot and caudex, the caudex branches with dark brown marcescent leaf bases; stems 3–10 cm tall, decumbent-ascending to erect, spreading-hairy; basal leaves 0.4–6 cm long, 1.2–5 mm wide, narrowly oblanceolate, the veins not apparent, pilosulose, obtuse apically; cauline leaves more or less developed, but much reduced upward; heads solitary; involucre 10.5–18 mm wide, 6.4–7.8 mm high; bracts imbricate, spreading villous-pilose with multicellular hairs, thickened basally, green or the apices suffused purplish, the inner with scarious margins, the attenuate apices more or less glandular and sometimes spreading; rays 40–65, pink purple to pink or white, 6.8–10.4 mm long, 1.5–2 mm wide; pappus apparently single, of 20–30 minutely barbellate bristles; achenes 2-nerved, pilose. Engelmann spruce krummholz and meadow communities, often on rock outcrops or talus at 3050 to 3400 m in Duchesne (type from the Uinta Mts.), Summit, Uintah, and Utah counties; endemic; 8 (0).

Erigeron jonesii Cronq. Jones Daisy. Perennial herbs, from a branching or simple caudex, the caudex branches clothed with blackish or dark brown marcescent leaf bases; herbage hirsute with short spreading hairs; stems mainly 10–25 cm tall, conspicuously decumbent and often purplish at the base; basal leaves 3-nerved, 1.5–8 cm long, 3–12 mm wide, oblanceolate to elliptic or spatulate, petiolate, entire or toothed; cauline leaves smaller than the basal; heads 1–4; involucre 9–15 mm wide, 5–7 mm high, the bracts glandular and spreading-hairy, slightly thickened dorsally, more or less imbricate, green, with tips often purplish; rays ca 25–50, blue, pink, or white, 4–8 mm long, 1.4–1.8 mm wide; pappus single or with a few short outer setae; achenes 2-nerved, hairy. Sagebrush, pinyon-juniper, mountain brush, and alpine meadow communities at 1890 to 3350 m in Juab, Tooele, and Washington counties; Nevada; 5 (iii). The Jones daisy simulates *E. eatonii* in habit and stature, but the definite spreading hairs of the herbage are apparently definitive in most instances. Possibly it would best be treated at some infraspecific rank within *E. eatonii*.

Erigeron kachinensis Welsh & Moore Kachina Daisy. Perennial herbs, from a short thick branching or simple caudex, the caudex branches clothed with brown marcescent leaf bases; herbage glabrous throughout; stems 6–18 cm tall, decumbent to erect; basal leaves 1.3–5 cm long, 2–13 mm wide, oblanceolate to obovate or spatulate, the blade tapering to the petiole, rounded or retuse apically,

entire; cauline leaves 5–11, reduced upward; heads solitary or 2–4, the involucre 5–6 mm broad, 3.2–4 mm high, the bracts distinctly imbricate, some purplish at the tip, glabrous or minutely glandular; rays 10–15, white or pinkish, 3.5–5.5 mm long, 0.9–1.1 mm wide; pappus double; achenes 2-nerved, hairy. Seeps and hanging gardens at 1680 to 1890 m in White (type from Natural Bridges National Monument) and Dark Canyons and Elk Ridge, San Juan County, Utah, and Montrose County, Colorado; 3 (ii). This distinctive dwarf daisy is a Colorado Plateau endemic.

Erigeron leiomerus Gray Glaber Daisy. [*E. minusculus* Greene, type from Big Cottonwood Canyon, Salt Lake County]. Perennial herbs, from a branching caudex, the caudex branches clothed with brown marcescent leaf bases; herbage glabrous or merely strigose; stems 4–12 (15) cm tall, decumbent to erect; basal leaves 1.3–7 cm long, 2–11 (15) mm wide, oblanceolate to spatulate or obovate, rounded to retuse apically, enlarged and often purplish basally, glabrous or strigose to glabrate; cauline leaves reduced upward, usually several, becoming acutish; head solitary, the involucre 7–13 mm wide, 4–6 mm high, the bracts somewhat imbricate, purplish overall or at tips, finely glandular; rays ca 15–60, purplish to blue or white, 6–11 mm long, 1.5–2.5 mm wide; pappus double; achenes 2-nerved, short-hairy; $2n = 18$. Talus slopes, boulder fields, and meadows in spruce and lodgepole pine and alpine tundra communities at 2950 to 3750 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Juab, Piute, Salt Lake, Summit (type from the Uinta Mts.), Tooele, and Uintah counties; Nevada and Idaho to Wyoming, Colorado, and New Mexico; 27 (x).

Erigeron linearis (Hook.) Piper Yellow Daisy. [*Daucopappus linearis* Hook.]. Perennial herbs from a pluricipital caudex, the branches of the caudex clothed with broad clasping brownish marcescent leaf bases; herbage strigose; stems 5–20 cm tall; basal leaves 1–9 cm long, 0.5–3 mm wide, linear to linear-oblanceolate, acute, the bases enlarged, more or less sheathing, straw colored and strongly ciliate; cauline leaves reduced upward; heads solitary or 2 or 3; involucre 8–13 mm wide, 4–7 mm high, strigose-villous with multicellular hairs and more or less glandular; bracts subequal to somewhat imbricate, green or greenish to straw colored, attenuate, thickened dorsally; rays ca 20–45, yellow, 4–11 mm long, 1.3–2.5 mm wide; pappus double, the inner of 10–20 barbellate bristles, the outer of scales; achenes 2-nerved, short hairy; $2n = 18, 27$. Sagebrush and juniper communities at 1675 to 2000+ m in Box Elder County; British Columbia, Washington, and Oregon, east to Idaho and Wyoming, and south to Nevada; 3 (0).

Erigeron lonchophyllus Hook. Longleaf Daisy. Short-lived perennial or biennial (?) herbs, with slender taproots and subfibrous roots from a poorly developed caudex; stems decumbent to erect, 5–55 (60) cm long, sparsely to densely spreading-hairy; basal leaves oblanceolate to spatulate, 1.2–11 (15) cm long, 2–12 mm wide; cauline leaves several to many, mostly 0.6–8 cm long, 2–6 mm wide; heads few to numerous, rarely solitary, borne on nearly erect peduncles; involucre 4–9 mm high, 7–17 mm wide, the bracts evidently imbricate, not especially thickened basally, greenish to brownish or yellowish, the tips commonly purplish, sparsely to moderately strigulose with multicellular hairs; rays numerous, white or pinkish, ca 2–4 mm long, lacking inner eligulate

pistillate corollas; pappus of ca 20–30 slender barbellate white bristles, surpassing the disk corollas; achenes 2-nerved, sparsely hairy; $n = 9$. Marshes, stream banks, seeps, and wet meadows at 1370 to 2900 m in Beaver, Cache, Carbon, Daggett, Duchesne, Garfield, Grand, Juab, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; Alaska and southern Yukon, south to California and New Mexico, and east to Quebec and South Dakota; 39 (vii).

Erigeron maguirei Cronq. Maguire Daisy. Perennial herbs, with a branching caudex, the caudex branches clothed with brown to straw colored marcescent leaf bases; herbage spreading hirsute; stems 7–18 cm high, decumbent to sprawling or erect; basal leaves 2–5 cm long, 3–8 mm wide, oblanceolate to spatulate, rounded apically; cauline leaves well developed, but somewhat reduced upward, becoming acutish; heads solitary or 2–5; involucre 5–6.5 mm high, 7–11 mm wide, the bracts imbricate, not much thickened, green or yellowish, the inner less pubescent and with scarious purplish tips, all finely glandular also; rays 12–20, white or pinkish, ca 6–8 mm long, 1.1–2 mm wide; pappus of 13–25 slender barbellate sordid bristles, with a few shorter outer ones; achenes 2-nerved, hairy. Canyon bottoms in Wingate (?) and Navajo formations at 1640 to 1740 m in Emery (type from Calf Canyon) and Wayne counties; endemic; 5 (ii). For the past four decades the Maguire daisy was known officially from the type locality in the San Rafael Swell in Emery County. Now, other material has been discovered at BRY and relocated in the field, which is distinguishable only technically from specimens at the type locality. These latter specimens (from Capitol Reef, Wayne County) tend to have more heads per stem, have narrower ray corollas, and shorter disk corollas. All of these features may be the result of ecological responses, but the plants from Capitol Reef (type locality) are recognized as *E. maguirei* var. *harrisonii* Welsh.

Erigeron mancus Rydb. La Sal Daisy. [*E. pinnatisectus* (Gray) A. Nels. var. *insolens* Macbr. & Payson, type from the La Sal Mts.]. Pulvinate caespitose subscapose perennials from a usually branched caudex, the caudex clothed with dark brown to straw colored marcescent leaf bases; herbage more or less hirtellous and puberulent or minutely glandular; stems mainly 2–6 cm long, erect or ascending; basal leaves 1.2–4 cm long, 2–4 mm wide, pinnatifid, the lobes lanceolate, sometimes again lobed; cauline leaves much reduced; heads solitary; involucre 5–6.5 mm high, 7–12 mm wide, glandular, villous with multicellular hairs, the bracts subequal, somewhat thickened basally, the acuminate tips often purplish; ray flowers lacking; pappus simple or nearly so, of 20–30 bristles; achenes 2-nerved, hairy; $n = 18$. Alpine forb and grass-edge communities at 3050 to 3660 m in the La Sal Mts. (type locality), astride the Grand - San Juan County line; endemic; 7 (0).

Erigeron melanocephalus (A. Nels.) A. Nels. Darkhead Daisy. [*E. uniflorus* var. *melanocephalus* A. Nels.]. Perennial herbs, from a simple or branched caudex, the caudex branches clothed with dark brown marcescent leaf bases; herbage more or less villous with multicellular hairs; stems commonly 5–12 cm tall, erect; basal leaves 0.8–6 cm long, oblanceolate to spatulate, rounded or retuse apically; cauline leaves much reduced upward;

heads solitary; involucre 10–14 mm wide, 5–9 mm high, the bracts more or less densely villous with multicellular hairs, the cross-walls black or dark purple, equal, attenuate, green, with purplish tips or purplish throughout; rays 50–70, white or pink, 7–11 mm long, 1.2–2 mm wide; pappus single, of ca 20–25 bristles; achenes 2-nerved, sparsely hairy. Alpine meadows at 3355 to 3720 m in Grand and San Juan counties (La Sal Mts.); Wyoming, Colorado, and New Mexico; 4 (0). Specimens from the Uinta Mts., which have involucre hairs with purple cross-walls, have been assigned here previously, but they seem to represent nothing more than phases of *E. simplex* (q.v.).

Erigeron nanus Nutt. Dwarf Daisy. [*E. inamoenus* A. Nels.]. Perennial herbs, from a branching caudex, the caudex branches clothed with imbricate ashy to straw colored marcescent leaf bases; stems 3–8 cm high, villous with contorted multicellular hairs, subscapose; basal leaves linear-oblanceolate, 1.2–4 cm long, 1–2 mm wide, hirtellous to sparingly villous or glabrous, ciliate toward base with spreading long hairs, the bases conspicuously enlarged; heads solitary; involucre 7–13 mm wide, 5–8 mm high, long-villous with multicellular hairs and more or less finely glandular; bracts subequal, the midstripe brown to purplish, the margins green to scarious or purplish; rays 15–35, purplish, 5–10 mm long, 1.3–2.4 mm wide; pappus of 15–25 bristles and some outer setae; achenes 2-nerved, hirsute. Sagebrush and sagebrush-grass communities, often on windswept ridges, at 2135 to 3270 m in Box Elder and Daggett counties; Idaho and Wyoming; 5 (0).

Erigeron nauseosus (Jones) A. Nels. Marysvale Daisy. [*E. caespitosus* Nutt. var. *nauseosus* Jones, type from near Marysvale]. Perennial herbs, from a stout branching brittle caudex, the branches clothed with dark brown marcescent leaf bases, the taproot similarly colored; stems 6–25 cm tall, ascending to erect, glandular-scabrous; basal leaves 2.3–10 cm long, 2–15 mm wide, oblanceolate to spatulate, rounded apically, tapering to the petiole, commonly 3-nerved; cauline leaves well developed, only gradually reduced upward; heads solitary, rarely 2; involucre 8–17 mm wide, 5–8 mm high, finely glandular (rarely sparingly strigose as well); bracts imbricate, somewhat thickened, often purplish, attenuate; rays 30–60, white or purplish, 6–12 mm long, 1.3–2 mm wide; pappus double, the inner of 12–23 bristles, the outer of inconspicuous setae; achenes 2-nerved, hairy. Crevices in limestone, quartzite, and igneous outcrops, and in talus in pinyon-juniper, sagebrush, mountain brush, and Douglas fir-white fir communities at 1830 to 2900 m in Beaver, Garfield, Millard, Piute, and Sevier counties; White Pine County, Nevada; a Great Basin endemic; 24 (iii).

Erigeron nematophyllus Rydb. Needleleaf Daisy. Perennial herbs from a branching caudex, the caudex branches clothed with fibrous ashy to brown marcescent leaf bases; herbage strigose to subglabrous; stems 4–15 cm tall; basal leaves 1–8 cm long, 1–3 mm wide, linear to linear-oblanceolate, ciliate near the enlarged sheathing base; cauline leaves few and reduced, not especially exceeding the basal cluster; heads solitary; involucre 6–13 mm wide, 4–6.5 mm high; bracts more or less imbricate, moderately strigulose, green or brown, the inner often with scarious margins and purplish tips; rays 15–55, white (less commonly pink), 4–8 mm long, 1.2–2.3 mm

wide; pappus of ca 15–25 bristles; achenes 2-nerved, shortly hairy. Sagebrush, mountain brush, and pinyon-juniper communities, often on Green River Shale, at 2280 to 2870 m in Carbon, Daggett, Duchesne, and Uintah counties; Wyoming and Colorado; 7 (i).

***Erigeron peregrinus* (Pursh) Greene** Strange Daisy. [*E. callianthemus* Greene; *E. peregrinus* ssp. *callianthemus* (Greene) Cronq.; *E. regalis* Greene; *E. peregrinus* var. *eucaallianthemus* Cronq.; *E. peregrinus* var. *scaposus* (T. & G.) Cronq.; *E. salsuginosus* var. *scaposus* T. & G.]. Perennial herbs, from a rhizome, the rhizome sometimes short, dark brown; stems 0.9–5.5 (7) dm tall, glabrous or sparingly to moderately villous below, often densely villous below the heads; basal leaves 2–16 (20) cm long, 0.8–3.2 (4.5) cm wide, oblanceolate to spatulate or obovate, tapering or abruptly contracted to the petiole, obtuse or rounded to acute apically, glabrous or rarely sparingly villous, ciliate; cauline leaves reduced upward, becoming sessile and more or less clasping; heads solitary, or 2–6; involucre 12–22 (25) mm wide, 6–9 (11) mm high; bracts subequal, reflexed at the attenuate apices, glandular and purplish throughout; rays ca 30–75, 8–17 (25) mm long, 1.8–4 mm wide, rose purple to white; pappus of ca 20–30 bristles, sometimes with a few outer setae; achenes 4– to 7-nerved, sparingly hairy; $2n = 18$. Aspen, spruce-fir, lodgepole pine, and sedge communities at 2280 to 3570 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Grand (?), Salt Lake, San Juan, Summit, Uintah, Wasatch, Weber, and Washington counties; Alaska south to California and New Mexico; 57 (x). Our materials were segregated by Cronquist (1947) into a dwarf alpine var. *scaposus* (T. & G.) Cronq. and a taller montane var. *eucaallianthemus*. On the basis of the rather abundant materials at hand there does not seem to be any means of recognition of those taxa, except arbitrarily. Thus, all our specimens are herein considered as belonging to ssp. *callianthemus* (Greene) Cronq. var. *callianthemus*.

***Erigeron proselyticus* Nesom** Professor Daisy. [*E. flagellaris* Gray var. *trilobatus* Maguire ex Cronq., type from Cedar Breaks]. Perennial herbs, from a subrhizomatous or substoloniferous caudex, the caudex branches with weakly persistent brown marcescent leaf bases; stems 14–25 cm tall, decumbent to ascending or erect, sparingly strigose; basal leaves 0.5–6.5 (7.5) cm long, 2–11 mm wide, oblanceolate to spatulate or linear, entire to pinnately few toothed or lobed, glabrous to sparingly strigose, acute to obtuse or rounded apically; cauline leaves gradually to abruptly reduced upward, entire or the lower few toothed; heads 3 to several; involucre 3.5–7 mm wide, 2.5–4.5 mm high, sparingly to moderately hirtellous; bracts subequal, brown, suffused with purple, or the inner greenish, with chartaceous margins; rays 22–46, white to purplish, 5.4–8.5 mm long, 1–1.4 mm wide; pappus double, the inner of 10–19 bristles, the outer of short setae; achenes 2- or 4-nerved, sparsely hairy; $2n = 18$. Bristlecone pine, spruce-fir, and aspen communities on sandstone and marly limestone formations at 2440 to 3050 m in Iron and Kane counties; endemic; 10 (i).

***Erigeron pulcherrimus* Heller** Basin Daisy. Perennial herbs, from a branching caudex, the caudex branches with exfoliating brownish bark, not especially clothed with persistent leaf bases; herbage silvery or grayish strigose; stems (5) 9–32 (35) cm tall, erect; basal leaves

0.8–7 cm long, 1–3 (5) mm wide, linear to linear-oblongate; cauline leaves reduced upward, but generally developed to stem middle or above; heads solitary; involucre 10–20 mm wide, 6–9 mm high, coarsely villous with spreading-ascending, multicellular hairs, obscurely glandular apically; bracts imbricate, greenish, the midrib often brown, the margins chartaceous, acuminate-attenuate, especially the inner; rays ca 25–60, white, pink, or violet, 8–15 mm long, 2–3.7 mm wide; pappus of a 30–50 bristles, the outer series more or less developed; achenes (2) 3- to 5-nerved, densely hairy. Salt desert shrub and pinyon-juniper communities on saline and seleniferous clays, clay-silts, and gravelly pediments at 1310 to 2105 m in Carbon, Daggett, Duchesne, Emery, Grand, Uintah, and Wayne counties; Wyoming, Colorado, and New Mexico; 61 (xiv). Our materials have been treated as belonging to a wide-leaved (1.5–5 mm) var. *wyomingia* (Rydb.) Cronq. and a narrow-leaved (1–1.5 mm) var. *puleherrima*. However, only arbitrary segregation appears to be possible, and it seems best not to attempt recognition of infraspecific taxa.

***Erigeron pumilus* Nutt.** Vernal Daisy. [*E. pumilus* ssp. *concinoides* var. *subglaber* Cronq., type from south of Monticello]. Perennial herbs, arising from a caudex, the branches clothed with ashy to brown marcescent leaf bases; herbage more or less hirsute with spreading hairs; stems 4–50 cm tall, leafy or subscapose; basal leaves 0.4–8 cm long, mostly 2–5 mm wide, linear-oblongate to oblanceolate; cauline leaves well-developed, somewhat reduced, or much reduced upward, or almost lacking; heads solitary or few to numerous; involucre 7–15 mm wide, 4–7 mm high, sparingly to densely spreading-villous with multicellular hairs; bracts subequal, acuminate to attenuate, green, with brownish midrib; rays mostly 50–100, white or pink to lavender, 6–15 mm long, 0.7–1.5 mm wide (or more); pappus double, the inner of 7–20 coarse bristles, the outer of evident bristles or scales; achenes 2-nerved, sparsely to moderately hairy; $2n = 18$. Blackbrush, shadscale, sagebrush, pinyon-juniper, and mountain brush communities at 885 to 2960 m in all Utah counties; Washington to Saskatchewan, south to California, Arizona, New Mexico, and Kansas. Our highly variable material was segregated on technical characteristics by Cronquist (1947) into two subspecies, with some five varieties. The bulk of the Utah specimens belong to ssp. *concinoides* Cronq., segregated in large measure from the much less common and more northern ssp. *intermedius* Cronq. by the fewer (7–15, not 13–20) inner pappus bristles and evidently puberulent (not glabrous or slightly puberulent) corolla tubes. The varieties *intermedius* (var. *euintermedius* Cronq.) and *gracilior* Cronq. of ssp. *intermedius* are only arbitrarily separable by stem thickness and head number. The weakly segregated varieties within ssp. *concinoides*, var. *concinoides* (var. *euconcinoides* Cronq.), var. *subglaber* Cronq., and var. *condensatus* (D. C. Eaton) Cronq., differ in degree of development of cauline leaves and pubescence, with var. *concinoides* having more equally leafy stems and var. *condensatus* tending to be subscapose. The var. *subglaber* has the stem only sparingly pubescent and the leaves sparsely to moderately pubescent. It seems best to treat our material as belonging to two variable taxa; ssp. *intermedius* and ssp. *concinoides*; 212 (xxvi).

***Erigeron religiosus* Cronq.** Religious Daisy. Short-lived perennial (or biennial?) herbs from a slender taproot

and poorly developed caudex; herbage more or less strigose and glandular below the heads; stems 6–35 cm tall, decumbent-ascending to erect; basal leaves 2–5.5 (7) cm long, 2–8 mm wide (or more), oblanceolate to spatulate, entire or some pinnately toothed or lobed; cauline leaves gradually reduced upward; heads 2 to numerous; involucre 5.5–7.5 mm wide, 2–3.5 mm high, sparingly to moderately villous and more or less glandular; bracts with brown midrib, somewhat thickened, scarious apically; rays 35–85, white or pinkish, 3.4–6.8 mm long, 0.5–1.4 mm wide; pappus double, the inner of 6–12 bristles, the outer of short setae; achenes 2–nerved, sparsely hairy. Ponderosa pine-oak and pinyon-juniper communities at 1525 to 1830 m in Kane and Washington (type from Clear Creek Canyon) counties; endemic; 20 (ix).

Erigeron simplex Greene Greene Daisy. Perennial herbs, from a simple or branched caudex, the caudex clothed with dark brown marcescent leaf bases; herbage more or less viscid-villous with multicellular hairs; stems commonly 2–15 (20) cm tall; basal leaves 0.8–6 (8) cm long, 2–10 (13) mm wide, oblanceolate to spatulate, obtuse to abruptly acute or mucronate apically; cauline leaves reduced; heads solitary; involucre 8–22 mm wide, 5–10 mm high, moderately to densely villous and somewhat viscid, the hairs with clear to reddish purple or purplish black cross-walls; bracts equal, suffused with purple or green, appressed or some reflexed; rays 50–125, blue purple to pink (or white), 7–11 mm long, 1.2–2.5 mm wide; pappus double, the inner of ca 10–15 barbellate bristles, the outer of conspicuous setae; achenes 2–nerved, sparsely hairy; $2n = 18$. Lodgepole pine, Engelmann spruce, alpine fir, and alpine meadow and tundra communities at 3355 to 3660 m (in Deep Creek, Tushar, La Sal, and Uinta mts.) in Beaver, Daggett, Duchesne, Juab, Piute, San Juan, Summit, and Uintah counties; Oregon to Montana, south to Nevada, Arizona, and New Mexico; 30 (vi). Our variable materials include specimens with purplish black cross-walls of the multicellular hairs, especially on the involucre and below the heads. These have been placed with the similar and related *E. melanocephalus* (q.v.), but differ in shape of lower leaves and general aspect of the plants.

Erigeron sionis Cronq. Zion Daisy. Low perennial herbs, with short stoloniferous branches arising from a slender taproot; stems 1.5–13.5 cm long, decumbent to erect, glabrous or appressed pubescent; basal leaves 0.5–3.5 cm long, 2–10 mm wide, oblanceolate to obovate, entire or more commonly 3- to 5-lobed, glabrous or sparsely strigose; heads solitary or 2 to several; involucre 5–7 mm wide, 2–3 mm high, glandular and sparsely to moderately spreading-hairy; bracts suffused purplish or the inner green with chartaceous margins; rays 23–38, white, the midstripe below purplish, 3.9–6.1 mm long, 1–1.6 mm wide; pappus double, the inner of 7–13 bristles, the outer of slender setae; achenes 2–nerved, sparsely pubescent. Seeps and hanging gardens in ponderosa pine and riparian communities in Navajo and Wingate sandstones at 1350 to 1600 m in Zion National Park (type locality), Washington and Kane (?) counties; endemic; 9 (iii).

Erigeron speciosus (Lindl.) DC. Oregon Daisy. Rhizomatous perennial herbs with the caudex more or less developed; stems 1.5–9 cm tall, ascending to erect, spreading-hairy to subglabrous or glandular above; basal

leaves often lacking at anthesis, the lowermost cauline ones oblanceolate to spatulate, petiolate, commonly 5–15 cm long, 4–20 mm wide; middle cauline leaves lanceolate to oval, oblanceolate, or elliptic, 2–11 cm long, 5–28 mm wide; upper leaves gradually to markedly reduced, lanceolate to obliquely ovate, ciliate, the surfaces glabrous, spreading-hairy, or glandular (or a combination); heads 1–15 (or more); involucre 11–22 mm wide, 5.5–9 mm high, glandular, with a few long hairs, or more or less spreading-hairy; bracts subequal, acuminate or attenuate, the tips more or less spreading, often suffused purplish; ray flowers ca 75–150, pink, pink purple or blue purple, or white, 7–18 mm long, 0.7–1 mm wide; pappus double, the inner of 20–30 bristles, the outer of more or less evident setae; achenes 2- to 4-nerved, hairy; $2n = 18, 36$. The *speciosus* complex in Utah, as herein interpreted, consists of four variable, and more or less intergrading, largely sympatric infraspecific taxa. All have been treated previously at specific rank, or they have been treated within *E. speciosus*, in part. Cronquist (1947) discussed the problem of intermediacy in the complex but hesitated to combine the taxa because “such a treatment would distort the facts as well as being unwieldy.” It is here contended that they are unwieldy apart; it seems therefore best to combine them as follows:

1. Leaves spreading-hairy on one or both surfaces; involucre spreading-hairy and more or less glandular *E. speciosus* var. *mollis*
- Leaves glabrous on both surfaces or minutely glandular, or with minute strigose hairs, rarely with a few spreading multicellular hairs 2
- 2(1). Leaves glandular on the surfaces (especially the upper ones), and also ciliate *E. speciosus* var. *uintahensis*
- Leaves glabrous on both surfaces, ciliate 3
- 3(2). Involucral bracts merely glandular, rarely also somewhat spreading-hairy; upper leaves often ovate *E. speciosus* var. *macranthus*
- Involucral bracts glandular and commonly also spreading-hairy; upper leaves lance-attenuate *E. speciosus* var. *speciosus*

Var. *macranthus* (Nutt.) Cronq. [*E. grandiflorus* Nutt., not Hook.; *E. macranthus* Nutt.; *E. leiophyllus* Greene, type from Fort Douglas]. $2n = 18$. Sagebrush, snowberry, aspen, spruce-fir, and alpine meadow communities at 1760 to 3420 m in Beaver, Box Elder, Cache, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Tooele, Utah, Wasatch, Washington, and Weber counties; Washington and Alberta south to Nevada, Arizona, and New Mexico; 104 (xv). This is our most common phase, but it is only arbitrarily separable from var. *speciosus*, to which it is completely transitional.

Var. *mollis* (Gray) Welsh [*E. glabellus* var. *mollis* Gray]. Aspen, spruce-fir, and meadow communities at 2070 to 3050 m in Carbon, Duchesne, Garfield, Grand, Juab, Salt Lake, San Juan, Sanpete, Sevier, Uintah, Utah, and Wasatch counties; Montana to South Dakota, and south to New Mexico and Nebraska; 20 (i). This variety includes what has traditionally been called *E. subtrinervis* Rydb.

Var. *speciosus* [*Stenactis speciosa* Lindl.]. Mountain brush, sagebrush, ponderosa pine, aspen, spruce-fir, and alpine meadows at 2040 to 3300 m in Duchesne, Garfield, Grand, Iron, Juab, Piute, San Juan, Sanpete, Sevier, and

Utah counties; British Columbia and Montana, south to Nevada and New Mexico; 23 (iv).

Var. *uintahensis* (Cronq.) Welsh [*E. uintahensis* Cronq., type from Mill Creek, Summit County]. $2n = 36$. Sagebrush, mountain brush, ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine meadow communities at 2070 to 3420 m in Beaver, Carbon, Daggett, Duchesne, Juab, Piute, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Wyoming; 39 (vi). The glandular condition of the leaves varies in amount and position, and the Uinta phase passes by degree into other taxa of the *speciosus* complex. Because of the intergradation it seems best that this most distinctive portion of the variation should be treated within an expanded *E. speciosus*.

***Erigeron superbus* Greene ex Rydb.** Splendid Daisy. Rhizomatous perennial herbs and with the caudex more or less developed, the perennating branches bearing brown marcescent leaf bases; herbage glabrous or glandular above and villous in some below the heads; stems 1–6 dm tall, erect; basal leaves smaller than the cauline and commonly present at anthesis, 3–15 cm long, 6–25 (33) mm wide, oblanceolate to obovate or spatulate, petiolate; middle cauline leaves somewhat smaller than the lower ones, oblong to elliptic or lanceolate, glandular (glabrous), the uppermost sessile and glandular, rarely some denticulate, not ciliate; heads 1–7; involucre 11–19 mm wide, 7–10 mm high; bracts subequal, glandular, sometimes with long spreading hairs near the base, acuminate, sometimes suffused purplish; rays 40–95, 1–2 mm wide, 12–20 mm long, rose purple or white; pappus double, the inner of 20–25 pinkish or tawny bristles, the outer of setae; achenes 2-nerved, hairy; $2n = 36$. Aspen, Douglas fir, lodgepole pine, and spruce-fir communities at 2250 to 3050 m in Beaver, Carbon, Daggett, Duchesne, Garfield, Kane, Piute, San Juan, Summit, and Uintah counties; Wyoming south to Arizona and New Mexico; 18 (v).

***Erigeron tener* Gray** Thin Daisy. Perennial herbs, from a branching caudex, the slender branches with ashy to brownish marcescent leaf bases; herbage strigose; stems slender, decumbent, ascending, or erect, 3–15 cm tall; basal leaves 1–7.5 cm long, oblanceolate to elliptic, rhombic, or obovate, petiolate, acute to obtuse apically; cauline leaves much reduced; heads solitary or 2 or 3; involucre 6–10 (12) mm wide, 3.5–5 mm high, glandular and with spreading multicellular hairs; bracts imbricate, somewhat thickened, brownish, the inner membranous or somewhat scarious, sometimes suffused with purple; rays ca 15–40, purplish or white, 4–8 mm long, 1–1.7 mm wide; pappus double, the inner of 15–30 bristles, usually with slender outer setae; achenes 2-nerved, hairy to subglabrous. Sagebrush, mountain brush, pinyon-juniper, and white fir-Douglas fir communities, often on limestone outcrops at 1980 to 2900 m in Beaver, Juab, Millard, Rich, Sanpete, Summit, Tooele, and Utah counties; Oregon to Wyoming south to California and Nevada; 20 (i).

***Erigeron untermannii* Welsh & Goodrich** Untermann Daisy. Perennial pulvinate herbs with an intricately branched caudex, the caudex branches clothed with persistent leaf bases; leaves mainly basal, 0.8–3.3 cm long, 1–4 mm wide, narrowly oblanceolate to spatulate, pilosulose with ascending, often curved, hairs; scapes 2–6 cm tall; heads solitary; involucre 7–11 mm wide, 5–5.7 mm high, the bracts more or less imbricate, green, or the

inner somewhat chartaceous, the margins hyaline, the tips suffused with purple (sometimes throughout), densely hispidulous with short spreading hairs; rays 14–26, white, 4–6.5 mm long, 1.5–2.1 mm wide; pappus apparently single, of ca 20 slender fragile bristles; achenes 2-nerved, pilose. Pinyon-juniper community on calcareous shales and sandstones of the Uinta and Green River formations at 2135 to 2380 m in Duchesne (type from Indian Canyon) and Uintah counties; endemic; 4 (0).

***Erigeron ursinus* D. C. Eaton** Bear Daisy. Perennial rhizomatous sod-forming herbs, the perennating organs arising from short superficial branches clothed with brown marcescent leaf bases; herbage subglabrous to strigose or variously ascending- or spreading-hairy; stems ascending, 5–25 (30) cm tall; basal leaves 1.2–12 cm long, 2–11 mm wide, oblanceolate to oblong, commonly acute or acutish apically, ciliate, the surfaces glabrous or variously hairy; cauline leaves reduced upward; heads solitary or 2 or 3; involucre 9–19 mm wide, 5–7 mm high, glandular and spreading-hairy with multicellular hairs; bracts subequal, green or suffused purplish at the usually reflexed tips; rays ca 30–100, pink or blue-purple, 6–15 mm long, 1–2 mm wide; pappus double, the inner of ca 10–20 bristles, the outer of setae or scales; achenes 2-nerved, hairy; $n = 9$. Sagebrush, aspen, lodgepole pine, and spruce-fir communities, often in forb-grass or forb-sedge meadows at 2440 to 3660 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Piute, San Juan, Sanpete, Sevier, Summit (type from Bear River Canyon), Uintah, Utah, Wasatch, and Wayne counties; Idaho and Montana, south to Nevada and Arizona; 95 (x).

***Erigeron utahensis* Gray** Utah Daisy. Perennial herbs from a branching caudex, the branches with grayish marcescent leaf bases and usually densely clothed with white villous-pilose hairs; stems 10–60 cm tall, erect, appearing grayish or silvery due to strigose hairs; basal and lowermost cauline leaves 1.5–10 cm long, 1–6 mm wide, linear-oblanceolate, commonly withered or lacking at anthesis; cauline leaves gradually reduced upward; heads solitary or few to many; involucre 5–15 mm wide; 3–7 mm high, strigose and often glandular apically; bracts imbricate, brownish, the inner with scarious margins; rays ca 10–40, blue, pink, or white, 4–18 mm long, 1–2.7 mm wide; pappus double, the inner of ca 20–30 bristles, the outer of setae; achenes 4-nerved, more or less pilose; $2n = 18, 36$. Two rather weakly separable varieties are present in Utah, as follows:

1. Stem bases not densely white-pilose; involucre mainly less than 8 mm wide; plants uncommon *E. utahensis* var. *sparsifolius*
- Stem bases densely white-pilose; involucre commonly more than 10 mm wide; plants common *E. utahensis* var. *utahensis*

Var. *sparsifolius* (Eastw.) Cronq. [*E. sparsifolius* Eastw. and *Wyomingia vitax* A. Nels., both types from San Juan County]. Sandstone outcrops in salt desert shrub and pinyon-juniper communities, often in shaded mesic areas, at 1220 to 1900 m in Emery, Garfield, Grand, Kane, and San Juan counties; Colorado and Arizona; 9 (iv).

Var. *utahensis* [*E. stenophyllus* var. *tetrapleuris* Gray, type from Kanab]. Creosote bush, blackbrush, warm desert shrub, pinyon-juniper, and Mountain brush communities at 900 to 2000 m in Emery, Garfield, Grand, Iron, Kane, San Juan, Washington, and Wayne counties; Colorado and Arizona; 75 (vii).

Erigeron vagus Payson Payson Daisy. Caespitose perennial herbs, from a diffuse caudex, the branches commonly soboliferous; herbage moderately villous and glandular; leaves mainly basal, tufted at the apex of the caudex branches, 0.5–2.5 cm long, palmately 3-toothed or -lobed; heads solitary, subcapitate; involucre 8–16 mm wide, 5–7.5 mm high, spreading-hairy and more or less glandular; bracts subequal, commonly suffused purplish at the attenuate apices; rays ca 25–35, white or pink, 4–7 mm long, 1–2 mm wide; pappus simple, of about 20 bristles; achenes 2-nerved, sparingly hairy. Ponderosa pine, western bristlecone pine, and sedge-forb communities at 2375 to 3660 m in Garfield, Grand (type from the La Sal Mts.), Iron, and San Juan counties; California east to Colorado; 18 (0).

Erigeron wahwahensis Welsh Wah Wah Daisy. Perennial herbs, from a branched caudex, the caudex branches with conspicuous fibrous brown to ash colored marcescent leaf bases; stems 15–40 cm long, decumbent to ascending; basal leaves 3–18 cm long, 4–13 mm wide, linear-oblongate to oblanceolate or elliptic, 3-nerved, petiolate, appressed to spreading-hairy with curved hairs; cauline leaves reduced, sessile, and bracteate above; heads solitary or 2 or 3; involucre 13–17 mm wide, 6–7 mm high, spreading-villous with multicellular hairs, glandular apically; bracts imbricate, green, the tips reddish, thickened basally; rays 30–40, pink or white, 5.5–7 mm long, 1.7–2.2 mm wide; disk corollas 3.5–4.2 mm long, the tube ca 2 mm long, the lobes 0.4 mm long; pappus of 15–20 bristles, with inconspicuous outer setae; achenes 2-nerved, short-hairy. Sagebrush, oak-maple, and pinyon-juniper communities at 1670 to 2440 m in Beaver (type from Wah Wah Mts.) and Washington counties; endemic; 19 (iii). The Wah Wah daisy stands between the distributions of *E. jonesii* and *E. eatonii*, and it shares features of both. The specimens examined from Washington County have appressed strigose stems, and are highly variable. Those from the Wah Wah Mountains have spreading hairy stems. Additional work is indicated.

Erigeron zothecinus Welsh Alcove Daisy. Perennial herb, with a taproot and well-developed caudex, the caudex branches clothed with brown to ashy leaf bases; stems erect or ascending to the base, 10–21 cm long, strigose to strigulose with stiff hairs, these ascending to spreading-ascending; basal leaves narrowly oblanceolate to linear, 1–4 mm wide, more or less sheathing basally; cauline leaves numerous, linear to linear-oblongate, 0.5–2.5 cm long, 1–2 mm wide; heads solitary or 2 or 3; involucre 4.5–5.2 mm high, 7–13 mm wide, the bracts slightly imbricate, somewhat thickened dorsally, green, strigose to strigulose or hirtellous with multicellular glandular hairs; rays ca 30–50, pink purple, 5–6 mm long, 0.8–1.2 mm wide; pappus double, the inner of 5–8 bristles, the outer of setae or scales; achenes 2-nerved, hairy. Saline seeps on vertical walls of alcoves at ca 1125 to 1160 m in eastern Kane County (type from along Lake Powell); endemic; 3 (iii).

Eriophyllum Lag.

Annual or perennial woolly herbs; leaves alternate, entire or toothed to lobed; heads solitary or corymbosely clustered; radiates; rays few, pistillate and fertile, yellow or white; involucre campanulate or hemispheric; bracts 1 (apparently 2)-seriate, firm, erect; receptacle flat to low-conic, naked; disk flowers perfect, fertile, the tube glandular or hairy; pappus of firm nerveless chaffy scales; style branches flattened; achenes 4-angled.

dular or hairy; pappus of firm nerveless chaffy scales; style branches flattened; achenes 4-angled.

Constance, L. 1937. A systematic study of the genus *Eriophyllum*. Univ. California Publ. Bot. 18: 69–136.

- 1. Plants perennial *E. lanatum*
- Plants annual 2
- 2(1). Rays white; pappus of unequal scales *E. lanosum*
- Rays yellow; pappus of equal scales or reduced to a short crown *E. wallacei*

Eriophyllum lanatum (Pursh) Forbes Pursh Woollyleaf. Perennial herbs, the herbage tomentose; stems erect or decumbent from a ligneous base, mainly 10–20 cm tall; leaves mainly 1–4 cm long, entire or 3- to 5-toothed or -lobed; heads solitary or corymbose on naked peduncles 3–10 cm long; involucre campanulate, 6–10 mm wide, 6–8 mm high; bracts 5–8 (10), carinate, distinct, the tips erect; rays 5–8 (10), yellow, 6–10 mm long, 2–5 mm wide; pappus of 8–10 variable scales; achenes 2.5–4 mm long, 4-angled, variously glabrous, hairy, or glandular; n = 8, 9, 10, 16, 24, 32. Sagebrush community (reported from Utah in the Pacific Northwest Flora); British Columbia to Montana, south to California, Nevada, Idaho, and Wyoming; 0 (0). Our material likely belongs to var. *integrifolium* (Hook.) Smiley [*Trichophyllum integrifolium* Hook.].

Eriophyllum lanosum (Gray) Gray Gray Woollyleaf. [*Actinolepis lanosa* Gray]. Annual floccose-tomentose herbs; stems mainly 2–10 cm tall, simple and erect or branching from the base; leaves 0.5–1.8 cm long, 1–2 mm wide, linear to linear-oblongate, entire or essentially so; heads turbinate, solitary on naked peduncles 0.5–5 cm long; involucre 5–6.5 mm wide, 5–7 mm high; bracts 8–10, oblong, acute, distinct or nearly so; rays 5–10, white, 3–5 mm long, 2.5–3.5 mm wide; pappus of ca 5 slender hyaline awn-tipped scales; achenes 2.5–4.5 mm long, slender, sparsely strigulose; n = 4. Larrea, blackbrush, and Joshua tree communities at 700 to 900 m in Washington County; California, Nevada, and Arizona; 13 (i).

Eriophyllum wallacei (Gray) Gray Wallace Woollyleaf. [*Bahia wallacei* Gray]. Annual tomentose herb; stems mainly 1–8 cm tall, simple or branched from the base; leaves 0.5–1.5 cm long, simple, spatulate to obovate, entire or 3-lobed; heads solitary, turbinate-cylindric, on short peduncles; involucre 4–6 mm wide, 5–7 mm high; bracts 6–10, ovate, distinct; rays 5–10, yellow, 3–4 mm long, 2.5–3.5 mm wide; pappus of 6–10 scales or none; achenes ca 2 mm long, linear, hairy or glabrous; n = 5. Creoste bush, blackbrush, and Joshua tree communities at 700 to 1585 m in Washington County; California, Nevada, Arizona, and Mexico; 32 (iii).

Eupatorium L.

Perennial herbs; leaves alternate, opposite, or whorled, simple; heads discoid, the flowers all perfect and tubular; involucre cylindric to campanulate, the bracts striate, imbricate; receptacle naked, mainly flat; anthers obtuse and entire basally, or minutely sagittate; style branches with short stigmatic lines and an elongate papillate appendage; pappus of numerous capillary bristles; achenes 10-nerved.

- 1. Leaves alternate; plants of Box Elder and Tooele counties *E. occidentale*
- Leaves opposite or whorled; plants of various distribution 2
- 2(1). Leaves opposite; flowers white to cream ... *E. herbaceum*
- Leaves whorled; flowers purple or purplish *E. maculatum*

***Eupatorium herbaceum* (Gray) Greene** White Thoroughwort. [*E. ageratifolium* var. ? *herbaceum* Gray]. Perennial herbs from a woody caudex; stems 4–7 dm tall, branched above; herbage scabrous-puberulent; leaves mainly opposite, the blades 1.5–6 cm long, 0.5–4 cm wide, ovate, the bases cordate or truncate, coarsely crenate-serrate, acute; heads numerous, in dense corymbose clusters; involucre 3.5–5 mm wide, 3–4 mm high; bracts green, puberulent, subequal; corollas white; achenes black, 1.5–2 mm long; n = 17. Ponderosa pine and spruce-fir communities at 1585 to 2745 m in Grand, Kane, Piute, San Juan, and Washington counties; California Arizona, and Colorado; 5 (ii).

***Eupatorium maculatum* L.** Joe-Pye Weed. Robust perennial herbs from short subrhizomatous caudices; stems mainly 6–15 dm tall, branching in the inflorescence; herbage puberulent and glandular-dotted; leaves in whorls of 3 or 4, mainly 6–25 cm long and 1.5–7 cm wide, lanceolate to lance-elliptic or lance-ovate, sharply serrate; heads numerous in corymbose clusters; involucre 3.5–5 mm wide, 6.5–9 mm high, the outer puberulent, the inner glabrous dorsally, often ciliate, purplish to straw colored; flowers purple; achenes ca 3 mm long, green to brown, glandular-dotted; 2n = 20. River and canal banks, wet meadows, bogs, and seeps at 1370 to 1865 m in Box Elder, Cache, Davis, Kane, Uintah, and Utah counties; British Columbia to Newfoundland, south to New Mexico, Illinois, and Michigan. Our material belongs to var. *bruneri* (Gray) Breitung [*E. bruneri* Gray]; 15 (i).

***Eupatorium occidentale* Hook.** Western *Eupatorium*. Perennial herbs from a rhizome and with a branching caudex; stems 1.5–7 dm tall, often branched above; herbage scabrous-puberulent; leaves alternate, the blades mainly 1.5–6 cm long, 0.6–3 cm wide, deltoid or deltoid-ovate, serrate or subentire; heads numerous, in compact corymbose clusters; involucre 3–5 mm wide and as high; bracts subequal, puberulent, green or suffused with purple; flowers pink or purplish; achenes ca 3 mm long, brown, glandular-dotted. Rock crevices and talus (usually in quartzite) at 2135 to 2745 m in Box Elder and Tooele counties; Washington to Idaho, south to California and Nevada; 2 (0).

***Filago* L.**

White-tomentose annual herbs; leaves entire, alternate; heads discoid, small, in capitate clusters; involucre reduced, the bracts resembling those of the receptacle; outer flowers pistillate, fertile, with tubular-filiform corolla, in several series, epappose and subtended by concave, partly enclosing bracts, the inner flowers bractless and with pappus of capillary bristles, the central flowers 2–5, apparently perfect, but often sterile, bractless and with capillary bristles; achenes subterete, nerveless.

***Filago californica* Nutt.** Fluffweed. Annual herbs, the stems erect, simple or branched above, 0.5–3 dm tall;

leaves 0.8–2 cm long, narrowly oblong to oblanceolate; heads ovoid, 3–4 mm high, subequal to involucre leaves; bracts of outer pistillate flowers 8–10, tomentose, boat-shaped, the tips hyaline, the inner ones thinner and less hairy, the inner florets ca 12–20; inner achenes papillose; n = 14. Warm desert shrub at 915 to 1070 m in Washington County; Arizona and California; 1 (0).

***Flaveria* Juss.**

Annual herbs; leaves opposite, sessile, more or less connate; heads several to numerous, in compact corymbose clusters; involucre cylindrical; bracts carinate, striate, 2–5, subequal; receptacles naked; ray flowers pistillate, fertile, commonly 1 per head, yellowish, inconspicuous; disk flowers 2–5, perfect, fertile, yellowish; anthers not caudate at the base; pappus none; achenes 8– to 10–ribbed, glabrous.

***Flaveria campestris* J. R. Johnston** Marshweed. Plants 12–85 cm tall, simple or branched, glabrous or hairy at the nodes; leaves 1–8 cm long, 0.4–1.5 cm wide, lance-oblong to linear, serrate to subentire, commonly 3–veined, glabrous; inflorescence leafy bracted; involucre 5–8 mm high, the longer inner bracts mostly 3, strongly keeled, glabrous; rays ca 1–2 mm long; achenes black, ca 3 mm long; n = 18. Sand bars, stream banks, and seeps at 1220 to 1680 m in Juab, Grand, San Juan, and Tooele counties; Colorado to Missouri, south to New Mexico and Texas; 8 (iii).

***Gaillardia* Foug.**

Perennial (or biennial or annual) herbs; leaves alternate or mainly basal, entire or pinnatifid; heads radiate, the rays yellow, 3–lobed, neuter or sometimes pistillate and fertile; involucre 2– or 3-seriate, herbaceous, more or less spreading, reflexed in fruit; receptacle convex, with numerous setae; disk flowers perfect, fertile; anthers auricled at the base; pappus of 5–10 scarious, awned scales; achenes broadly obpyramidal, long-hairy.

- 1. Disk flowers purple or purplish 2
- Disk flowers yellow 3
- 2(1). Base of involucre bracts densely long-villous or the corolla lobes 5–11 mm long, or both; plants mainly montane in northeastern Utah *G. aristata*
- Base of involucre bracts not especially hairy, the corolla lobes mainly less than 5 mm long, plants of lower elevations in southeastern to southwestern Utah *G. pinnatifida*
- 3(1). Stems with well developed, pinnately dissected cauline leaves; plants of canyon bottoms of the Tavaputs Plateau *G. flava*
- Stems subscapose or, if the cauline leaves well developed, merely toothed or lobed, and plants mainly of other distribution 4
- 4(3). Pappus scales broadly oblong or oval, awnless or abruptly short awned; plants annual, of southern Utah *G. arizonica*
- Pappus scales oblong-lanceolate, awned; plants perennial, rarely flowering the first year 5
- 5(4). Leaves mainly basal, entire or rarely some of them toothed or lobed *G. parryi*
- Leaves cauline, toothed, lobed or entire ... *G. spatulata*

***Gaillardia aristata* Pursh** Blanketflower. Perennial herbs from a slender taproot; stems 20–80 cm tall, com-

monly foliose to middle or above, less commonly with basal leaves only; leaves 1.5–16 cm long, 3–25 mm wide, oblong to oblanceolate or elliptic, entire or toothed to pinnatifid, puberulent and sparingly long-villous with multicellular hairs; heads solitary or few, long-peduncled; disk mainly 2–2.5 cm wide, purple; involucre bracts (and/or peduncle apex) commonly long-villous basally, green or suffused with purple, attenuate; rays 6–16, yellow, often purplish at the base, the lobes 5–12 mm long; setae of receptacle well developed; disk corollas densely woolly-villous, the hairs with reddish purple cross-walls, often obscuring the attenuate lobes; pappus of slender lance-attenuate scales, the caudate apex entire; achenes ca 1.5 mm long, rufous-pilose; $n = 17, 34$. Pinyon-juniper, ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 2135 to 2870 m in Daggett and Uintah counties; British Columbia to Saskatchewan, south to Oregon, Colorado, and South Dakota; 9 (ii). A specimen by Neese (5711 BRV) is only sparingly villous on the basal portion of the bracts. The species is known from cultivation in Utah and Emery counties; 3 (0).

Caillardia arizonica Greene Arizona Blanketflower. Annual herbs from a slender taproot, mainly 15–40 cm tall; stems typically short, the leaves mostly near the plant base; leaves 1.9–10 cm long, 3–28 mm wide, oblanceolate to elliptic in outline, pinnatifid or less commonly subpinnatifid, more or less glandular and sparingly to rather densely long-villous with multicellular hairs; heads solitary or few, long-peduncled; disk 1.5–2.5 cm wide, yellow; involucre bracts commonly long-villous near the base and on the margins, green or suffused with purple, attenuate; rays 5–16, yellow, the lobes 3–12 mm long; setae of receptacle well developed; disk corollas villous, the hairs with pale cross-walls, not obscuring the lobes; pappus of broadly blong or oval, awnless or awn-tipped, scales; achenes ca 1.5 mm long; $n = 17$. Warm desert shrub community at ca 900 m in Washington County; Nevada and Arizona; 1 (0).

Caillardia flava Rydb. Yellowflower. Perennial herbs from a subrhizomatous woody caudex; stems 20–50 cm tall, foliose to the middle or above; leaves 2–5 cm long, 4–25 mm wide, pinnately incised, minutely puberulent and glandular-punctate; heads solitary, on peduncles to 25 cm long; disk 17–32 mm wide, yellow; involucre bracts sparingly to moderately villous, green, caudate-attenuate; rays 8–12, yellow, the lobes 3–5 mm long; setae of receptacle well developed, coarse and spinescent; disk corollas sparingly villous, the hairs with colorless cross-walls, the lobes acute; pappus scales oblong to oblanceolate, abruptly contracted to a barbellate appendage; achenes ca 1–1.5 mm long, yellowish pilose. Stream terraces and valley bottoms, commonly in cottonwood, willow, and tamarix communities at 1280 to 1650 m in Emery (type from Lower Crossing) and Grand counties; endemic; 6 (v). The plants are extremely resinous glandular, with a very bitter-flavored exudate.

Caillardia parryi Greene Parry Blanketflower. [*C. acaulis* Gray, type from near St. George]. Perennial herbs from a woody caudex; stems 10–35 cm tall, foliose basally, less commonly with some leaves cauline; leaves 2.5–9 cm long, 8–25 mm wide, petiolate, the blades ovate to elliptic, sparingly puberulent, minutely glandular-punctate, entire or irregularly lobed, obtuse; heads solitary on scapose peduncles; disks 17–32 mm wide, yellow; involucre bracts sparingly villous, green, attenu-

ate; rays ca 8–12, yellow, the lobes 3–5 mm long; setae of receptacle copious, surpassing achenes; disk corollas sparingly villous, hairs with translucent cross-walls, the lobes acutish; pappus scales lanceolate, rather abruptly contracted to a smooth bristle; achenes ca 1.5 mm long, yellowish pilose. Pinyon-juniper and ponderosa pine communities, often in disturbed sites, at 1525 to 1830 m in Garfield, Kane, and Washington counties; northern Arizona; 7 (i).

Caillardia pinnatifida Torr. Hopi Blanketflower. [*C. mearnsii* Rydb.; *C. crassifolia* Nels. & Macbr., type from LaVerkin; *C. gracilis* A. Nels., type from Diamond Valley; and *C. straminea* A. Nels., type from LaVerkin]. Perennial (less commonly biennial or annual) herbs, the caudex seldom well developed; stems 8–55 cm tall, foliose to the middle, less commonly all leaves basal; leaves 1–7.5 cm long, 2–15 mm wide, petiolate; blades elliptic to oblanceolate or linear-oblong, puberulent and minutely glandular-punctate, pinnatifid to entire, acute to obtuse; heads solitary, on long peduncles; disks 15–35 mm wide, purple; involucre bracts moderately to sparingly villous, green or suffused purplish, caudate-attenuate; rays 7–12, yellow, the lobes 2–5 mm long; setae of receptacle spinescent; disk corollas sparingly villous, hairs with translucent or reddish cross-walls, the lobes acute; pappus scales oblanceolate, abruptly contracted to a scabrous awn; achenes ca 2 mm long, white-pilose. Blackbrush, shadscale, ephedra-Vancevea, and pinyon-juniper communities at 915 to 1830 m in Carbon, Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Colorado and Arizona to Texas and Mexico; 75 (ix).

Caillardia spathulata Gray Perennial herbs from a taproot and caudex; stems 6–35 cm tall, commonly foliose to middle or above; leaves 1–7.5 cm long, 0.4–2.3 cm wide, petiolate to sessile; blades oblanceolate to elliptic or ovate to oval, sparingly villous and glandular-punctate, entire or variously toothed or lobed, obtuse; heads solitary or few, on long peduncles; disks 18–33 mm wide, yellow; involucre bracts moderately to densely villous-pilose, green, lance-attenuate; rays 7–10, yellow, the lobes 2–4 mm long; setae of receptacle short, spinescent; disk corollas shortly villous on the obtuse lobes, the hairs with colorless cross-walls; pappus scales oblong-lanceolate, abruptly contracted to a scabrous awn; achenes ca 3.5 mm long, yellowish pilose. Salt desert shrub and shrub-grass communities at 1220 to 2320 m in Carbon, Emery, Garfield, Grand, and Wayne (type from Rabbit Valley) counties; endemic; 58 (xi).

Ceraea T. & G.

Annual herbs; leaves alternate; heads radiate, showy, solitary or few in a corymbose panicle; involucre hemispheric, 2- or 3-seriate; bracts white-ciliate; receptacle convex, the bracts clasping the achenes; rays neuter, yellow; pappus of 2 awns, connected by a low whitish crown; disk achenes flat, cuneate, villous-ciliate, black.

Ceraea canescens T. & G. Desert Sunflower. Annual herbs; stems 2–6 dm tall, simple or branched, white-hirsute, glandular; leaves 1–7 cm long, 0.8–4 cm wide, lanceolate to oblanceolate or ovate, acute to obtuse, entire or few-toothed, reduced upward; heads showy, borne on slender, often bracteate peduncles; involucre 10–25 mm wide, 7–12 mm high; bracts green, strongly ciliate, lance-acuminate; rays 10–21, yellow, 7–20 mm long; ach-

enes 6–7 mm long; n = 18. Warm desert shrub communities at 700 to 900 m in Beaver Dam Wash, Washington County; Nevada, Arizona, and California; 6 (ii).

Glyptopleura D. C. Eaton

Low annual herbs with milky juice; leaves rosetiform, with a few-toothed, white crustaceous margin; heads many, short peduncled, the flowers all raylike, white or pale yellowish (or drying pinkish); involucre of 7–12 scarious-margined bracts subtended by a basal group of pinnatifid or toothed bractlets; pappus of capillary white bristles in several series, the outer falling separately; achenes oblong, 5–angled, each face with 2 rows of tubercles, abruptly beaked.

- 1. Ray flowers showy, long exerted, 1.5–2.5 cm long; plants of Washington County *G. setulosa*
- Ray flowers inconspicuous, only shortly exerted, mainly less than 10 mm long; plants broadly distributed *G. marginata*

Glyptopleura marginata D. C. Eaton Crustweed. Depressed annual herbs; stems 0.5–4 cm long; leaves crowded on the short stems, mainly 0.5–4 cm long, pinnatifid, the margins white-crustose, extended into irregular white processes; involucre 10–13 mm high, urceolate; bracts green, the margins hyaline; bractlets with white irregular branched processes, crustose at the apex; rays mainly 4–7 mm long, withered and pinkish on drying; achenes 4–5 mm long, tan, sculptured; n = 9. Desert shrub communities at 1240 to 1590 m in Beaver, Box Elder, Iron, Piute, San Juan, Sevier, and Uintah counties; Oregon and Nevada; 9 (i).

Glyptopleura setulosa Gray Low annual herbs; stems 1.5–6 cm long; leaves crowded on the short stems, mainly 0.3–5 cm long, pinnately lobed, the margins white-crustose into teeth; involucre 10–13 mm high, urceolate; bracts green or purplish tipped, the bracts with expanded apices bearing simple or coalescent processes; rays mainly 1.5–2.5 cm long, pale yellowish, showy; achenes 4–5 mm long, tan, sculptured. Larrea, blackbrush, and Joshua tree communities at 700 to 915 m in Washington (type from near St. George) County; Arizona, Nevada, and California; 6 (0).

Gnaphalium L.

Annual or perennial tomentose herbs; leaves alternate, entire; heads discoid, the flowers white, yellowish, or suffused with pink, borne in spikes, corymbs, or panicles; involucre campanulate to ovoid; bracts imbricate, scarious apically (at least); receptacle naked; outer flowers numerous, slender and pistillate, the few inner ones broader and perfect; style branches of inner flowers flattened, truncate, the stigmatic portion not sharply differentiated; anthers caudate; pappus of capillary bristles; achenes small, nerveless.

- 1. Heads small, the involucre 2–4 mm long; clusters of heads commonly surpassed or equaled by leafy bracts; plants mainly 4–20 cm tall 2
- Heads large, mostly 4–7 mm high; clusters of heads not or rarely surpassed by leafy bracts; plants often over 20 cm tall 4
- 2(1). Leaves spatulate to oblong, mainly 3–8 mm wide; plants loosely tomentose *G. palustre*

- Leaves linear to narrowly oblanceolate, mainly 1–3 mm wide; plants rather closely tomentose 3
- 3(2). Leafy bracts commonly less than 1.5 cm long, more loosely tomentose than the following *G. exilifolium*
- Leafy bracts commonly more than 1.5 cm long, the tomentum appressed *G. uliginosum*
- 4(1). Herbage more or less glandular-hairy, at least the upper leaf surfaces *G. viscosum*
- Herbage more or less tomentose, not at all glandular ... 5
- 5(4). Pappus bristles ciliate near the base, basally united into small, easily fractured groups *G. luteo-album*
- Pappus bristles not ciliate, falling separately 6
- 6(5). Leaves strongly decurrent; bracts of involucre yellowish or fading yellowish; plants annual or biennial .. *G. chilense*
- Leaves not strongly decurrent or the plants perennial; bracts of involucre pearly white 7
- 7(6). Middle involucral bracts ca 3 times as long as broad, mostly acutish apically; leaves not strongly decurrent *G. wrightii*
- Middle involucral bracts ca twice as long as broad, mostly obtuse to rounded apically; leaves narrowly decurrent *G. microcephalum*

Gnaphalium chilense Sprengel Cottonbatting Cudweed. Annual or biennial herbs, the tomentose stems 15–40 cm tall or more; leaves 1.5–7 cm long, 2–8 mm wide, oblong to linear or the lowermost oblanceolate, decurrent, tomentose, reduced upward; heads numerous, in capitate clusters at stem apices; involucre 4–7 mm high, the bracts yellowish, tomentose only at the base; n = 14. Disturbed, often moist sites at 1370 to 1770 m in Daggett, Duchesne, Kane, Salt Lake, Utah, and Wasatch counties; British Columbia to Montana, south to California, Arizona, and Texas; 5 (0).

Gnaphalium exilifolium A. Nels. [*G. grayi* Nels. & Macbr.]. Annual herbs; stems 8–25 cm tall, simple or branching from the base, tomentum appressed or somewhat loose; leaves 0.4–4 cm long, 1–3 mm wide, linear to linear-oblanceolate; heads clustered, in capitate cymes or spicate, subtended by leafy bracts that surpass them; involucre ca 3 mm high; bracts with hyaline brownish tips, tomentose at the base; n = 7. Sedge-grass community, known in Utah from Piute, Wasatch, and Washington counties; Colorado, New Mexico, and Arizona; 3 (0). This plant simulates *G. uliginosum*, with which it has been synonymized by some workers. More material is necessary to provide a definitive solution as to its proper taxonomic position.

Gnaphalium luteo-album L. Annual herbs; stems mainly; 10–40 cm tall, simple or moderately branched, woolly; basal leaves oblanceolate, mainly 1–4.5 cm long and 4–10 mm wide; cauline leaves reduced upward; heads solitary or in cymose clusters; involucre 3.5–5 mm high; bracts hyaline, brownish stramineous, woolly only at the base, finally spreading; pappus bristles mostly united at the base, falling in an easily fragmented ring. Weedy species known from ca 2135 m in Washington County; adventive from Europe; 1 (0).

Gnaphalium microcephalum Nutt. Perennial herbs; stems mainly 2–7 dm tall, usually several from a root crown; leaves mainly 3–10 cm long and 2–10 mm wide, broadly linear or oblanceolate, narrowly and often shortly decurrent at the base; heads typically numerous in cymose clusters, these commonly forming a broad, open

inflorescence; involucre 4–7 mm high, the bracts numerous, imbricate, white to tan, woolly only at the base (if at all); pappus bristles numerous, falling separately. Open sites at ca 1830 m in Weber County; British Columbia to Montana, south to California and Colorado; 1 (0).

Gnaphalium palustre Nutt. Lowland Cudweed. Annual herbs; stems 3–20 (30) cm tall, simple or more commonly much branched, loosely tomentose; leaves 1–3.5 cm long, 2–6 (10) mm wide, oblong to oblanceolate; heads clustered in capitate terminal or axillary cymes, subtended by leafy bracts that equal or surpass them; involucre 3–4 mm high; bracts brown, usually with whitish tips, tomentose below; $n = 7$. Tamarix-willow, mountain brush, ponderosa pine, Douglas-fir, and sedge-grass communities, often on sand bars, lake shores, and pond margins, at 1370 to 2600 m in Box Elder, Cache, Garfield, Iron, Juab, Millard, Piute, Salt Lake, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; British Columbia and Alberta, south to California and New Mexico; 51 (v).

Gnaphalium uliginosum L. Marsh Cudweed. Annual herbs; stems 3–15 (25) cm tall, simple or more commonly much branched, closely tomentose; leaves 1–5 cm long, 1–3 mm wide, linear to linear-oblanceolate; heads clustered in capitate terminal or axillary cymes, subtended by leafy bracts that much surpass them; involucre 3–4 mm high; bracts brown with pale tips, tomentose below; $n = 7$. Lake and pond margins and other disturbed sites at 1430 to 2830 m in Beaver, Daggett, Garfield, Iron, Sevier, Uintah, and Washington counties; widely distributed in North America; probably introduced from Europe; 8 (0).

Gnaphalium viscosum H.B.K. Viscid Cudweed. Annual or biennial herbs; stems 4–9 dm tall, simple or branched from the base, the stem conspicuously glandular-hairy, becoming tomentose upward; leaves numerous, oblanceolate to linear-oblong, evidently decurrent at the base, glandular-hairy on the upper surface, more or less woolly on the lower one, 4–10 cm long and 5–20 mm wide; inflorescence many-headed; involucre 4–7 mm high, the bracts numerous, yellowish to nearly white, woolly at the base, acute; pappus bristles distinct, falling separately. Mountain brush, juniper, ponderosa pine, and lodgepole pine communities at 2350 to 2715 m in Piute, Salt Lake, San Juan, Summit, and Uintah counties; British Columbia to Quebec, south to Mexico and Tennessee; 3 (0).

Gnaphalium wrightii Gray Wright Cudweed. Perennial herbs; stems 3–8 dm tall, branched in the inflorescence; leaves 1.5–7 cm long, lance-linear, the lower ones spatulate; panicle open, with capitate clusters of heads not subtended or surpassed by bracteate leaves; involucre 5–6 mm high; bracts pearly white, tomentose below. Ponderosa pine and live oak communities at 1585 to 1830 m in Garfield and Washington counties; California to Texas, south to Mexico; 10 (i).

Grindelia Willd.

Annual, biennial, or perennial herbs, sometimes woody at the base; leaves alternate, simple, more or less resinous-punctate, usually sessile, often clasping; heads radiate or discoid, the rays 10–45, pistillate, fertile, yellow; involucre imbricate, more or less resinous; bracts thickish, with pale appressed base and often squarrose or revolute herbaceous tips; receptacle naked, flattish; disk

flowers fertile, yellow; style branches with slender hispidulous appendages; pappus of 2–8 stiff, often curved, deciduous awns; achenes compressed to angular, glabrous.

1. Heads discoid 2
- Heads radiate 3
- 2(1). Plants perennial; involucre bracts much thickened apically *G. fastigiata*
- Plants annual or biennial; involucre bracts only somewhat thickened *G. aphanactis*
- 3(1). Involucre bracts, at least middle and upper ones, with appressed or erect tips, these not revolute or thickened *G. laciniata*
- Involucre bracts spreading or recurved apically, often thickened apically 4
- 4(3). Rays mostly 12–25, rarely more; leaves entire or sharply toothed, not callous-serrulate; achenes usually with one or more knobs on the apical margin; plants perennial *G. nana*
- Rays mostly 25–40, rarely fewer; leaves regularly callous-serrulate to sharply toothed or entire; achenes mainly lacking apical knobs; plants biennial or perennial *G. squarrosa*

Grindelia aphanactis Rydb. Biennial herbs; stems 1.5–9 dm tall, uniformly leafy, glabrous; leaves mainly 2.5–7 cm long, 2–12 mm wide, oblong or oblanceolate, entire, crenulate-serrate or denticulate to pinnatifid, glabrous, the margin scabridulous; heads discoid, campanulate; involucre 7–20 mm high, 10–28 mm wide, resinous, mostly in 5 or 6 series, the upper portion loosely to moderately reflexed, glabrous; pappus awns 2 or 3; achenes 2.3–3 mm long, brown, mainly truncate apically; $n = 12$. Weedy species of disturbed sites in Kane and San Juan counties; Colorado, Arizona, and Texas; 1 (0).

Grindelia fastigiata Greene Erect Gumweed. Perennial herbs; stems 5–10 dm tall or taller, glabrous; leaves mainly 1.5–13 cm long, 10–18 mm wide, oblanceolate to lance-oblong, entire or denticulate to dentate or serrate, glabrous; heads discoid; involucre campanulate, 10–14 mm high, 9–17 mm broad; bracts in ca 6 series, only the upper third or fourth spreading, with revolute, thickened tips; pappus awns 2 or 3; achenes oblong, 3.5–5 mm long; $n = 6$. Sandy terraces and washes at 1125 to 1375 m in Emery, Grand, and San Juan counties; Colorado; a Plateau endemic; 12 (vi).

Grindelia laciniata Rydb. Perennial herbs; stems 2.5–4.5 dm tall, glabrous; leaves mainly 2–6 cm long, 3–1.5 mm broad, pinnatifid or the upper subentire or entire, narrowly oblanceolate to oblanceolate, glabrous; heads radiate; involucre 7–10 mm high and wide; bracts with upper 1/3–1/2 spreading, glabrous; pappus awns 3–5; achenes 2.5–3.5 mm long; $n = 6$. Sandy washes in San Juan County (type from San Juan County); Arizona; 1 (0).

Grindelia nana Nutt. Low Gumweed. [*G. brownii* Heller; *G. nana* f. *brownii* (Heller) Steyererm.]. Perennial herbs; stems 0.8–6.5 (8) dm tall, glabrous; leaves mainly 1.5–10 cm long, 5–30 mm wide, oblanceolate, scarcely clasping; heads radiate; involucre campanulate; bracts in 5–7 series, reflexed or revolute in the upper third to fifth; rays 11–28, yellow, 5–11 mm long; pappus awns 2; achenes 3.5–4 mm long; $n = 12$. Ruderal weed at ca 1585 to 1650 m in Cache County; Washington to Montana, south to California and Idaho; 4 (0).

Grindelia squarrosa (Pursh) Dunal Curly Gumweed. [*Donia squarrosa* Pursh]. Perennial or biennial herbs; stems 1-8 (10) dm tall, glabrous; leaves mostly 2-5 cm long, oblong, regularly callous toothed, sometimes sharply toothed or entire, the upper clasping; heads radiate, strongly resinous; bracts with the green tips strongly rolled back; rays 25-40, yellow, 7-15 mm long; pappus awns 2 or 3 (to 6); achenes 2.3-3 mm long; 2n = 12, 24. Two more or less distinctive varieties are present in Utah.

- 1. Main upper cauline leaves 2-4 times longer than broad, oblong-ovate to oblong *G. squarrosa* var. *squarrosa*
- Main upper cauline leaves 5-8 times longer than broad, narrowly oblong to oblanceolate *G. squarrosa* var. *serrulata*

Var. *serrulata* (Rydb.) Steyerl. [*G. serrulata* Rydb.]. n = 6. Salt desert shrub, sagebrush, saline meadow, and mountain brush communities at 1310 to 1420 m in all Utah counties; Wyoming south to New Mexico and Arizona, and introduced widely elsewhere; 72 (vii).

Var. *squarrosa* [*G. serrulata* f. *depressa* Steyerl., type from west of Salt Lake City]. Waste places at 1300 to 2135 m in Duchesne, Juab, Salt Lake, Utah, and Wasatch counties; widespread mainly to the east of our area; 6 (0).

Gutierrezia Lag.

Perennial shrubs or subshrubs, glutinous, glabrous or hirtellous; leaves alternate, linear, often punctate; heads radiate, small, numerous; rays pistillate or neutral, yellow, or lacking; involucre cylindrical to turbinate, the bracts imbricate, chartaceous; receptacles naked or bristly, convex; disk flowers few to many, yellow, perfect or sterile; pappus of 10-12 unequal scales; achenes obovoid or oblong, pubescent.

Lane, M. 1982. Generic limits of *Xanthocephalum*, *Gutierrezia*, *Anaphichris*, *Gymnosperma*, *Greenella*, and *Thurovia* (Compositae: Asteraceae). *Systematic Botany* 7: 405-417.

Solbrig, O. T. 1960. Cytotaxonomic and evolutionary studies in the North American species of *Gutierrezia* (Compositae). *Contr. Gray Herb.* 188: 1-63.

- 1. Heads cylindrical, the ray and disk flowers 1 or 2 each *G. microcephala*
- Heads turbinate, with more than 4 flowers 2
- 2(1). Ray and disk flowers 3-8 each; involucre 2-3 mm thick; heads often clustered at ends of branches; plants widespread *G. sarothrae*
- Ray flowers 4-10, disk flowers 5-23; involucre 2-7 (9) mm thick; heads solitary or in pairs at branch ends; plants of restricted distribution 3
- 3(2). Disk flowers 5-12, 3.5-4.5 mm long; ray flowers 2-5 mm long; plants of Uintah County *G. pomariensis*
- Disk flowers 15-23, ca 3 mm long; ray flowers 5-7 (10) mm long; plants of eastern Millard County *G. petradoria*

Gutierrezia microcephala (DC.) Gray Thread Snakeweed. [*Brachyris microcephala* C.; *G. sarothrae* var. *microcephala* DC.] L. Benson; *Xanthocephalum microcephalum* (DC.) Shinn.]. Rounded shrub, 30-100 cm tall; stems slender, grayish to straw colored or green above, from a woody crown; leaves dimorphic, the cauline 2-5 cm long, 2-4 mm wide, linear or linear-lanceolate, and with shorter, narrower fasciculate axillary ones, often one or both lacking at anthesis; heads clustered at branch ends, sessile; involucre 3-4 mm long, 1-1.5 mm wide,

cylindric; bracts fewer than 10, lanceolate, the tip greenish, slightly thickened; ray flowers 1 or 2, 3-4 mm long; disk flowers 1-3, 2-3 mm long; pappus of ca 8 scales; achenes of disk flowers abortive, those of ray flowers fertile, 2-3 mm long, hairy; n = 4, 8. Blackbrush, Vaneleva-ephedra, saltbush, purple sage, rabbitbrush, and pinyon-juniper communities at 850 to 1830 m in Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Utah, Washington, and Wayne counties; Nevada and California to Colorado, south to Texas and Mexico; 27 (viii).

Gutierrezia petradoria (Welsh & Goodrich) Welsh Goldenrod Snakeweed. [*Xanthocephalum petradoria* Welsh & Goodrich]. Perennial, suffrutescent; stems herbaceous except at the base, hirtellous, simple below the inflorescence, loosely caespitose, from a stout taproot and branching, mostly underground, woody caudex; leaves arranged singly along the stems, linear, 0.5-4.5 cm long, 1-3 (4) mm wide, reduced upward, secondary fascicled leaves in some lower axils; heads solitary or in pairs on bracteate peduncles, or some almost sessile; involucre 5-9 mm high, 3-7 mm wide (to 9 when pressed), campanulate, the bracts ca 20, in 3 (4) series, greenish, the tips thickened; ray flowers 4-10, 5-10 mm long, 1-4 mm wide, when fresh; disk flowers 15-23, ca 3 mm long; pappus scales ca 10-12; achenes 3-4 mm long, pubescent, abortive in disk flowers. Sagebrush, oakbrush, mountain mahogany, and white fir communities at 1920 to 2590 m in eastern Millard County (Canyon and Pavant ranges); type from the Canyon Mountains; endemic; 9 (0).

Gutierrezia pomariensis (Welsh) Welsh Orchard Snakeweed. [*G. sarothrae* var. *pomariensis* Welsh; *Xanthocephalum sarothrae* var. *pomariense* (Welsh) Welsh]. Orchard Snakeweed. Rounded subshrubs; stems 1.2-4.5 dm tall, several to many from a persistent woody base; leaves 1.5-5.2 cm long, 0.5-2.5 mm wide, linear, entire, glabrous or scabrous, glandular-punctate; heads in corymbose inflorescences, solitary or 2 or 3 clustered at stem ends; involucre 5-7.5 mm high, 2-5 mm broad, turbinate to cylindrical; bracts broadly obtuse, with a greenish subapical spot, resin coated; ray flowers 5-9, the corollas 2-5 mm long; disk flowers 5-12, the corollas 3.5-4.5 mm long; pappus scales ca 5-8; achenes 1-2 mm long, hairy. Mixed desert shrub communities at 1460 to 2135 m in Duchesne and Uintah (type from Orchard Creek Draw, Dinosaur National Monument) counties; endemic; 17 (iv).

Gutierrezia sarothrae (Pursh) Britt. & Rusby Broom Snakeweed. [*Solidago sarothrae* Pursh; *Xanthocephalum sarothrae* (Pursh) Shinn.]. Rounded shrubs; stems 9-90 cm tall, profusely branched from the base, otherwise in the inflorescence, from a woody caudex and stout taproot; leaves dimorphic, the main cauline ones 2-7 cm long, 1-3 mm wide, linear to linear-lanceolate, the fascicled secondary ones in lower axils, entire, glabrous to tomentulose; heads in corymbose inflorescences, usually in clusters of 3-10 at branchlet ends, seldom solitary; involucre 3-4.5 mm high, 2-3.5 mm wide, turbinate; bracts narrow, acute, with green thickened tip; ray flowers 3-7, yellow, 2-5 mm long; disk flowers mostly 3-8, 2-3 mm long; pappus of 8-10 scales; achenes 1-2 mm long, hairy; n = 4. Warm desert shrub, sand sagebrush, live oak, sagebrush, rabbitbrush, mountain brush, and pinyon-juniper communities, often in disturbed sites, at 760 to 2440 m in probably all Utah counties; British

Columbia east to Saskatchewan and south to Mexico. Our variable material adjusts to disturbances and increases on grazed native rangelands; it is not considered to be palatable; 208 (xlv).

Haplopappus Cassini

Annual or perennial herbs, subshrubs, or shrubs, usually resinous or glandular; leaves alternate, entire or toothed to lobed; heads discoid or radiate, usually small to large, variously clustered or solitary; involucre cylindrical to turbinate or campanulate, the bracts imbricate, not aligned; receptacle flat to convex, naked; rays yellow when present; disk flowers perfect, yellow; pappus of barbelate capillary bristles; achenes angled or striate to smooth.

Hall, H. M. 1928. The genus *Haplopappus*. Carnegie Institution of Washington. 391 pp.

- | | | |
|---------|---|-------------------------|
| 1. | Plants low, rounded, branched shrubs, or tall slender shrubs or subshrubs | 2 |
| — | Plants annual or perennial herbs, branched or unbranched | 11 |
| 2(1). | Heads borne on stems 2.5–5 dm long; plants of saline sandy drainages or sandstone outcrops in southern Utah | 3 |
| — | Heads borne on stems less than 2.5 dm long; plants of various substrates and distribution | 4 |
| 3(2). | Plants definitely shrubby, the mature branchlets ashy gray or white, of sandstone outcrops and canyons | |
| | <i>H. scopulorum</i> | |
| — | Plants shrubby only at the base, the branchlets straw colored to greenish; plants of saline drainage bottoms and terraces | <i>H. drummondii</i> |
| 4(2). | Stems of the season white-tomentose; involucre 10–13 mm long, the bracts only somewhat imbricate; plants commonly of high elevations | <i>H. macronema</i> |
| — | Stems glabrous, glandular, or hairy, not tomentose; involucre mainly less than 10 mm long, but, if longer, otherwise differing | 5 |
| 5(4). | Involucre campanulate, 8–12 mm long; heads showy, the rays 8–10 mm long; plants of lower elevations in Washington County | <i>H. linearifolius</i> |
| — | Involucre turbinate to cylindrical or campanulate, commonly less than 8 mm long; heads not especially showy, the rays mainly 2–5 mm long, or lacking | 6 |
| 6(5). | Leaves densely glandular-punctate, linear; ray flowers present; plants known from Washington County | <i>H. laricifolius</i> |
| — | Leaves not glandular-punctate, narrowly to broadly oblanceolate or oblong; ray flowers lacking; plants more broadly or otherwise distributed | 7 |
| 7(6). | Heads 12–22 mm high, the bracts subequal, the outer herbaceous and the inner chartaceous and with broad hyaline margins; plants of limestone outcrops in the Paunsagunt and Markagunt plateaus, or mainly of igneous outcrops in the Pine Valley Mts. | 8 |
| — | Heads 5.5–9.5 mm high, the bracts imbricate in several series, variously herbaceous or chartaceous, but seldom any with broad hyaline margins; plants of various substrates and distribution | 9 |
| 8(7). | Involucral bracts 1-nerved; achenes evenly though sparingly hairy; plants of the Pine Valley Mts., Washington County | <i>H. crispus</i> |
| — | Involucral bracts 3-nerved; achenes glabrous except for a few hairs apically; plants of the Paunsagunt and Markagunt plateaus | <i>H. zionis</i> |
| 9(7). | Leaves densely stipitate-glandular, oblanceolate, acute, the margins not especially repand | <i>H. watsonii</i> |
| — | Leaves lacking stipitate glands, narrowly oblanceolate to oblong or, if oblanceolate, the margins repand-undulate | 10 |
| 10(9). | Leaves oblanceolate, 2–5 mm wide | <i>H. cervinus</i> |
| — | Leaves narrowly oblanceolate to oblong, 0.5–2 mm wide | <i>H. nanus</i> |
| 11(1). | Leaves strongly 3-nerved and veiny, thick and leathery; caudices thick, woody, branched | 12 |
| — | Leaves not 3-nerved and veiny; caudices simple or, if branched, not woody | 13 |
| 12(11). | Bracts obtuse to rounded or less commonly acutish, strongly imbricate; plants of the Colorado drainage system | <i>H. armerioides</i> |
| — | Bracts acute to attenuate, subequal to strongly imbricate; plants widespread | <i>H. acaulis</i> |
| 13(11). | Leaves with lobes or teeth spinulose tipped; involucral bracts spinulose tipped | 14 |
| — | Leaves entire or toothed, but then not spinulose tipped; involucral bracts not spinulose tipped | 15 |
| 14(13). | Involucral bracts glabrous or glandular dorsally; leaves pinnatifid; plants perennial | <i>H. spinulosus</i> |
| — | Involucral bracts strigose dorsally, also minutely ciliate; leaves lobed or merely toothed to entire; plants annual | <i>H. gracilis</i> |
| 15(13). | Stems mainly 20–40 cm tall, loosely tomentose above; involucre 15–30 mm wide; plants evidently rare | <i>H. croceus</i> |
| — | Stems 5–20 cm tall or, if taller, not or seldom loosely tomentose, or the heads smaller | 16 |
| 16(15). | Heads racemously or spicately arranged; stems erect or nearly so, not strongly bent at the base | <i>H. racemosus</i> |
| — | Heads solitary or corymbosely (rarely racemously) arranged; stems strongly bent at the base | 17 |
| 17(16). | Involucre 12–15 mm high, 20–30 mm wide; plants not hairy in the leaf axils | <i>H. clementis</i> |
| — | Involucre 5–10 mm high, 10–20 mm wide or, if larger, the plants with hair tufts in basal leaf axils | 18 |
| 18(16). | Involucral bracts herbaceous throughout; achenes glabrous; plants rare, known only from the Tushar Mts. | <i>H. apargoides</i> |
| — | Involucral bracts herbaceous only apically; achenes hairy; plants locally common in saline meadows | <i>H. lanceolatus</i> |

Haplopappus acaulis (Nutt.) Gray Stemless Goldenweed. [*Chrysopsis acaulis* Nutt.; *C. caespitosa* Nutt.]. Perennial caespitose herbs from a thick ligneous pluricipital caudex and stout taproot, the caudex branches clothed with brown to ashy marcescent leaf bases and leaves; herbage resinous, scabrous to glabrous; stems mainly 5–20 cm tall; basal leaves 0.3–6 cm long, 1.5–10 mm wide, rigid, narrowly to broadly oblanceolate, sharply mucronate, 1- to 3-nerved; cauline leaves few, developed or reduced upward; heads solitary (rarely 2); involucre hemispheric, 6–10 mm high, 8–20 mm wide; bracts in 3 series, more or less mucronate; rays 6–15, 8–10 mm long, 2–4 mm wide; pappus white to brownish; achenes silky-villous or glabrous; $2n = 36$. This is a variable taxon, with several morphological phases. Despite the tendency for some of the variations to be correlated geographically, it seems best to regard our materials as consisting of two mainly sympatric varieties.

1. Cauline leaves well developed, often the main foliage leaves; herbage merely resinous-glandular; plants of the Great Basin *H. acaulis* var. *glabratus*

— Cauline leaves usually much reduced, surpassed in size by the basal ones; herbage scaberulous or merely resinous-glandular; plants more widely distributed *H. acaulis* var. *acaulis*

Var. *acaulis* Sagebrush-grass, pinyon-juniper, mountain brush, ponderosa pine, western bristlecone, and spruce-fir communities at 1430 to 2685 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Juab, Kane, Millard, Sanpete, Sevier, Summit, Tooele, Uintah, and Utah counties; Oregon to Wyoming, south to California, Nevada, and Colorado; 60 (ix). There is a narrow-leaved glabrous phase of this taxon in the southern portion of Duchesne County, mainly on Green River Shale. Possibly it deserves recognition at some taxonomic rank.

Var. *glabratus* D. C. Eaton [*Stenotus falcatus* Rydb., type from Iron County; *H. falcatus* (Rydb.) Blake in Tidestr.; *S. latifolius* A. Nels., type from Utah County]. n = 9. Black sagebrush, wildrye, pinyon-juniper, mountain brush, and grass-shrub communities at 1525 to 2900 m in Beaver, Iron, Juab, Millard, Tooele, and Utah counties; Saskatchewan south and west to California and Nevada; 22 (iv).

Haplopappus apargoides Gray Perennial shortly caulescent herbs, 3–8 (15) cm tall, from a taproot and simple or branched caudex, this clothed with brown marcescent leaf bases; basal leaves mainly 2–6 cm long, 2–6 mm wide, lanceolate to narrowly oblanceolate; cauline leaves reduced upward, sessile, the margins scabrous or ciliate; herbage sparingly long-villous with multicellular hairs; heads solitary; involucre hemispheric, 8–12 mm high, 10–14 mm broad; bracts imbricate, lanceolate to oblong, acute, cuspidate, herbaceous almost or quite to the base, glabrous dorsally, the margins long-ciliate; ray flowers 15–40, yellow, 8–15 mm long; pappus tawny; achenes glabrous; n = 6. Alpine tundra community at 3355 m in Piute County (Tushar Mts.); California and Nevada; 1 (i). The specimen examined (Welsh and Thorne 12982 BRV) is tentatively assigned to this species, which is known otherwise only from the eastern Sierra Nevada and adjacent Nevada.

Haplopappus armerioides (Nutt.) Gray Thrifty Goldenweed. [*Stenotus armerioides* Nutt.]. Perennial caespitose herbs from a thick ligneous pluricipital caudex and stout taproot, the caudex branches clothed with brown to ashy marcescent leaf bases and leaves; herbage resinous-glandular, otherwise glabrous or with scabrous leaf margins; stems 0.5–20 cm tall; basal leaves 1.5–8 cm long, 1.5–10 mm wide, rigid, linear to oblanceolate, sharply mucronate, 1- to 3-nerved; cauline leaves few, reduced upward; heads solitary (rarely 2); involucre campanulate, 8–13 mm high, 10–18 mm wide; bracts in 3 or 4 series, imbricate, oblong to oval or obovate, obtuse, sometimes lobed below the apex, greenish near the apex, glabrous; rays 8–12, 10–12 mm long, yellow, 3–5 mm wide; pappus white; achenes silky-villous; n = 9. This distinctive species is represented in Utah by two phases, which are more or less morphologically distinctive and geographically correlated.

1. Stems mainly 3–8 cm tall; leaves linear to linear-ob lanceolate, mainly 1–3 mm wide; plants of the Green River Formation, Duchesne and Uintah counties *H. armerioides* var. *gramineus*

— Stems usually over 8 cm tall, leaves oblanceolate, mainly 3–10 mm wide; plants widespread *H. armerioides* var. *armerioides*

Var. *armerioides* Blackbrush, black sagebrush, pigmy sagebrush, salt desert shrub, pinyon-juniper, mountain brush, and ponderosa pine communities at 1340 to 2120 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, and Uintah counties; Montana to Arizona, east to New Mexico and Nebraska; 85 (xii).

Var. *gramineus* Welsh & F. G. Sm. Desert shrub and pinyon-juniper communities at ca 1585 to 1895 m in Duchesne and Uintah counties; endemic; 17 (0).

Haplopappus cervinus Wats. Antelope Goldenbush. Shrubs, 1–4 dm tall, much branched; branchlets grayish to straw colored; leaves 6–18 mm long, 2.2–6 mm wide, oblanceolate, straight or curved, entire or repand-undulate, attenuate basally, cuspidate apically, glabrous or resinous; heads few, cymose; peduncles 3–10 mm long; involucre 6.5–7.5 mm high, 5–8 mm wide; bracts imbricate in several series, the outer greenish ones narrowly acuminate with straight or spreading tips, the inner chartaceous ones narrowly oblong, acute or cuspidate, all glabrous but resinous; ray flowers 5–7, yellow, 2.5–4 mm long, ca 1 mm wide; disk flowers 5–11, glabrous or the tube sparingly puberulent; pappus tawny; achenes strigose; n = 9. Black sagebrush, shadscale, pinyon-juniper, and mountain brush communities at 1670 to 2440 m in Millard and Sevier counties; Arizona; 5 (0). The type came from a place called Antelope Canyon (possibly in present-day western Millard County, Welsh 1982). More collections are needed.

Haplopappus clementis (Rydb.) Blake Clement Goldenweed. [*Pyrrocoma clementis* Rydb.; *P. subcaesia* Greene, type from Panguitch Lake; *P. lapathifolia* Greene, type from "Utah"; *P. chieranthifolia* Greene, type from W of Ephraim]. Perennial herbs from a simple caudex and stout taproot, the subrhizomatous caudex clothed with brown, often shredded marcescent leaf bases; stems 10–30 (40) cm tall, decumbent-ascending from an abruptly curved base, villous; basal leaves mostly 2–15 cm long, 4–17 mm wide, oblanceolate, glabrous or sparingly puberulent, entire or dentate, tapering to a petiole, acute; cauline leaves reduced upward, sessile and somewhat clasping; heads solitary (rarely 2 or 3); involucre broadly hemispheric, 8–16 mm high, 18–30 mm wide; bracts in several series, oblong to lanceolate, green throughout or the base chartaceous, villous; ray flowers 30–60, yellow or golden, 8–14 mm long; pappus tawny; achenes hairy; n = 18. Grass-sagebrush, spruce-fir, sedge-forb, and meadow communities at 2590 to 3390 m in Beaver, Daggett, Duchesne, Emery, Garfield, Iron, Kane, Piute, Sanpete, Summit, and Uintah counties; Wyoming to Colorado; 39 (vi). Specimens from Utah that have been determined as *H. integrifolius* Gray apparently fall here, including the type of *Pyrrocoma lapathifolia*, which was discussed by Hall (1920). Involucral bracts vary from herbaceous throughout to chartaceous at the base. More work is indicated. A report of *H. uniflorus* (Hook.) T. & G. (Hall 1920) from the Uinta Mts. probably belongs here.

Haplopappus crispus L. C. Anderson Pine Valley Goldenbush. Shrubs, much branched from the base, 3–5 dm tall (or more); branchlets covered with short-stalked glands; leaves 1.5–3 cm long, 3–8 mm wide, entire,

green, spatulate to oblong-ob lanceolate, acuminate, the margins undulate-cripsed, glutinous with low glands, not crowded below the inflorescence; heads 1 or 2, or more commonly more per branch, loosely paniculate to congested and cymose; involucre campanulate, the heads 12.5–16 mm long, 5–9 mm wide; bracts in several series, finely glandular, the outermost green, leaflike; rays lacking; disk flowers 14–24, pale yellow; pappus tawny; achenes 6.5–8.5 mm long, sparsely but evenly hairy. Ponderosa pine, fir, manzanita, and aspen communities at (915?) 2471 to 3050 m in Washington (type from Pine Valley Mts.) and Millard (?) counties; endemic; 9 (0).

Haplopappus croceus Rydb. Perennial herbs, mainly 2–6 cm tall, from a simple caudex and stout taproot, the caudex clothed with fibrous marcescent leaf bases; basal leaves 8–20 cm long, 6–25 (40) mm wide, elliptic to oblanceolate, petiolate, entire or undulate, obtuse to acutish, glabrous or puberulent; cauline leaves reduced upward, sessile, more or less clasping; heads solitary (rarely more); involucre hemispheric, 12–18 mm high, 20–30 mm wide; bracts in several series, ovate to oblong or oblanceolate, herbaceous apically, chartaceous to leathery basally; ray flowers 25–70, burnt orange, 10–25 mm long; pappus brownish; achenes glabrous or pilose; $n = 6, 12$. Mountain brush community at ca 2470 m in San Juan (La Sal Mts.) and Washington (Kolob Reservoir) counties; Wyoming south to Arizona and New Mexico; 3 (0).

Haplopappus drummondii (T. & G.) Blake [*Linosyris drummondii* T. & G.]. Perennial subshrub, the stems subherbaceous, arising from a woody base, 25–75 cm tall, straw colored to tan, longitudinally striate, glabrous; leaves 1.5–7.5 cm long, 1–16 mm wide, entire or irregularly lobed, linear to spatulate, glabrous, resinous; heads few to numerous, borne in corymbose cymes, peduncled; involucre turbinate, 6–8 mm high, 4–7.2 mm wide; bracts in 4 or 5 series, lance-oblong, coriaceous, with a thick green or brownish subapical spot, acute, resinous; ray flowers lacking; pappus tawny; achenes silky. Saline riparian areas in greasewood, saltgrass, rabbitbrush, saltbush, and tamarix communities at 1050 to 1800 m in Emery, Garfield, Grand, Kane, and San Juan counties; Colorado, Arizona, New Mexico, and Texas; 25 (vii).

Haplopappus gracilis (Nutt.) Gray Slight Goldenweed. [*Dieteria gracilis* Nutt.]. Annual herbs, 3–25 (30) cm tall, commonly branched from near the base; leaves 4–25 mm long, 1–3 mm wide, linear to narrowly spatulate, spinulose-dentate to pinnatifid, white-strigose, progressively reduced and entire upward; heads solitary or few to several and corymbosely arranged; involucre 6–8.5 mm high, 8–12 mm wide; bracts in 5 or 6 series, linear-lanceolate, awn tipped, herbaceous medially, strigulose, not glandular; rays 15–30, yellow, 6–9 mm long; strigulose, not glandular; pappus tawny to white; achenes pilose; $n = 2, 4$. Creosote bush-matchweed, ponderosa pine, and spruce-fir communities at 850 to 960 m in Iron, Kane, and Washington counties; California to Colorado, south to Mexico; 10 (0).

Haplopappus lanceolatus (Hook.) T. & G. Meadow Goldenweed. [*Donia lanceolata* Hook.; *H. tenuicaulis* D. C. Eaton; *H. lanceolatus* var. *tenuicaulis* (D. C. Eaton) Gray; *Pyrocoma subviscosa* Greene; *H. lanceolatus* ssp. *subviscosus* (Greene) Hall; *Donia uniflora* Hook.; *H. uniflorus* (Hook.) T. & G.]. Perennial herbs from a simple caudex and stout taproot, the caudex clothed with brown

to ashy marcescent, often fibrous, leaf bases; stems decumbent-ascending, abruptly bent at the base, 5–68 cm long; basal leaves 3–16 cm long, 3–35 mm wide, elliptic-oblong or lanceolate, glabrous or tomentose, petiolate, entire or dentate to lobed, often densely tomentose in the axils; cauline leaves reduced upward, finally sessile and clasping; heads solitary or few to several, and subcorymbose or less commonly racemose; involucre hemispheric, 5–12 mm high, 10–18 mm wide; bracts imbricate in 3 or 4 series, with green tips, glabrous or tomentulose; ray flowers 10–45, yellow, 5–10 mm long; pappus tawny; achenes densely hairy; $n = 12, 18$. Saline meadows at 1300 to 2500 m in Beaver, Cache, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Millard, Piute, Rich, Salt Lake, Sevier, Summit, Tooele, and Utah counties; Oregon to Saskatchewan, south to California, Nevada, Colorado, and Nebraska; 42 (xi). This is a highly variable taxon of saline meadows through much of our area. Heads vary from solitary to numerous, from solitary to corymbosely or racemously arranged. Vesture is lacking or tomentose, or rarely glandular. Recognition of taxonomic categories within the variation appears to be only arbitrarily possible, and it seems best to treat our specimens conservatively.

Haplopappus laricifolius Gray Larchleaf Goldenbush. Rounded shrubs 3–8 dm tall; branchlets resinous, yellowish, becoming gray in age; leaves 5–18 mm long, 1–1.5 mm wide, thick, linear, resinous-punctate; heads few to several in compact cymes, shortly pedunculate; involucre campanulate, 3–5 mm high, 3–6 mm wide; bracts imbricate in ca 3 series, narrowly oblong, acute, yellowish or hyaline, glabrous or puberulent-ciliate; ray flowers 3–6, yellow, 4–5 mm long; disk flowers 9–16, glabrous or minutely pubescent; pappus tawny; achenes white hairy; $n = 9$. Saltgrass seep margin in warm desert shrub at 1220 m in Washington County; Arizona to Texas and Mexico; 6 (v).

Haplopappus linearifolius Gray Mohave Goldenbush. Shrubs, mainly 4–10 (12) dm tall; branchlets yellowish, resinous, becoming gray in age; leaves 6–28 mm long, 1–2.5 mm wide, thickish, linear to narrowly oblanceolate, resinous-punctate; heads few to many, solitary on naked peduncles mainly 2–7 cm long; involucre hemispheric, 8–10 mm high, 10–18 mm wide; bracts biseri-ate, lance-linear, acute or acuminate, herbaceous medially, sometimes minutely glandular; rays 12–18, yellow, 9–15 mm long, 4–5 mm wide; disk flowers numerous; pappus white; achenes densely hairy. Joshua tree, creosote bush, blackbrush, juniper, live oak, and sagebrush communities at 700 to 1375 m in Washington County; California, Nevada, Arizona, and Baja California; 30 (ii). Our material is assignable to var. *interior* (Cov.) Jones [*H. interior* Cov.; *H. linearifolius* ssp. *interior* (Cov.) Hall].

Haplopappus macronema Gray Cobwebby Goldenbush. [*Macronema discoideum* Nutt.]. Shrubs, mainly 1–5 dm tall; branchlets white-tomentose; leaves 8–32 mm long, 2–7 mm wide, oblanceolate to oblong, entire or more commonly undulate-cripsed, acute to obtuse, mucronate, glandular-scabrous; heads solitary or 2 to several; involucre campanulate, 9–13 mm high, 6–12 mm wide; bracts subequal, the outer few herbaceous, oblong, the inner lance-acuminate, chartaceous, glandular-scabrous; ray flowers lacking; disk flowers 10–25; pappus tawny; achenes villous. Douglas fir, lodgepole pine, spruce-fir,

and alpine tundra communities at 2135 to 3420 m in Beaver, Box Elder, Duchesne, Garfield, Iron, Juab, Piute, Salt Lake, Sanpete, Sevier, Tooele, Salt Lake, and Utah counties; Oregon to Wyoming, south to California, Nevada, and Colorado; 38 (vi).

***Haplopappus nanus* (Nutt.) D. C. Eaton** Low Goldenbush. [*Ericameria nana* Nutt.]. Compact shrubs, mainly 1–3 (5) dm tall; branchlets yellowish, resinous, becoming gray in age; leaves 3–18 mm long, 0.5–2 mm broad, narrowly oblanceolate to linear, entire, acute, resinous but not punctate; heads solitary or few to several in compact cymes, sessile or shortly pedunculate; involucre narrowly turbinate, 5.5–8.5 mm high, 3–7 mm wide; bracts imbricate in 4 or 5 series, the outer often greenish medially, the inner chartaceous, with hyaline margins, glabrous; rays 1–7, yellow, 2–3 mm long; disk flowers 4–10; pappus tawny; achenes villous or glabrous; $n = 9$. Desert shrub, shrub-grass, and juniper or pinyon-juniper communities at 1310 to 2820 m in Beaver, Juab, Millard, Piute, Sevier, Tooele, and Washington counties; Oregon, California, Nevada, and Idaho; 18 (iii).

***Haplopappus racemosus* (Nutt.) Torr.** Slender Goldenweed. [*Homopappus racemosus* Nutt.]. Perennial herbs, from a simple caudex and stout taproot, the caudex clothed with fibrous marcescent leaf bases; stems 20–60 (100) cm tall, erect, not abruptly bent at the base (in ours); basal leaves mainly 6–25 cm long, 5–30 mm wide, the blades elliptic to oblong or oblanceolate, petiolate, rigidly erect, entire or toothed, glabrous or puberulent; cauline leaves reduced, sessile, clasping; heads racemose, in panicles or spikes, shortly pedunculate; involucre 8–12 mm high, 4–18 mm wide; bracts in 3 or 4 series, with green tips and coriaceous bases, abruptly pointed apically; rays 10–35, yellow, 5–12 mm long; pappus tawny; achenes hairy or glabrous. Saline meadows at 1370 to 1470 m in Millard and Utah counties; Oregon to Idaho, south to California and Nevada; 2 (i). Utah lies at the eastern margin of the range of this species complex, in which Hall (1928) recognized nine subspecies. Our material is hardly representative of the variation within the assemblage of forms which lie to the west of this region. One of our specimens (Welsh et al. 14514 BRY) belongs to the spiciform narrow-headed var. *sessiliflorus* (Greene) Welsh [*Pyrrocoma sessiliflora* Greene], and the other is a paniculiform large headed phase apparently nearest to var. *prionophyllus* (Greene) Welsh [*P. prionophylla* Greene]. Much more material is required to evaluate the nature of the specimens in Utah. Racemose phases of the closely related *H. lanceolatus* (q.v.) have been mistaken for *H. racemosus*. The erect or suberect stems and stiffly erect leaves appear to be diagnostic for our specimens of *H. racemosus*.

***Haplopappus scopulorum* (Jones) Blake** Spindly Goldenbush. [*Bigelovia menziesii* var. *scopulorum* Jones, type from Zion Canyon; *H. scopulorum* var. *hirtellus* Blake, type from Cedar Canyon]. Shrubs, mainly 3–10 dm tall, branchlets green to straw colored or white, glabrous; leaves 0.7–7.8 cm long, 1–8 mm wide, narrowly lanceolate to oblong, entire, 3-nerved, glabrous, the margins scabrous, attenuate to a spinulose apex; heads few to many, borne in loose to subcompact cymes, peduncled; involucre narrowly campanulate, 6.5–9.5 mm high, 3–5.5 mm wide; bracts in 5 or 6 series, oblong, chartaceous and pale, or the tips greenish or often brownish, rounded-obtuse, glabrous, not resin coated; ray flowers

lacking; disk flowers 10–20; pappus white; achenes white-pilose. Pinyon-juniper, mountain brush, and ponderosa pine communities at 1370 to 1830 m in Iron, Kane, San Juan, and Washington counties; Arizona; 10 (vii).

***Haplopappus spinulosus* (Pursh) DC.** Spiny Goldenweed. [*Amellus spinulosus* Pursh]. Perennial herbs from a ligneous caudex; stems mainly 12–50 (60) cm tall, branching above the base; leaves 0.5–6 cm long, 1–10 mm wide, pinnatifid to bipinnatifid or the upper ones entire, or merely toothed, spinulose; heads solitary, or few in corymbose clusters; involucre 5–8 mm high, 8–12 mm wide; bracts in 4–6 series, linear, awn-tipped, herbaceous medially, glandular, not strigulose; rays 15–50, yellow, 8–10 mm long; pappus brownish; achenes pilose; $n = 4, 5, 8$. Desert shrub community at ca 1300 m in San Juan and Washington counties; Alberta to Minnesota, south to California, Arizona, New Mexico, Texas, and Mexico; 4 (ii).

***Haplopappus watsonii* Gray** Watson Goldenbush. Shrubs, 1–4 dm tall; herbage stipitate-glandular; branchlets yellowish, becoming whitish to straw colored or grayish in age; leaves 4–28 mm long, 3–10 mm wide, oblanceolate to obovate or spatulate, entire or undulate, abruptly cuspidate-acuminate apically; heads several to numerous (rarely some solitary) in loose cymes, the peduncles 1–7 mm long; involucre subcylindric to narrowly campanulate, 5.5–8 mm high, 3–7.6 mm wide; bracts in ca 5 series, the outer ones greenish, the inner chartaceous or greenish at the tips; rays 5–10, yellow, 4–6 mm long; disk flowers 5–15; pappus brownish; achenes hairy; $n = 9$. Rock outcrops (limestone, sandstone, or quartzite) in desert shrub, pinyon-juniper, mountain brush, and ponderosa pine communities at 1310 to 3440 m in Beaver, Box Elder, Cache, Davis, Juab, Millard, Salt Lake, Summit, Tooele, and Weber counties; Nevada and Utah; 33 (ii). Our material belongs to one of a vicarious pair of infraspecific taxa within the Great Basin known as var. *rydbergii* (Blake) Welsh [*H. rydbergii* Blake; *Macronema obovatum* Rydb., type from City Creek Canyon]. The var. *rydbergii* differs in having fewer disk flowers (5–15 not 15–25). Other supposedly diagnostic features (i.e., the green outer involucral bracts) fail, being present to a greater or lesser degree in both phases. The type variety has not been discovered in Utah, but should be expected in the western border region.

***Haplopappus zionis* L. C. Anderson** Cedar Breaks Goldenbush. Shrubs, mainly 1–3 dm tall; herbage minutely and shortly stipitate-glandular; leaves 0.8–3.5 (4) cm long, 2–4.5 (7) mm wide, oblong to narrowly oblanceolate, 1-nerved, entire, abruptly mucronate; heads solitary or 2 or 3, in cymose clusters, peduncled; involucre cylindrical-campanulate, 12–15 mm high, 6–12 mm wide; bracts subequal, herbaceous (outer) and greenish, the inner chartaceous or with a subapical green spot and broadly hyaline margins; rays lacking; disk flowers 8–21; pappus tawny; achenes glabrous below, strigose apically. Ponderosa pine and spruce-fir communities, commonly on limestone members of the Cedar Breaks (Wasatch) Formation, at 2440 to 3050 m in Garfield, Iron (type from Cedar Canyon), and Kane counties; endemic; 9 (i).

Helenium L.

Annual or perennial herbs; leaves alternate, glandular-punctate, decurrent or clasping; heads solitary or few to

numerous in corymbose clusters, radiate, yellow; involucre bracts in 2 or 3 series, the bracts subequal or the inner shorter and narrower, herbaceous or essentially so, soon deflexed; receptacle naked, convex or conic; rays pistillate or neuter; disk flowers numerous, perfect; pappus of 5–10 scarious or hyaline scales; achenes truncately obpyramidal, 4– or 5–angled, with as many intermediate ribs.

1. Leaves sessile, clasping; stems not winged; plants of aspen communities and upward *H. hoopesii*
 — Leaves decurrent; stems winged below the leaf bases; plants of riparian communities at lower elevations
 *H. autumnale*

***Helenium autumnale* L.** Common Sneezeweed. Perennial herbs; stems mainly 1.5–10 (12) dm tall, puberulent and glandular, corymbosely branched above; leaves 1.5–15 cm long, 3–35 (40) mm wide, serrate to entire, glandular-punctate; heads 3 to many, the disk hemispheric to subglobose, yellow, 1–2 cm wide; rays 10–20, yellow, mainly 8–12 mm long, soon reflexed; pappus scales lance-ovate, with slender awn-tip as long as the body; achenes ca 1.5 mm long, hirsute and glandular; $n = 16, 17, 18$. Cattail-willow, tamarix-greasewood, sedge-rush, and other riparian and palustrine communities at 1220 to 1830 m in Box Elder, Daggett, Emery, Rich, Uintah, and Utah counties; British Columbia to Quebec, south to Arizona, and Florida; 18 (iii). This species is poisonous to livestock.

***Helenium hoopesii* Gray** Orange Sneezeweed. [*Helianstrum hoopesii* (Gray) Kuntze; *Dugaldia hoopesii* (Gray) Rydb.]. Perennial herbs, mainly 2–8 (10) dm tall, with a subrhizomatous caudex and fibrous roots; herbage more or less villous-tomentose to glabrate; basal leaves 2–30 cm long, 0.5–5 cm wide, oblanceolate, tapering to a clasping base; cauline leaves reduced upward, oblanceolate to elliptic or lanceolate, entire; heads 2–11, in loose corymbs; disks hemispheric, 2–3.5 cm wide; involucre 5–8 mm high, the bracts lanceolate to elliptic; rays 13–21, yellow or yellow orange, 15–35 mm long, finally reflexed; pappus scales hyaline, lanceolate, attenuate; achenes 3–4 mm long, hairy; $n = 15, 17$. Sagebrush, mountain brush, aspen, and spruce-fir communities, often in openings or riparian zones, at 1830 to 3420 m in Beaver, Box Elder, Cache, Carbon, Duchesne, Garfield, Grand, Iron, Juab, Piute, Rich, San Juan, Sevier, Summit, Utah, Wasatch, and Washington counties; Oregon to Wyoming, south to California, Arizona, and New Mexico; 90 (xvi). This is a poisonous plant, causing spewing sickness in sheep.

***Helianthella* T. & G.**

Perennial herbs; leaves simple, opposite or alternate, entire; heads radiate, solitary or few to several in loose subcorymbose clusters; bracts imbricate to subequal, more or less herbaceous; receptacle plano-convex, chaffy throughout, the persistent bracts clasping the achenes; disk flowers numerous, fertile, yellow, or purple; rays yellow; pappus of 2 slender awns and short scales; achenes strongly compressed at right-angles to involucre bracts.

Weber, W. A. 1952. The genus *Helianthella* (Compositae). Amer. Midl. Naturalist 48: 1–35.

1. Heads 3–12 or more, mainly less than 20 mm broad, rays 7–13 mm long, inconspicuous; disk flowers normally purple *H. microcephala*

- Heads solitary or 2 or 3, mainly over 20 mm broad; rays 15–30 mm long, showy; disk flowers yellow 2
 2(1). Heads erect; involucre bracts lance-oblong, short-ciliate *H. uniflora*
 — Heads nodding; involucre bracts oblong-ovate, long-ciliate with multicellular hairs *H. quinquenervis*

***Helianthella microcephala* (Gray) Gray** Smallhead Sunflower. [*Eucelia microcephala* Gray, type from Sierra Abajo, San Juan County]. Perennial herbs; stems 20–65 cm tall; herbage appressed hispidulous; basal leaves mainly 4–30 cm long, 0.5–3 cm wide, petiolate, the blades elliptic to lanceolate, scabrous and harshly ciliate, acute to obtuse; cauline leaves reduced upward; heads 3–12 or more; bracts imbricate in ca 3 series, oblong to lanceolate or oblanceolate, strigose and roughly ciliate and glandular; rays 8–10, yellow, 7–13 mm long; disk flowers commonly purple; achenes 7–8 mm long, long-pilose. Desert shrub, pinyon-juniper, ponderosa pine, mountain brush, and Douglas fir-limber pine communities at 1220 to 2745 m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Uintah, and Washington counties; Colorado and Arizona; 34 (x). In one plant from Navajo Mt. the disk flowers are apparently yellow. A single collection from west of Richfield (Welsh et al. 17487 BRY) is the only record examined for the Great Basin.

***Helianthella quinquenervis* (Hook.) Gray** Fivenerve Sunflower. [*Helianthus quinquenervis* Hook.]. Perennial herbs; stems 5–15 dm tall, glabrous or villous above; basal leaves 0.3–40 cm long, 0.8–4 cm wide, petiolate, the blades elliptic to oblong or oblanceolate, entire, obtuse to acute; cauline leaves often enlarged to near stem middle then reduced, becoming subsessile or sessile, the largest (at least) prominently 5-nerved; heads nodding, solitary or 2 or 3; disk 2.5–4 cm wide; bracts ovate-lanceolate, acuminate, long-ciliate; rays 12–21, yellow, 15–35 mm long; achenes 8–10 mm long, pilose; $n = 15$. Sagebrush, aspen, ponderosa pine, and spruce-fir communities at 2115 to 3175 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, San Juan, Sevier, Summit, Uintah, and Wasatch counties; Oregon to South Dakota, south to Nevada, Arizona, and New Mexico; 23 (0).

***Helianthella uniflora* (Nutt.) T. & G.** Onehead Sunflower. [*Helianthus uniflorus* Nutt.; *Helianthella multicaulis* D. C. Eaton, type from Parleys Park, Summit County]. Perennial herbs from a branching caudex; stems mainly 3–10 dm tall, glabrous below or more or less spreading-hairy throughout; basal leaves 3–15 cm long, 0.6–5.5 cm wide, petiolate, the blades oblanceolate to elliptic or lanceolate, entire, obtuse to acute; cauline leaves often enlarged to near stem middle, then reduced, becoming sessile or subsessile, the largest prominently 3-nerved; heads erect, solitary or 2 or 3; disk 1.5–3 cm wide; bracts lance-linear, acuminate or obtuse, scabrous-puberulent, shortly ciliate; rays 13–17, yellow, 2–4.5 cm long; achenes 6–7 mm long, pilose. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1525 to 3175 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Garfield, Grand, Iron, Millard, Morgan, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Alberta to Montana, south to Nevada and Colorado; 83 (v).

***Helianthus* L.**

Annual or perennial herbs; leaves simple, opposite below, usually alternate above; heads radiate, showy,

solitary or few in corymbs; involucre bracts imbricate or subequal, herbaceous; receptacle flat to convex, chaffy throughout, its bracts clasping the achenes; ray flowers conspicuous, yellow, neuter; disk flowers yellow or reddish, fertile; pappus usually of 2 main awns, scalelike at base, sometimes with additional scales present; achenes narrowly obovate in outline, 4-angled or obcompressed.

Blauer, A. C. 1965. *Helianthus* (Compositae) in Utah. Proc. Utah Academy 42: 240-251.

Heiser, C. B. Jr. 1947. Hybridization between sunflower species *Helianthus annuus* and *H. petiolaris*. Evolution 1: 249-262.

- 1. Plants perennial; disk flowers yellow; leaves mainly opposite, lanceolate to linear-lanceolate *H. nuttallii*
- Plants annual; disk flowers reddish brown to purplish; leaves mainly alternate; leaves lanceolate to ovate 2
- 2(1). Involucre bracts linear to narrowly lanceolate; pappus of numerous unequal scales *H. anomalus*
- Involucre bracts lanceolate to ovate; pappus commonly of 2 distinct awns 3
- 3(2). Involucre bracts ovate, rather abruptly narrowed to an acuminate tip, the central ones inconspicuously hairy; leaves often cordate and with serrate margins *H. annuus*
- Involucre bracts lanceolate, tapering to the tip, the central ones often white bearded apically; leaves seldom cordate, usually entire *H. petiolaris*

***Helianthus annuus* L.** Common Sunflower. Annual herbs; stems commonly hispid and rough, 3-40 dm tall, simple or branched; leaves alternate above, (3) 5-40 cm long, 2-40 cm wide, lance-ovate to broadly ovate, acute to obtuse, serrate, truncate or cordate basally, hispid to hispidulous on both sides, petiolate; heads solitary or few; disks mainly 2-5 cm wide; involucre bracts lance-ovate to ovate, attenuate to caudate, hispid to hispidulous, ciliate; disk corolla lobes purplish red (rarely yellow); pappus of 2 awnlike ovate-lanceolate scales; achenes glabrous to strigose; n = 20, 34. Saltgrass-muhly grass, desert shrub, pinyon-juniper, and mountain brush communities, commonly where disturbed, at 1200 to 2440 m, probably in all Utah counties; widespread in the U. S., Canada, Mexico, and elsewhere; 70 (xv). Our common weedy sunflower is assignable to ssp. *lenticularis* (Dougl.) Cockerell [*H. lenticularis* Dougl.]; the cultivated large-headed phase to var. *macrocarpus* (DC.) Cockerell [*H. macrocarpus* DC.].

***Helianthus anomalus* Blake** Sand Sunflower. [*H. deserticola* Heiser, type from west of Hurricane]. Annual herbs; stems sparingly hispid to glabrate, 5-70 cm tall; leaves mainly alternate, petiolate, the blades 1.2-10 cm long, 0.4-4 cm wide, narrowly lanceolate to lance-ovate, yellowish green, acute, cuneate to obtuse basally, hispidulous to hispid on both sides; heads solitary or few, showy; disks mainly 12-24 mm wide; involucre bracts linear, commonly 10-25 mm long and 2-3 mm wide, hispid above, definitely hispid-ciliate, at least below, often some much surpassing the disk; disk corolla lobes purple; pappus of 2 large linear scales and numerous similar subequal scales; achenes 3.5-5.5 mm long, appressed pilose. Blackbrush, ephedra, purple-sage, Vanclevea, psorothamnus, and pinyon-juniper communities, commonly in dunes or other sandy sites, at 1150 to 1830 m in Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Wayne (type from near Hanksville), and Washington counties; Arizona; 35 (xi). This is a Colorado Plateau endemic, with an extension onto dunes of the eastern Great Basin.

***Helianthus nuttallii* T. & G.** Nuttall Sunflower. [*H. bracteatus* E. E. Watson, type from Logan; *H. giganteus* var. *utahensis* D. C. Eaton, type from Wasatch Mountains; *H. utahensis* (D. C. Eaton) A. Nels.]. Perennial rhizomatous herbs with tuberous roots; stems 3-20 dm tall or more, glabrous or sparingly scabrous or hispid; leaves mainly opposite, shortly petiolate, the blades 4-16 cm long, 0.8-3 cm wide, narrowly lanceolate, acute to attenuate, entire or denticulate, cuneate basally, scabrous on both sides; heads solitary or few to many; disks mainly 12-28 mm wide; bracts lance-linear, 1.5-3 mm wide, subequal to, or surpassing, the disk, attenuate, appressed pubescent and more or less ciliate; disk corolla lobes yellow; pappus of 2 narrow awnlike scales; achenes 3-4 mm long, glabrous. Seeps, springs, wet meadows, and canal banks at 1280 to 2200 m in Cache, Carbon, Duchesne, Garfield, Juab, Rich, Salt Lake, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia to Saskatchewan, South to Nevada, Arizona, and New Mexico; 18 (0). Note: The perennial sunflower, *H. tuberosus* L., is grown for its edible roots in our area. It persists following cultivation and is difficult to eradicate. The leaves are broadly lanceolate to ovate.

***Helianthus petiolaris* Nutt.** Prairie Sunflower. [*H. niveus* authors, not (Benth.) Brandegees]. Annual herbs; stems 0.5-12 dm tall, strigose to hispid or glabrous; leaves mainly alternate, petiolate, the blades 1-8 cm long, 4-25 (30) mm wide, lanceolate to ovate, acute to obtuse, entire or rarely serrate, cuneate to truncate basally, hispidulous to strigose; heads solitary or few; disk 10-25 mm wide; involucre bracts 2-5 mm wide, 7-15 mm long, lanceolate, acuminate or attenuate, hispidulous, usually short-ciliate; disk corolla lobes purplish; pappus of 2 lanceolate awnlike scales; achenes 3-4.5 mm long, hairy. Salt desert shrub, desert shrub, pinyon-juniper, and riparian communities, often where disturbed, at 1220 to 1920 m in Beaver, Duchesne, Emery, Garfield, Grand, Kane, Millard, San Juan, Sevier, Uintah, Wasatch, Washington, and Wayne counties; Alberta to Maine, south to California, Arizona, New Mexico, Texas, Louisiana, and South Carolina; 62 (xxii). Our material has been assigned to ssp. *fallax* Heiser. The material appears to be indigenous in the Colorado drainage system, but the rare specimens in the Great Basin seem to be adventive.

***Heterotheca* Cassini**

Annual, biennial, or perennial herbs; leaves alternate, simple, entire; heads radiate; involucre campanulate to hemispheric; bracts numerous, narrow, imbricated in several series; receptacle convex, naked; rays yellow, pistillate and fertile; pappus of capillary bristles; disk flowers numerous, the pappus present and usually double, the inner of capillary bristles, the outer (when present) of short scales or bristles; achenes hairy.

Wagenknecht, B. L. 1960. Revision of *Heterotheca*, Section *Heterotheca* (Compositae). Rhodora 62: 61-76, 97-109.

- 1. Plants low, creeping, arising from subrhizomatous caudex branches; heads nodding, solitary or 2 or 3, known from sandy sites in Garfield, Kane, and Washington (?) counties *H. jonesii*
- Plants various in habit, the caudex branches, if present, not rhizomatous; heads few to numerous, seldom nodding, distribution various 2

- 2(1). Plants perennial, from a woody root crown, the stems numerous, forming rounded clumps, common . . . *H. villosa*
- Plants annual or biennial, the root crown herbaceous; stems solitary or few, not forming rounded clumps, rare . . . 3
- 3(2). Upper leaves cordate-clasping basally; involucre glandular-puberulent and canescent *H. psammophila*
- Upper leaves tapering to a sessile base; involucre glandular, pubescent, not canescent *H. grandiflora*

***Heterotheca grandiflora* Nutt.** Telegraph Weed. Annual or biennial herbs; stems stout, branched above, 5–12 (20) dm tall, hirsute, glandular-pubescent; leaves 2–6 cm long, 0.8–2.5 cm wide (or more), ovate to elliptic, oblong, or oblanceolate, serrate, the lower petiolate and lobed at base; heads numerous; involucre 7–9 mm high; rays 25–35, 6–8 mm long, ca 1 mm wide, the tube hairy; disk flowers numerous, slender; pappus tawny; 2n = 18. Sandy roadside at ca 915 m in Washington County; California and Arizona; 4 (ii). Our material has the pappus merely tawny, not brick red as reported elsewhere for the species.

***Heterotheca jonesii* (Blake) Welsh & Atwood** Jones Goldenaster. [*Chrysopsis caespitosa* Jones, not Nutt.; *Chrysopsis jonesii* Blake]. Perennial caespitose herbs from a creeping subrhizomatous caudex; stems 4–8 cm tall, loosely villous; leaves 5–11 mm long, 1.5–4 mm wide, petiolate, the blades obovate to spatulate, pilose; heads solitary or 2 or 3; involucre 5–7.5 mm high, 6–10 mm wide, the bracts narrowly lance-oblong, strigose-pilose, the hyaline margins reddish; ray flowers 5–13, yellow, 4–6 mm long, 1.5–2.5 mm wide; pappus tawny; achenes 2–3 mm long, hairy. Ponderosa pine, manzanita, and Douglas fir communities, on sandstone or in sand, at 1580 to 2745 m in Garfield, Kane, and Washington (?) counties (the type presumably came from Springdale); endemic; 8 (iii).

***Heterotheca psammophila* Wagenkn.** Sand Goldenaster. [*H. subaxillaris*, authors]. Annual or biennial herbs; stems stout, 5–12 (20) dm tall, branching above, hispid hirsute and glandular upward; leaves mainly 1–7 cm long, ovate to lance-oblong, serrate to subentire the lower petiolate, the upper cordate-clasping; heads numerous; involucre 8–12 mm high, glandular and canescent; rays 20–30, yellow, mainly 3–7 mm long; pappus tawny; achenes 2.4–3.8 mm long; n = 9. Sandy roadside at ca 970 to 1350 m in Grand and Washington counties; Arizona to Texas, south to Mexico; 1 (i). The specimen from Grand County (Welsh & Moore 2745) is missing from BRY, the Washington County locality is reported by Meyer.

***Heterotheca villosa* (Pursh) Shinn.** Hairy Goldenaster. [*Amellus villosus* Pursh; *Chrysopsis villosa* (Pursh) Nutt. ex DC.]. Perennial herbs, from a ligucous root-crown and taproot; stems several to numerous, forming rounded clumps, mainly 1.5–5 dm tall; herbage hirsute to strigose and more or less glandular; leaves 0.5–5 cm long, 2–10 mm wide, oblanceolate to spatulate or elliptic, green or silvery to gray green, petiolate or subsessile; heads few to numerous, mainly corymbose; involucre 7–10 mm high, 7–12 mm wide; bracts lance-linear, green or chartaceous, the margins hyaline, sometimes reddish; rays 10–25, yellow, 6–10 mm long; pappus tawny; achenes 2–3 mm long, hairy; n = 9, 18. Our materials represent only a small portion of the vast array of variation within the *villosa* complex. Three infraspecific taxa are apparent

among our specimens, but application of names is difficult. The following treatment is therefore tentative, with a definitive treatment awaiting monographic study.

- 1. Leaves green or gray green, the surface apparent through the spreading to subappressed hairs; plants widespread *H. villosa* var. *hispid*
- Leaves silvery or grayish, the surface seldom apparent through the usually appressed hairs; plants restricted . . . 2
- 2(1). Stems mainly appressed hairy, or with some hairs ascending; to spreading *H. villosa* var. *villosa*
- Stems with appressed and spreading contorted long hairs *H. villosa* var. *foliosa*

Var. *foliosa* (Nutt.) Harms [*Chrysopsis foliosa* Nutt.]. n = 18. Mountain brush and bunchgrass (*Elymus* et al.) communities at 1280 to 2135 m in Davis, Duchesne, Salt Lake, San Juan (?), Utah, and Weber counties; widespread in western U. S.; 9 (0).

Var. *hispid* (Hook.) Harms [*Diplopappus hispidus* Hook.; *Chrysopsis hispid* (Hook.) Nutt.; *C. villosa* var. *scabra* Eastw. (?), type from San Juan County; *C. viscid* var. *cinerascens* Blake, type from Beaver Canyon]. n = 9, 18. Shadscale-rabbitbrush, ephedra-lycium-dropseed, sagebrush-grass, pinyon-juniper, mountain brush, ponderosa pine-manzanita, and aspen communities at 1150 to 2745 m in all Utah counties; widely distributed in the western U. S.; 105 (xii).

Var. *villosa* Blackbrush, pinyon-juniper, and ponderosa pine communities at 1090 to 2785 m in Garfield, Kane, Washington, and Wayne counties; widespread in western U. S.; 8 (iii).

***Hieracium* L.**

Perennial rhizomatous herbs with milky juice; leaves alternate or basal and still alternate, entire or toothed, simple; heads few to numerous, in corymbose clusters; flowers all raylike, yellow to orange or white; involucre cylindrical to hemispheric; bracts more or less imbricate; receptacle naked; pappus usually of brownish capillary bristles; achenes terete or prismatic, more or less strongly ribbed.

- 1. Flowers white; stems long-setose basally if at all, the petioles and leaves long-setose on the lower midrib *H. albiflorum*
- Flowers yellow; stems long-setose throughout or only above; leaves variously setose or glabrous 2
- 2(1). Leaves long-hairy, mainly 10–20 cm long, the cauline ones well developed, reduced above . . . *H. cynoglossoides*
- Leaves glabrous or short-hairy, 2–10 cm long, mainly basal, the stems merely bracteate 3
- 3(2). Involucre grayish tomentose and with a few long, white setae; plants of Washington County *H. fendleri*
- Involucre brownish to blackish tomentose and more or less markedly setose with long hairs; the prophylls blackish; plants of the Uinta Mts. *H. grand*

***Hieracium albiflorum* Hook.** White Hawkweed. Perennial herbs; stems erect, 15–75 cm tall, long-hairy at the base, becoming glabrous upward; basal leaves 2–12 (17) cm long, 0.8–4.5 cm wide, oblanceolate, petiolate, entire or remotely toothed, long-hairy on petioles and midvein, commonly long-ciliate; cauline leaves sessile, reduced upward; stellate hairs lacking; heads few to many, on slender peduncles, the inflorescence open; in-

volucres 6–11 mm high, blackish green, glandular or sparingly long-hairy, or glabrous; flowers 12–35, white; pappus tawny; $n = 9$. Lodgepole pine, spruce, and spruce-fir communities at 1980 to 3420 m in Daggett, Duchesne, Sanpete, Summit, Uintah, and Utah counties; Alaska and Yukon to Saskatchewan, south to California, Nevada, and Colorado; 12 (ii).

***Hieracium cynoglossoides* Arv.-Touv.** Houndstongue Hawkweed. (*H. griseum* Rydb.; *H. scouleri*, authors). Perennial herbs; stems erect, 20–75 cm tall, pubescent with long coarse loose or spreading white setae that dry yellowish; basal leaves commonly withered at anthesis; lower cauline leaves 10–25 cm long, 1–3 cm wide, petiolate, the blades oblanceolate to elliptic, long-hairy; middle and upper leaves reduced, sessile; heads yellow, few to many, 15– to 40-flowered, corymbose, the inflorescence more or less open; involucre 7–12 mm high; bracts greenish, the margins chartaceous to hyaline, minutely stellate and stipitate-glandular; pappus tawny; $n = 9$. Grass-forb, aspen, and spruce-fir communities at 2000 to 2990 m in Box Elder, Duchesne, Salt Lake, Summit, Utah, Wasatch, and Weber counties; British Columbia and Alberta, south to Oregon and Wyoming; 18 (0).

***Hieracium fendleri* Schulz-Bip** Fendler Hawkweed. Perennial herbs; stems erect, 20–50 cm tall, almost glabrous or with a few long, spreading white setae; basal leaves 5–12 cm long, 1.5–6 cm wide, oblanceolate to obovate, acute to rounded and apiculate, cuspidate-seriate, attenuate basally, sparingly hairy on both surfaces; stem leaves greatly reduced or lacking; heads 3–40 per plant; inner involucre bracts 10–12 mm long; achenes ca 5.5 mm long, tapered almost from the base to the summit; pappus sordid-white. Ponderosa pine, mountain brush, and cottonwood communities at ca 2250 m in Washington County; New Mexico, Arizona, Colorado, Texas, and Mexico; 4 (i).

***Hieracium gracile* Hook.** Slender Hawkweed. [*H. utahense* Gand., type from Cache County]. Perennial herbs; stems erect, 8–40 cm tall, tomentulose to glabrous; basal leaves 2–10 cm long, 0.4–2 cm wide, petiolate; blades oblanceolate, entire or denticulate, stipitate-glandular to glabrous or less commonly with a few long blackish setae; cauline leaves much reduced; heads solitary or more commonly few to several; involucre greenish black, stellate hairy, and with long black setae; pappus tawny; $n = 9$. Lodgepole pine, spruce-fir, and grass-forb communities at 3050 to 3390 m in Daggett, Duchesne, Summit, Uintah, and Wasatch counties; Alaska and Yukon to Mackenzie, south to California and New Mexico; South America; 13 (v).

***Hofmeisteria* Walp.**

Shrubs; leaves opposite below, alternate above, simple, petiolate; heads discoid, few to several in terminal corymbose clusters; involucre campanulate; bracts striate, narrow, imbricated; receptacle naked; disk flowers whitish; pappus of 10–12 scabrous bristles and other short scales; achenes 5-angled, callous-thickened.

***Hofmeisteria plurisetata* Gray** Arrowleaf. Shrubs, low, rounded, and intricately branched, mostly 3–5 dm tall; branchlets green, glandular-puberulent, becoming white barked in age; leaves long petioled, the petioles 0.8–4 cm long, the blades hastately lobed to entire, 4–10 mm long, 2–4 mm wide; heads small; involucre 4–9 mm high; bracts 3-lined, acuminate; disk flowers whitish. Re-

ported for Utah in Munz (Flora of California, p. 267); to be sought on rock outcrops at lower elevations in Washington County; Nevada, California, and Arizona; 0 (0).

***Hulsea* T. & G.**

Perennial viscid-pubescent aromatic herbs; leaves alternate, simple; heads radiate; involucre hemispheric, the bracts subequal in 2 or 3 series, herbaceous, finally reflexed; receptacle convex, naked; ray flowers yellowish to purplish, pistillate, fertile; disk flowers perfect, fertile; pappus of 4 hyaline scales united at the base; achenes compressed, angled, villous.

***Hulsea heterochroma* Gray** Plants from a stout taproot; herbage viscid-villous, scented, 3–10 (12) dm tall; basal leaves oblanceolate or spatulate, tapering to a broadly petioled base, dentate; cauline leaves mainly 3–10 cm long, 1.5–3.5 cm wide, sessile, and more or less clasping; heads conspicuous, in racemose or corymbose clusters; bracts with long-attenuate, often reddish tips, subequal to the disk; rays reddish to purple or yellowish, hairy and glandular; pappus scales unequal, lacerate; achenes 6–7 mm long; $n = 19$. Pinyon-juniper community at 2135 m in the Beaver Dam Mts., Washington County (Higgins 1410 BRY); Nevada and California; 4 (0).

***Hymenoclea* T. & G.**

Xerophytic shrubs; leaves alternate, linear, usually entire; heads discoid, small, numerous, mostly glomerate-paniculate, with both sexes in each leaf axil, the staminate above the pistillate; staminate heads several-flowered; pistillate heads 1-flowered; involucre becoming indurated and beaked in fruit, the bracts persistent as scarious wings; pappus none.

***Hymenoclea salsola* T. & G.** Burrobush. Shrubs, 6–12 (15) dm tall; branchlets green, becoming straw colored to gray in age; herbage yellow green, resinous, glabrous or scabrous; leaves 2–5 cm long, linear, entire; staminate heads 2–3 mm high, 2.5–5 mm wide, the bracts obtuse to rounded, ciliate on the hyaline margin; pistillate heads mainly 6–9 mm high at maturity, the middle and upper bracts with white, chartaceous, broadly rounded, erose margins, longitudinally veined. Blackbrush, creosote bush, and Joshua tree communities at 670 to 900 m in Washington County; Nevada, Arizona, and California; 19 (ii).

***Hymenopappus* L'Her.**

Perennial herbs; leaves alternate or mainly basal (and still alternate), mainly pinnatifid; heads discoid, the flowers perfect; involucre bracts in 2 or 3 series, subequal, at least the inner with broad rounded scarious or hyaline margins; receptacle flat, naked or rarely chaffy; corollas yellow or white; anthers sagittate; pappus of several membranous scales; achenes 15– to 20-nerved, 4– or 5-angled.

Turner, B. L. 1956. A cytotoxic study of the genus *Hymenopappus* (Compositae). *Rhodora* 55: 163–305.

***Hymenopappus filifolius* Hook.** Hyalineherb. Perennial subscape herbs; stems 5–60 (100) cm tall, tomentose to glabrate; basal leaves 3–20 cm long, twice pinnately dissected, the ultimate divisions mainly 2–25 mm long, minutely punctate; cauline leaves lacking or several, much reduced upward; heads solitary or more commonly few to numerous, turbinate to campanulate, with

10–59 flowers or more, on peduncles 0.5–10 cm long or more; involucre bracts mainly 3–14 mm long; corollas yellow or white, 2–7 mm long; pappus of narrowly oblong scales; achenes 3–7 mm long, densely hairy; $n = 17, 34$. This is a polymorphic species, which consists of a series of geographic and/or edaphically correlated infraspecific taxa. Those taxa peripheral to the main body of the species in the Colorado Plateau province are the most distinctive. The following treatment differs from that of Turner (1956) and represents a more conservative approach.

1. Basal leaf axils sparingly tomentose or glabrous; stems scapose, or with 1 or 2 leaves; plants of high elevations *H. filifolius* var. *nudipes*
- Basal leaf axils prominently white-tomentose; stem leaves often more than 2; plants of middle and lower elevations 2
- 2(1). Corollas 2–3 mm long; flowers fewer than 30; plants of Daggett, Summit, and Uintah counties *H. filifolius* var. *luteus*
- Corollas 3–7 mm long or, if shorter, not of Daggett or Uintah counties; flowers in main heads often more than 30; leaves more coarsely dissected; plants of various distribution 3
- 3(2). Flowers white; achene hairs 0.5–1 mm long; plants of Washington County *H. filifolius* var. *eriopodus*
- Flowers yellow; achene hairs 1–2 mm long; plants more widely distributed 4
- 4(3). Leaves mainly basal; plants of the Great Basin *H. filifolius* var. *nanus*
- Leaves cauline and basal; plants of the Colorado drainage system *H. filifolius* var. *cinereus*

Var. *cinereus* (Rydb.) Johnston [*H. cinereus* Rydb.; *H. lugens* Greene; *H. filifolius* var. *lugens* (Greene) Jepson; *H. filifolius* var. *megacephalus* Turner, as to Utah materials; *H. pauciflorus* Johnston, type from near Bluff; *H. filifolius* var. *pauciflorus* (Johnston) Turner; *H. tomentosus* Rydb., type from St. George; *H. filifolius* var. *tomentosus* (Rydb.) Turner; *H. niveus* Rydb., type from Springdale]. Blackbrush, warm desert shrub, salt desert shrub, sand sagebrush-ephedra, pinyon-juniper, ponderosa pine, and sagebrush communities at 1065 to 2685 m in Carbon Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Washington, and Wayne counties; Colorado, California, Arizona, New Mexico, and Texas; 144 (xxix). The variety *cinereus*, as interpreted herein, includes three largely sympatric phases that were treated by Turner (1956) at varietal rank. Although there is a tendency for these phases to be geographically correlated, they are connected completely by series of intermediates, and they can be segregated only arbitrarily. Turner noted that herbarium specimens of var. *megacephalus* from eastern Utah, inter alia, carried a “hodgepodge of annotations: *H. lugens*, *cinereus*, *pauciflorus*, *tomentosus*, *eriopodus*, etc.,” and further that “the possibility exists that the variety [*megacephalus*] here typified includes only the individuals from Clark County, Nevada, and vicinity, and that most of the remaining material to the east represents either a weakly defined separate variety or a common area of extensive hybridization and introgression among the several peripheral taxa mentioned above, . . .” A phase of the *cinereus* complex from Washington County has cauline leaves well developed and plant bases appearing bulbous due to a copious tomentum. These plants are apparently intermediate be-

tween var. *tomentosus* (Rydb.) Turner, in a narrow sense, and var. *eriopodus* (A. Nels.) Turner, which shares the feature of the “bulbous” bases.

Var. *eriopodus* (A. Nels.) Turner [*H. eriopodus* A. Nels., type from Diamond Valley]. Pinyon-juniper community at 1675 to 2135 m in Washington County; California to Nevada; 3 (0). This variety is evidently rare in Utah, and might best be treated within an expanded var. *cinereus* (q.v.).

Var. *luteus* (Nutt.) Turner [*H. luteus* Nutt.]. Salt desert shrub, mixed cool desert shrub, and pinyon-juniper communities at 1525 to 1830 m in Daggett, Summit, and Uintah counties; Wyoming and Colorado; 7 (ii). The small flowers and finely divided leaves appear to be diagnostic for this variety.

Var. *nanus* (Rydb.) Turner [*H. nanus* Rydb.]. Black sagebrush-rabbitbrush, pinyon-juniper, and ponderosa pine communities at 1490 to 2300 m in Beaver, Garfield, Iron, Juab, Millard, Piute, Sevier, Tooele, and Washington counties; Nevada, California, and Arizona; 26 (v).

Var. *nudipes* (Maguire) Turner. [*H. nudipes* var. *alpestris* Maguire, type from Cedar Breaks; *H. nudipes* Maguire, type from 15 mi N of Orderville; *H. filifolius* var. *alpestris* (Maguire) Turner]. Ponderosa pine, western bristlecone pine, sagebrush-grass, limber pine, aspen, and alpine tundra communities, commonly on limestone or thermally modified igneous outcrops, at 2445 to 3450 m, in Beaver, Carbon, Duchesne, Emery, Iron, Garfield, Kane, Millard, Piute, Sanpete, Sevier, Summit, Utah, and Washington counties; Wyoming; 46 (ix). This is the most distinctive of the varieties within *H. filifolius* in Utah.

Hymenoxys Cassini

Perennial or biennial herbs from a taproot and commonly with a pluricipital caudex; stems simple or branched; leaves basal or basal and cauline, simple and entire or pinnately to ternately divided; heads radiate, pedunculate; involucre hemispheric; bracts in 2 or 3 series, the outer distinct or connate basally, subequal or imbricate, herbaceous or cartilaginous; receptacle naked, hemispheric; ray flowers yellow, pistillate, fertile, prominently veined, 3-toothed; disk flowers perfect, fertile; pappus scales usually 5, hyaline, nerved or nerveless, the nerve often produced into an awn; achenes obpyramidal, more or less 5-angled, appressed hairy.

1. Leaves entire, essentially all basal 2
- Leaves pinnatifid or palmatifid, or some entire, the cauline ones well developed 5
- 2(1). Involucre bracts sparsely pubescent or glabrous apically, the margins thin and scarious or hyaline 3
- Involucre bracts moderately to densely villous-pilose or some rarely glabrous, the margins not at all or only narrowly scarious 4
- 3(2). Plants depressed pulvinate-caespitose, acaulescent; outer involucre bracts recurved, thickened and reddish apically; disks less than 10 mm wide *H. lapidicola*
- Plants merely caespitose, scapose; outer involucre bracts erect, not thickened and seldom reddish apically; disks over 10 mm wide *H. torreyana*
- 4(2). Plants pulvinate-caespitose; caudex branches clothed with a marcescent thatch of erect-ascending leaf bases; leaves mainly linear, cuspidate apically *H. depressa*

- Plants seldom pulvinate-caespitose; caudex branches without a definite thatch of ascending or erect leaf bases; leaves various, sometimes cuspidate apically . . . *H. acaulis*
- 5(1). Disks 18–30 mm wide or more; involucre bracts similar, distinct, in 2 or 3 indefinite subequal series; herbage villous-tomentose; plants of high elevations *H. grandiflora*
- Disks 7–22 mm wide; involucre bracts in 2 dissimilar series, the outer thickened and united at the base 6
- 6(5). Plants silvery-canescens; leaves entire or 3–cleft, the blades or segments 1.5–4 mm wide *H. subintegra*
- Plants green or, if silvery-canescens, the leaves commonly 3– to 5–cleft 7
- 7(6). Plants apparently biennial, with an evident basal rosette and taproot, cauline leaves numerous, gradually reduced upward, ternate or palmatifid *H. cooperi*
- Plants perennial, from a taproot and caudex; cauline leaves rather well developed, palmatifid to entire 8
- 8(7). Stems merely glandular or glandular-scarbrous; plants of low elevation saline meadows in western Utah *H. lemmonii*
- Stems more or less villous; plants of various habitats, but seldom of saline meadows and not of western Utah 9
- 9(8). Stems few to several from a pluricipital caudex; leaf bases conspicuously long-villous below; leaf segments mainly 1–2.5 mm wide *H. richardsonii*
- Stems solitary or few from a simple or branched caudex; leaf bases glabrous or only somewhat hairy; leaf segments 2–6 mm wide *H. helenoides*

***Hymenoxys acaulis* (Pursh) Parker** Stemless Woolly-base. [*Gaillardia acaulis* Pursh]. Perennial caespitose herbs from a short multicipital caudex, the caudex branches clothed with short brownish or blackish marcescent leaf bases, 2–50 cm tall, villous to glabrous; leaves 1–6 cm long, 2–8 mm wide, all basal or some cauline, glandular-punctate or epunctate, linear to oblanceolate, entire; heads solitary (rarely 2); disk 7–20 mm broad; bracts distinct, in 2 or 3 subequal series, 4–9 mm high; rays 5–9, yellow, 6–15 mm long; pappus scales 2.5–4.5 mm long, acute or shortly awned; achenes 2.5–4.5 mm long. This is a complex entity, consisting of a series of morphological phases, which are more or less geographically or edaphically correlated.

- 1. Plants with 1–4 (or more) cauline leaves; stems simple or branched *H. acaulis* var. *ivesiana*
- Plants scapose, with cauline leaves lacking or rarely with 1; scapes unbranched 2
- 2(1). Leaves linear to linear-oblanceolate, conspicuously glandular-punctate, sparingly long-hairy to glabrous; plants of the Colorado drainage system *H. acaulis* var. *arizonica*
- Leaves narrowly to broadly oblanceolate, inconspicuously glandular-punctate, merely punctate, or epunctate, or plants of the Great Basin, densely pilose to villous or glabrous 3
- 3(2). Leaves epunctate or nearly so, glabrous or less commonly silky-hairy; plants of the Colorado rainage system *H. acaulis* var. *caespitosa*
- Leaves punctate, silky-hairy, or less commonly glabrous; plants of the Great Basin. . . *H. acaulis* var. *acaulis*

Var. *acaulis* 2n = 70. Sagebrush, mixed desert shrub, pinyon-juniper, and bunchgrass communities, often on windswept ridges, at 1525 to 2990 m in Beaver, Box

Elder, Juab, Millard, Sanpete, Sevier, Tooele, and Washington counties; Idaho east to Saskatchewan, south to Nevada, Colorado, and Texas; 42 (viii). Specimens from the Great Basin might not belong to var. *acaulis* in a strict sense, and perhaps should be regarded as a separate variety. The problem cannot be solved on the basis of Utah specimens alone.

Var. *arizonica* (Greene) Parker [*Tetranneuris arizonica* Greene]. 2n = 56. Salt and sandy desert shrub, pinyon-juniper, sagebrush, blue grama, aspen, Douglas fir, white fir, and ponderosa pine communities at 1220 to 3175 m in Carbon, Daggett, Duchesne, Emery, Grand, Kane, San Juan, and Uintah counties; Colorado and Arizona; 108 (xvi).

Var. *caespitosa* (A. Nels.) Parker [*Tetranneuris acaulis* var. *caespitosa* A. Nels.; *Tetranneuris punctata* A. Nels., type from Dyer Mine]. 2n = 28. Shadscale-erigonum, black sagebrush, sagebrush, pinyon-juniper, mountain brush, and alpine tundra, often on plateau margins and windswept ridges, at 1585 to 3510 m in Carbon, Daggett, Duchesne, Emery, Grand, Sanpete, Sevier, Summit, and Uintah counties; Wyoming south to New Mexico; 87 (viii).

Var. *ivesiana* (Greene) Parker [*Tetranneuris ivesiana* Greene; *H. ivesiana* (Greene) Parker; *H. argentea* (Gray) Parker; *Actinella argentea* Gray]. 2n = 28, 56. Sand sagebrush, ephedra, pinyon-juniper, and ponderosa pine communities at 1150 to 2505 m in Garfield, Grand, Kane, San Juan, and Wayne counties; Colorado, New Mexico, and Arizona; 66 (xii). This variety approaches phases of the partially sympatric var. *arizonica* in stature, and it is possible to confuse some specimens when cauline leaves are lacking and the stems are unbranched. The varieties *acaulis*, *arizonica*, and *caespitosa* are tetraploids, i. e. 2n = 60, whereas var. *ivesiana* is diploid, i. e., 2n = 30. Because of this difference, Parker (1960. Leaf. W. Bot. 9: 93) elevated this taxon to specific rank.

***Hymenoxys cooperi* (Gray) Cockerell** Cooper *Hymenoxys*. [*Actinella cooperi* Gray; *A. biennis* Gray, type from Washington County?; *H. acaulis* var. *cooperi* (Gray) Cockerell]. Biennial or short-lived perennial herbs; stems 16–60 (80) cm tall, leafy, simple below, branched in a corymbose inflorescence above, often reddish, scurfy villous, canescent; basal rosette leaves mainly 2–10 cm long, pinnately divided, the linear lobes often again divided, mainly 1–1.5 mm wide; stem leaves longer than the internodes; heads (1) 3–50; involucre 5–6 mm high, 10–24 mm wide, hemispheric; bracts thickened and united basally, more or less pubescent and glandular; rays 7–13, yellow, 6–15 mm long; pappus scales acuminate; achenes 2–3 mm long, densely pilose; n = 15. Sagebrush and pinyon-juniper communities at 975 to 2380 m in Garfield, Juab, Kane, and Washington counties; Nevada, California, and Arizona; 18 (i).

***Hymenoxys depressa* (T. & G.) Welsh & Reveal** Low *Hymenoxys*. [*Actinella depressa* Gray]. Pulvinate-caespitose scapose perennial herbs from a multicipital caudex, the caudex branches clothed with conspicuous, commonly erect marcescent leaf bases (often forming a thatch), 1–4 cm tall; scapes villous; leaves 0.4–3 (4) cm long, 1–2 (4) mm wide, linear to oblanceolate, the outer sparingly if at all glandular-punctate, the inner definitely so, sparingly villous to glabrous, cuspidate; heads solitary; disk 6–10 mm wide; involucre 4–6 mm high; bracts in 2 or 3 subequal series, long villous, the margins nonscari-

ous, the apices erect; rays 5–7, yellow, 3–6 mm long; pappus scales 2–3 mm long, long-acuminate; achenes 2–3 mm long. Ephedra, sagebrush, shadscale, and pinyon-juniper woodland at 1340 to 2170 m in Duchesne, Emery, and eastern Sevier counties; endemic? There is justification for inclusion of *H. depressa* within the *H. acaulis* complex, at some infraspecific rank. And the plants have been suggested as merely depauperate phases of that group. However, if they are ecologically controlled variations, they should be expected through much of the range of *H. acaulis*, but they are not. Dwarf forms of *H. acaulis*, especially of the var. *caespitosa*, have been mistaken for this species, but they are more hairy, have usually broader leaves, and lack glandular punctae. There is also a question of typification; the type of *H. depressus* was taken by John Charles Fremont, on his second expedition in the Rocky Mountains. Fremont evidently traversed the area occupied by *H. depressa* in 1844, and the material could have come from Duchesne County; 24 (iv).

Hymenoxys grandiflora (T. & G.) Parker Graylocks. [*Actinella grandiflora* T. & G.]. Perennial herbs from a taproot and usually simple caudex, this clothed with brown marcescent leaf bases; stems mainly 5–25 cm tall, 1 to several, simple or branched basally, densely villous; leaves basal and cauline, 2–10 cm long, 2- or 3-times ternately or palmately divided, the lobes linear, villous to glabrate; heads solitary; disk 1.5–3 cm wide or more; involucre bracts subequal, in 2 or 3 series. 8–14 (16) mm high, densely villous-tomentose; rays 15–50, yellow, 25–35 mm long; pappus scales 3.5–7 mm long, attenuate; achenes 3–5 mm long. Sedge-forb communities at or above timberline, often in talus or rock stripes, at 3050 to 3660 m in Duchesne, Grand, Salt Lake, San Juan, Summit, and Utah counties (Uinta, Wasatch, and La Sal mts.); Idaho to Montana, south to Colorado; 24 (ii). This is a strikingly beautiful yellow sunflower of alpine tundra in our mountains.

Hymenoxys helenioides (Rydb.) Cockerell [*Picradenia helenioides* Rydb.]. Perennial herbs from a simple or branched caudex, this clothed with broad brown marcescent leaf bases; stems mainly 25–45 cm tall, simple below, branched above, scurfy and more or less villous; leaves basal and cauline, mainly 5–15 cm long, entire or 2- to 5-lobed, the lobes mainly 3–8 mm wide, finely glandular-punctate, glabrous or puberulent; heads 3–13, in corymbose clusters; disks 10–21 mm wide; involucre 6.5–8 mm high, the outer bracts green, connate in the lower portion, more or less villous and glandular; rays 5–11, yellow, 8–19 mm long; pappus scales 2.5–3.5 mm long, acuminate; achenes 2.5–3 mm long. Mountain brush, sagebrush, and aspen communities, often in meadows, at 2440 to 2990 m in Emery, Garfield, Sanpete, and Sevier counties; Colorado and Arizona; 10 (i). This handsome plant has long remained obscure in Utah, partially due, no doubt, to its resemblance to *Helenium hoopesii* (q.v), with which it occurs in the aspen communities of central and southern Utah.

Hymenoxys lapidicola Welsh & Neese Rock Hymenoxys. Pulvinate caespitose herbs from a multicapital caudex, this densely clothed with brown marcescent leaf bases, acaulescent; leaves all basal, 0.3–1.2 cm long, 0.8–2 mm wide, narrowly oblanceolate, the inner conspicuously glandular-punctate, the blades glabrous, the axils long-villous; heads solitary, immersed in the leaves;

disks 5.5–9 mm wide; involucre 5–8 mm high; bracts distinct, in 2 or 3 subequal series, sparingly villous and suffused reddish, the margins scarious, the tips more or less squarrose-spreading and somewhat thickened; rays 5 or 6, yellow, 5–6 mm long; pappus scales lance-acuminate, 2.3–3 mm long; achenes 2–2.5 mm long, pilose. Pinyon-juniper and ponderosa pine-manzanita communities, often in rock crevices, at 1830 to 2476 m in Uintah (type from Blue Mt.) County; endemic; 4 (0).

Hymenoxys lemmonii (Greene) Cockerell Lemmon Hymenoxys. [*Picradenia lemmonii* Greene; *H. lemmonii* ssp. *greenei* Cockerell, type from Washington County (?)]. Perennial herbs from a taproot and short lignous caudex, the caudex clothed with brown to straw colored or purplish clasping leaf bases; stems 20–60 cm tall, 1 to few, glabrous; leaves cauline and basal, 2–15 cm long, pinnately parted, the lobes linear, 2–3 mm wide, glabrous, glandular-punctate; cauline leaves longer than the internodes, the uppermost often unlobed; heads 5–12; involucre 4.5–7 mm high, hemispheric, 8–14 mm wide; outer bracts green, sparsely scurfy and glandular, thickened dorsally and connate below; rays 6–10, yellow, 6–13 mm long; pappus lance-attenuate, 1.6–2 mm long; achenes 2.5–3 mm long, pilose. Saline rabbitbrush-alkali sacaton meadows at 1660 m in Millard, Tooele, and Washington (?) counties; Nevada and California; 3 (i).

Hymenoxys richardsonii (Hook.) Cockerell Colorado Rubberweed. [*Picradenia richardsonii* Hook.; *H. r.* var. *utahensis* Cockerell, type from Emery]. Perennial caespitose herbs from a pluricapital lignous caudex, the caudex branches clothed with a thatch of marcescent brown leaf bases, usually with villous leaf axils; stems few to numerous, 6–40 (50) cm tall, simple below, branched; leaves basal and cauline 2–12 (15) cm long, ternate or with 5–7 linear segments, or some entire, pubescent to glabrous; involucre hemispheric, 5–8 mm high, the outer bracts connate basally, thickened dorsally, green or chartaceous, more or less villous; rays 9–14, yellow, 8–20 mm long; pappus 2–4.5 mm long, acuminate; achenes 2.5–4 mm long, pilose; $n = 15, 28$. Salt desert shrub, cool desert shrub, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, fir, and western bristlecone pine communities at 1460 to 2870 m. Our material falls into two varieties, a low plant with 1–5 large heads of Daggett and Uintah counties, belonging to var. *richardsonii*, and a taller plant with 3–20 smaller heads of Beaver, Carbon, Duchesne, Emery, Garfield, Kane, Millard, Piute, Sanpete, Sevier, Uintah, and Wayne counties, belonging to var. *florabunda* (Gray) Parker; Alberta and Saskatchewan to Arizona and Texas; 129 (xvii). The plants are considered poisonous to sheep, cattle, and goats.

Hymenoxys subintegra Cockerell Perennial (or biennial) herbs from a taproot; stems solitary or few, 10–60 cm tall, branched above; herbage silvery canescent; basal leaves often withered at flowering; cauline leaves numerous, 1.5–8 cm long, 2–4 mm wide, entire or 2- or 3-lobed; heads few to several; disks 9–12 mm wide; involucre 5–7 mm high; outer bracts connate basally, villous; rays ca 12–20, yellow, 5–10 mm long; pappus scales lance-acuminate, 2.8–3.2 mm long; achenes ca 3 mm long. Ponderosa pine, aspen, and spruce-fir communities in Sanpete (Maguire 20049 BRV) and Washington (reported by Meyer) counties; Arizona; 1 (0).

Hymenoxys torreyana (Nutt.) Parker [*Actinella torreyana* Nutt.]. Perennial caespitose scapose herbs from a

stout pluricipital caudex, the caudex branches densely clothed with brown to straw colored or ashy leaf bases, 3–10 cm tall, villous; leaves 1–7.5 (9) cm long, 2–6 mm wide, all basal, glandular-punctate, narrowly oblanceolate, entire; heads solitary; disk 12–20 mm wide; involucre hemispheric, 5–10 mm high; bracts distinct, in 2 or 3 subequal series, less pubescent to glabrous apically, the margins scarious, not thickened apically, the tips erect, sometimes reddish; rays 10–16, yellow, 8–20 mm long; pappus scales ovate-acuminate, 2.8–3.5 mm long; achenes 2–3 mm long. Pinyon-jumper, sagebrush, and mountain brush communities at 1830 to 2200 m in Daggett and Uintah counties; Wyoming; 6 (0).

Hypochaeris L.

Perennial subscapose herbs from taproots, the juice milky; leaves primarily basal, simple, pinnately lobed to pinnatifid, the cauline leaves small and bractlike; heads solitary or few in a branching inflorescence; involucre bracts in several series, greenish black, the inner ones with hyaline margins; receptacle chaffy; corollas of ray flowers only, perfect, yellow or purplish on the dorsal surface; pappus of plumose capillary bristles; style branches semicylindrical; achenes several-nerved, subterete, minutely roughened, long beaked.

Hypochaeris radicata L. Cat's-ears. Plants 1.5–5 dm tall, the stems simple or branched above, glabrous or spreading-hairy below; basal leaves 3–16 (25) cm long, 0.5–3.5 (5) cm broad, oblanceolate, pinnately toothed or pinnatifid, sparsely to moderately spreading-hairy above and below, rounded to obtuse apically, tapering to a broad petiole basally; cauline leaves alternate, minute or lacking; heads solitary, or more commonly 2–5; peduncles glabrous; involucre 5–15 mm high, 7–20 mm wide; bracts glabrous or stiffly hairy along the midribs; corollas numerous, longer than the bracts; achenes 4–7 mm long, the beak mostly 2–3 mm long. Weedy species of disturbed soils in Davis and Salt Lake counties; widespread in North America; adventive from Europe; 2 (0).

Inula L.

Perennial tomentose herbs; leaves basal and cauline, alternate; heads radiate, large, hemispheric, few to numerous in cymose clusters; involucre bracts imbricate in several series; receptacle naked; ray flowers pistillate, yellow, 3-toothed; disk flowers perfect, fertile; anthers sagittate at the base; style branches of disk flowers linear; pappus of capillary bristles; achenes 4- or 5-ribbed.

Inula helenium L. Elecampane. Perennial herbs, mainly 6–20 dm tall, from thick roots; stems simple below; basal leaves 2–5 dm long, petiolate, the blades ovate to oblong, denticulate, rough-hairy above, velvety beneath; cauline leaves reduced upward, cordate-clasping, acute; heads large and showy; involucre 15–23 mm high, 30–50 mm wide; outer bracts foliaceous, ovate; ray flowers numerous, 18–30 mm long, narrow; achenes glabrous; 2n = 20. Canal banks and moist meadows at 1370 to 1830 m in Sanpete and Utah counties; widespread in North America; adventive from Eurasia; 2 (i).

Iva L.

Annual or perennial herbs; leaves opposite, at least below; heads discoid, the pistillate flowers few, with corolla tubular or lacking; involucre campanulate; bracts subequal or imbricate in 1–3 series, sometimes with a

short inner series subtending the achenes; receptacle chaffy, the receptacular bracts linear to spatulate; staminate flowers with abortive pistils, the styles undivided, the filaments monadelphous; anthers obtuse basally, almost distinct, pappus none; achenes compressed.

- 1. Leaves sessile or shortly petiolate, entire; plants rhizomatous, mainly less than 40 cm tall, of saline low-elevation sites *I. axillaris*
- Leaves petiolate, serrate; plants taprooted annuals, mainly much over 40 cm tall, ruderal weeds *I. xanthifolia*

Iva axillaris L. Poverty Weed. Perennial herbs from elongate rhizomes, scented; stems 15–50 (60) cm tall, branched from the base; herbage strigose to strigulose and more or less glandular; leaves opposite below, alternate above, 0.8–4.5 cm long, 4–15 mm wide, elliptic to obovate or lanceolate; heads numerous in terminal bracteate spicate clusters, nodding, 3–7 mm wide; bracts connate, shallowly 4- or 5-lobed; pistillate flowers 4–8, perfect; achenes 2–3 mm long, glandular. Commonly in saline riparian sites in warm desert shrub, salt desert shrub, pinyon-jumper, and aspen communities at 760 to 2440 m in all Utah counties; British Columbia to Manitoba, south to California, New Mexico, and Oklahoma; 60 (viii).

Iva xanthifolia Nutt. Marsh-elder. Coarse perennial herbs, mainly 4–25 dm tall, simple or branched, essentially glabrous below, glandular above; leaves opposite below, petiolate, the blades 4–20 cm long and about as wide, broadly ovate to lance-ovate, serrate and sometimes lobed, green above, canescent beneath; heads 2–4 mm thick, numerous, borne ebracteate in paniculate clusters; involucre bracts distinct, ovate; pistillate flowers 5; achenes sparsely pilose apically, ca 2 mm long.; 2n = 36. Ruderal weeds of disturbed soils at 1370 to 2290 m in Beaver, Duchesne, Emery, Iron, Kane, Millard, Salt Lake, Sevier, Summit, Uintah, Utah, and Wayne counties; Alberta to Saskatchewan, south to Washington, Arizona, and New Mexico; widely distributed elsewhere; 22 (iii).

Kuhnia L.

Perennial herbs from a woody caudex and taproot; stems branched, erect or ascending; leaves alternate or some lower ones opposite; entire or lobed; heads discoid, several to numerous in paniculate clusters; involucre campanulate; involucre bracts in 4–7 series, the outer ones only graduated; receptacle naked; disk flowers perfect, fertile, whitish; style tips flattened, clavate; pappus of plumose bristles; achenes 10-ribbed.

Kuhnia chlorolepis Woot. & Standl. False Bonset. Perennial clump-forming herbs; stems 30–75 cm tall, much branched, minutely hairy; leaves 5–50 mm long (or more), 1–3 mm wide, entire or with a pair of basal lobes, linear; involucre 8–12 mm high; bracts linear to narrowly oblong, striate; corollas 6–7.5 mm long; achenes 4.8–5.2 mm long, dark brown, short-hairy; n = 9. Rabbit-brush community in intermittent stream courses at 1890 to 2045 m in Uintah County; Colorado to Arizona, New Mexico, Texas, and Mexico; 2 (i).

Lactuca L.

Annual, biennial, or perennial herbs; leaves alternate, entire or pinnatifid; flowers all raylike, yellow, blue, or

white; heads paniculately arranged; involucre cylindrical; bracts imbricate in several series; receptacle flat, naked; pappus copious, of white or brownish capillary bristles; achenes oval, oblong, or linear in outline, compressed, ribbed on each face, short- to long-beaked.

1. Plants perennial, rhizomatous; rays long-exserted, blue *L. tatarica*
- Plants annual or biennial; rays not long-exserted, yellow (often fading blue) or blue to white (in *L. biennis*) 2
- 2(1). Achenes prominently 1-nerved on each side 3
- Achenes prominently several-nerved on each side 4
- 3(2). Involucres 10–15 mm high in fruit; pappus 5–7 mm long; achenes 4.5–6.5 mm long, including the beak *L. canadensis*
- Involucres 15–22 mm high in fruit; pappus 7–12 mm long; achenes 7–10 mm long *L. ludoviciana*
- 4(2). Involucres cylindrical at anthesis; flowers not fading blue; plants cultivated and occasionally escaping. *L. sativa*
- Involucres tapering to the apex at anthesis; flowers fading blue 5
- 5(4). Achenes with a long filiform beak as long as or longer than the body of the achene; pappus white *L. serriola*
- Achenes with a short beak much shorter than the body of the achene; pappus brownish *L. biennis*

***Lactuca biennis* (Moench) Fern.** [*Sonchus biennis* Moench]. Annual or biennial, glabrous or hairy (on mid-vein of leaves) herbs; stems erect, mainly 6–20 (35) dm tall; leaves mainly 10–40 cm long, 4–20 mm wide, pinnatifid or merely toothed; heads 13– to 50-flowered, numerous, arranged in a narrow paniculate inflorescence; rays bluish to white; pappus brownish; achenes 4–5.5 mm long, prominently several nerved on each face, beakless or short beaked; $2n = 34$. Moist sites at ca 1800 m in Salt Lake County (Arnow 2561 BRY, UT); Alaska to Newfoundland, south to California, Colorado, and North Carolina; 1 (0).

***Lactuca canadensis* L.** Annual or biennial, glabrous or hirsute herbs; stems erect, 3–25 dm tall; leaves mainly 10–35 cm long, 1–12 cm wide, entire to pinnatifid; heads mostly 13– to 22-flowered, arranged in open panicles; rays yellow (fading blue); pappus white; achenes black, obovate, transversely rugose and with 1 prominent longitudinal vein on each face, 4.5–6.5 mm long, including the beak from half as long to as long as the body; $2n = 34$. Weedy species of moist sites at ca 1155 m in Kane County (Atwood 4118 BRY); widespread in U. S.; 1 (0).

***Lactuca ludoviciana* (Nutt.) Riddell** [*Sonchus ludovicianus* Nutt.]. Biennial or short-lived perennial herbs; stems 6–15 dm tall or more; leaves 10–35 cm long or more, mainly 1–10 (20) cm wide, commonly pinnatifid and weakly spinose-toothed, setose-hispid on the lower midrib, the uppermost auriculate-clasping; heads numerous in an open paniculate cluster, the peduncles bracteate; involucre 15–22 mm high in fruit; heads mostly 20– to 50-flowered, the flowers yellow or sometimes blue, fading blue; pappus white, 7–10 mm long at maturity; achenes flattened, blackish, with a longitudinal median nerve on each face, transversely rugulose, 4–5 mm long. Collected once in Salt Lake County (without collector, UT); widespread in the northwestern U. S.; 1 (0).

***Lactuca sativa* L.** Lettuce. Annual herbs; stems erect, mostly 5–12 dm tall, glabrous; leaves mainly 10–30 cm

long and as broad, undulate-crested and serrate, glabrous; involucre 7–10 mm high; heads ca 15-flowered, the flowers yellow, not fading blue, numerous in a paniculate cluster; pappus white; achenes brownish, oblanceolate in outline, flattened, hispid apically, 3.5–4.5 mm long, with 5–7 longitudinal nerves on each face, the beak 2.5–3.5 mm long. Cultivated food plant in much of Utah; introduced from Europe; 2 (0).

***Lactuca serriola* L.** Prickly Lettuce. [*L. scariola*, *scariola*, orthographic variants]. Biennial or winter annual herbs; stems erect, 3–18 dm tall, hispid below or glabrous overall; leaves mainly 3–30 cm long, 1–10 cm wide, pinnatifid or pinnately lobed, or merely spinose-toothed, the blades vertically oriented (twisted at the base), setose-hispid on main veins beneath; involucre 7–15 mm high at maturity; heads mostly 6– to 12-flowered, the flowers yellow, fading blue, several to numerous in a paniculate cluster; pappus white; achenes brown, the body obovate to oblong in outline, flattened, hispid along margin apically, 3–4.5 mm long, with 5–8 longitudinal nerves on each face, the beak 3–7 mm long; $2n = 18$. Ruderal weeds at 850 to 2440 m, probably in all Utah counties; widely distributed in the U. S.; adventive from Europe; 37 (v). This species invades lower elevation range lands, where it is eaten by wildlife and livestock. It is reported to produce fertile hybrids with *L. sativa* (q.v.).

***Lactuca tatarica* (L.) C. A. Mey.** Blue Lettuce. Perennial rhizomatous herbs; stems 2–12 dm tall, glabrous; leaves 4–20 cm long, 5–35 mm wide, linear to lanceolate or oblong, entire, toothed, lobed, or pinnatifid, short-petiolate below, sessile above; involucre 10–20 mm high; heads cylindrical, 15– to 50-flowered, the flowers blue, numerous in an elongate paniculate cluster; pappus white; achenes black to pale, oblong-lanceolate in outline, flattened, 4–7 mm long, with several longitudinal nerves on each face, the beak ca 2 mm long; $2n = 16, 18$. Marshes, canal and stream banks, and roadsides at 1370 to 2440 m in Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, Sevier, Tooele, Uintah, Utah, Washington, and Weber counties; Alaska to Minnesota, south to California and Missouri; 39 (vii). Our material belongs to ssp. *pulchella* (Pursh) Stebbins [*Sonchus pulchellus* Pursh], the North American phase of a circumboreal species.

Lapsana L.

Annual herbs from taproots, the juice milky; leaves alternate, simple, subtentire to toothed or lyrate-pinnatifid; heads numerous; involucre bracts in 2 series, the inner ones large and keeled, the outer minute, greenish; receptacle naked; corollas of ray flowers only, perfect, yellow; pappus none; style branches semicylindrical; achenes subterete, several-nerved, tapering at both ends, beakless.

***Lapsana communis* L.** Nipplewort. Plants mostly 2.5–10 dm tall, the stems erect, simple or branched, pubescent with stipitate glands or glabrous; leaves mostly 3–10 cm long and 1.4–5 (7) cm wide, the blades subtentire to toothed, or the lower ones lyrate-pinnatifid, sparsely hairy to glabrous above and below; heads numerous, the peduncles glabrous or nearly so; involucre 5–8 mm high, 3–9 mm broad, the bracts glabrous; flowers mostly 10–14; achenes 3–5 mm long; $2n = 14, 16$. Weedy species of disturbed sites in Salt Lake County (Arnow 4747, BRY, UT); widely established in North America; adventive from Eurasia; 1 (0).

Layia H. & A.

Annual herbs from taproots; leaves mainly alternate, subentire to toothed or pinnatifid, heads radiate, solitary or few to several, subcorymbose; ray and disk flowers both fertile; involucre campanulate to broadly hemispheric; bracts with thin margins abruptly dilated below, enclosing the ray achenes; receptacle plano-convex, chaffy marginally; ray flowers 8–24, white or yellow or with the tips white; pappus of numerous bristles, awns, or scales, the bristles often plumose below; ray achenes obcompressed, commonly glabrous and epappose; disk achenes pubescent and pappose.

- 1. Ray flowers yellow with a white tip; pappus setae merely scabrous; anthers black; plants rare in San Juan County *L. platyglossa*
- Ray flowers white; pappus setae plumose; anthers yellow; plants locally common, widespread *L. glandulosa*

Layia glandulosa (Hook.) H. & A. Tidy tips. [*Blepharipappus glandulosus* Hook.]. Plants slender, the stems simple or branched, 0.8–3 dm tall or more, often reddish, with long spreading-ascending multicellular setae; leaves 0.8–6 cm long, 1.5–16 mm wide, often mainly basal, hispid, toothed to lobed, the cauline ones reduced upward and finally entire; heads solitary or 2 to numerous; involucre 6–9 mm high, 10–18 mm wide; bracts hispid and with some tacklike purplish black stipitate glands; rays white, 6–15 mm long; disk flowers numerous, yellow; ray achenes 3–4 mm long; disk achenes 3–6 mm long; pappus of 10–12 white flattened setose scales plumose to above the middle with straight capillary and tangled woolly hairs; n = 7, 8. Sagebrush-grass, grassland, and piñon-juniper communities at 1370 to 1865 m in Daggett, Garfield, Juab, Kane, Millard, Salt Lake, Sanpete, Tooele, Utah, and Washington counties; British Columbia, south to Baja California and Arizona; 24 (i).

Layia platyglossa (Fisch. & Mey.) Gray [*Callichroa platyglossa* Fisch. & Mey.]. Plants slender, the stems erect, simple or branched, setose with long multicellular hairs, often reddish; leaves mainly 1–6 cm long, 2–7 mm wide, with long, slender, spreading multicellular hairs, the cauline leaves reduced upward and finally entire; heads solitary or few; involucre 6–12 mm high, 12–20 mm wide; bracts hairy like the leaves and with some tacklike purplish black stipitate glands; rays yellow with white tips, 6–18 mm long; disk flowers numerous; ray achenes 3–4 mm long; disk achenes 3–5 mm long; pappus of scabrous setae. Dunes at ca 1375 m in San Juan County (Harrison 2545 BRY); California. Our material apparently belongs to var. *brevisetata* Gray [ssp. *campestris* Keck], and this is apparently the only known station for the species east of California. The collection was taken in 1927. The plants resemble those of *Gaillardia* in a general way, and our material has been filed for more than four decades in a folder of that genus.

Lepidospartum Gray

Shrubs; leaves alternate, linear, entire; heads several to numerous, in corymbose or racemose clusters; heads discoid, the flowers perfect, yellow; involucre subcylindric; bracts chartaceous, imbricate in several series, rounded apically (at least the inner); receptacle flat, naked; anthers sagittate; style branches flattened; pappus of copious capillary bristles; achenes oblanceolate in outline, long-pilose.

Lepidospartum latisquamum Wats. Nevada Broomshrub. Shrubs mainly 6–15 dm tall or more; branchlets with prominent longitudinal striae, the striae glandular, the intervening areas tomentose; leaves 0.5–3 cm long, linear, 0.5–1 mm wide, apiculate; heads 4– to 7-flowered; involucre 8–10 mm high, 3.5–6 mm wide; bracts chartaceous, tomentose, the outer apiculate, very short, the inner broadly rounded and more or less hyaline margined; achenes 4–5 mm long, long-pilose with copious white hairs 3–4 mm long. Rabbitbrush community along a wash at 1705 to 1740 m in Millard County (Pine Valley); Nevada and California; 7 (iii).

Leucelene Greene

Perennial rhizomatous herbs; leaves alternate, simple, entire, linear or subulate; heads radiate, solitary or few to many; involucre turbinate; bracts imbricate in several series, green, the margins scarious; ray flowers white or tinged pink, pistillate; disk flowers perfect, fertile, yellow; pappus of capillary bristles; achenes subcylindric or somewhat compressed.

Shinners, L. H. 1946. Revision of the genus *Leucelene* Greene. *Wrightia* 1: 82–89.

Leucelene ericoides (Torr.) Greene Rose-heath. [*Inula* ? *ericoides* Torr.; *L. arenosa* Heller; *Aster bellus* Blake; *A. leucelene* Blake; *A. hirtifolius* Blake]. Perennial herbs from a branching caudex and rhizome, simple or more commonly branched, 3–17 cm tall, strigose and more or less glandular; leaves 2–10 mm long, 1–2 (3) mm wide, linear to spatulate, becoming subulate upward; heads solitary or few to many; involucre 5–7 mm high, 5–12 mm wide; bracts in 3–5 series; rays 12–25, white to pink, 3–6 mm long; achenes appressed-hairy; n = 8, 16. Blackbrush, desert shrub, salt desert shrub, piñon-juniper, and ponderosa pine communities at 1370 to 2595 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Nevada and California, east to Kansas, south to Arizona and Mexico; 145 (xvii).

Lygodesmia D. Don

Perennial or annual herbs with milky juice; leaves alternate or mainly basal and still alternate, entire or pinnatifid; heads solitary or few to many in corymbose or paniculate clusters; flowers all raylike, pink to pink purple or white; involucre cylindrical; bracts mostly 5–9, with some more or less reduced outer ones; receptacle naked; pappus of numerous capillary bristles; achenes linear, subterete, prominently several nerved.

- 1. Rays 10–12 mm long, ca 4 mm wide; pappus 6–9 mm long *L. juncea*
- Rays 15–25 mm long, 6–10 mm wide; pappus 12–17 mm long 2
- 2(1). Flowers white (or pink?, and drying pinkish); stems ligneous, branching from the base, forming rounded clumps; leaves stiff, spreading; plants of Emery and Grand counties *L. entrada*
- Flowers pink or pink purple; stems various but, if branched from the base, the leaves either lax or the plants of different distribution *L. grandiflora*

Lygodesmia entrada Welsh & Goodrich Entrada Rush-pink. Perennial herbs from a subterranean caudex,

branching from the base, the branches lignous and wiry, mainly 25–45 cm tall; leaves entire, linear or acicular, 5–30 (70) mm long; peduncles with numerous bracts, 12–20 cm long; involucre bracts hyaline-margined, the outer 5–10 mm long, fimbriate, the inner ca 6, 16–18 mm long, puberulent at the apex; rays white, ca 3 cm long; pappus barbellate, sordid, 10–15 mm long; achene ribs glabrous. Juniper and mixed desert shrub communities at 1340 to 1465 m in Emery and Grand (type from near Courthouse Wash) counties; endemic; 3 (i). The status of this entity is unclear; certainly it is a portion of the *grandiflora* complex. Further work is indicated.

Lygodesmia grandiflora (Nutt.) T. & G. Showy Rush-pink. [*Erythremia grandiflora* Nutt.]. Perennial herbs from deeply placed elongate rhizomes; stems 0.6–5 dm tall, simple or branched from the base or above; leaves alternate, 0.5–10 cm long or more, 1–5 mm wide, attenuate, gradually to abruptly reduced upward; involucre cylindrical, 18–25 mm high, densely hairy to glabrous (?), the outer mostly short and ovate to lance-ovate, the inner 5–9 equal, narrowly oblong; rays 5–10, pink, pink purple, or rarely white, mostly 2–4 cm long; pappus of numerous barbellate tawny bristles; achenes 12–18 mm long, ribbed, glabrous; $x = 9$. Our material consists of three taxa, which have been regarded at specific rank. Intermediates between the taxa suggest a more conservative approach.

1. Main involucre bracts 8 or 9; flowers 8–12; plants of east central and northeastern Utah *L. grandiflora* var. *grandiflora*
- Main involucre bracts 5 or 6; flowers 5–7 (10); plants of Southeastern and western Utah 2
- 2(1). Uppermost leaves reduced to linear scales mainly 3–10 mm long; achenes 13–19 mm long, smooth on the lower surface *L. grandiflora* var. *dianthopsis*
- Uppermost leaves not reduced to scales, mainly 20–40 mm long; achenes 10–13 mm long, rugose on the lower surface *L. grandiflora* var. *arizonica*

Var. *arizonica* (Tomb) Welsh [*L. arizonica* Tomb; *L. doloresensis* Tomb, at least for Utah specimens]. $n = 9$. Blackbrush-ephedra and Indian ricegrass-dropsed communities at 1125 to 1590 m in Kane and Wayne counties; Arizona; 7 (ii).

Var. *dianthopsis* (D. C. Eaton) Welsh [*L. juncea* var. *dianthopsis* D. C. Eaton in Wats., type from Great Salt Lake islands; *L. dianthopsis* (D. C. Eaton) Tomb]. $n = 9$. Sagebrush-grass, pinyon-juniper, and mountain brush communities at 1370 to 2440 m in Beaver, Cache, Kane, Millard, Salt Lake, Sevier, and Utah counties; Nevada; 22 (iii). Intermediate specimens transitional to var. *arizonica* occur in south central Utah.

Var. *grandiflora* [*L. grandiflora* var. *stricta* Maguire, type from south of Price]. $n = 9$. Shadscale, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen-sagebrush communities at 1460 to 2750 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, and Uintah counties; Wyoming south to New Mexico; 37 (vii). The var. *stricta* is a phase with stiffly erect leaves, but seems to represent only an ecological variant. Specimens of intermediate nature occur southward with both varieties *arizonica* and *dianthopsis*.

***Lygodesmia juncea* (Pursh) D. Don** [*Prenanthes juncea* Pursh]. Perennial glabrous herbs from a deeply placed elongate root (rhizome?); stems mainly 1.5–6 dm tall,

much branched; leaves stiff, entire, mainly 1–4 cm long, 1–4 mm wide, the upper ones reduced to subulate scales; heads few to several, mainly 5 (4–10) -flowered; flowers pink or less commonly white; involucre 9–16 mm high, with 4–8 main bracts and several shorter outer ones; pappus tawny; achenes ca 5–7 mm long, several nerved; $n = 9$. Our few specimens from sandy sites in mixed desert shrub and juniper communities at ca 1400 to 1590 m in Emery and Juab counties; British Columbia to Minnesota, south to Arizona and Arkansas; 3 (0). This is mainly a Great Plains species, with disjunct populations westward, often in sandy habitats.

Machaeranthera Nees

Annual, biennial, or perennial herbs from taproots; leaves alternate, entire or pinnatifid to toothed or lobed, spinulose apically and the teeth, when present, spinulose; heads solitary or 2 to numerous; involucre bracts in several series, herbaceous apically, chartaceous or coriaceous basally, mainly squarrose; rays pistillate and fertile, pink, lavender, pink purple, or white, or lacking; receptacle naked; anthers not caudate; pappus of capillary bristles; achenes narrowly oblong in outline.

Cronquist, A. and D. D. Keck. 1957. A reconstitution of the genus *Machaeranthera*. Brittonia 9: 231–239.

1. Heads discoid; leaves spinose-toothed . . . *M. grindelioides*
- Heads radiate; leaves various, but not conspicuously spinose-toothed 2
- 2(1). Plants perennial, from a definite caudex, of montane sites, commonly on granite, limestone, or quartzite . . . *Aster kingii* D. C. Eaton (q.v.)
- Plants biennial, winter annual, or annual (rarely short-lived perennial), the caudex not well developed; plants of various habitats and substrates 3
- 3(2). Leaves pinnately dissected; plants annual *M. tanacetifolia*
- Leaves merely toothed to entire; plants mainly biennial or short-lived perennial 4
- 4(3). Involucre bracts with green tip commonly equaling or longer than the chartaceous base, the long-tapering apices often reflexed *M. bigelovii*
- Involucre bracts with green tip much shorter than the chartaceous base, the reflexed to erect tips shortly attenuate to acute *M. canescens*

***Machaeranthera bigelovii* (Gray) Greene** Bigelow Aster. [*Aster bigelovii* Gray; *M. mucronata* Greene, sensu Utah materials; *M. commixta* Greene, type from the Henry Mts.; *M. canescens* var. *commixta* (Greene) Welsh]. Short-lived perennial (biennial in some?) herbs from a taproot, a caudex not or only poorly developed; stems 11–35 cm long, puberulent above, becoming glandular to stipitate-glandular above; basal leaves often withered at anthesis; cauline leaves oblanceolate to linear or oblong, mainly 1–7.5 cm long, 1.5–8 mm wide, the surfaces glabrous and more or less glandular or stipitate-glandular, ciliate, entire to spinose-toothed; heads few to many in corymbose inflorescences; involucre 9–12 mm high, 12–23 mm wide; bracts lance-linear, attenuate apically, the green apex subequal to the coriaceous base, especially in the outer bracts, commonly spreading-reflexed, glandular and glandular-ciliate; rays 21–31, violet or pink purple, 10–15 mm long, 2–4.2 mm wide; pappus off-white; achenes glabrous or sparingly strigose, 2.5–4.2

mm long; n = 4. Mountain brush, aspen, spruce-fir, and alpine meadow communities at 2440 to 3355 m in Garfield, Iron, Kane, and Washington counties (Henry Mts., Markagunt Plateau, and Kolob Terrace); Colorado, New Mexico and Arizona; 18 (iii).

Machaeranthera canescens (Pursh) Gray Hoary Aster. [*Aster canescens* Pursh]. Biennial (winter annual) or short-lived perennial herbs from a taproot, a caudex seldom developed; stems 5–60 cm tall or more, variously glabrous, glandular, or puberulent; basal leaves withered or persistent at anthesis; cauline leaves linear to oblong or oblanceolate, 1–10 cm long, 1–22 mm wide, the surfaces glabrous, puberulent, or glandular, commonly ciliate, entire or toothed; heads few to many in paniculate to corymbose clusters; involucre 6–10 (12) mm high, 6–15 mm wide; bracts linear to oblong, attenuate to abruptly attenuate, the green apex commonly much shorter than the coriaceous base, sometimes spreading-reflexed, glandular and/or puberulent; rays 15–25, pink to pink purple or white, 5–12 mm long, 1.5–2.5 mm wide; pappus off-white; achenes pilose, ca 2.5 mm long; n = 4. The *canescens* complex consists of a series of intergrading taxa, which, in the extreme, are distinctive and geographically or edaphically correlated. Many names have been applied to members of the complex, and specimens often bear annotations of several of the names involved. This is partial in recognition of the intermediate nature of the specimens and partially due to the quality of diagnostic criteria. It seems best to treat the materials from Utah as belonging to a single polymorphic species, consisting of four intergrading varieties.

- 1. Leaf surfaces glabrous, the upper leaves commonly glandular to stipitate-glandular; upper branches usually with numerous bracteate leaves; plants of southeastern Utah, rarely elsewhere *M. canescens* var. *aristata*
- Leaf surfaces puberulent, the upper leaves sometimes also glandular; upper branches lacking bracteate leaves or variously so; plants of broad distribution, but not of southeastern Utah 2
- 2(1). Upper branches with numerous bracteate leaves; rosette leaves abruptly and angularly lobed or toothed, plants biennial, of central and southwestern Utah *M. canescens* var. *leucanthemifolia*
- Upper branches seldom especially bracteate; rosette leaves various; plants biennial or short-lived perennial, of various distribution 3
- 3(2). Involucral bracts 1–1.5 (2) mm broad, abruptly attenuate apically; plants often perennial, mainly of higher middle elevations *M. canescens* var. *latifolia*
- Involucral bracts 0.5–1 mm wide, rather gradually attenuate apically; plants often biennial, mainly of lower to middle elevations *M. canescens* var. *canescens*

Var. aristata (Eastw.) Turner comb. nov. [based on: *Aster canescens* var. *aristatus* Eastw., Proc. Calif. Acad. II, 6: 296. 1896, type from San Juan County; *A. c.* var. *vacans* (A. Nels.) Welsh; *M. pulverulenta* var. *vacans* A. Nels., type from San Juan County, Utah]. Salt desert shrub, mixed desert shrub, pinyon-juniper, and ponderosa pine communities at 1155 to 2380 m in Carbon, Emery, Garfield, Grand, Kane, Juab, San Juan, and Washington counties; Colorado, Arizona, and New Mexico; 61 (xix). This material has been treated as *M. linearis* Rydb., a glabrous-leaved phase of *M. canescens* whose type came from Yellowstone Park, Wyoming. Work of a monographic nature is necessary for the entire *canescens*

complex. The earlier epithet at varietal rank, *aristatus*, was called to my attention by B. L. Turner, to whom the combination is gratefully attributed.

Var. canescens [*M. pulverulenta* (Nutt.) Greene]. Salt desert shrub, mixed desert shrub, pinyon-juniper, mountain brush, aspen-sagebrush, Douglas fir, and lodgepole pine communities at 1250 to 2900 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Washington counties; British Columbia to Saskatchewan, south to California, Arizona, and Colorado; 102 (xiii). This is a variable complex of forms that differs in several morphological features, but further segregation seems unwarranted. I have been unable to distinguish *M. tephrodes* (Gray) Greene from among our rather large collection.

Var. latifolia (A. Nels.) Welsh comb. nov. [based on: *M. latifolia* A. Nels., Proc. Biol. Soc. Washington 20: 38. 1901, type from Big Cottonwood Canyon; *M. leptophylla* Rydb., type from Logan; *M. paniculata* A. Nels, type from Parleys Canyon; *M. rubricaulis* Rydb.; *Aster rubrotinctus* Blake]. n = 4. Mountain brush, aspen, Douglas fir, sagebrush, spruce-fir, and alpine meadow communities at 1705 to 3420 m in Beaver, Cache, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wayne counties; Wyoming and Colorado; 82 (v).

Var. leucanthemifolia (Greene) Welsh [*Aster leucanthemifolius* Greene; *M. leucanthemifolia* (Greene) Greene]. n = 4. Blackbrush, mixed desert shrub, pinyon-juniper, mountain brush, and ponderosa pine communities at 915 to 2135 m in Beaver, Iron, Juab, Sanpete, Sevier, Utah, and Washington counties; Nevada and Arizona; 43 (xiii). This plant is mainly a xerophyte of sandy and silty habitats at lower elevations in the Great Basin and lower Virgin River drainage systems; it is transitional at higher elevations with the preceding varieties. Phases of var. *canescens* from northeastern Utah have been regarded as portions of this variety, but they seem not to fit the concept of var. *leucanthemifolia*, whose type is from Mineral County, Nevada.

Machaeranthera grindelioides (Nutt.) Shinn. Gumweed Aster. [*Eriocarpum grindelioides* Nutt.; *Haplopappus nuttallii* T. & G.]. Perennial herbs from a woody caudex and stout taproot, the caudex branches more or less clothed with marcescent leaf bases; stems 2–30 cm tall, pilosulose or spreading-hairy below, stipitate-glandular and/or hairy above; basal leaves withered or persistent at anthesis; cauline leaves oblanceolate to spatulate or oblong, mainly 0.5–4.5 cm long, 2–12 mm wide, serrate, the teeth with spinulose tips 1–3 mm long, the surfaces pilosulose and/or stipitate-glandular; heads solitary or few to many in corymbose clusters; involucre 6.5–9.5 mm high, 8–15 mm wide; bracts narrowly oblong, attenuate to an acute apex; the apical portion green or brown, the base chartaceous, erect, glandular; rays lacking; pappus off-white to brownish; achenes densely pilose, ca 3 mm long. Two distinctive varieties are present in Utah.

- 1. Plants dwarf, often monocephalous; leaves commonly clustered at stem bases; plants of semibarren habitats in the Great Basin *M. grindelioides* var. *depressa*
- Plants seldom dwarf, often with more than 1 head; leaves mainly cauline; plants seldom of the Great Basin *M. grindelioides* var. *grindelioides*

Var. depressa (Maguire) Cronq. & Keck [*Haplopappus nuttallii* var. *depressa* Maguire, type from Millard County]. Mixed desert shrub, pinyon-juniper, and mountain brush communities at 1465 to 2320 m in Beaver, Juab, and Millard counties; Nevada, a Great Basin endemic; 24 (xiv).

Var. grindelioides Blackbrush, mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1340 to 3175 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Rich, San Juan, Sanpete, Sevier, Summit, Uintah, and Utah counties; Montana to Saskatchewan, south to Nevada, Arizona, and New Mexico; 98 (xiii). There is a tendency for leaves of plants from the Great Basin to be more glandular than for those in the main body of distribution in the Colorado drainage system.

Machaeranthera tanacetifolia (H. B. K.) Nees Tansyleaf Aster. [*Aster tanacetifolius* H. B. K.]. Annual (winter annual) herbs; stems 8–50 cm tall, glandular-puberulent and more or less villous; leaves 1–6 cm long, 1- or 2-pinnatifid, the segments ending in spinulose bristles; heads 1 to many, in corymbose clusters; involucre 8–12 mm high, 10–18 mm wide, hemispheric; bracts lance-linear, attenuate, chartaceous basally, green apically, spreading, the reflexed tips glandular; rays 11–23 (36), pink purple or blue purple, 11–14 mm long; pappus off-white; achenes ca 2.5 mm long, pilose. Mixed desert shrub, salt desert shrub, and pinyon-juniper communities at 1125 to 1830 m in Emery, Garfield, Grand, Juab, Kane, San Juan, Sevier, Utah, Wasatch, Washington, and Wayne counties; 31 (vi). The plants are somewhat weedy, colonizing disturbed sandy and silty soils. The similar *M. parviflora* Gray [*Aster parvulus* Blake] is reported for Utah by various authors. It differs in having once-pinnatifid leaves, involucre 4–6 mm long, and rays 5–7 mm long. No material has been seen from Utah by me.

Madia Molina

Annual or biennial tar-scented herbs from taproots; leaves opposite below, alternate above, simple, entire; heads radiate, the rays pistillate, fertile, yellow, or inconspicuous; involucre bracts uniseriate, equal, enfolding the ray achenes; receptacle flat or convex, with a single series of bracts between the ray and disk flowers; disk flowers perfect; pappus none, a short crown, or a few scales; achenes finely striate, commonly incurved, compressed.

- 1. Heads turbinate-ovoid, 6–12 mm wide (when pressed); rays 4–7 mm long, showy *M. gracilis*
- Heads ellipsoid, 2–5 mm wide (when pressed); rays to 2.5 mm long, or lacking *M. glomerata*

Madia glomerata Hook. Tarweed. Annual herbs; stems mainly 8–40 (60) cm tall; herbage strigose and with long setiform multicellular hairs on leaf bases and on stems above, and stipitate-glandular upward, malodorous; leaves 1.2–9 cm long, 1.5–7 mm wide, linear; heads in dense terminal clusters or sometimes open; involucre 5.5–9 mm high, 2–5 mm wide; rays inconspicuous, mostly 1.5–2.5 mm long, yellow or purplish; disk flowers 1–10; achenes 5–nerved, glabrous. Sagebrush, mountain brush, aspen, spruce-fir, grass-forb, and alpine meadow communities at 1830 to 3175 m in Cache, Carbon, Davis, Duchesne, Emery, Iron, Juab, Piute, Rich, Salt Lake,

Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Alaska to Saskatchewan, south to California, Arizona, and Colorado; 38 (iv).

Madia gracilis (J. E. Sm.) Keck [*Sclerocarpus gracilis* J. E. Sm. in Rees]. Annual herbs; stems mainly 10–60 (100) cm tall; herbage pilosulose, becoming hirsute with long multicellular hairs upward, stipitate-glandular with dark capitate glands on the peduncles and involucre; leaves 1–10 cm long, 2–7 (10) mm wide, linear to elliptic or oblong; heads several to many in an open corymbose cluster; involucre 6–11 mm high, 6–12 mm wide; rays conspicuous 5–13, yellow, 4–7 mm long; disk flowers 15–35; achenes often mottled. Opening in mountain brush community at ca 1925 m in Salt Lake County; British Columbia to Montana, south to California; 1 (0).

Malacothrix DC.

Annual (winter annual) or perennial herbs from taproots with milky juice; leaves alternate or mainly basal, mostly pinnatifid; heads of ray flowers only, long-peduncled, solitary or few to several and more or less corymbose; flowers yellow or white; involucre campanulate; bracts subequal in 2–4 series, with a few short outer ones; receptacle flat, setose or naked; rays 5-lobed; pappus of capillary bristles, these more or less united at the base and falling together or with some persistent; achenes columnar, glabrous, 10- to 15-ribbed, crowned or denticulate at the summit.

Williams, E. W. 1957. The genus *Malacothrix* (Compositae). Amer. Midl. Naturalist 58: 494–512.

- 1. Leaves merely dentate, elliptic to oblong or lanceolate, the cauline ones clasping basally; involucre bracts orbicular to ovate and with broad scarious margins *M. coulteri*
- Leaves pinnatifid or incised to pinnately lobed, the cauline ones not especially clasping; involucre bracts linear to narrowly lanceolate 2
- 2(1). Leaves linear-filiform or pinnately dissected into linear segments *M. glabrata*
- Leaves with triangular to oblong lobes or teeth, these sometimes attenuate but not linear 3
- 3(2). Involucre longer than broad (when pressed); persistent pappus setae 1 or 2; stems decidedly tapering upward; plants rare, in Washington County *M. clevelandii*
- Involucre broader than long (when pressed); persistent pappus setae 1–5 or lacking; stems various 4
- 4(3). Leaves with lateral lobes regularly toothed; involucre mainly less than 10 mm long; achenes 2–2.8 mm long; pappus bristles all deciduous *M. sonchoides*
- Leaves with lateral lobes irregularly toothed or lobed; involucre more than 10 mm long; achenes 3–4 mm long; pappus often with 1 or few persistent bristles *M. torreyi*

Malacothrix clevelandii Gray Cleveland Malacothrix. Annual herbs; stems mainly 10–40 cm tall, often branched, glabrous, commonly reddish; leaves basal and cauline, 1–10 cm long, 5–15 mm wide, oblanceolate to elliptic, pinnately lobed or merely toothed; heads few to many in a subcorymbose cluster; involucre campanulate, 6–7 mm high; main involucre bracts linear, glabrous, green, the tips often purple, the margins narrowly scarious; rays yellow or white, ca 2–3 mm long; pappus decid-

uous or with 1 or 2 persistent bristles; achenes ca 2 mm long, slender, longitudinally striate. Creosote bush, Joshua tree, pinyon-juniper and live oak communities at ca 1375 m in Washington County; California, Nevada, and Arizona; 3 (0).

Malacothrix coulteri Harv. & Gray in Gray Snakeshead *Malacothrix*. Annual (winter annual) herbs; stems mainly 10–50 cm tall, often branched, glabrous and straw colored to whitish tan; leaves basal and cauline 1.2–10 cm long, oblong to oblanceolate or lanceolate, the cauline ones clasping basally; heads few to several, corymbose; involucre hemispherical, 10–15 mm high; bracts imbricate, suborbicular to ovate, with broad scarious margins, the midline broad, purplish; rays yellow to off-white, 5–18 mm long; pappus with 1–4 persistent bristles; achenes 2–2.8 mm long, striate; $n = 7$. Warm desert shrub community at ca 950 m in Washington County (Galway sn BRY); Arizona and California; 2 (0).

Malacothrix glabrata (D. C. Eaton) Gray [*M. californica* var. *glabrata* D. C. Eaton]. Annual (winter-annual) or biennial herbs; stems mainly 10–60 cm tall, often branched from the base and above, glabrous; leaves basal and cauline, 0.5–15 cm long, pinnately lobed, glabrous or more or less villous, with rachis and lobes linear to linear-filiform, the cauline ones similar to the basal except reduced upward; head solitary or more commonly few to many and subcorymbosely arranged; involucre broadly campanulate 10–14 mm high, the main bracts linear to narrowly oblong, with narrow hyaline margins, glabrous, the outer bracts commonly more or less villous; rays yellow, 10–20 mm long; pappus with usually 2 persistent bristles; achenes 2–3 mm long, striate; $n = 7$. Joshua tree, blackbrush, Yancevea-ephedra, and pinyon-juniper communities at 700 to 1525 m in Kane, Millard, San Juan, and Washington counties; Oregon to Idaho, south to California and Arizona; 22 (iv).

Malacothrix sonchoides (Nutt.) T. & G. [*Leptoseria sonchoides* Nutt.]. Annual or winter annual herbs; stems mainly 6–37 cm tall, often branched from the base and above, glabrous or with short yellowish glandular hairs in the inflorescence; leaves basal and cauline, 0.7–12 cm long, 1–28 mm wide, the basal ones at least pinnatifid and the lobes regularly toothed; heads solitary or more commonly few to many and subcorymbosely arranged; involucre campanulate 7.5–10.2 mm high, 6.5–12 (14) mm wide, the main bracts lance-oblong to linear, with narrowly hyaline margins, glabrous, the outer sometimes with yellowish stipitate glands; rays yellow, 7–12 mm long; pappus bristles all deciduous; achenes 2–2.8 mm long, striate; $n = 7$. Blackbrush, Krameria-psorothamnus, mixed desert shrub, sagebrush, and pinyon-juniper communities at 915 to 1856 m in Beaver, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, Washington, and Wayne counties; California and Nevada, east to Nebraska and New Mexico; 72 (vi).

Malacothrix torreyi Gray [*M. sonchoides* var. *torreyi* (Gray) E. W. Williams]. Annual or winter annual herbs; stems mainly 8–29 cm tall, often branched from the base and above, glabrous, or with yellowish stipitate glands in the inflorescence; leaves basal and cauline, 1.7–9.5 cm long, 5–27 mm wide, the basal ones at least pinnatifid, and the lobes irregularly toothed or lobed, often more or less white-villous; heads solitary, or more commonly few to several or many and subcorymbosely arranged; involucre broadly campanulate, 10.5–15 mm high, 12–21 mm

wide, the main bracts lance-linear, with hyaline margins, glabrous or some with stipitate yellowish glands, the outer bracts often stipitate-glandular; rays yellow, 10–14 mm long; pappus all deciduous or with 1–5 persistent setae; achenes 3–4 mm long, striate; $n = 7$. Shadscale, greasewood, other salt desert shrub, and mixed desert shrub communities at 1460 to 1925 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Millard, Piute, Salt Lake, Sevier, Tooele (type from Great Salt Lake), and Uintah counties; Oregon to Wyoming, south to California and Arizona; 28 (i).

Matricaria L.

Biennial or perennial herbs; leaves alternate, 2- to 3-pinnatisect, with ultimate segments linear-filiform; heads radiate, few to many in corymbose clusters; involucre broadly campanulate, the bracts in several series, the margins scarious; receptacle hemispheric, solid, naked; rays pistillate, white; disk flowers 5-lobed, perfect, yellow; pappus a small crown; achenes laterally compressed, with 3 smooth ribs on the ventral surface and 1 or 2 (rarely more) resin glands at the apex of the dorsal face. Note: Tentatively I have chosen to follow authors of *Flora Europaea* (Vol. 4) in segregating *Chanomilla* (q.v.) from *Matricaria*. The genera are much alike and are separated mainly on technical characteristics that are discernible only when fruit is mature.

Matricaria maritima L. Biennial, or less commonly, perennial, essentially unscented herbs; stems 1–6 dm tall, glabrous or nearly so; leaves 1–8 cm long, the ultimate segments long and slender; heads several to many, the disk 8–15 mm wide; rays 10–25, white, 6–13 mm long; $n = 18$. Ruderal weed of moist sites at 1830 to 2135 m in Salt Lake, Sanpete, and Sevier counties; widespread in North America; adventive from Europe; 2 (i).

Microseris D. Don

Annual or perennial, scapose or caulescent taprooted herbs with milky juice; leaves alternate or all basal, entire or pinnatifid; heads many flowered, erect or nodding in bud; involucre cylindrical to campanulate, the innermost bracts lance-attenuate, subequal, the outer ones shorter and imbricate; receptacle naked; corollas all raylike, showy, yellow to yellow orange (fading bluish); pappus of awn-tipped scales or of plumose capillary bristles; achenes columnar to fusiform, not or only short beaked, ca 10-ribbed.

1. Plants annual; pappus of 5 scales, each extended into a scabrous bristle apically *M. lindleyi*
- Plants perennial; pappus of numerous plumose capillary bristles arising from short scales *M. nutans*

Microseris lindleyi (DC.) Gray [*Calais lindleyi* DC.; *Uropappus linearifolius* Nutt.; *M. linearifolia* (Nutt.) Schultz-Bip.]. Annual herbs from slender taproots; herbage puberulent or glabrate; stems lacking or more or less developed, the scapose peduncles 10–25 cm high; leaves 6–15 (30) cm long, pinnately lobed to entire, linear to narrowly elliptic; heads many flowered, erect, the main bracts lance-attenuate, 15–30 mm long, subequal, the outer ones shorter and unequal; rays yellow (drying blue); pappus 10–20 mm long, silvery, deciduous, of 5 lance-linear scales, each terminating in a scabrous awn from a bifid apex; achenes dark brown, 9–13 mm long, tapering api-

cally, scabrous on the ribs; $n = 9$. Blackbrush, creosote bush, and pinyon-juniper communities at 915 to 1375 m in Washington County; Washington to Idaho, south to Baja California and Arizona; 4 (i).

Microseris nutans (Geyer) Schultz-Bip. [*Scorzonella nutans* Geyer; *Ptelocalais macrolepis* Rydb., type from Salt Lake City]. Perennial herbs from tuberous roots; herbage glabrous or sparsely scurfy; stems more or less developed, the scapose peduncles mainly 12–40 (60) cm high, pinnately lobed to entire, linear to elliptic, lanceolate, or oblanceolate; heads solitary or 2–5, many flowered, nodding in bud, the main bracts 10–20 mm long, lance-attenuate, subequal, the outer bracts shorter and unequal; rays yellow (drying lavender or blue); pappus of numerous narrow scales, each with a plumose terminal bristle; $n = 9$. Sagebrush, pinyon-juniper, mountain brush, Douglas fir, and aspen communities at 1675 to 2745 m in Box Elder, Cache, Daggett, Davis, Juab, Millard, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, and Weber counties; British Columbia to Montana, south to California, Nevada, and Colorado; 33 (ii).

Monoptilon T. & G. ex Gray

Annual herbs, branched from base, the herbage hispid; leaves alternate, spatulate, entire; heads radiate, solitary on branch tips, closely subtended by upper leaves; involucre campanulate, the bracts subequal, linear, herbaceous; receptacle flat, naked; ray flowers pistillate, white to pink; disk flowers perfect, fertile, yellow (purplish); pappus of a short scarious cup and 1 apically plumose bristle, or of numerous bristles alternating with short scales; achenes compressed, marginally nerved, pubescent.

1. Pappus of usually several nonplumose bristles alternating with scales; disk corollas sparsely if at all pilose; reported for Utah by Abrams and Ferris (Illustrated Flora of the Pacific States), but not seen by me *M. bellioides* (Gray) Hall
- Pappus consisting of minute scales and a single apically plumose bristle; disk corollas densely pilose below *M. bellidiforme*

Monoptilon bellidiforme T. & G. in Gray Depressed annual branching herbs; stems 1–5 cm high; leaves 4–10 mm long, 0.5–2.5 mm wide, narrowly oblanceolate; heads showy; involucre 4–5 mm high; bracts linear, attenuate or acuminate, hirsute, and minutely glandular; rays 12–20, ca 4–5 mm long, the tube pilose; pappus of 1 apically plumose bristle and several shorter scales, or the pappus rarely lacking; achenes ca 2 mm long; $n = 8$. Warm desert shrub at 700 to 900 m in Washington County; California, Nevada, and Arizona; 2 (0).

Opopordum L.

Biennial caulescent spiny herbs from taproots, the juice watery; leaves basal and cauline, alternate, winged-decurrent; heads solitary or few to several; involucre bracts in several series, imbricate, spine tipped; receptacle flat, fleshy, honeycombed, often with short bristles on the partitions, not densely bristly; corollas all discoid, reddish purple or pink, perfect; pappus bristles barbelate; achenes glabrous, subquadrangular, 4- or 5-ribbed.

Opopordum acanthium L. Scotch Thistle; Winged Thistle. Biennial herbs; stems mainly 5–15 (30) dm tall; leaves of basal rosettes 5–50 cm long or more and 2–15

cm wide, pinnately lobed and serrate-dentate, tomentose on both surfaces, but less so above, spinose; cauline leaves pinnatifid, tomentose to glabrate, strongly winged-decurrent along the stem length; involucre 25–35 mm high, 30–65 mm wide, the bracts lance-attenuate, with spreading spine tips, tomentose to glabrate marginally, the inner erect; spines 3–5 mm long, yellowish; corollas reddish purple to pink; $2n = 34$. Ruderal weeds at low elevations in Millard, Salt Lake, Summit, Tooele, Utah, Wasatch, and Washington counties; adventive from Europe; 8 (ii). This handsome but troublesome thistle is spreading through the state, but less vigorously than the musk thistle, *Carduus nutans* (q.v.).

Oxytenia Nutt.

Perennial riparian herbs from a lignose caudex; leaves alternate, pinnately divided or some entire, the segments linear-filiform, involute; heads discoid, numerous, in elongate paniculate inflorescences; marginal flowers 5, pistillate, inner flowers 10–30, staminate; flowers yellowish white; involucre bracts 5, orbicular, mucronate; receptacle chaffy, the chaffy bracts slender, with dilated villous tips; pappus lacking; achenes obovoid, densely villous, 1-ridged on each face.

Oxytenia acerosa Nutt. Copperweed. [*Iva acerosa* (Nutt.) R. Jackson]. Perennial herbs; stems erect, mainly 5–12 dm tall, broomlike in the inflorescence, striate; leaves 3–15 cm long, pinnately 3- to 7-lobed, or the upper ones simple; herbage strigulose; heads 3–4 mm wide, erect or ascending; involucre bracts herbaceous, strigulose; achenes 1.5–2 mm long, black, long villous-pilose. Saline riparian areas and near seeps and springs at 1220 to 2135 m in Carbon, Emery, Garfield, Grand, Kane, San Juan, and Washington counties; Colorado, New Mexico, Arizona, Nevada, and California; 25 (vii). Copperweed is poisonous to livestock.

Palafoxia Lag.

Annual herbs; leaves alternate, entire; heads discoid, few to several, corymbose or paniculate; involucre cylindrical; bracts in 1 series, herbaceous; receptacle flat, naked; flowers white, all alike or the outer with unequal lobes; pappus scales 4–8, slender, unequal, with a strong nerve; achenes linear, quadrangular.

Palafoxia arida Turner & Morris Spanish Needle. [not *P. linearis* (Cav.) Lag., misapplied]. Annual herbs; herbage hispid with slender multicellular hairs, glandular upward; stems commonly branched above the base, 1–7 dm tall; leaves petiole, the blades 1–7.5 cm long, 2–8 mm wide, linear-lanceolate, long-attenuate; involucre 12–18 mm high, glandular, and more or less hispid, 10- to 20-flowered, the corollas white with pink exerted styles; pappus scales usually 4; achenes strigose; $n = 12$. Warm desert shrub community at 700 to 1000 m in Washington County; California to Arizona and Mexico; 5 (0).

Parthenium L.

Herbs or shrubs; leaves alternate, entire or lobed; heads solitary or few and more or less clustered, inconspicuously radiate; ray flowers 5, white, pistillate, fertile, persistent; disk flowers staminate; receptacle plano-convex, chaffy throughout; pappus of 2 or 3 awns or scales; ray achenes dorsiventrally compressed, rotund in outline, the margins thickened into riblike structures attached to

the contiguous pair of infertile disk flowers and the subtending bract, the achene, the 2 attached flowers, and the bract falling as a unit.

Rollins, R. C. 1950 The guayule rubber plant and its relatives. *Contr. Gray. Herb.* 179: 1-73.

- 1. Plants shrubs, the internodes apparent; heads seldom solitary; known from Washington County *P. incanum*
- Plants pulvinate-caespitose herbs, the internodes not apparent; heads solitary; plants of eastern Utah . . . *P. ligulatum*

***Parthenium incanum* H.B.K.** Aromatic shrub, 4–10 dm tall, much branched, the branchlets loosely tomentose, becoming glabrate; leaves short-petioled, the blades 0.5–5 cm long, 0.4–1.5 cm wide, lobed, white-tomentose below, less so above; heads several to many, corymbose, 3–5 mm wide, outer involucre bracts oblong, acute, villous, the inner ones suborbicular, membranous; rays white, emarginate to incised, 1–2 mm long; pappus of 2 or more pubescent awns; achenes black, oblanceolate, 1.5–2 mm long, pubescent on the ventral surface; n = 18, 36. Limestone cliffs in creosote bush-blackbrush community at ca 1220 m in Washington County (Higgins 4102 BRY); Arizona to Texas, south to Mexico; 1 (0).

***Parthenium ligulatum* (Jones) Barneby** [*P. alpinum* var. *ligulatum* Jones, type from Theodore (Duchesne); *Bolophyta ligulata* (Jones) W. A. Weber]. Pulvinate caespitose to merely caespitose acaulescent mound-forming herbs to ca 3 cm high, from a taproot and branched caudex, the caudex branches densely clothed with brownish marcescent leaf bases and often with ashy leaves of the previous year; leaves 3–20 mm long, 1.5–4 mm wide, spatulate to oblanceolate, strigose; heads solitary at branch ends, sessile, 5–7 mm high, 4.5–6 mm wide; outer bracts oblong, densely pubescent apically; pappus scales distinct or adnate to the corolla tube; rays white, 1–2 mm long, emarginate; achenes oblanceolate, densely hairy, 4–5 mm long, 2–3 mm wide. Barren or semibarren calciferous or gypsiferous outcrops of the Green River, Uinta, Ferron, and Carmel formations in salt desert shrub and pinyon-juniper communities at 1705 to 2135 m in Daggett, Duchesne, Emery, and Uintah counties; Colorado (a Colorado Plateau endemic); 42 (iv). This amazing plant is one of a series of edaphically restricted moundformers in semibarren habitats on shales and clays of arid sites in Utah. It belongs to a closely related assemblage of two or three taxa within section Bolophytum, and has been regarded at specific status within the segregate genus *Bolophyta*. Its phylogenetic position was reviewed by Rollins (1950), and its status within *Parthenium* seems to represent best its generic affinities.

***Pectis* L.**

Annual herbs; leaves opposite, entire, glandular-dotted; heads radiate, few to several in cymose clusters; involucre turbinate to subcylindric; bracts 3–12 in one series, expanded basally, enclosing the ray flowers, often with translucent glands; receptacle naked; ray flowers perfect, yellow; disk flowers few; anthers entire, obtuse at base; style branches short, hispidulous; pappus of short-plumose bristles on disk flowers, that of ray flowers a short crown of united scales; achenes terete.

- 1. Leaves dilated at base; pappus a short crown, with or without 1 or 2 awns *P. angustifolia*
- Leaves not dilated at base; pappus commonly of numerous plumose bristles *P. papposa*

***Pectis angustifolia* Torr.** Annual herbs; stems dichotomously branched, 3–20 cm long, the herbage greenish;

leaves 10–50 mm long, 0.5–2 mm wide, with a few setae along the expanded base; heads on peduncles 0.2–1 cm long; involucre gibbous at the base, sparingly glandular; ray flowers yellow, 709, 4–6 mm long; achenes 4–5 mm long. Sandy sites in mixed desert shrub communities at 1300 to 1400 m in Kane and San Juan counties; Arizona to Nebraska, Texas, and Mexico; 8 (iii).

***Pectis papposa* Harv. & Gray** in Gray Chinch-weed. Annual herbs; stems dichotomously branched, often decumbent-spreading, 5–20 (25) cm long, the herbage yellowish green; leaves 6–40 (60) mm long, 0.5–2 mm wide, with a few setae at the base, glabrous, bearing oval to elliptic large yellowish glands; heads on peduncles mainly 0.3–1 (2) cm long; involucre gibbous at the base, rounded dorsally, sparingly glandular like the leaves; ray flowers yellow, 7–9, ca 4–6 mm long; achenes 4–5 mm long, stipitate-glandular; n = 12. Sandy soil in warm and sandy desert shrub communities at 850 to 1300 m in Washington County; California to New Mexico, and south to Mexico; 8 (i).

***Perezia* Lag.**

Perennial herbs from a caudex, this clothed with rusty woolly hairs; leaves alternate, simple, clasping; heads numerous in corymbose cymes, apparently discoid; involucre campanulate, strongly imbricate; flowers perfect, pink to pink purple, the corollas bilabiate, the outer lip 3-toothed, the inner lip recurved, 2-toothed; anthers appendaged; style branches flattened, truncate apically; pappus of white capillary bristles; achenes subterete, minutely glandular.

***Perezia wrightii* Gray** [*Acourtia wrightii* (Gray) Reveal & King]. Perennial herbs; stems 4–6 (10) dm tall, often purplish at the base, the rusty hairs at stem base copiose; leaves lance-oblong to ovate or lanceolate, spinulose-dentate, glandular-puberulent on both sides, the lower ones petiolate, becoming sessile and clasping upward; involucre 5–8 mm high and about as broad, the bracts graduated, the outer ones ovate, the inner lance-oblong, obtuse, green, the margins often purplish, ciliate; corollas pink to pink purple; achenes 4.8–5.2 mm long; n = 27. Warm desert shrub and juniper communities at 915 to 1525 m in Kane, San Juan, and Washington counties; Arizona to Texas, south to Mexico; 7 (i).

***Perityle* Benth.**

Annual herbs or perennial subshrubs; leaves mostly opposite below, alternate above, simple, petiolate; heads few to numerous, corymbose, radiate or discoid; involucre hemispheric or turbinate, the bracts somewhat keeled, in 1 or 2 subequal series; receptacle flat, naked; ray flowers (when present) pistillate, white or yellow; disk flowers perfect; anthers subentire to auriculate at the base; style branches linear or subulate; achenes flattened; pappus of scales, or of 1 or 2 awnlike bristles, or lacking.

Powell, A. M. 1973. Taxonomy of *Perityle* section Laphamia (Compositae-Helmeae-Peritylinae). *Sida* 5: 61–128.

Powell, A. M. 1974. Taxonomy of *Perityle* section Perityle (Compositae-Peritylinae). *Rhodora* 76: 229–305.

- 1. Plants annual *P. emoryi*
- Plants subshrubs 2
- 2(1). Heads radiate; plants glandular-hispidulous, of the Great Basin *P. stansburii*
- Heads discoid; plants villous or glandular-hispidulous, of the Colorado or Virgin drainages 3
- 3(2). Herbage short-villous and more or less glandular; pappus bristles 1; plants of Washington County *P. tenella*

— Herbage hispidulous; pappus of 3 (4) unequal bristles; plants of Grand County *P. specuicola*

Perityle emoryi Torr. in Emory Emory Rock-daisy. Annual herbs, mainly 2–5 dm tall; stems erect or spreading, commonly branched above, puberulent; leaves mostly alternate, petiolate, the bases 0.5–4 cm long, 0.6–3 (5) cm wide, ovate, cordate, or suborbicular, toothed, lobed, cleft, or divided, the lobes again toothed or lobed, hirsute to glandular-pubescent; heads radiate; involucre 5–6 mm high and usually broader; rays 8–12, white, 1.5–5 mm long; disk flowers numerous; pappus vestigial or a crown of scales and 1 slender bristle; achenes 2–3 mm long, the flattened faces nearly glabrous, the margin thickened and bearing short stiff hairs. Sand sagebrush community at lower elevations in Washington County (Tanner sn 1941 BRY); Nevada, California, Arizona, and Mexico; 1 (0).

Perityle specuicola Welsh & Neese Alcove Rock-daisy. Perennial suffruticose herbs, mainly 50–75 cm tall; stems sprawling or pendulous, much branched; herbage glandular-hispidulous; leaves mostly alternate, short-petiolate, the blades 3–6 mm long, 1.5–3 mm wide, ovate-elliptic, entire, hispidulous; heads few to many in a branching corymbose inflorescence; involucre 3.5–5 mm high, 5–6 mm wide; bracts 11–16, oblong to elliptic, keeled; ray flowers lacking; disk flowers numerous, ca 2.5 mm long, whitish (?); pappus of 3 unequal scabrous bristles and often with 1 apically flattened and sigmoid scale; achenes 3–3.8 mm long, the faces flattened, glabrous, the margin thickened and with short ascending hairs. Hanging garden communities at ca 1125 to 1220 m in Grand and San Juan counties; endemic; 5 (v).

Perityle stansburyi (Gray) Macbr. Stansbury Rock-daisy. [*Laphamia stansburyi* Gray, type from Stansbury Island]. Suffruticose perennials, clump-forming, 7–30 cm tall and as broad or more; herbage glandular-hirtellous; leaves mainly alternate, the blades 3–14 mm long, 1.5–12 mm wide, broadly ovate to deltoid or orbicular, typically few to several lobed; petioles 1–14 mm long; heads few to many in a branching corymbose inflorescence; involucre 5–6.5 mm high, 5–10 mm wide; bracts 16–21, lanceolate to oblanceolate, strongly keeled; ray flowers 10–14, yellow, 3–5.5 mm long; disk flowers numerous, yellow, 4–5 mm long; pappus of 1 stout bristle and a very short crown of hyaline scales; achenes 2.3–3.5 mm long, with thin callous margins, short-pubescent on margins and on faces; $n = 17$. Limestone, dolomite, and igneous ignimbrite (ash flow tuff) outcrops, in mixed desert shrub, pinyon-juniper, and mountain brush communities, at 1280 to 1895 m in Beaver, Juab, Millard, Salt Lake, Sanpete, Sevier, Tooele, and Utah counties; Nevada; a Great Basin endemic; 39 (v).

Perityle tenella (Jones) Macbr. Jones Rock-daisy. [*Laphamia palmeri* Gray, type from Beaver Dam, Arizona?, not *P. palmeri* Wats.; *L. palmeri* var. *tenella* Jones, type from Springdale]. Suffruticose perennials, clump-forming, 9–25 cm tall and as broad or more; herbage villous and glandular; leaves mainly alternate, the blades 4–13 mm long, 3–15 mm wide, deltoid-ovate, the base obtuse to truncate or cordate; petioles 1–8 mm long; heads solitary or few to many, corymbose; involucre 4–6.5 mm long, 5–10 mm wide; bracts 11–18, lance-elliptic, keeled; ray flowers absent; disk flowers numerous, yellow, 3–4 mm long; pappus of a single bristle; achenes 2.5–3 mm long, with thin callous margins, short-pubescent on margins and on faces. Joshua tree, creosote

bush, blackbrush, warm desert shrub, pinyon-juniper, and ponderosa pine communities at 915 to 2135 m in Washington County; Arizona; a Mohave endemic; 16 (iv). Plants from the Beaver Dam Mts. have heads that average larger, but they seem not to differ otherwise from the typical materials taken near Zion National Park.

Petradoria Greene

Suffrutescent perennials from a taproot and woody caudex; stems herbaceous, leafy; leaves basal and cauline, alternate, entire, 3- to 5-veined, coriaceous; heads radiate (in ours), congested at branch ends in an open corymbose inflorescence; involucre cylindrical; bracts in several series, in more or less vertical ranks; flowers 4–7, yellow, the corollas glabrous; pappus of brownish capillary bristles; achenes somewhat compressed, glabrous.

Anderson, L. C. 1964. Studies on *Petradoria* (Compositae); anatomy, cytology, taxonomy. Trans. Kansas Acad. Sci. 66: 632–684.

Petradoria pumila (Nutt.) Greene Rock Goldenrod. [*Chrysoma pumila* Nutt.]. Plants from a well-developed caudex, the caudex branches clothed with dark to ashy or tan marcescent leaf bases; leaves 1.5–12 cm long, 1–11 mm wide, oblanceolate to lanceolate, elliptic, or linear; cauline leaves reduced upward; heads numerous; involucre 5–9.5 mm high, 1.3–2.8 mm wide; involucral bracts 10–21, in 3–6 series, more or less keeled; flowers 2–8, the rays 1–3, yellow, 4–9 mm long; achenes 4–5 mm long, glabrous, 6- to 9-nerved; $2n = 18$. Shadscale, mixed desert shrub, pinyon-juniper, sagebrush, and ponderosa pine communities at 1525 to 3050 m in all (?) Utah counties; Idaho and Wyoming, south to Nevada, California, Arizona, and New Mexico; 100 (xv). Most of our specimens belong to the broad-leaved var. *pumila*, but one specimen from Emery County (Harris 546 BRY) seems to be clearly allied to var. *graminea* (Woot. & Standl.) Welsh [*Petradoria graminea* Woot. & Standl.; *P. p. ssp. graminea* (Woot. & Standl.) L. C. Anderson]. That taxon has been known previously only from Arizona.

Peucephyllum Gray

Aromatic evergreen shrubs; leaves alternate, linear, subterete, resinous-punctate, overlapping; heads solitary on branchlet tips, discoid; involucre campanulate, the bracts in 2 series, narrowly subulate, the outer ones subterete, the inner flattened; receptacle flat, naked; flowers perfect, fertile; corolla lobes short; achenes oblong-obconic, 10-striate, appressed-hairy; pappus of scabrous capillary bristles, some of them sometimes flattened and with hyaline margins.

Peucephyllum schottii (Gray) Gray Pigmy-cedar. [*Psathyrotes schottii* Gray]. Shrubs mainly 1–2 m tall, with a single stem, this much branched upward, rounded to flat-topped; leaves mainly 5–12 (20) mm long; heads subsessile; involucre 6–8 mm high, green and resin-coated; flowers yellow; achenes 3.5–4 mm long; pappus 3–4 mm long, tawny. Talus slopes in creosote bush community at ca 1037 m in the Beaver Dam Mts., Washington County; California, Nevada, and Arizona; 3 (i). This plant, more characteristic of the hotter deserts to the south, was discovered first in Utah by G. I. Baird, during April of 1986.

Platyschkuhria (Gray) Rydb.

Perennial herbs from a woody caudex and rootstock; leaves alternate, simple, coriaceous, often impressed-punctate; heads few to many in a cymose paniculate clus-

ter, radiate, campanulate to hemispheric; involucre bracts subequal in 2 series; receptacle essentially flat, naked; rays pistillate, fertile, yellow; disk flowers numerous, perfect; anthers more or less sagittate basally; pappus of 8–16 scales with midribs sometimes produced apically; achenes narrowly obpyramidal and 4-sided, hairy or glabrous on the sides.

Ellison, W. L. 1971. Taxonomy of *Platyschukhria* (Compositae). Brittonia 23: 269–279.

Platyschukhria integrifolia (Gray) Rydb. [*Schukhria integrifolia* Gray; *Bahia nudicaulis* Gray; *B. integrifolia* (Gray) Macbr.]. Perennial herbs; stems solitary or few to several, mainly 12–55 cm tall; herbage white-strigulose or stipitate-glandular, especially above; main leaves near the stem base, petiolate, the blades 1.5–9.5 cm long, 0.5–4 cm wide, ovate to lanceolate, elliptic, or oblanceolate; cauline leaves reduced upward, finally merely bractcate; heads (1) 2–10; rays 7–11, yellow, 6–14 mm long; achenes 5–8 mm long; n = 12, 24, 36. Three rather distinctive varieties are present in eastern Utah, as indicated below.

- 1. Stems leafy almost or quite to the apex; plants of south-eastern San Juan County *P. integrifolia* var. *oblongifolia*
- Stems leafy mainly below the middle; plants not known from San Juan County 2
- 2(1). Pubescence of upper stems merely white-strigulose; involucre bracts caudate-attenuate *P. integrifolia* var. *ourolepis*
- Pubescence of upper stems stipitate-glandular; involucre bracts mainly obtuse to acute *P. integrifolia* var. *desertorum*

Var. *desertorum* (Jones) Ellison [*Bahia desertorum* Jones, type from Cisco; *P. desertorum* (Jones) Rydb.]. n = 12, 36. Salt desert shrub, pinyon-juniper, and mountain brush communities, mainly in saline substrates, at 1280 to 2565 m in Carbon, Duchesne, Emery, Garfield, Grand, Sevier, Uintah, and Wayne counties; Colorado; a Colorado Plateau endemic. A report by Ellison (1971) of var. *integrifolia* (a Wyoming-Montana endemic) belongs here; 39 (xi). The var. *desertorum* is closely allied with var. *integrifolia*, as indicated by pubescence and bract shape similarities. This variety is transitional with var. *ourolepis*.

Var. *oblongifolia* (Gray) Ellison [*Schukhria integrifolia* var. *oblongifolia* Gray; *Bahia oblongifolia* (Gray) Gray; *P. oblongifolia* (Gray) Rydb.]. n = 36. Desert shrub communities in San Juan County; Arizona, Colorado, New Mexico; 1 (i).

Var. *ourolepis* (Blake) Ellison [*Bahia ourolepis* Blake, type from Green River]. n = 12. Salt desert shrub and pinyon-juniper communities at 1280 to 1830 m in Duchesne, Emery, Grand, and Uintah counties; endemic; 24 (iii). The main body of this variety lies in Uintah County.

***Pluchea* Cassini**

Shrubs or aromatic annual herbs; leaves alternate, simple, entire or crenate to serrulate, glabrous to glandular pubescent, or sericeous; heads discoid, few to numerous, aggregated in terminal cymose or corymbose clusters; involucre campanulate to cylindrical; bracts imbricate in several series, herbaceous or scarious, the outer ones sericeous to glandular and sometimes ciliate; receptacle flat or concave, naked; outer flowers pistillate, numerous,

their filiform corollas 3- or 4-toothed; central flowers perfect but the innermost sterile, their tubular corollas 5-toothed, that of the fertile flowers 3-lobed; anthers sagittate basally; pappus of outer flowers a single whorl of barbellate bristles or merely capillary bristles, those of inner flowers clavate apically, or all uniformly linear.

- 1. Plants woody shrubs; leaves narrowly lanceolate to lanceolate, densely sericeous *P. sericea*
- Plants herbaceous; leaves broadly elliptic to ovate-lanceolate not densely sericeous *P. camphorata*

Pluchea camphorata (L.) DC. Camphor-weed. [*Erigeron camphoratum* L.]. Annual or perennial herbs, 1.5–10 dm tall or more; stems glabrate below, puberulent upward, leafy to the summit; leaf blades elliptic to oblong-elliptic, 6–15 cm long, 1–7 cm wide, dentate-serrate to repand-serrate to subentire, sparsely resinous on both sides, puberulent beneath; heads in a paniculiform cyme; bracts with resin globules, the outermost sparingly puberulent and ciliate, the median and inner ones not pubescent; achenes usually less than 1 mm long, cylindrical, 4- to 6-angled, brown to reddish brown, setose to hirtellous or glabrous. Reservoir bottom and stream margin at ca 850 m in Washington County; Arizona east to the southeastern U. S.; 4 (ii). Plants previously identified *P. camphorata* in Arizona were placed by R. K. Godfrey (Jour. Elisha Mitchell Sci. Soc. 68: 2: 238–272, 1952) into *P. purpurascens* (SW.) DC. Our material appears to more closely fit *P. camphorata*.

Pluchea sericea (Nutt.) Cov. Arrowweed. [*Polypappus sericeus* Nutt.; *Tessaria sericea* (Nutt.) Shinn.]. Shrubs with slender, erect, willowlike branches, mainly 0.8–3 m tall, sericeous throughout, longitudinally striate; leaves 0.8–4.5 cm long, 2–9 mm wide, elliptic to narrowly lanceolate or lanceolate, entire, sessile; heads more or less conspicuous; involucre 3.5–5 mm high, 4–7 mm wide; outer bracts ovate to ovate-lanceolate, abruptly acute, deciduous, often purplish; pistillate flowers purplish, numerous; perfect flowers purplish, fewer; achenes glabrous; pappus bristles of perfect flowers dilated apically. Riparian areas at 460 to 1220 m in Garfield, Kane, San Juan (?), and Washington counties; California to Texas, south to Mexico; 22 (iii). The genus *Pluchea*, in a broad sense, includes annual and perennial herbs and shrubs. *Tessaria*, when segregated from *Pluchea*, consists of the shrubby species that have dimorphic corollas and the inner perfect flowers with apically flared pappus bristles. The residue within *Pluchea* contains only herbs with uniformly 4-lobed or some 3-lobed corollas and pappus of uniform barbellate capillary bristles. I follow tradition in maintaining this species in *Pluchea*.

***Porophyllum* (Vaill.) Adanson**

Suffruticose perennial; leaves alternate or opposite, simple, with at least some elliptic to oval oil glands; heads discoid, solitary, or few to several in corymbose clusters; involucre cylindrical, the bracts usually 5, in subequal series, glandular like the leaves; receptacle naked; flowers perfect, fertile, purplish; anthers rounded basally; style branches slender, hirtellous, subulate; pappus of scabrous bristles; achenes slender, striate.

Porophyllum gracile Benth. Odora. Rounded bushy perennials from a woody base; stems much branched, 1.5–4 dm tall; herbage dark green or often purplish,

glaucous, odoriferous; leaves 1–4 cm long, linear-filiform, entire; involucre subcylindric, 10–15 mm long; bracts 5, dark green, tinged purplish, oblong, the hyaline margin pink, gibbous basally, bearing conspicuous glands, especially apically; corollas purplish, white; pappus bristles pinkish; achenes 8–9 mm long, hispidulous; $n = 24$. Desert shrub communities in Washington County (Cottam 5522 UT); California to Arizona and Mexico; 1 (0).

Prenanthea Rydb.

Annual herbs, with milky juice; leaves basal and alternate, simple, pinnately lobed, toothed, or pinnatifid; heads small, few to numerous; involucre campanulate; bracts in 2 series, the inner subequal, 3 or 5, the outer much reduced, 1 or 2, herbaceous; flowers all raylike, 4 or 5; achenes 5–ribbed; pappus of white capillary bristles.

Prenanthea exigua (Gray) Rydb. [*Prenanthes exigua* Gray; *Lygodesmia exigua* (Gray) Gray]. Annual; stems branched from the base, forming rounded clumps, 7–24 (30) cm tall; inflorescence paniculate, comprising more than half the plant height; lower leaves 1–4 (6.54) cm long, 3–12 (20) mm wide, spatulate to oblanceolate, the rosette often withered at anthesis; cauline leaves reduced upward, finally bracteate scales; herbage sparingly stipitate-glandular; involucre 3–5.5 mm long, 1.2–3.5 mm wide; inner bracts oblong, herbaceous, apically constricted in bud; rays pink or white, 1.5–2 mm long; achenes 3–3.5 mm long, 5–ridged, scabrous; pappus of white capillary bristles. Blackbrush, creosote bush, other warm desert shrub, salt desert shrub, and pinyon-juniper communities at 850 to 1925 m in Beaver, Carbon, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, and Washington counties; California, Nevada, Colorado, Arizona, and New Mexico; 20 (ii).

Psathyrotes Gray

Annual or perennial (?) herbs; leaves alternate, petiolate, simple, entire or lobed to toothed; heads discoid, the flowers yellow or purplish in age; involucre campanulate; bracts biseriate, the outer often shorter or otherwise different; receptacle flat, naked; anthers minutely sagittate; style branches flattened; achenes hairy; pappus of capillary bristles.

1. Plants lanate-tomentose as well as scurfy; outer involucral bracts expanded apically, oblong-obovate; reported for Utah by Munz (A California Flora), but not seen by me *P. ramosissima* (Torr.) Gray
- Plants scurfy and less commonly somewhat tomentose; outer involucral bracts tapering apically, lanceolate 2
- 2(1). Leaves entire; herbage scurfy and with long-piliferous multicellular hairs *P. pilifera*
- Leaves toothed, herbage scurfy but not long-piliferous *P. annua*

Psathyrotes annua (Nutt.) Gray Mealy Rosettes. [*Bulbostylis annua* Nutt.]. Annual or winter annual herbs forming low rounded cushions, mainly 2–18 cm tall; leaves petiolate, the blades 5–17 mm long, 5–20 mm wide, orbicular to fan-shaped, dentate; herbage scurfy; heads few to numerous, corymbose; involucre 5.5–7.5 mm high, 5–8 mm wide; outer bracts lanceolate to oblong, more or less constricted above the middle, scurfy and ciliate; disk corollas 3.5–4.2 mm long, yellow, becoming purplish; achenes 2–2.5 mm long, pilose; $n = 17$.

Warm desert shrub, salt desert shrub, and pinyon-juniper communities, commonly on limestone and dolomitic gravels, at 790 to 1740 m in Juab, Millard, Tooele, and Washington counties; Idaho south to California, Nevada, and Arizona; 29 (ix).

Psathyrotes pilifera Gray Annual or winter annual herbs forming hemispheric cushions, mainly 5–15 cm tall; leaves petiolate, the blades 5–15 mm long, 4–16 mm wide, obovate, ovate, or oval-elliptic, entire; herbage scurfy and piliferous with long multicellular hairs; heads few to many, corymbose; involucre 8.5–10 mm high, 4–5.5 mm wide; outer bracts lanceolate, seldom constricted above the middle, scurfy and with long-piliferous setae marginally; disk corollas 6–6.5 mm long, yellow, becoming purplish; achenes 3.8–4.8 mm long; $n = 17$. Warm desert shrub and salt desert shrub, commonly on gypsiferous substrates of the Moenkopi and Chinle formations, at 760 to 2260 m in Garfield, Grand, Kane, San Juan, and Washington counties; Arizona; endemic; 15 (vi).

Psilocarpus Nutt.

Low floccose-woolly annual herbs; leaves opposite, simple, entire; heads discoid, subglobose; involucre per se essentially lacking; receptacle chaffy, subglobose; pistillate flowers numerous, imbricate, each enclosed by and deciduous with its subtending bract, woolly, the sides meeting in the center, bearing below the rounded tip on inner side a scarios appendage; corollas filiform; pappus lacking; perfect flowers few, central, ebracteate, the corollas 4– or 5-toothed, epappose; anthers sagittate.

Psilocarpus brevissimus Nutt. Low white-woolly annuals; stems simple or with decumbent-prostrate branches mainly 1.5–20 cm long; leaves 5–15 mm long, 1–3 mm wide, spatulate to lanceolate, apiculate; heads solitary or clustered, long-woolly, ca 5–7 mm thick, subtending leaves about as long as the head or longer; pistillate flowers 20–34 or more, the enclosing bracts 2.5–3.2 mm long, woolly, the appendage horizontally produced to erect, ca 0.5 mm long; perfect flowers ca 6–10; achenes subcylindric, terete, 1.3–2 mm long; $2n = 28$. Lake and reservoir beds at ca 1710 m in Cache and Salt Lake counties; Washington to Montana, south to California, Mexico, and South America; 6 (0).

Psilostrophe DC.

Perennial herbs or shrubs; leaves alternate, simple, entire or merely lobed; heads few to many, corymbose; involucre campanulate; bracts in 1 series, subequal; receptacle naked; ray flowers yellow, pistillate, becoming papery and persistent; disk flowers perfect, 5–lobed; anthers obtuse basally; style branches truncate; pappus of 4–6 hyaline scales; achenes obtusely angled, glabrous or hairy.

1. Plants shrubby; stems closely white-tomentose; of Washington County *P. cooperi*
- Plants herbaceous, from a definite caudex; stems glabrous or loosely tomentose; not known in Washington County 2
- 2(1). Stems loosely tomentose; involucre densely white villos-tomentose; plants of Grand County *P. tagetina*
- Stems glabrous, or tomentose only at the base; involucre sparingly tomentose, greenish; plants of Wayne, Garfield, and Kane counties *P. sparsiflora*

Psilostrophe cooperi (Gray) Greene Whitestem Paperflower. [*Riddellia cooperi* Gray]. Shrubs; stems closely white-tomentose, mainly 30–60 cm tall; leaves 1.2–7 cm long, linear, entire, sparingly tomentose, finally glabrate; involucre tomentose, 6–8 mm high, 5–8 mm wide; rays 4–8, yellow, 8–20 mm long; pappus scales ca 2 mm long, acute; achenes whitish, 4.5–7 mm long; $n = 16$. Joshua tree, creosote bush, blackbrush, and pinyon-juniper communities at 915 to 2135 m in Washington County; Nevada, California, Arizona, and New Mexico; 15 (iv).

Psilostrophe sparsiflora (Gray) A. Nels. Greenstem Paperflower. [*Riddellia tagetina* var. *sparsiflora* Gray]. Perennial herbs from a caudex; stems 14–60 cm tall, densely to moderately pilose basally, sparingly villous-tomentose upward; leaves 0.9–11.5 (14.5) cm long, 1–11 mm wide, spatulate to oblanceolate or linear, pubescent like the stems or glabrate; involucre 4.5–6 mm high, 4–6 mm wide; rays usually 3, yellow, 6–12 mm long; pappus scales 1.5–2.5 mm long, acutish; achenes yellowish, 2.5–3 mm long; $n = 16$. Salt desert shrub, pinyon-juniper, and sagebrush communities at 1430 to 2045 m in Garfield, Kane, and Wayne counties; Arizona, New Mexico, and Mexico; 42 (vi).

Psilostrophe tagetina (Nutt.) Greene Woolly Paperflower. [*Riddellia tagetina* Nutt.]. Perennial herbs from a caudex; stems 10–40 cm tall, densely white-woolly below, loosely tomentose upward; leaves 0.8–10 cm long, 2–15 mm wide, spatulate to oblanceolate, entire or lobed, pubescent like the stems; cauline leaves reduced upward; heads usually numerous in dense to loose corymbiform clusters; peduncles usually 5–20 (30) mm long; involucre loosely villous-tomentose, 5–7 mm high, ca 3–4 mm wide; rays 3–6, yellow, 6–12 (15) mm long; pappus scales ca 2 mm long, rounded; disk flowers 6–12; achenes whitish, ca 2–2.5 mm long. Sandy warm desert shrub community at ca 1285 m in Grand County; Arizona to Texas and Mexico; 4 (ii)

Rafinesquia Nutt.

Annual herbs with milky juice; stems fistulose; leaves alternate, pinnatifid; heads 2 to several, large, showy, with white or rose-tinged flowers; involucre essentially cylindrical; bracts 7–15, in 2 series, the inner subequal, the outer ones much shorter, obtuse or subcordate basally; flowers all raylike; pappus white or tawny, of 8–15 slender long-plumose bristles; achenes terete, obscurely few ribbed, attenuate into a beak.

1. Rays mainly 5–8 mm long; achene beak as long as the body; plumose hairs of pappus straight *R. californica*
- Rays mainly 12–18 mm long; achene beak shorter than the body; plumose hairs of pappus crinkled; plants of Washington County *R. neomexicana*

Rafinesquia californica Nutt. California Chicory. Annual (winter annual), mainly 2–7 (10) dm tall, simple or branched above; leaves mainly 5–15 cm long, oblong in outline, subentire to pinnatifid, the lower ones petioled, becoming auriculate-clasping and reduced upward; heads few; involucre 15–18 mm high; rays 5–8 mm long, white; $2n = 16$. Uncommon in mixed warm desert shrub community at ca 1035 m in Washington County; Arizona, Nevada, and California; Mexico; 1 (i).

Rafinesquia neomexicana Gray Desert Chicory. Annual (winter annual) herbs; stems mainly 15–40 (50) cm tall, simple or branched, often growing up through

shrubs; basal leaves 1.2–9 cm long, pinnatifid, often withered at anthesis, cauline leaves sessile and auriculate-clasping, reduced upward; involucre 15–25 mm high, 5–9 mm wide; main bracts lance-attenuate, the margins scarious, the outer ones more or less cordate basally; rays 12–18 mm long, white or suffused with pink, 5-toothed or -lobed apically; pappus bristles white, the bases flattened, plumose to near the apex; achenes 12–15 mm long, papillate-puberulent; $n = 8$. Joshua tree, creosote bush, blackbrush, and desert almond communities at 700 to 1070 m in Washington County; California to Texas and Mexico; 16 (ii).

Ratibida Raf.

Perennial herbs from a caudex and stout taproot; leaves alternate, pinnatifid; heads radiate, solitary or few and corymbose; rays neuter, commonly yellow (sometimes purple in part or throughout); involucre in 1 series, green; receptacle columnar, chaffy throughout, the bracts more or less clasping the achenes; disk flowers perfect, fertile; anthers sagittate; style branches flattened; achenes compressed at right angles to the involucre bracts, glabrous, the margins sometimes ciliate; pappus of an evident tooth and sometimes with a second one.

Ratibida columnifera (Nutt.) Woot. & Standl. Prairie Coneflower. [*Rudbeckia columnifera* Nutt.; *Ratibida columnaris* Pursh]. Perennial herbs; stems mainly 3–6 (12) dm tall, several, often branched above, strigose; leaves 2–9 cm long, pinnatifid, with the terminal division often the largest; heads borne on slender peduncles 6–18 cm long, the disk grayish in bud, purplish brown in flower, 1.5–3 cm long; rays 3–7, yellow (or purple), 1–3 (4.5) cm long, spreading or reflexed; pappus an evident awn-tooth on the inner angle of the achene, often also a shorter one on the outer edge; achenes ciliate and more or less winged on the inner edge; $n = 14$. Salt desert shrub and sagebrush communities at 1585 to 2565 m in Cache, Garfield, Grand, Millard, San Juan, and Washington counties; British Columbia to Minnesota, south to Arizona, Texas, and Mexico; 4 (i). Our material appears to be adventive from the main body of the species in the prairies and plains provinces to the east of Utah.

Rudbeckia L.

Perennial caulescent herbs; leaves alternate, serrate or pinnately to palmately lobed; heads radiate or discoid, the rays (when present) neuter, commonly yellow; involucre bracts in 2 or 3 series, mainly unequal, herbaceous, spreading or reflexed; receptacle conic or columnar, chaffy throughout, the bracts clasping the achenes; disk flowers fertile; anthers obtuse or sagittate basally; style branches flattened; pappus a crown or none; achenes quadrangular or flattened at right angles to the involucre bracts.

1. Heads radiate; disks 1–2 cm wide and about as long, little elongate in fruit, plants of San Juan County *R. laciniata*
- Heads discoid; disks 1.5–2.5 cm wide, mostly 2–5 cm long, elongating in fruit; plants not of San Juan County 2
- 2(1). Leaves laciniately lobed; plants glabrous or merely scabrous-ciliate on leaf margins; known from Iron and Washington counties *R. montana*
- Leaves crenate-serrate, dentate, undulate, or entire, not lobed; plants evidently short-hairy to almost glabrous; known from mountains of central northern to south central Utah *R. occidentalis*

Rudbeckia laciniata L. Cutleaf Coneflower. Perennial herbs; stems erect from a coarse ligneous base, mainly 5–10 (20) dm tall, glabrous or scabrous-ciliate; leaves petiolate, the blades lacinate-pinnatifid to palmatifid, mainly 4–15 cm long and as broad; heads showy, the disk 1–2 cm wide and about as high; rays yellow, 6–16, deflexed-spreading, 2–5 cm long; pappus a short crown; n = 9. Moist meadows at 1890 to 2200 m in Grand and San Juan counties; Montana to Quebec, south to Arizona and Florida; 2 (0).

Rudbeckia montana Gray Montane Coneflower. [*R. occidentalis* var. *montana* (Gray) Perdue]. Perennial herbs; stems erect, from a short subrhizomatous caudex, 6–12 dm tall, glabrous; leaves petiolate, the blades lacinate-pinnatifid, mainly 4–20 cm long and about as broad; heads discoid, the disk 1.5–2.5 cm wide, 3–5 cm high; rays lacking; pappus an irregularly margined, almost toothed crown. Spruce-fir community at 2590 to 3050 m in Iron and Washington counties; Colorado; 2 (0). This material is probably best regarded as a variety of *R. occidentalis*.

Rudbeckia occidentalis Nutt. Western Coneflower. Perennial herbs; stems erect from a coarse ligneous rhizome, mainly 5–20 dm tall, glabrous or strigulose; leaves petiolate, the blades 5–20 cm long, 2.5–10 cm wide, ovate to ovate-lanceolate or lanceolate, attenuate to acuminate, entire, crenate-serrate, or dentate; heads discoid, the disks 1.5–2.5 cm wide, 3–6 cm long; rays lacking; pappus a short crown. Mountain brush, aspen, grass-tall forb, and spruce-fir communities at 2135 to 3175 m in Cache, Carbon, Davis, Duchesne, Emery, Piute, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Weber counties; Washington to Montana, south to California and Wyoming; 42 (iii).

Senecio L.

Annual, biennial, or perennial herbs with rhizomes, caudices, or taproots, the juice watery; stems erect, ascending, or decumbent at the base; leaves alternate, simple, entire, toothed, or lobed to pinnatifid; heads solitary, or few to many in corymbose cymes; involucre bracts in 1 series, often with smaller bractlets at the base, green throughout or the margins scarious or hyaline, or variously colored; receptacle flat or convex, naked; ray flowers yellow or orange, or sometimes lacking; pappus of capillary bristles; style branches flattened; achenes terete, 5- to 10-nerved, glabrous or pubescent. Note: This genus consists of a series of species that intergrade freely when they are in contact with others of the group. Because of hybridization the species lines tend to be blurred, and it is not possible to place all specimens with confidence. Keys are, and have been, based on features that are subject to interpretation; the present one is not an exception, being tentative at best.

Barkley, T. M. 1978. *Senecio*. N. Amer. Flora II. 10: 50–139.

- 1. Leaves pinnatilobate with linear-filiform divisions or entire and linear-filiform; stems with leaves only gradually reduced upward, often more or less woody below 2
- Leaves variously lobed, toothed, or entire, but the segments and leaves not linear-filiform; stems with leaves various, seldom, if at all, woody at the base ... 3
- 2(1). Heads cylindric, subcylindric, or narrowly campanulate; main involucre bracts 8–13, the outer ones much reduced and inconspicuous; plants glabrous *S. spartioides*

- Heads campanulate to broadly campanulate; main involucre bracts 13–21, the outer ones conspicuous, or, if inconspicuous, the plants tomentose . . . *S. douglasii*
- 3(2). Heads nodding, especially in bud, or, if erect, with both distinctly black triangular tips on involucre bracts and cauline leaves prominently clasping 4
- Heads erect, even in bud; plants various but not as above 7
- 4(3). Heads discoid 5
- Heads radiate 6
- 5(4). Heads 8–12 mm high, 6–9 mm wide, narrowly campanulate, conspicuously pedunculate *S. pudicus*
- Heads 12–20 mm high, 14–20 mm wide, broadly campanulate, short-pedunculate *S. bigelovii*
- 6(4). Heads erect, the involucre bracts black-tipped *S. crassulus*
- Heads nodding, the involucre bracts often suffused with purple throughout, but not especially black-tipped *S. amplexans*
- 7(3). Plants annual or winter annual, introduced weedy species *S. vulgaris*
- Plants perennial, indigenous species 8
- 8(7). Stems uniformly leafy to the inflorescence, or the leaves concentrated upward 9
- Stems few-leaved or the upper leaves definitely reduced in size and distribution 12
- 9(8). Stems 1–3 dm tall, more or less sprawling, arising from a subrhizomatous caudex *S. fremontii*
- Stems mostly 2–15 dm tall, erect or ascending, arising from a rhizome or a caudex 10
- 10(9). Plants mainly 2–4 dm tall; leaves pinnatifid to lobed or lacinate; involucre bracts with dark tips *S. eremophilus*
- Plants mainly 5–10 dm tall; leaves dentate to serrate; involucre bracts uniformly greenish or brownish ... 11
- 11(10). Leaf blades acute to obtuse basally, the teeth all about alike *S. serra*
- Leaf blades truncate to obtuse basally, or more or less hastately lobed, the lowermost teeth often the largest *S. triangularis*
- 12(8). Plants glaucous tall herbs, semiaquatic; leaves entire or denticulate, thick and leathery *S. hydrophilus*
- Plants not or seldom glaucous, terrestrial (though sometimes growing where wet); leaves entire, toothed, or pinnatifid, not thick and leathery 13
- 13(12). Rays orange or orange red (see also *S. pauperculus*) *S. crocatus*
- Rays yellow or lacking 14
- 14(13). Heads discoid; plants tomentose, soboliferous *S. fendleri*
- Heads radiate (or rarely discoid in some individuals and the plants otherwise differing); plants tomentose, glabrate, or glabrous, not soboliferous (except in *S. wernerifolius*) 15
- 15(14). Leaves pinnatifid, at least the cauline ones, or the basal ones commonly rounded apically or oblanceolate to ovate or oval in outline 16
- Leaves serrate to entire, the basal ones variously shaped, but mainly acute to attenuate apically 20
- 16(15). Basal leaves distinctly pinnately divided, the lobes often again toothed *S. multilobatus*
- Basal leaves merely toothed to subentire 17

- 17(16). Basal and lower cauline leaves entire to dentate, but not pinnatifid *S. hartianus*
- Basal and lower cauline leaves toothed to pinnatifid 18
- 18(17). Middle and upper cauline leaves clasping with large auriculate bases *S. dimorphophyllus*
- Middle and upper cauline leaves without a prominent clasping or auriculate base 19
- 19(18). Basal leaves obovate to oblanceolate ovate, rounded apically, thickish; plants of dryish habitats *S. streptanthifolius*
- Basal leaves oblanceolate to elliptic, obtuse, but usually pointed apically, thin; plants of wet meadows *S. pauperculus*
- 20(15). Cauline leaves rounded and more or less clasping basally, long-attenuate apically, entire or denticulate *S. integerrimus*
- Cauline leaves tapering to the base or with a few basal clasping lobes in some, usually not attenuate apically 21
- 21(20). Stems subscapose, the cauline leaves none or few and bractlike; plants often soboliferous or with a branching rhizomatous caudex *S. wernerifolius*
- Stems more or less leafy, the cauline leaves gradually reduced upward, but hardly bractlike; plants seldom as above 22
- 22(21). Involucral bracts ca 8 or fewer; heads 5–6 mm wide, mainly 20–60 per inflorescence *S. atratus*
- Involucral bracts mostly 13–21; heads 8–12 mm wide or more, fewer or larger than above 23
- 23(22). Plants with glabrous achenes and more typically more than 30 cm tall, known from northwestern Box Elder County *S. foetidus*
- Plants either with glabrous achenes and less than 30 cm tall or the achenes hirtellous or hispulous 24
- 24(23). Achenes glabrous; plants often less than 20 cm tall 25
- Achenes hirtellous or hispulous; plants often over 20 cm tall 26
- 25(24). Main leaves regularly and evenly pinnatifid or pinnatisect; plants often with slender rhizomes *S. fendleri*
- Main leaves entire to dentate, not as above; plants shortly rhizomatous *S. canus*
- 26(24). Main leaves 10–15 cm long or more, entire or denticulate; plants 50–70 cm tall, of northern Utah *S. sphaerocephalus*
- Main leaves 2–8 cm long, dentate, serrate, or subentire; plants mainly 15–35 cm tall, of southern Utah *S. neomexicanus*

Senecio amplexens Gray Alpine Groundsel. [*Ligularia amplexens* (Gray) W. A. Weber]. Perennial short-rhizomatous herbs; stems ascending to erect, mainly 8–30 cm tall; herbage glabrous or sparingly tomentose; main leaves middle and lower cauline, the lower ones broadly petiolate, more or less clasping the stem, the blades 3–10 cm long, 0.8–3 cm wide, dentate to shallowly lobed; cauline leaves becoming short-petiolate or sessile upward, finally bractlike; heads 1–5 (rarely more), conspicuously nodding, corymbose; involucre broadly hemispheric, 10–15 mm long and about as wide or wider; bracts mainly ca 21, usually brown, with scarious margins, glabrous; outer bracts to about half as long as the inner; rays 7–17, yellow, 10–25 mm long; pappus white; achenes glabrous. Spruce-fir and alpine tundra communi-

ties, often in talus or on ridge margins, at 3050 to 3570 m in Beaver, Grand, Piute, San Juan, Sanpete, and Utah counties (Wasatch, Tushar, and La Sal mts., and Wasatch Plateau); Montana, Wyoming, Colorado, and Nevada; 34 (v). Our material belongs to var. *holmii* (Greene) Harrington [*S. holmii* Greene; *Ligularia holmii* (Greene) W. A. Weber].

Senecio atratus Greene Black Groundsel. Perennial subrhizomatous herbs from a branching caudex; stems erect or ascending, 2–8 dm tall; herbage floccose-tomentose; basal and lower cauline leaves petiolate, mainly 8–30 cm long, 1–4 cm wide, the blade oblanceolate or oblong, conspicuously dentate to subentire; cauline leaves gradually reduced upward, becoming sessile or subsessile and finally bracteate; heads ca 15–60, in more or less compact corymbose clusters; involucre 6–8 mm high, 3–6 mm wide; main bracts 8 or fewer, greenish to brownish, the margins scarious, the tips black, tufted-hairy apically; rays 3–5, yellow, 4–8 mm long; pappus white; achenes glabrous; 2n = 40, 46, 90+. Aspen, spruce-fir, mixed conifer, and tall forb communities at 2440 to 3335 m in Duchesne, Garfield, Iron, Salt Lake, San Juan, Sanpete, Summit, and Uintah counties; Colorado and New Mexico; 22 (iv).

Senecio bigelovii Gray in Torr. Bigelow Groundsel. [*Ligularia bigelovii* (Gray) W. A. Weber]. Perennial subrhizomatous herbs; stems erect, mainly 3–8 (10) dm tall; herbage floccose-tomentose to glabrate or glabrous; main leaves cauline, largest below, reduced gradually upward, petiolate below, sessile and clasping to auriculate above, mostly 7–15 cm long, 0.6–3 (5) cm wide, the blades oblanceolate to oblong or elliptic, subentire to serrate; heads 3–8, nodding, racemously arranged; involucre 8–12 mm long, 12–25 mm wide; bracts mainly ca 21, usually brown, with scarious margins, the outer to half as long as the inner, all sparingly tomentose; ray flowers lacking; achenes glabrous. Mountain brush, ponderosa pine, aspen, and spruce-fir communities at 2745 to 3175 m in San Juan County; Wyoming south to New Mexico and Arizona; 4 (0). Our material has been assigned to var. *hallii* Gray [*Ligularia bigelovii* ssp. *hallii* (Gray) W. A. Weber]; the type variety is more southern.

Senecio canus Hook. Gray Groundsel. [*S. purshianus* Nutt.; *S. convallium* Greeman, type from Rabbit Valley]. Perennial short-rhizomatous herbs, often with a caudex; stems 8–30 cm tall (rarely more), erect or ascending; herbage woolly-tomentose; basal leaves petiolate, the blades 1–5 cm long, 3–30 mm wide, lanceolate to oblanceolate, elliptic or ovate, entire or denticulate, obtuse to rounded apically; cauline leaves reduced upward, the upper ones often clasping, finally bracteate, occasionally lobed in some introgressant forms; heads mainly 2–10, subumbellate or corymbose; involucre 3–8 mm long, 4–10 mm wide; main bracts 13–21, lance-attenuate, greenish or with brownish midstripe, glabrous or tomentose; outer bracts very short; rays 8–13, yellow, 5–10 mm long; achenes glabrous; 2n = 46, 69, 90, 132. Pinyon-juniper, sagebrush, Douglas fir, aspen, spruce-fir, and alpine tundra communities, often in talus or on windswept ridges, at 2105 to 3815 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Garfield, Iron, Kane, Juab, Millard, Piute, San Juan, Sanpete, Sevier, Summit, Uintah, and Utah counties; British Columbia to Manitoba, south to California, Nevada, Colorado, and Kansas; 56 (xiii). This attractive grayish white

species forms intermediates with *S. multilobatus*, *S. streptanthifolius*, and *S. wernerifolius*.

Senecio crassulus Gray Thick Groundsel. Perennial short-rhizomatous herbs, often with a caudex; stems 15–50 cm tall or more, erect; herbage glabrous; lower leaves broadly petiolate, the main ones 3–15 cm long, 0.6–3 (5) cm wide, lanceolate to elliptic or oblanceolate, dentate to entire; cauline leaves reduced upward, becoming sessile and clasping; heads solitary or 2–12, corymbose; involucre 8–13 mm high, 12–21 mm wide; main bracts 8–21, oblong to lance-oblong, greenish to brown, with scarios margins, the tips black and tufted-hairy; outer bracts to half as long as the inner or more; rays 8–13, yellow, 5–12 mm long; achenes glabrous. Aspen, lodgepole pine, and spruce-fir communities, often in forb-grass meadows, at 1830 to 3355 m in Box Elder, Cache, Carbon, Duchesne, Grand, Iron, Salt Lake, San Juan, Sanpete, Sevier, Summit, and Utah counties; Oregon to Montana, south to New Mexico; 34 (iv).

Senecio crocatus Rydb. Saffron Groundsel. Perennial subrhizomatous herbs, the caudex more or less developed; stems erect, mainly 2–8 dm tall; herbage glabrous or with minute hairs in the inflorescence; basal leaves with long slender petioles, the blades 1–8 cm long, 1–4 cm wide, ovate to oblong, lanceolate, or elliptic, subcordate to acute basally, often rounded apically, entire to crenate-dentate; cauline leaves reduced upward, becoming lobed or sublyrate, sessile and sometimes auriculate and/or clasping; heads mainly 3–30; involucre 4–8 mm long, 5–8 mm wide; main bracts 13–21, lance-oblong, green or suffused with red or purple; outer bracts very short; rays 6–13, orange or orange red; pappus white; achenes glabrous. Rush-grass, willow, aspen-forb, and lodgepole pine communities at 2195 to 2990 m in Cache, Duchesne, Rich, Summit, Utah, and Wasatch counties; Colorado; 23 (i). One specimen from Rich County (Thorne 1465 BRV) is apparently intermediate with *S. eremophilus*. The species is remarkably like the next.

Senecio dimorphophyllus Greene Different Groundsel. Perennial subrhizomatous herbs; stems erect, mainly 30–70 cm tall; herbage glabrous or essentially so; basal leaves with long slender petioles, the blades 1–7 cm long, 1–5 cm wide, oval to oblong or elliptic, subcordate to acute basally, commonly rounded apically; cauline leaves becoming sessile, lyrate-pinnatifid, and auriculate-clasping, the auricles often lobed; heads mainly 2–25, subumbellately to corymbosely arranged; involucre 5–8 mm high, 6–10 mm wide; main bracts 13–21, lance-attenuate, green, sometimes suffused reddish, the tips not black, tufted-hairy; outer bracts very short; rays 8–13, yellow, 5–8 mm long, pappus white; achenes glabrous. Two weakly discernible varieties are present in Utah.

1. Cauline leaves merely lobed to subtire; plants of the La Sal Mts. *S. dimorphophyllus* var. *intermedius*
- Cauline leaves sharply lobed, plants of Uinta Mts. and Wasatch Plateau *S. dimorphophyllus* var. *dimorphophyllus*

Var. *dimorphophyllus* Aspen-tall forb and spruce-fir communities at 1860 to 3265 m in Duchesne, Emery, Sanpete, and Utah counties; Wyoming and Colorado; 9 (0). Utah materials approach *S. crocatus* in most morphological features, including the tall stature. If the flower color is discounted and the larger heads are not definitive, then the specimens could be considered as a portion of *S. crocatus*. Some specimens from Duchesne County appear to be transitional to *S. sphaerocephalus*.

Var. *intermedius* T. M. Barkley Wet meadows at 3050 to 3115 m in the La Sal Mts., Grand, San Juan (type from Geysers Pass), and Sanpete counties; endemic; 3 (0).

Senecio douglasii DC. Douglas Groundsel. Suffrutescent perennials; stems erect or ascending, mainly 3–8 (10) dm tall; herbage glabrous or tomentose; leaves simple and linear-filiform or pinnatifid into linear-filiform segments, 2–11 cm long, 0.8–3 mm wide; heads few to numerous, in paniculately branched subcorymbose cymes; involucre campanulate, mainly 5–10 mm long, 6–14 mm wide; main bracts 13–21, lance-oblong, green, with scarios margins, minutely tufted-hairy apically; the outer bracts short and inconspicuous or to half as long as the inner ones; rays 8–17, yellow, 10–18 mm long; pappus white; achenes hairy. Two infraspecific taxa, previously treated at specific rank with some justification, are present in Utah.

1. Herbage grayish or whitish tomentose; outer involucre bracts short and inconspicuous; plants rather broadly distributed *S. douglasii* var. *longilobus*
- Herbage green, glabrous or essentially so; outer involucre bracts to about half as long as the inner ones; plants of Washington County *S. douglasii* var. *monoensis*

Var. *longilobus* (Benth.) L. Benson [*S. longilobus* Benth.; *S. filifolius* var. *jamesii* T. & G., nom. illeg.]. *n* = 20. Warm desert shrub, salt desert shrub, sagebrush-rabbitbrush, saltgrass, and pinyon-juniper communities at 1095 to 2200 m in Beaver, Duchesne, Garfield, Iron, Kane, Millard, Piute, San Juan, Sevier, Washington, and Wayne counties; Arizona to Texas; 52 (x).

Var. *monoensis* (Greene) Jepson [*S. monoensis* Greene]. Creosote bush, blackbrush, other warm desert shrub, and pinyon-juniper communities at 760 to 1465 m in Washington County; California to Texas; 23 (vi).

Senecio eremophilus Richards. Desert Groundsel. Perennial subrhizomatous herbs; stems rather equably leafy, erect or ascending, mainly 2.5–9 dm tall; herbage glabrous or essentially so; lower leaves often deciduous or withered at anthesis; cauline leaves 2–15 cm long (or more), 0.4–5 (7) cm wide, oblanceolate to elliptic, or lanceolate in outline, pinnatifid or pinnately lobed or toothed, the lower ones petiolate, becoming sessile upward; heads several to numerous, corymbose; involucre 5–8 mm high, 6–10 mm wide; main bracts 8–17, lance-oblong, brownish or greenish, with scarios margins, blackish tips, and hair-tufted apices; outer bracts very short; rays 7–10, yellow, 5–10 mm long; pappus white; achenes glabrous or puberulent along the ribs; *n* = 20. Grass-forb, ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine tundra communities, at 1615 to 3450 m in Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Wayne counties; British Columbia and Mackenzie south to Arizona and New Mexico; 104 (xiv). Our material belongs to var. *kingii* (Rydb.) Greenman [*S. kingii* Rydb., type from Cottonwood Canyon]. This plant forms intermediates with *S. spartioides*.

Senecio fendleri Gray Fendler Groundsel. Perennial rhizomatous herbs, with a caudex more or less developed; stems mainly 5–30 cm tall, erect or ascending; herbage floccose-tomentose; basal leaves petiolate, the blades 1–6 cm long, 4–20 mm wide, pinnatifid or pinnately lobed; cauline leaves reduced upward, becoming sessile, finally

bracteate; heads 3 to many, corymbose; involucre 4–6 mm high, 5–8 mm wide; main bracts ca 13, lance-attenuate, greenish, the margins scarious or hyaline, minutely hairy apically, more or less tomentose below; outer bracts very short; ray flowers lacking; pappus white; achenes glabrous; $n = 23$. Ridge tops on limestone barrens near Musineca Peak, at ca 2960 to 3295 m in Sanpete County, (Lewis 4274, 5516 BRY); Wyoming south to New Mexico; 2 (0). Our specimens approach *S. canus*, more or less.

***Senecio foetidus* Howell** Foetid Senecio. Perennial herbs from a short erect root crown, mainly 3–10 dm tall; leaves thickish and somewhat succulent, generally dentate, the basal and lowermost cauline ones petiolate, the blades 6–25 cm long, 2–7 cm wide, elliptic to broadly oblanceolate; the middle and upper cauline leaves progressively reduced, finally sessile; heads numerous, the inflorescence congested; involucre 6–9 mm high, the bracts ca 13 (to 21), often black-tipped; rays few and to ca 8 mm long, or lacking; achenes glabrous. Wet meadows with false hellebore and hairgrass at ca 2680 m in Box Elder County (Goodrich 17824 BRY); British Columbia, Washington, Oregon, and Idaho; 1 (0).

***Senecio fremontii* T. & G.** Fremont Groundsel. Perennial herbs, subrhizomatous or from a caudex and taproot; stems 0.6–4 dm tall; herbage glabrous; leaves cauline, 1–6 cm long, 0.5–2 cm wide, oblanceolate to obovate, shortly petiolate or sessile and somewhat clasping, dentate to subentire; heads 1–5; involucre 6–12 mm high, 7–12 mm wide; main bracts 8–17, lance-oblong or lance-attenuate, green or brown, the margins scarious, tufted hairy apically; outer bracts short and inconspicuous or to half as long as the inner ones; rays 7–10, yellow, 5–12 mm long; pappus white; achenes glabrous or hairy. Two rather weak varieties are present.

1. Involucre mostly 8–10 mm high; stems mostly less than 20 cm high *S. fremontii* var. *fremontii*
- Involucre 10–12 mm high; stems often over 30 cm tall *S. fremontii* var. *blitoides*

Var. *blitoides* (Greene) Cronq. [*S. blitoides* Greene]. $2n = 40$. Alpine communities, often in talus or on rock outcrops, at 2745 to 3355 m in Salt Lake, Tooele, and Utah counties; Wyoming to Colorado; 9 (0).

Var. *fremontii* Spruce-lodgepole pine and alpine tundra communities at 3050 to 3965 m in Duchesne, Grand, San Juan, Salt Lake, Summit, Uintah, and Utah counties; British Columbia and Alberta, south to Oregon and Wyoming; 16 (v).

***Senecio hartianus* Heller** Hart Groundsel. Perennial herbs from a subrhizomatous or stoloniferous caudex; stems erect, 2–5 dm tall; herbage floccose-tomentose, sometimes glabrate; basal leaves petiolate, the blades 1–5 cm long, 0.5–3 cm wide, oval to obovate or elliptic, serrate or crenate, rounded apically; cauline leaves reduced upward, subpinnatisect to entire; heads 3–12, corymbose; involucre 4–7 mm high and as broad; main bracts 13–21, lance-attenuate, greenish, the tips glabrous; rays ca 10–13, yellow, 5–8 mm long; achenes glabrous. Ponderosa pine community at ca 2290 m in Kane County (Atwood 7425 BRY); Arizona; 1 (0).

***Senecio hydrophilus* Nutt.** Water Groundsel. Perennial subaquatic herbs from a caudex and fibrous roots; stems erect, mainly 4–10 dm tall; herbage glaucous, blue-green; basal and lower cauline leaves petiolate, the broad petioles with clasping bases, the blades 5–35 cm long or

more, 1–10 cm wide, elliptic to oblanceolate, entire or denticulate, thick and leathery; cauline leaves reduced upward, becoming sessile, finally bracteate; heads numerous in a branching corymbose cluster; involucre 5–8 mm long, 4–76 mm wide; main bracts 8–13, oblong or lance-attenuate, yellowish, the tips often black, tufted-hairy; rays 3–5 or lacking, yellow, 3–8 mm long; pappus white; achenes glabrous. Stream banks, pond margins, and wet meadows at 1375 to 2745 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Garfield, Juab, Kane, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties; British Columbia, south to California and Colorado; 25 (iv).

***Senecio integerrimus* Nutt.** Wet-the-bed; Gauge Plant. Perennial herbs with a short subrhizomatous caudex; stems mainly 1–6 (7) dm tall, erect; herbage arachnoid-villous or glabrate; basal and lower cauline leaves broadly petiolate, 3–20 cm long, 0.8–4 cm wide, lanceolate to elliptic or oblanceolate to oblong, entire or serrate to dentate, rounded to obtuse apically; cauline leaves reduced upward; heads few to many, in a corymbose to subumbellate cyme; involucre 6–12 mm high, 8–18 mm wide; main bracts 13–21, lance-attenuate, green, with scarious margins and black tips, the tips tufted-hairy; outer bracts very short; rays 8–13 (or lacking), yellow, 4–15 mm long; pappus white; achenes glabrous. Sagebrush, pinyon-juniper, forb-grass, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1460 to 3660 m in probably all Utah counties; British Columbia to Montana, south to California; 132 (xiv). Presumed hybrids with *S. dimorphophyllus* are known (Hansen sn 1976 BRY). This plant has been used by various livestock owners as a gauge to range condition. When it came into flower, the range was sufficiently developed for grazing to begin.

***Senecio multilobatus* T. & G.** Uinta Groundsel. [*S. lapidum* Greenman, type from Silver Reef]. Perennial (or biennial?) herbs from a taproot; stems mainly 1–6 dm tall; herbage glabrous, glabrate, or tomentose throughout or only in axils of basal leaves; basal leaves 2–12 cm long, 0.3–3.5 cm wide, spatulate to obovate in outline, pinnatifid to lyrate-pinnatifid, the segments variously again toothed, petiolate; cauline leaves reduced upward, finally bracteate; heads few to many, corymbose or subumbellate; involucre 4–9 cm high, 4–10 mm wide; main bracts 13–21, lance-attenuate or oblong-attenuate, the margins scarious, the apices hair-tufted; rays 7–13, yellow, 4–10 mm long, or lacking; pappus white; achenes glabrous; $2n = 46$. Blackbrush, desert shrub, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 915 to 3420 m in all Utah counties (type from the Uinta River); Idaho and Wyoming to California, Arizona, and New Mexico; 312 (xliv). This widespread and common species forms presumed hybrids with *S. streptanthifolius* and *S. neomexicanus*.

***Senecio neomexicanus* Gray** Perennial (or biennial?) herbs from a taproot; stems 14–40 cm tall, erect; herbage tomentose; basal and lower cauline leaves petiolate, the blades 1–5 cm long, 0.6–2 cm wide, oblanceolate to obovate or oval, dentate, serrate or subentire, toothed to obtuse apically; cauline leaves reduced upward, toothed to lobed or entire, bracteate in inflorescence; heads few to many, corymbose or subumbellate; involucre 4–7 mm high, 5–12 mm wide; main bracts 13–21, lance-attenu-

ate, green or brown, with scarios margins, not especially hairy apically; rays 8–13, yellow, 4–10 mm long; pappus white; achenes pubescent. Sagebrush, mountain brush, ponderosa pine, and aspen communities at 2105 to 3050 m in Garfield, Kane, San Juan, and Wayne counties; Colorado, New Mexico, and Arizona; 10 (0). Our materials are assigned to var. *mutabilis* (Greene) Barkley [*S. mutabilis* Greene]. Through this variety there is virtually a complete intergrading series into *S. uernerifolius*, *S. streptanthifolius*, and *S. multilobatus* (Barkley 1978).

Senecio pauperculus Michx. Balsam Groundsel. Perennial herbs from a subrhizomatous caudex; stems erect, mainly 2–4 dm tall; herbage glabrous or somewhat tomentose in axils of basal leaves; basal leaves petiolate, the blades mainly 2–6 cm long, 0.5–3 cm wide, oblanceolate to elliptic, obovate or ovate, crenate, dentate, or subentire; cuneate basally, toothed to obtuse apically; cauline leaves reduced upward, becoming sessile, pinnatifid, not especially auriculate, finally bracteate; heads few to many, corymbose or subumbellate; involucre 4–8 mm long, 5–9 mm wide; main bracts 13–21, lance-attenuate, often with scarios margins, the tips not especially tufted-hairy; outer bracts very short; rays 8–13, yellow or yellow orange, 4–10 mm long; pappus white; achenes glabrous or puberulent along the angles; $n = 20, 22, 44$. Lodgepole pine and spruce-fir communities, usually in moist meadows, at 2345 to 2745 m in Daggett, Garfield, Rich, Uintah, and Wasatch counties; Alaska to Labrador, south to Oregon and Georgia; 5 (0). Our material is intermediate to both *S. streptanthifolius* and *S. crocatus*.

Senecio pudicus Greene Butterweed. [*S. cernuus* Gray, not L.f.; *Ligularia pudica* (Greene) W. A. Weber]. Perennial herbs from a subrhizomatous caudex; stems 20–50 cm tall, erect; herbage glabrous; basal and lower cauline leaves petiolate, the blades 3–15 cm long, 0.5–3 cm wide, lanceolate to oblanceolate or narrowly elliptic, tapering basally, acute apically, entire or shallowly dentate; cauline leaves reduced upward, finally bracteate; heads few to many, nodding; involucre 5–9 mm long and as broad; main bracts 8–13, lance-oblong, green to brown, the margins scarios, tufted-hairy apically; outer bracts very short; ray flowers lacking; pappus white; achenes glabrous. Aspen, spruce-fir, and alpine tundra communities at 2650 to 3480 m in Carbon, Daggett, and Garfield counties; Colorado; 11 (i).

Senecio serra Hook. Saw Groundsel. Perennial herbs from a caudex, with coarse felt-covered roots; stems equally leafy, erect, 4–15 dm tall (or more), glabrous or sparingly tomentose; leaves 3–15 cm long, 0.4–4 cm wide, short-petiolate, the blades lanceolate to narrowly lanceolate or linear, dentate to subentire; heads several to numerous, corymbose; involucre 4–11 mm high, 2–10 mm wide; main bracts 8–13, lance-oblong, greenish to brownish, the margins scarios, black-tipped, hair tufted; outer bracts very short; rays 5–8, yellow, 3–10 mm long; pappus white; achenes glabrous or essentially so; $n = 20$. Two rather distinctive varieties are present.

1. Involucral bracts 4–6 mm long, 2–6 mm wide; disk flowers ca 12; plants of central and northern Utah *S. serra* var. *serra*
- Involucral bracts 6–8 mm long, 6–10 mm thick; disk flowers ca 20; plants of San Juan County *S. serra* var. *admirabilis*

Var. *admirabilis* (Greene) A. Nels. [*S. admirabilis* Greene]. Ponderosa pine and subalpine meadow communities at 1830 to 3185 m in San Juan County; Wyoming and Colorado; 2 (0).

Var. *serra* Sagebrush, mountain brush, aspen, forbgrass, lodgepole pine, and spruce-for communities at 1830 to 3035 m in Box Elder, Cache, Davis, Duchesne, Juab, Morgan, Rich, Salt Lake, Sanpete, Summit, Utah, Wasatch, and Weber counties; Washington to Montana, south to California and Nevada; 42 (vi).

Senecio spartioides T. & G. Broom Groundsel. Perennial herbs from a taproot; stems equally leafy, erect or ascending, 2–10 dm tall or more, often in clumps; herbage glabrous; leaves 2–10 cm long or more, linear, simple and entire or with linear lobes, mainly 1–3 mm wide (wider in some hybrid derivatives); heads several to many in branching corymbose cymes; involucre subcylindric to narrowly campanulate, 5–10 mm high, 4–8 mm wide; main bracts 8–13, lance-linear, green, the margins scarios, not tufted-hairy; outer bracts very short; rays 4–8, yellow, 7–12 mm long; pappus white; achenes white-hairy. Two intergrading varieties are present.

1. Leaves simple and unlobed, or, if lobed, lower cauline leaves often over 4 mm wide; plants widely spread *S. spartioides* var. *spartioides*
- Leaves commonly with 4–6 lateral lobes, seldom if ever more than 2.5 mm wide; plants of southeastern Utah *S. spartioides* var. *multicapitatus*

Var. *multicapitatus* (Greenman) Welsh [*S. multicapitatus* Greenman in Rydb.]. Warm desert shrub and pinyon-juniper communities, often in saline riparian sites, at 1220 to 1895 m in Emery, Garfield, Grand, San Juan, and Wayne counties; Colorado, Arizona, New Mexico; and Texas; 11 (vii). Barkley (1978) hesitated to combine *S. multicapitatus* with *S. spartioides*, because of field distinctions. They are, however, much alike and evidently lack diagnostic criteria that will allow segregation of all specimens. Further, specimens intermediate between *S. spartioides* and *S. eremophilus* bear "multicapitatus" leaves. I follow a moderate course in maintaining this taxon at varietal level.

Var. *spartioides* [*S. incurvus* A. Nels., type from Zion National Park]. Warm desert shrub, pinyon-juniper, sagebrush, mountain brush, and aspen communities, often in sand, at 1155 to 2870 m in Beaver, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, San Juan, Sanpete, Sevier, Uintah, Washington, and Wayne counties; Wyoming to South Dakota, south to California and New Mexico; 75 (xxv). Intermediates are formed with *S. eremophilus*.

Senecio sphaerocephalus Greene Roundhead Groundsel. [*S. lugens* var. *hookeri* D. C. Eaton, type from Summit (?) County]. Perennial herbs from a short stout rhizome; stems erect or ascending, 3–8 dm tall; herbage tomentose; basal leaves petiolate, the blades 4–15 cm long, 1–3.5 cm wide, oblanceolate to elliptic, entire or denticulate, obtuse apically; cauline leaves reduced upward, becoming sessile, finally bracteate; heads few to many, corymbose; involucre 3–7 mm long, 6–12 mm wide; main bracts 13–21, oblong- to ovate-lanceolate, greenish or brownish, with scarios margins, the tips black, hair-tufted apically; outer bracts very short; rays

8–13, yellow, 4–10 mm long; pappus white; achenes hairy; $2n = 40$. Lodgepole pine and spruce-fir communities, in meadows, at 2315 to 3205 m in Daggett, Duchesne, Summit, Uintah, and Wasatch counties; Oregon and Montana, south to Nevada and Wyoming; 10 (i).

Senecio streptanthifolius Greene Manyface Groundsel. [*S. aquariensis* Greenman, type from Aquarius Plateau; *S. jonesii* Rydb., type from Alta; *S. leonardii* Rydb., type from American Fork Canyon; *S. malmstenii* Blake in Tidestr., type from Little Podunk Creek, Kane County; *S. pammelii* Greene, type from Peterson, Morgan County; *S. platylobus* Rydb., type from the Wasatch Mts.; *S. rubricaulis* var. *aphanactis* Greenman, type from Logan; *S. wardii* Greene, type from Fish Lake Mt.]. Perennial herbs from a taproot and simple or branched and infrequently subrhizomatous caudex; stems erect, mainly 8–47 cm tall; herbage glabrous or rarely sparingly tomentose; leaves thickish; basal leaves petiolate, the blades 1–5 cm long, 0.3–3 cm wide, oblanceolate to obovate, suborbicular, elliptic, or ovate, crenate, dentate, or subentire, less commonly lobed; cauline leaves reduced upward, commonly some of them pinnatifid, finally bracteate; heads few to many, corymbose to subumbellate; involucre 4–8 mm high, 5–12 mm wide; main bracts 8–21, lance-oblong, green or brownish, the margins scarious, sparingly hair-tufted apically; outer bracts very short; rays 8–13, yellow, 5–8 mm long; pappus white; achenes glabrous; $2n = 23$. Sagebrush, mountain brush, ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine tundra communities, often in meadows, at 1370 to 3415 m in all Utah counties, except Beaver and Iron; Yukon to Northwest Territories, south to California and New Mexico; 107 (vii). This species forms a plexus around which revolves such species as *S. pauperculus*, *S. multilobatus*, *S. neomexicanus*, and *S. canus*, as judged from morphological intermediates, which are presumed to be hybrids.

Senecio triangularis Hook. Arrowleaf Groundsel. Perennial herbs from a caudex and more or less well-developed rhizome; stems equally leafy, erect, 2.5–12 dm tall or more; herbage glabrous or sparingly tomentose; leaves petiolate, the blades mainly 3–15 cm long, 0.5–6 cm wide, lance-oblong to triangular, abruptly contracted or subhastate at the base, dentate to sinuate-dentate or subentire, finally bracteate in the inflorescence; heads few to many, subcorymbose; involucre 6–12 mm high, 8–17 mm wide; main bracts 8–12, lance-attenuate, the margins often scarious, tufted-hairy apically; outer bracts very short; rays 5–9, yellow, 6–15 mm long; pappus white; achenes glabrous; $n = 20, 40$. Aspen-mountain brush, Douglas fir-white fir, lodgepole pine, and spruce-fir communities at 1765 to 3265 m in Cache, Daggett, Duchesne, Grand, Salt Lake, Summit, Uintah, Utah, Wasatch, and Weber counties; Alaska and Yukon, south to California and New Mexico; 25 (viii).

Senecio vulgaris L. Common Groundsel. Plants annual or biennial, with fibrous roots, 1–5.5 dm tall, the stems glabrous or sparingly villous; basal leaves smaller than the main cauline ones, often withered by anthesis; cauline leaves not much reduced upward, 2–10 cm long, 0.5–4.5 cm wide, irregularly pinnatifid, the lobes again toothed, glabrous or more or less villous, especially along the veins beneath, the lower ones petiolate, the upper ones becoming sessile and auriculate-clasping; heads few to many; involucre 5–8 mm high, 4–10 mm wide; outer bracts

short and black tipped, the inner lance-linear, green, with scarious margins, black tipped; ray flowers lacking; pappus white; achenes hairy; $2n = 20, 40$. Weedy species of disturbed sites in Cache, Salt Lake, and Utah counties; adventive from Europe; 6 (0).

Senecio wernerifolius (Gray) Gray Montana Groundsel. [*S. aureus* var. *wernerifolius* Gray]. Plants commonly rhizomatous or sololiferous herbs; stems erect or ascending, 3–18 cm tall; herbage tomentose, often glabrate or glabrous in age; basal leaves petiolate, the blades 0.6–3 cm long, 0.4–2 cm wide, oval to elliptic, obovate, or oblanceolate, thickish, sometimes revolute; cauline leaves few, commonly inconspicuous and bracteate; heads 1–4; involucre 4–10 mm long, 7–15 mm wide; main bracts 13–21, lance-oblong, green or suffused with purple, the margins scarious, hair tufted apically; outer bracts to half as long as the inner; rays 8–13, yellow, 4–10 mm long; pappus white; achenes glabrous; $n = 23$. Ponderosa pine, western bristlecone pine, aspen-conifer, and spruce-fir communities, often in semibarrens, at 2375 to 3600 m in Beaver, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Summit, and Utah counties; Idaho and Montana, south to California, Nevada, and Arizona; 28 (ii).

Solidago L.

Perennial herbs from a caudex or rhizome; leaves alternate, simple; heads numerous, radiate, yellow, borne in paniculate, racemose, or cymose clusters; involucre imbricate in several series or subequal, commonly chartaceous or with the tips green; receptacle flat, naked; ray flowers fertile; disk flowers perfect, fertile; anthers subentire basally; style branches with lanceolate appendages; pappus of capillary bristles; achenes few nerved, pubescent.

- 1. Heads in corymbs or flat-topped cymes; leaves punctate; plants of lower elevations riparian habitats [Euthamia] *S. occidentalis*
- Heads racemose or panicled; leaves not punctate; plants of various habitats 2
- 2(1). Stems glabrous 3
- Stems puberulent with short incurved hairs or villous with multicellular hairs 5
- 3(2). Involucre 2.5–4 mm long; plants definitely rhizomatous, of lower elevations *S. missouriensis*
- Involucre various; plants subrhizomatous, of high or low elevations 4
- 4(3). Plants with very large basal leaves, mainly 5–10 dm tall, known from saline seeps in western Utah and Washington County *S. spectabilis*
- Plants with basal leaves not especially large, mainly less than 5 dm tall, usually of high elevations ... *S. spathulata*
- 5(2). Stems villous with multicellular hairs; petioles long-ciliate *S. multiradiata*
- Stems puberulent with short incurved hairs; petioles scabrous or strigose marginally 6
- 6(5). Involucre 6–11 mm high, the outer bracts subfoliaceous *S. parryi*
- Involucre 2–5 mm high, the bracts not subfoliaceous ... 7
- 7(6). Leaves very numerous and much longer than the internodes, gradually attenuate or acuminate, not dimorphic, strongly 3-nerved *S. canadensis*

- Leaves not very numerous, often less than twice as long as the internodes, acute or rounded apically, often dimorphic, with lateral nerves obscure or moderately apparent 8
- 8(7). Leaves sparingly hairy to glabrous, the margins rough-hairy; plants widespread and common *S. sparsiflora*
- Leaves cinereous-puberulent with disoriented hairs, the margins hairy like the surfaces; plants more restricted and less common *S. nana*

Solidago canadensis L. Goldenrod. [*S. altissima* L.; *S. lepida* DC.]. Perennial herbs from creeping rhizomes; stems 3–12 dm tall or more; herbage puberulent with short incurved hairs, or the stems glabrous below; basal leaves often deciduous or withered at anthesis; cauline leaves numerous and crowded, 2–10 cm long or more, 3–20 mm wide, lanceolate to lance-linear, or narrowly elliptic, tapering to a sessile base, 3-nerved, serrate to entire, attenuate to acuminate apically; inflorescence commonly (but not always) of recurved branches with secund heads; involucre 2–5 mm high and about as broad, the bracts lance-attenuate, scarious or greenish; rays 10–17, yellow, 1–3 mm long; $n = 9, 20-24, 27$. Riparian and other mesic sites at 350 to 2290 m in all Utah counties; widespread in North America; 87 (xvi). This plant serves as host for a peculiar red and black leaf beetle. A phase of the species is cultivated as an ornamental in Utah. Designation of varietal level in Utah seems academic. The species is transitional to *S. sparsiflora*.

Solidago missouriensis Nutt. Missouri Goldenrod. Perennial herbs from creeping rhizomes; stems 2–5 (9) dm tall; herbage glabrous or sparingly puberulent in inflorescence only; basal leaves oblanceolate, often withered at anthesis; main cauline leaves 2–13 cm long, 0.4–1.5 cm wide, oblanceolate to elliptic or linear, tapering to a sessile base, mainly 3-nerved, entire or essentially so, acute to obtuse apically; inflorescence compact, with ascending branches, somewhat or not at all secund; involucre mostly 3–5 mm high and as broad, the bracts lance-attenuate, greenish to scarious; rays 7–13, yellow, 2–3 mm long; $2n = 18, 36$. Riparian communities at 1525 to 2475 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, and Wasatch counties; British Columbia to Ontario, south to Arizona, Texas, and Tennessee; 13 (ii).

Solidago multiradiata Ait. Low Goldenrod. [*S. ciliosa* Greene]. Perennial herbs from a rhizome or rhizomatous caudex; stems 5–45 cm tall; herbage villous with multicellular hairs, at least on upper stem and petiole bases; basal and lower cauline leaves 1.5–14 cm long, 5–24 mm wide, oblanceolate to spatulate or elliptic, tapering to a conspicuously ciliate petiole, obscurely 3-nerved, entire or serrate, rounded to obtuse apically; inflorescence loosely to densely corymbose; involucre 4–6 mm high, 5–7 mm wide, the bracts lance-oblong, green apically, with prominent midvein; rays ca 13, yellow, 4–5 mm long; $2n = 18, 27, 36$. Aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 2745 to 3660 m in Beaver, Cache, Carbon, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Kane, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, and Utah counties; Alaska to Quebec, south to California and New Mexico; 84 (xvii). Our specimens belong to var. *scopulorum* Gray.

Solidago nana Nutt. Dwarf Goldenrod. [*S. radulina* Rydb., type from Cottonwood Canyon]. Perennial herbs from a rhizome or subrhizomatous caudex; stems 13–48

cm tall; herbage densely canescent with fine hairs of mixed orientation; basal and lower cauline leaves petiolate, 1.5–9 cm long, 0.7–2.3 cm wide, oblanceolate to spatulate, tapering to a petiole, weakly 3-nerved, entire or slightly toothed, rounded to obtuse apically; cauline leaves definitely reduced upward; inflorescence corymbose, seldom if at all secund; involucre 4–6 mm high and about as broad; rays 5–8, yellow, 3–4 mm long. Desert shrub upward to spruce-fir communities, mainly in riparian or wet meadow sites, at 1460 to 2745 m in Daggett, Duchesne, Emery, Kane, Salt Lake, Sevier, Summit, Uintah, Utah, and Wasatch counties; Idaho to Montana, south to Arizona and Colorado; 15 (i).

Solidago occidentalis (Nutt.) T. & G. Western Goldenrod. [*Euthamia occidentalis* Nutt.]. Perennial herbs from elongate rhizomes; stems erect, branched above, mainly 4–12 (20) dm tall; herbage essentially glabrous; leaves numerous, sessile, linear to lance-linear, 2–10 cm long, 1–10 mm wide; inflorescence usually large, leafy-bracted, broadly rounded; involucre 3.5–4.5 mm high and about as broad, the bracts narrowly oblong, greenish apically, the midnerve conspicuous; rays 15–30, yellow, 1.5–2.5 mm long; $n = 9$. Riparian habitats at 850 to 1650 m in Box Elder, Cache, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Kane, Salt Lake, San Juan, Sevier, Uintah, Utah, Washington, and Weber counties; British Columbia and Alberta, south to California, New Mexico, and Nebraska; 42 (x). I follow tradition by including this taxon in *Solidago*; it might best be treated in *Euthamia*.

Solidago parryi (Gray) Greene Parry Goldenrod. [*Haplopappus parryi* Gray; *H. parryi* var. *minor* Gray, type from Alta]. Perennial rhizomatous herbs; stems erect or ascending, 8–50 cm tall; herbage scabrous to hispidulose; basal and lower cauline leaves petiolate, mainly 3–20 cm long, 0.9–3.8 cm wide, oblanceolate to elliptic, entire, obtuse to rounded apically; cauline leaves becoming sessile and smaller upward, more or less clasping; heads few to many in compact branched cymes; involucre 8–11 mm high, 7–14 mm wide; outer bracts ovate to ovate-lanceolate, green, ciliate, the bases often scarious; inner bracts narrower and with scarious or hyaline margins; rays 12–20, yellow, 5–8 mm long; $n = 9$. Aspen, tall forb, lodgepole pine, spruce-fir, and alpine tundra communities at 2285 to 3570 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wasatch counties; Wyoming, New Mexico, Arizona; 50 (ix).

Solidago sparsiflora Gray Alcove Goldenrod. [*S. garrettii* Rydb., type from Big Cottonwood Canyon]. Perennial rhizomatous herbs; stems erect or ascending, mainly 15–50 dm tall; herbage puberulent (often sparingly so on leaf surfaces); leaves cauline or basal, oblanceolate to elliptic or spatulate, mainly 1–10 cm long, 2–25 mm wide, entire or less commonly some of them serrate, acute to attenuate or obtuse to rounded apically, often dimorphic, with the upper ones reduced in size; inflorescence a pyramidal to conic or cylindrical cluster, compact or with branches curved and heads secund; involucre 4–6 mm high and about as broad; bracts oblong to subulate, chartaceous basally, green apically, the midvein conspicuous; rays 5–10 or more, yellow, 3–4 mm long; $n = 9, 18$. Piñon-juniper, mountain brush, sagebrush, aspen, ponderosa pine, and spruce-fir communities at 1125 to 3050 m in all Utah counties (except Box Elder and

Morgan); Wyoming and South Dakota, south to Arizona and Nevada: 141 (xix). Our materials are far from uniform; in the hanging gardens of southeastern Utah they are transitional to *S. canadensis* (having more ray flowers), and at high elevations they are more or less intermediate with *S. spathulata*. Possible additional influence of *S. mollis* Bartling and/or *S. nemoralis* Ait. is indicated, although they are not known from the state currently.

***Solidago spathulata* DC.** Coast Goldenrod. Perennial herbs from a subrhizomatous caudex; stems 5–30 cm tall (rarely more), erect or ascending; herbage glabrous or somewhat scabrous and often glutinous above; basal leaves oblanceolate to spatulate, 2–15 cm long, 8–30 mm wide, serrate to entire, obtuse to rounded apically; cauline leaves reduced upward, finally sessile and more or less clasping; inflorescence compact to elongate, narrow, the heads not secund; involucre 4–6 mm high and as broad or more; bracts oblong, scarious or greenish along the prominent midvein; rays 5–10, yellow, 2.5–4 mm long; $n = 9$. Aspen, spruce-fir, and alpine tundra communities at 2440 to 3510 m in Beaver (?), Daggett, Duchesne, Emery, Garfield, Grand, San Juan, Sevier, Summit, and Uintah counties; Alaska to Quebec, south to California, Arizona, and New Mexico; 21 (v). Two completely intergrading phases, regarded as varieties, are present in Utah; a tall montane phase known as var. *neomexicana* (Gray) Cronq. [*S. multiradiata* var. *neomexicana* Gray], and a dwarf alpine phase known as var. *nana* (Gray) Cronq. [*S. humilis* var. *nana* Gray; *S. decumbens* Greene].

***Solidago spectabilis* (D. C. Eaton) Gray** Nevada Goldenrod. [*S. guiradonis* var. *spectabilis* D. C. Eaton]. Perennial herbs from a subrhizomatous caudex; stems 4–13 dm tall, erect or ascending; herbage glabrous or hispidulous above; basal leaves oblanceolate, petiolate, 9–20 cm long or more, 1–2 cm broad or more, the cauline leaves much reduced upward; inflorescence more or less paniculate, dense, often less than 10 cm long, the heads secund; involucre 3–4 mm high and as broad; bracts linear-oblong, obtusish, scarious or greenish along the midvein; involucre 4–4.5 mm high, rays 4–7 (11–15), yellow; disk flowers ca 8–10 (15–22); achenes puberulent. Saline seeps at ca 885 m in Millard and Washington counties; Oregon, California, and Nevada; 3 (ii). Our material differs from Nevada specimens in the more open inflorescence and fewer florets.

***Sonchus* L.**

Annual or perennial herbs from taproots or deep-seated, rhizomelike roots, the juice milky; leaves chiefly cauline, alternate, simple, entire to lobed or pinnatifid; heads few to several; involucre bracts imbricate in several series, green or greenish (drying brownish), the inner ones with hyaline margins; receptacle naked; corollas of ray flowers only, yellow, perfect; pappus of capillary bristles; style branches semicylindrical; achenes compressed, several to many nerved, beakless, glabrous.

- 1. Plants perennial, spreading from rhizomelike roots; involucre more than 14 mm long in fruit 2
- Plants annual from taproots, involucre less than 14 mm long in fruit 3
- 2(1). Involucre and peduncles bearing coarse stipitate glands *S. arvensis*
- Involucre and peduncles glabrous or tomentose, not stipitate-glandular *S. uliginosus*

- 3(1). Leaves sharply and narrowly toothed, and sometimes lobed; achenes not transversely wrinkled, merely longitudinally nerved *S. asper*
- Leaves sharply and broadly toothed, or merely toothed and lyrate pinnatifid; achenes transversely wrinkled and longitudinally nerved *S. oleraceus*

***Sonchus arvensis* L.** Field Sow-thistle. Plants perennial with deep-seated rhizomelike roots; stems 4–10 dm tall or more, pubescent with coarse stipitate glands, at least above, and often glabrous below; leaves 5–40 cm long, 0.8–10 cm broad, more or less pinnatifid, auriculate-clasping basally, acute to obtuse apically, prickly margined; heads few to several, the peduncles stipitate-glandular; involucre 14–20 mm high and 10–30 mm broad in fruit, the bracts lance-oblong to lance-linear, glandular like the peduncles; rays yellow, mostly 10–20 mm long; achenes transversely wrinkled; $n = 18, 36, 54$. Weedy species of disturbed soils at 1370 to 2135 m in Cache, Duchesne, Salt Lake, and Utah counties; widely distributed and considered as a “noxious” weed in North America; adventive from Europe; 10 (0).

***Sonchus asper* (L.) Hill** Spiny Sow-thistle. [*S. oleraceus* var. *asper* L.; *S. a.* var. *glandulifera* Garrett, type from Utah?]. Plants annual from taproots; stems 3–10 dm tall, pubescent with coarse stipitate glands, at least above, often glabrous below (less commonly throughout); leaves 3–15 cm long, 1–5 cm broad, merely lobed or lobeless, auriculate-clasping basally, acute to acuminate or less commonly obtuse apically, the margins armed with slender sharp prickles; heads few to several, the peduncles stipitate-glandular or glabrous; involucre 9–14 mm long and 10–16 mm wide in fruit, the bracts lance-oblong to lance-linear, glabrous or with few stipitate glands; rays yellow, mostly 5–10 mm long; achenes 2–3 mm long, several nerved, not transversely wrinkled; $2n = 18, 36$. Weed of disturbed sites at 760 to 2135 m in Box Elder, Cache, Duchesne, Garfield, Grand, Kane, Millard, Piute, Salt Lake, San Juan, Sevier, Tooele, Uintah, Utah, and Washington counties; widespread in North America; adventive from Europe; 27 (ii).

***Sonchus oleraceus* L.** Common Sow-thistle. Plants annual from taproots, the stems 2–10 dm tall or more, glabrous throughout or sometimes with stipitate glands above; leaves 4–20 cm long, 0.6–10 cm broad, more or less lyrate-pinnatifid, auriculate-clasping basally, acute to obtuse apically, irregularly and broadly toothed, the teeth weakly prickly; heads few to several, the peduncles glabrous or stipitate-glandular; involucre 10–13 mm high and 8–20 mm broad in fruit, the bracts lance-linear to lance-oblong, glabrous or with a few stipitate glands; rays yellow, mostly 8–12 mm long; achenes 2–3 mm long, several nerved and transversely wrinkled; $2n = 18, 32, 36$. Weeds of disturbed sites at 850 to 2135 m in Cache, Duchesne, Garfield, Salt Lake, Utah, and Washington counties; widely distributed in North America; adventive from Europe; 9 (i).

***Sonchus uliginosus* M. Bieb.** Meadow Sow-thistle. Plants perennial from deeply seated rhizomelike roots; stems 4–10 dm tall or more; herbage glabrous or obscurely tomentose; leaves 5–40 cm long, 0.8–10 cm wide, pinnatifid, auriculate-clasping basally, acute to obtuse apically, prickly margined; heads few to several, the peduncles glabrous; involucre mainly 14–16 mm high and 10–20 mm broad in fruit; bracts lance-linear to -oblong, glabrous or tomentose; rays yellow, mostly 10–20 mm

long; achenes 2–3.5 mm long, several nerved, transversely wrinkled; $2n = 18, 27, 36$. Weeds of disturbed sites at 1220 to 2260 m in Daggett, Duchesne, Garfield, Grand, Juab, Salt Lake, Uintah, and Utah counties; widespread in North America; adventive from Europe; 22 (ii). Authors of *Flora Europaea* (Tutin et al. 1976) treat this entity as *S. arvensis* ssp. *uliginosus* (M. Bieb.) Nyman. Arnov et al. (*Flora of the Central Wasatch Front, Utah*) discount the usefulness of stipitate glands as diagnostic features, noting that glandular and eglandular plants occur together in the same populations, and that glands are not correlated with other features. On a statewide basis the plants act like legitimate taxa, and the eglandular plants do seem to have somewhat smaller heads.

Sphaeromeria Nutt.

Perennial herbs or subshrubs; leaves alternate or mainly basal, simple and entire or pinnatifid to palmatifid; heads discoid, few to several, corymbose to subcapitate; involucre hemispheric to campanulate; bracts in 2 or 3 series, imbricate to subequal; receptacle conic or concave, naked; outer flowers pistillate, fertile; disk flowers perfect, fertile; pappus lacking or a short crown; achenes usually 5- to 10-ribbed, glabrous or glandular.

Holmgren, A. H., L. M. Shultz, and T. K. Lowrey. 1976. *Sphaeromeria*, a genus closer to *Artemisia* than to *Tanacetum* (Asteraceae: Anthemidae). *Brittonia* 28: 255–262.

1. Heads capitately arranged on subscapose branches; plants pulvinate-caespitose, known from Garfield County. *S. capitata*
- Heads in paniculate or corymbose clusters on leafy branches; plants caulescent subshrubs, not of Garfield County 2
- 2(1). Leaves pinnatifid, at least some, tomentose; heads paniculate; plants of Washington County *S. ruthiae*
- Leaves entire or pinnatifid, glabrous; heads corymbose; plants not of Washington County *S. diversifolia*

Sphaeromeria capitata Nutt. [*Tanacetum capitatum* (Nutt.) T. & G.]. Pulvinate-caespitose herbs; herbage canescent with malpighian hairs; stems subscapose, 2–12 (20) cm tall; leaves mainly basal, 4–10 mm long, 1- or 2-palmately lobed, the cauline entire and reduced upward; heads few to numerous in a compact headlike cluster; involucre 3–5 mm high, the broad bracts with hyaline margins; corollas 2.5–3 mm long. With western bristlecone pine on Cedar Breaks Limestone, at ca 2380 m in Garfield County; Montana and Wyoming; 1 (0).

Sphaeromeria diversifolia (D. C. Eaton) Rydb. [*Tanacetum diversifolium* D. C. Eaton, type from American Fork Canyon]. Subshrubs, mainly 1–4 dm tall; herbage glabrous; leaves simple, entire, or some of them pinnately lobed, 8–55 mm long, 0.5–5 mm wide, linear; heads several to many in compact to open corymbose clusters; involucre 3–4 mm high, the broad bracts with hyaline margins; corollas 2–2.5 mm long. Juniper, mountain brush, mixed conifer, and aspen communities upward to alpine tundra, often in rock crevices, at 1370 to 3205 m in Davis, Juab, Millard, Salt Lake, Tooele, and Utah counties; Nevada; 33 (i). This is a Great Basin endemic.

Sphaeromeria ruthiae Holmgren, Shultz, & Lowrey Subshrubs, mainly 3–7 dm tall; herbage tomentose-canescens with malpighian hairs; leaves pinnately lobed

or the upper ones entire, 1–9 cm long, 2–4 mm wide or more; heads several to many, paniculate; involucre 3–5 mm high, the broad bracts with hyaline margins; corollas 1.8–2 mm long, yellow. Crevices in Navajo Sandstone, ponderosa pine community, in Washington County (type from Zion Canyon); endemic; 5 (0).

Stephanomeria Nutt.

Annual, biennial, or perennial herbs with milky juice; leaves alternate, often pinnatifid; flowers all raylike, perfect, pink or white; involucre cylindrical; main bracts few, subequal; outer bracts much shorter; receptacle naked; pappus of plumose bristles (barbellate in *S. spinosa*); achenes 5-angled or -ribbed.

1. Plants annual, from slender taproots *S. exigua*
- Plants perennial, a caudex often more or less developed 2
- 2(1). Plants spinescent; pappus barbellate *S. spinosa*
- Plants unarmed; pappus plumose 3
- 3(2). Involucre 12–15 mm high; heads with 10 or more flowers *S. parryi*
- Involucre 5–12 mm high (rarely higher); heads with 3–9 flowers 4
- 4(3). Main leaves runcinate-pinnatifid; plants commonly 1–2 dm tall *S. runcinata*
- Main leaves entire or pinnatifid, often deciduous at anthesis; plants commonly 2–8 dm tall 5
- 5(4). Stems very slender; leaves filiform to linear, entire or dentate; pappus bristles white (rarely brownish), plumose to the base *S. tenuifolia*
- Stems not very slender; leaves linear-subulate, often pinnatifid or lobed; pappus brownish, scabrous toward the base *S. pauciflora*

Stephanomeria exigua Nutt. Annual Wirelettuce. Annual or biennial (winter annual) herbs from slender taproots; herbage glabrous or puberulent; stems 5–60 cm tall, erect and commonly branched from the base upward, often fistulose; main leaves 1–6 cm long, pinnatifid to bipinnatifid, deciduous or withered by anthesis; cauline leaves soon reduced and bracteate upward; heads more or less corymbose, terminating bracteate branchlets; involucre 5–10 mm high, 3–4.5 mm wide; main bracts usually 3–5; rays pink or white, 3–5 mm long; pappus of white to off-white bristles plumose in the upper half; achenes 3–4 mm long, tuberculate; $n = 8$. Warm, mixed cool, and salt desert shrub, and pinyon-juniper communities, often in sand, at 850 to 2230 m in Beaver, Emery, Garfield, Grand, Iron, Kane, Millard, San Juan, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Oregon to Wyoming, south to California and New Mexico; 84 (x).

Stephanomeria parryi Gray Parry Wirelettuce. Perennial herbs; stems 1 to few, weak, branching, 8–25 cm tall; herbage glabrous; leaves 2–8 cm tall, runcinate-pinnatifid, thickish, the lobes weakly spinulose-tipped; heads terminating very short bracteate branches, 10- to 14-flowered; involucre 12–15 mm high; rays whitish, 15–20 mm long; pappus bristles tawny, scabrous at the base only; achenes 3–4 mm long, not rugose; $n = 16$. Blackbrush community at ca 1460 m in Kane County (Atwood & Allen 2822a BRY); California to Arizona; 1 (0).

Stephanomeria pauciflora (Torr.) A. Nels. in Coult. & Nels. Fewflower Wirelettuce. [*Prenanthes?* *pauciflora*

Torr.]. Perennial herbs (or somewhat woody below) from a caudex, branched from the base, mostly 30–60 cm tall; herbage glabrous; main leaves 2–7 cm long, runcinate-pinnatifid, the lobes weakly spinulose-toothed; heads terminating short to elongate branchlets, 3- to 5-flowered; involucre 8–10 high, 3–5 mm wide; main bracts 5; rays pink or white, mainly 4–7 mm long; pappus bristles brownish, plumose except at the base; achenes 3.5–7 mm long, striate, more or less wrinkled; $n = 8$. Warm, salt, and mixed desert shrub, and juniper communities, often in sandy soil, at 760 to 1525 m in Beaver, Garfield, Grand, Juab, Kane, Millard, San Juan (?), Tooele, and Washington counties; California to Kansas, south to Texas and Mexico; 26 (v).

Stephanomeria runcinata Nutt. Desert Wirelettuce. Perennial herbs from a caudex; stems branched from the base, mostly 8–25 (30) cm tall; herbage glabrous, scabrous, or sparingly villous; main leaves 2–7 cm long, runcinate-pinnatifid, the lobes merely cuspidate; heads terminating naked or sparingly bracteate branchlets, commonly 5-flowered; involucre 9–12 mm high, 3.5–7 mm wide; rays pink, mainly 8–12 mm long; pappus bristles white, plumose almost to the base; achenes 4–5 mm long, tuberculate; $n = 8$. Salt desert shrub and pinyon-juniper communities at 1250 to 2535 m in Daggett, Duchesne, Emery, Grand, Uintah, and Wayne counties; Montana to Nebraska and Colorado; 17 (i).

Stephanomeria spinosa (Nutt.) Tomb Thorn Wirelettuce. [*Lygodesmia spinosa* Nutt.]. Perennial herbs from a woody caudex, the caudex branches clothed with brownish marcescent leaf bases, the axils copiously villous-hairy; stems 11–52 cm tall, thorny; herbage glabrous upward or the branches puberulent; leaves linear 0.5–7 cm long, 1–3 mm wide, reduced to bracteate scales upward, often lacking at anthesis; heads terminal on short lateral branches or sessile, 3- to 5-flowered; involucre 5.7–10 mm high, 3–5 mm wide; main bracts oblong to lance-oblong, green or often suffused with purple; outer bracts proportionately broader; rays pink, 3–5 mm long; pappus bristles off-white, scabrous throughout; achenes 4–6.5 mm long, smooth; $n = 8$. Desert shrub, sagebrush-grass, pinyon-juniper, mixed conifer, and aspen communities, often in moist sites, at 1675 to 3050 m in Beaver, Box Elder, Emery, Garfield, Juab, Kane, Millard, Piute, Sevier, Tooele, Washington, and Wayne counties; British Columbia to Montana, south to California and Arizona; 41 (ii).

Stephanomeria tenuifolia (Torr.) Hall Slender Wirelettuce. [*Prenanthes? tenuifolia* Torr.]. Perennial herbs from a woody caudex; caudex branches lacking or with few marcescent leaf bases, not hairy; stems 25–100 cm tall or more; herbage glabrous or puberulent; leaves filiform to linear, 1–8 (11) cm long, 1–3 (8) mm wide, entire or dentate, much reduced upward; heads terminating elongate or short lateral bracteate branchlets, 5-flowered; involucre 8–11.2 (16) mm high, 3–5 mm wide; main bracts lance-oblong, green, puberulent or glabrous; outer bracts very short; rays 4–8 (10) mm long, pink; pappus bristles white, dull white, or less commonly brownish, plumose to the base; achenes 4–6 mm long, longitudinally ribbed, smooth. Two more or less distinctive phases are present, recognizable as varieties.

1. Involucre 10–16 mm high, the bracts attenuate; basal leaves bipinnatifid, at least some of plants of Uintah County *S. tenuifolia* var. *uintahensis*

- Involucres mainly 8–11.2 mm high, the bracts not especially attenuate; basal leaves seldom if ever bipinnatifid, plants of rather broad distribution *S. tenuifolia* var. *tenuifolia*

Var. *tenuifolia* Desert shrub, hanging garden, pinyon-juniper, mountain brush, ponderosa pine, and white-fir communities, at 1155 to 2746 m in Beaver, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, San Juan, Sevier, Uintah, Washington, and Wayne counties; British Columbia to Montana, south to California, Arizona, and Texas; 46 (xvi). The great sprawling plants of the canyonlands portion of Utah might be worthy of taxonomic consideration; sometimes they approach *S. pauciflora* in having tawny pappus bristles.

Var. *uintahensis* Goodrich & Welsh Ponderosa pine community at ca 2490 m in Uintah (type from Brownie Canyon) County; endemic; 2 (0).

Stylocline Nutt.

Woolly annual herbs; stems commonly branched; leaves alternate, simple, entire; heads discoid, leafy bracted; involucre per se lacking; outer receptacular bracts subtending and enclosing pistillate flowers; receptacle cylindrical; pistillate flowers many, deciduous with the enclosing bract, the bract apex hyaline; corollas filiform; pappus none; perfect flowers (functionally staminate) few, surrounded by linear hyaline bracts; corollas tubular, the ovaries vestigial; pappus of 3–5 deciduous bristles; anthers sagittate basally; achenes ellipsoid, few nerved.

Stylocline micropoides Gray Desert Nest-straw. Annual woolly herbs; stems usually branched, 4–12 cm tall; leaves 4–12 mm long, 0.5–1.5 mm wide, acute; bracteate leaves 6–10 mm long, 1.5–2.5 mm wide, lanceolate; heads clustered at branch tips, densely woolly; pistillate flowers with bracts boat-shaped, densely long-woolly, hyaline margined; staminate flowers with pappus of 3–5 deciduous bristles; achenes ellipsoid, ca 1.5 mm long; $n = 14$. Blackbrush, bursage, and indigo bush communities at 915 to 1160 m in San Juan and Washington counties; California to New Mexico, south to Mexico; 3 (i).

Syntrichopappus Gray in Torr.

Annual herbs; stems simple or branched; leaves alternate (or some opposite below), simple, entire or lobed; heads radiate, many, terminating branchlets; involucre subcylindric; bracts few, in 1 series, partly enclosing ray achenes; receptacle flat, naked; ray flowers pistillate, fertile, yellow; disk flowers perfect, fertile, yellow; anthers obtuse at base; style branches flattened; pappus of barbellate bristles; achenes 5-angled.

Syntrichopappus fremontii Gray Annual herbs, 2–14 cm tall; herbage floccose-tomentose; leaves 5–22 mm long, narrowly spatulate to spatulate, rounded to 3-lobed apically, cuneate basally; heads few to many; involucre 5–6 mm high, 3–4 mm wide; bracts 5, oblong, greenish, with scarious margins, abruptly acute apically; rays 5, yellow, 2–5 mm long; disk corollas numerous, yellow; pappus of white barbellate bristles falling together; $n = 6$. Joshua tree, creosote bush, blackbrush, sagebrush, and juniper communities at 760 to 1375 m in Washington County; California, Nevada, Arizona; 8 (i).

Tanacetum L.

Perennial herbs from a rhizome; leaves alternate, 2- to 3-pinnatifid; heads discoid, numerous, corymbose; flow-

ers perfect; involucre hemispheric; bracts in 2 or 3 series, more or less imbricate, the margins scarious; receptacle low-convex, naked; anthers entire at the base; pappus a minute crown; achenes 5-angled, truncate.

Tanacetum vulgare L. Tansy. Aromatic, glabrous or sparingly tomentose perennials, 3-10 (15) dm tall; leaves 6-15 cm long, sessile or subsessile, the blades 2- to 3-pinnatifid; heads many, discoid, yellow; involucre ca 4-5 mm high and 6-10 mm broad; bracts lanceolate; marginal flowers 3-lobed; inner flowers 5-lobed; achenes glandular, 5-angled, ca 1 mm long; $n = 9$. Weedy species of disturbed soils at 1370 to 1985 m in Emery, Uintah, and Utah counties; widespread in the U.S.; adventive from Europe; 3 (0).

Taraxacum Weber

Perennial scapose herbs with milky juice, from taproots; leaves all basal, pinnatifid to subentire; heads solitary on a scape; involucre bracts in 2 series, herbaceous, the outer shorter, the inner often dilated or appendaged apically, usually with broad hyaline or scarious margins, at least basally; receptacle naked; corollas of ray flowers only, perfect, yellow; pappus of capillary bristles; style branches semicylindric; achenes angular or terete, prominently nerved or ribbed, usually spinulose or with ridges near the body apex, glabrous, beaked.

1. Inner involucre bracts commonly dilated or bearing appendages apically, over 10 cm long; plants indigenous, of high elevations *T. ceratophorum*
- Inner involucre bracts usually not dilated or with appendages apically; plants various 2
- 2(1). Outer bracts reflexed or spreading, the inner ones 12-18 mm long; achenes straw colored to olive drab or brownish; plants adventive *T. officinale*
- Outer bracts erect, the inner ones 6-10 mm long; achenes black to grayish; plants indigenous at high elevations *T. lyratum*

Taraxacum ceratophorum (Ledeb.) DC. Rough Dandelion. [*Leontodon ceratophorus* Ledeb.]. Plants mostly 4-10 cm tall, from a simple or branched caudex; leaves 4-8 cm long, 0.7-2 cm broad, subentire to toothed; scapes sparingly villous, moderately so below the head; involucre 12-17 mm high in flower, the outer bracts ovate to lanceolate, appressed or ascending, the inner ones lance-oblong, attenuate, the apex dilated or appendaged; rays yellow; achene bodies 3-7 mm long, straw colored to olive-drab or brownish, the beak usually 2-4 times longer than the body; pappus white; $2n = 16, 24, 32, 40, 80$. Spruce krummholz and sedge-forb meadows at 3230 to 3660 m in Daggett, Duchesne, Summit, and Uintah counties (Leidy Peak); Alaska to Yukon, east to the Atlantic, south to California, New Mexico, and Massachusetts; circumboreal; 6 (0).

Taraxacum lyratum (Ledeb.) DC. Alpine Dandelion. [*Leontodon lyratus* Ledeb.]. Plants mostly 2-8 cm tall, from a simple or branched caudex; leaves 1-6 cm long, 0.3-1 cm wide, pinnately lobed to pinnatifid or subentire; scapes glabrous or nearly so; involucre 6-10 mm high, the outer bracts lanceolate-ovate, appressed or ascending-spreading, the inner ones lance-oblong to oblong, scarcely or slightly dilated; rays yellow (fading bluish); achene bodies 3-6 mm long, black or grayish, the beak subequal to the body; pappus white. Alpine tundra

and meadows in spruce-fir communities at 3325 to 3965 m in Daggett, Duchesne, San Juan, and Summit counties; Alaska and Yukon, south to Nevada, Arizona, and Colorado; Asia 7 (i).

Taraxacum officinale Weber ex Wiggers Common Dandelion. Plants mostly 3-60 cm tall, from a simple or branched caudex; leaves 5-40 cm long, 1-10 cm wide, pinnately lobed to pinnatifid, the terminal lobe broader than the lateral ones; scapes villous to subglabrous, often moderately to densely villous below the head; involucre 15-25 mm high in flower, the outer bracts lance-acuminate, reflexed, the inner ones lance-attenuate, not or scarcely dilated apically, rarely appendaged; rays yellow, or bluish externally; achene bodies 3-4 mm long, straw colored to olive drab, the beak usually 2-4 times longer than the body; pappus white; $2n = 24, 48$. Ubiquitous brightly flowered weedy species at 885 to 3205 m throughout Utah; widespread in North America; adventive from Eurasia; 65 (xiii). This handsome plant is among the earliest of our spring flowers, and among the last to bloom in autumn.

Tetradymia DC.

Armed or unarmed shrubs; stems pannose-tomentose; leaves alternate, entire, foliaceous or modified as spines, with secondary leaves fasciculate in the axils; heads discoid, corymbose or racemose; involucre cylindrical to turbinate or hemispheric; receptacle naked; bracts 4-6, equal or nearly so; flowers 4-8, yellow or cream; style branches truncate to rounded or conic apically; anthers sagittate basally; pappus of capillary bristles or barbellate scales; achenes striate. Note: At least some, and probably all, species are poisonous to livestock, especially to sheep, in which consumption results in a syndrome known as "big head."

Strother, J. L. 1974. Taxonomy of *Tetradymia* (Compositae: Senecionieae). *Brittonia* 26: 177-202.

1. Heads solitary or 2 or 3, axillary; primary leaves modified as spines 2
- Heads several to many in terminal corymbose clusters; primary leaves foliaceous or modified as spines 3
- 2(1). Spines commonly recurved, mainly 5-20 mm long, pannose-tomentose; achenes 6-8 mm long; plants widespread, not of Washington County *T. spinosa*
- Spines straight, mainly 20-40 mm long, glabrescent; achenes 4-5 mm long, plants of Washington County *T. axillaris*
- 3(2). Primary leaves modified as persistent spreading, straight or recurved spines 5-25 mm long *T. nuttallii*
- Primary leaves not modified as persistent spines, if at all spinescent then appressed-ascending 4
- 4(3). Primary leaves linear-subulate, spinescent apically, appressed-ascending, tomentose; secondary leaves obtuse apically, glabrous or essentially so *T. glabrata*
- Primary leaves various but not spinescent, not contrasting in shape and pubescence with the secondary ones *T. canescens*

Tetradymia axillaris A. Nels. Longspine Horsebrush. Spiny shrubs, mainly 4-12 dm tall; branchlets evenly white-pannose; primary leaves modified as persistent spines 1-5 cm long, straight or becoming curved, tomentose at first, becoming glabrate; secondary leaves linear to spatulate, 2-12 mm long, essentially glabrous; heads soli-

tary or 2 or 3, from nodes of the previous year; involucre 8–11 mm high; bracts 5, subequal, tomentose; flowers 5–7, pale yellow, the corollas 7.5–9 mm long; pappus of slender bristles; achenes 4.5–5.5 mm long; achenes pilose, the hairs 9–11 mm long; $2n = 60, 62$. Salt and warm desert shrub communities at 850 to 1375 m in Washington County; Nevada and California. 18 (ii). Our material belongs to var. *longispina* (Jones) Strother [*T. spinosa* var. *longispina* Jones, type from St. George].

***Tetradymia canescens* DC.** Gray Horsebrush. [*T. linearis* Rydb., type from Iron Co.]. Unarmed shrubs, mainly 1–9 dm tall; branchlets white-pannose except for glabrate streaks below the primary leaves; primary leaves 0.5–4 cm long, 1–6 mm wide, lanceolate to oblanceolate or spatulate, tomentose; secondary leaves similar to the primary ones but shorter and narrower. Heads few to several at branch tips; involucre 6–8 mm high or more; bracts 4, subequal, tomentose; flowers 4, yellow to cream, the corollas 7–11 mm long; pappus of white or tawny bristles; achenes 2.5–5 mm long, glabrous or hairy; $2n = 60, 62, 90, 120$. Sagebrush-grass, mountain brush, ponderosa pine, mixed conifer, and aspen communities at 1525 to 3150 m throughout Utah; British Columbia to Montana, south to California, Arizona, and New Mexico; 75 (viii).

***Tetradymia glabrata* T. & G.** Littleleaf Horsebrush. Shrubs, mainly 3–12 dm tall; branchlets pannose except for glabrate or glabrous streaks below the primary leaves; primary leaves mainly 5–15 mm long, 0.8–1.4 mm wide, linear-subulate, spinose tipped, soon deciduous; secondary leaves linear to narrowly spatulate, glabrous or thinly tomentose; heads few to many on branch tips; involucre 7–10 mm high; bracts 4, subequal, tomentose to glabrous; flowers 4, yellow to cream, the corollas 9–10 mm long; pappus of white bristles; achenes 3–5 mm long, hirsute; $2n = 60, 120, 180$. Shadscale, greasewood, sagebrush, rabbitbrush, and juniper communities at 1370 to 2370 m in Box Elder, Emery, Juab, Millard, Sanpete, Sevier, Tooele, Uintah, and Wayne counties; Oregon and Idaho, south to California and Nevada; 44 (v).

***Tetradymia nuttallii* T. & G.** Nuttall Horsebrush. Spinescent shrubs, 3–12 dm tall; branchlets white-pannose except for glabrescent streaks below the primary leaf bases; primary leaves modified as persistent straight or recurved spines 5–25 mm long, tomentose to glabrous; heads in terminal clusters of (2) 3–6; involucre 6–9 mm high, bracts 4, equal; flowers 4, yellow, the corollas 8–10 mm long; pappus of white or tawny bristles; achenes 4–6 mm long, hirsute; $2n = 60$. Shadscale, greasewood, sagebrush-rabbitbrush and pinyon-juniper communities at 1370 to 1830 m in Beaver, Box Elder, Daggett, Duchesne, Juab, Millard, Sanpete, Tooele, and Uintah counties; Wyoming and Nevada; 25 (i).

***Tetradymia spinosa* H. & A.** Thorny Horsebrush. Spinescent shrubs, 3–12 dm tall, branchlets evenly pannose; primary leaves modified as spines, 5–20 mm long, tomentose, finally glabrate; secondary leaves linear to spatulate, glabrous or glabrescent; heads borne singly or in pairs, laterally, on stems of the previous season; involucre 8–12 mm high; bracts 4–6, subequal, tomentose; flowers 5–8, yellow, the corollas 6–10 mm long; pappus of slender bristles, white; achenes 6–8 mm long, hairy, the trichomes 9–12 mm long; $2n = 60$. Mixed desert shrub, shrub-grass, and pinyon-juniper communities at 1250 to 1925 m in Box Elder, Carbon, Daggett, Duch-

esne, Emery, Garfield, Grand, Iron, Juab, Millard, Salt Lake, Sevier, Tooele, Uintah, and Utah counties; Oregon to Montana and Wyoming, south to California, Nevada, and New Mexico; 15 (vi).

Thelesperma Less.

Perennial glabrous or sparingly puberulent herbs; leaves opposite, pinnately to palmately parted, or the upper ones entire; heads pedunculate, solitary or few per stem; involucre hemispheric to campanulate; bracts in 2 unlike series, the outer ones spreading and distinct, the inner ones connate to the middle and calyxlike; receptacle flat, chally with broad scarious scales; rays present (or lacking), neuter, yellow; disk flowers perfect, fertile; anthers not caudate basally; pappus of 2 retrorsely hispid awns, a crown, or lacking; achenes oblong to linear.

1. Plants 30–80 cm tall; rays normally lacking; pappus of 2 awns; known from San Juan and Washington counties
..... *T. megapotamicum*

— Plants 3–35 cm tall, rays normally present; pappus a crown or none
..... *T. subnudum*

***Thelesperma megapotamicum* (Sprengel) Kuntze** Greenthread. [*Bidens megapotamica* Sprengel]. Perennial herbs from a caudex and stout root; stems 30–80 cm tall; leaves mainly 2–7 cm long, once or twice pinnatifid, the lobes linear, or the uppermost simple; outer bracts 4–6, oblong to ovate, obtuse, much shorter than the inner; inner bracts 6–12 mm high, connate to above the middle, the lobes with narrow scarious margins; rays lacking; disk flowers yellow (or brownish); pappus of 2 or 3 retrorsely hispid awns; outer achenes somewhat papillose dorsally; $n = 11, 17, 22, 44$. Desert shrub community at ca 915 to 1375 m in San Juan and Washington counties; Wyoming to Nebraska, south to Arizona, Texas, and Mexico; 5 (ii).

***Thelesperma subnudum* Gray** Perennial herbs from a taproot and less commonly with a caudex and creeping rootstock; stems 3–35 cm tall, subscapose; leaves mainly at base of stem, 1.5–9 cm long, pinnately to subpalmately lobed or some or all of them entire; petioles often ciliate and blades more or less puberulent; involucre 6.3–14 mm high, 9–22 mm wide; outer bracts oblong to lanceolate, with narrow scarious margins, to half as long as the inner ones; inner bracts united to below the middle, conspicuously scarious-margined; rays present and bright yellow, 10–28 mm long and 6–18 mm wide, or lacking; disk flowers yellow; pappus a toothed crown or lacking; achenes glabrous or hairy apically, 3.5–4.5 mm long. This taxon is variable being radiate or discoid, in division of leaves, and in position of leaves along the stem. They occur mainly at elevations below 2135 m elevation. A dwarf alpine phase occurs above that elevation, and because of its small size, lack of rays, and apparent ecotypic differences these plants are herein designated at varietal level.

1. Plants mainly 3–7 cm tall; involucre 6.3–9 mm high, 9–14 mm wide, heads discoid . . . *T. subnudum* var. *alpinum*

— Plants mainly 9–35 cm tall; involucre 5–14 mm high, 12–22 mm wide; heads commonly radiate
..... *T. subnudum* var. *subnudum*

Var. *alpinum* Welsh Pinyon-juniper, mountain brush, and western bristlecone pine communities at ca 2745 m in Wayne (type from 3 mi N of Bicknell) County; endemic; 3 (0).

Var. *subnudum* Mixed desert shrub, salt desert shrub, and pinyon-juniper communities at 1065 to 2135 m in Carbon, Duchesne, Emery, Garfield, Grand, Iron (type from Red Creek), Kane, San Juan, Sanpete, Uintah, Washington, and Wayne counties; Colorado, Arizona, and New Mexico; 109 (xiv).

Townsendia Hook.

Annual, biennial, or perennial herbs, caulescent or acaulescent; leaves alternate, entire or rarely lobed or toothed; heads radiate, solitary or few, terminating branches, or sessile; receptacle convex, naked; involucre campanulate to hemispheric; bracts in 2-7 series; rays pistillate, fertile, the corollas white, pink, or yellow; disk flowers perfect, yellow; disk pappus of barbellate capillary bristles; ray pappus similar to that of the disk or shortened; achenes 2- or 3-ribbed, compressed, usually hairy.

Beaman, J. H. 1957. The systematics and evolution of *Townsendia* (Compositae). *Contr. Gray Herb.* 183: 1-151.
 Reveal, J. L. 1970. A revision of the Utah species of *Townsendia* (Compositae). *Great Basin Nat.* 30: 23-52.

- 1. Plants caulescent, the internodes apparent, annual or biennial (short-lived perennial) 2
- Plants acaulescent, the internodes not elongating, perennial 5
- 2(1). Plants annual or winter annual; disk pappus shorter than disk-corollas; plants of southeastern Utah (Navajo Basin) *T. annua*
- Plants biennial or short-lived perennials; disk pappus subequal to or longer than the disk corollas 3
- 3(2). Achenial hairs unevenly branched; ray flowers usually dark pink purple dorsally; plants biennials of western Utah *T. florifer*
- Achenial hairs glochidiate; ray flowers variously colored, but, if dark pink purple dorsally, the plants perennial and of different distribution 4
- 4(3). Stems gray white, the pubescence dense; plants of broad distribution, perennial *T. incana*
- Stems thinly strigose, evident beneath the hairs; plants of the Uinta Basin, biennial *T. strigosa*
- 5(1). Involucral bracts linear to narrowly lanceolate, typically in 5-7 series 6
- Involucral bracts lanceolate to narrowly oblong, ovate, or elliptic, typically in 2-5 series 9
- 6(5). Involucral bracts hair tufted apically, linear, acuminate; plants of Carbon, Duchesne, and Daggett counties *T. hookeri*
- Involucral bracts not hair tufted apically, narrowly lanceolate, acute; plants variously distributed 7
- 7(6). Rays glandular dorsally; leaves caescent; plants of Duchesne and Uintah counties *T. mensana*
- Plants glabrous or sparingly pubescent dorsally; leaves greenish or grayish-caescent; plants not or seldom of Duchesne and Uintah counties 8
- 8(7). Disk pappus 3-6 mm long; leaves green, the midveins not conspicuous; plants of the Wasatch Plateau and Uinta Mts. *T. leptotes*
- Disk pappus 6-12 mm long; leaves grayish caescent, the midveins conspicuous; plants of Sevier, Iron, Wayne, and Garfield counties *T. exscapa*
- 9(5). Rays yellow ventrally, densely glandular and often purplish dorsally; ray pappus 0.7-1 mm long; plants of Emery and eastern Sevier counties *T. aprica*

- Rays white or pink or bluish, or rarely yellow ventrally but, if yellow, the ray pappus 2-4.5 mm long and plants of other distribution 10
- 10(9). Plants villous with long, multicellular hairs, growing at high elevations in the Tushar Mts. *T. condensata*
- Plants not villous with long, multicellular hairs, of low to high elevations, but if high, not of the Tushar Mts. . 11
- 11(10). Plants green or greenish; flowers often bluish or purplish to pink, mainly of higher elevations in mountains and plateaus *T. montana*
- Plants grayish caescent or whitish; flowers seldom bluish or purplish, usually white to pink or yellowish ventrally; mainly of low to moderate elevations 12
- 12(11). Ray pappus 0.3-0.6 mm long; plants with densely white-hairy stems, mainly of eastern Utah *T. incana*
- Ray pappus 2-4.5 (6.2) mm long; plants not with densely white-hairy stems, mainly of western Utah . . 13
- 13(12). Involucral bracts strigulose dorsally; ray pappus 3.1-6.2 mm long; plants evidently rare in western Utah *T. scapigera*
- Involucral bracts sparingly if at all strigulose; ray pappus 2-4.5 mm long; plants locally common in western Utah *T. jonesti*

***Townsendia annua* Beaman** Caulescent annual or winter annual herbs, 2-18 cm tall; herbage strigose; leaves of basal rosettes soon withered or poorly developed; cauline leaves 5-28 mm long, 1-5 mm wide, oblanceolate to spatulate or linear, sparingly to moderately strigose, green or greenish; heads solitary or few; involucre 4.5-7 mm long, 6-14 mm wide; bracts in 2-4 series, green or suffused with purple, scarious, ciliate; rays 13-34, the corollas white or pink to lavender, 4-8 mm long, 1-2.3 mm wide, glabrous; disk corollas yellow, 2.2-3.5 mm long; achenes 1.9-2.6 mm long, pubescent with glochidiate hairs; ray pappus 0.2-0.8 mm long, that of disk flowers 1.8-3 mm long; n = 9. Sandy desert shrub and blackbrush communities at 1125 to 1590 m in Carbon, Emery, Garfield, Grand, Kane, and San Juan (type from 1.5 mi N of Bluff) counties; Colorado, Arizona, New Mexico, and Texas; 23 (v).

***Townsendia aprica* Welsh & Reveal** Pulvinate-caespitose acaulescent perennial herbs from a caudex, 1.5-2.5 cm tall; leaves 7-13 (16) mm long, 1-3.5 mm wide, spatulate to oblanceolate, strigose; heads sessile, submersed in the leaves; involucre 4-8 mm high, 7-13 mm wide; bracts in 3-4 series, lanceolate, fimbriate, red-scarious, hyaline-ciliate, the outermost sparsely strigose; rays 13-21, the corollas yellow to golden ventrally, purplish dorsally and glandular, 4-7 mm long; disk corollas yellow, 3.7-4.5 mm long; achenes 2-2.5 mm long, 2-ribbed, the hairs glochidiate; ray pappus 0.7-1 mm long; pappus of disk flowers 4-5 mm long. Salt desert shrub and pinyon-juniper communities, commonly on clay or clay-silt exposures of the Mancos Shale (Blue Gate Member), at 1860 to 2440 m in Emery and adjacent Sevier (type from south of Fremont Junction) counties; endemic; 10 (ii). The yellow flowers and short pappus of ray flowers are diagnostic.

***Townsendia condensata* D. C. Eaton** Pulvinate, acaulescent perennial herbs from a simple or branched caudex, mainly 1-2 cm tall; leaves 6-15 mm long, 1-3 mm wide, spatulate, villous with multicellular hairs; heads sessile, submersed in the leaves; involucre 8-18 mm high, 10-40 mm wide; bracts in 3-5 series, lance-

olate to linear, acuminate, the margins scarious and long-ciliate, pubescent with multicellular hairs, purplish to greenish dorsally; rays 22–60, the corollas white to pink or lavender, glandular on the dorsal surface, 8–16 mm long; disk corollas yellow, 4–6.5 mm long; achenes 3.2–4.5 mm long, 2-ribbed, moderately pubescent with simple or bifurcate hairs; ray and disk pappus ca 4–8 mm long. Alpine tundra at 3565 to 3630 m in the Tushar Mts., Piute County; disjunct in Wyoming and Montana; 2 (0). This distinctive dwarf plant was discovered in Utah by Alan Tays, authority on the flora of the Tushar Mts.

Townsendia exscapa (Richards.) T. C. Porter [*Aster?* *exscapa* Richards.]. Caespitose acaulescent perennial herbs from a simple or branched caudex, 2–3.5 cm high; leaves 0.6–5 cm long, 1–3.5 mm wide, oblanceolate to linear, acute and mucronate apically, strigose, with mid-vein apparent; involucre 10–18 mm high, 15–30 mm wide; bracts in 4–7 series, linear to narrowly lanceolate, ciliate on scarious margins, sparingly strigose to glabrous; ray flowers 21–40, the corollas white or pinkish, 8–15 mm long, 1.2–3 mm wide; disk corollas yellow; achenes 2- or 3-ribbed, pubescent with glochidiate hairs; ray pappus 4–8 mm long; disk pappus 6–12 mm long. Ponderosa pine, mountain sagebrush, and spruce-fir communities, often in meadows, at 2135 to 3295 m in Garfield, Iron, Sevier, and Wayne counties; British Columbia to Manitoba, south to Nevada, Arizona, Mexico, and Texas; 8 (ii).

Townsendia florifer (Hook.) Gray [*Erigeron?* *florifer* Hook.; *T. watsonii* Gray, type from Stansbury Island; *T. scapigera* var. *ambigua* Gray, type from Rabbit Valley; *T. florifer* var. *communis* Jones, type from Marysville]. Cauliscent winter annual or biennial herbs 3–20 cm tall; basal leaves 6–50 mm long, 3–12 mm wide, spatulate; cauline leaves narrowly oblanceolate to linear, 10–40 mm long, 1–5 mm wide, strigose, petiolate, grayish; heads solitary or few; involucre 6.5–13 mm high, 15–30 mm wide; bracts in 3 or 4 series, green or suffused with purple, scarious, ciliate; rays 13–34, the corollas white or pink ventrally, dark pink or lavender dorsally, 7–12 mm long, 1.2–3 mm wide, often glandular; disk corollas yellow, 3.3–6 mm long; achenes 3.3–4.5 mm long, pubescent with unequally forked hairs; ray pappus 1–6 mm long; disk pappus 3.5–7.5 mm long. Mixed desert shrub communities at 1280 to 1985 m in Beaver, Box Elder, Garfield, Juab, Millard, Sanpete, Sevier, Tooele, Utah, and Wayne counties; Washington to Idaho, Oregon, and Nevada; 56 (vii).

Townsendia hookeri Beaman Caespitose acaulescent perennial herbs from a simple or branched caudex, 2.5–3.5 cm high; leaves 10–40 mm long, 1–2.5 mm wide, linear to linear-oblanceolate, strigose; involucre 9–13 mm high, 9–14 mm wide; bracts in 5–7 series, linear to lance-linear, tufted-hairy apically, green or suffused with purple, strigose; rays 13–34, the corollas 6–9 mm long, 1–1.9 mm wide, white or pink ventrally, pinkish dorsally, glabrous; disk corollas yellow, 4.5–6 mm long; achenes 3.5–4.5 mm long, pubescent with glochidiate hairs; ray pappus 1–1.5 mm long; disk pappus 5.5–8.5 mm long. Sagebrush, sagebrush-grass, and mixed conifer communities at 2165 to 2716 m in Carbon, Daggett, Duchesne, and Uintah counties; Yukon to Saskatchewan, south to South Dakota and Colorado; 5 (0).

Townsendia incana Nutt. [*T. incana* var. *ambigua* Jones, type from Thompson]. Subcaulescent to acaulescent caespitose herbs, the caudex often branched; stems

conspicuously white-strigose, mainly 2–6 cm high, forming clumps to 2 dm wide; leaves 5–40 mm long, 1–5 mm wide, spatulate to oblanceolate, strigose; heads solitary or few; involucre 7–11 mm high, 8–20 mm wide; bracts in 3 or 4 series, lanceolate, green, the margins scarious and ciliate, strigose; rays 13–34, the corollas white ventrally, pink to lavender dorsally, 6–10 mm long, 1.5–3 mm wide; achenes 2.5–4.5 mm long, pubescent with glochidiate hairs; ray pappus 0.3–0.6 mm long; disk pappus 4–7.5 mm long; n = 9, 27, 36. Blackbrush, salt desert shrub, mixed desert shrub, pinyon-juniper, and sagebrush communities at 1310 to 2290 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, San Juan, Sevier, Uintah, and Wayne counties; Wyoming to Nevada, Arizona, and New Mexico; 183 (xxiii). This is the common townsendia of the Colorado drainage system in Utah; its Great Basin counterpart is *T. jonesii*, from which it can be distinguished by the white strigose stems and shorter ray pappus.

Townsendia jonesii (Beaman) Reveal [*T. mensana* var. *jonesii* Beaman, type from Mammoth]. Subcaulescent to acaulescent caespitose herbs, the caudex commonly branched; stems not conspicuously white strigose, mainly 2–4 cm tall, forming clumps to 1 dm wide; leaves 10–40 mm long, 1–4 mm wide, oblanceolate to spatulate or almost linear, strigose; heads mostly solitary; involucre 9–12.5 mm high, 8–14 mm wide; bracts in 4 or 5 series, lanceolate, green or suffused purple, sparsely strigose; rays 13–21, the corollas white to pink, cream, or yellow ventrally, pink to red purple dorsally, glandular, 4–7 mm long; disk corollas yellow, ca 3.5 mm long; achenes 3–5.5 mm long; pubescent with glochidiate hairs; ray pappus 2–4.5 mm long; disk pappus 5–8 mm long. Two weak, but geographically and edaphically correlated, varieties are present.

- 1. Ray flowers yellow to lemon-yellow ventrally; plants of gypsiferous substrates in Sevier and Piute counties *T. jonesii* var. *lutea*
- Ray flowers pink to white or cream ventrally; plants of various substrates, rather broadly distributed *T. jonesii* var. *jonesii*

Var. *jonesii* Sagebrush, shadscale, rabbitbrush, pinyon-juniper, and mountain brush communities at 1525 to 2745 m in Beaver, Juab, Millard, Sanpete, Sevier, and Washington counties; Nevada; 13 (ii). The type of *T. mensana* var. *jonesii* consists of strictly acaulescent plants with very slender leaves and smallish heads; it is unmatched in the specimens examined, and it is understandable why the taxon was placed initially with *T. mensana*.

Var. *lutea* Welsh Salt desert shrub and juniper communities at ca 1675 to 1830 m in Sevier and Piute counties (on Arapien shale and clays in volcanic rubble); endemic; 6 (i).

Townsendia leptotes (Gray) Osterh. [*T. sericea* var. *leptotes* Gray]. Perennial acaulescent herbs from a simple or more commonly branched caudex, 1–3 cm tall; herbage sparingly strigose, green; leaves 0.6–4 cm long, 1.3–2.6 mm wide, linear to narrowly oblanceolate; involucre 5–10 mm high, 9–14 mm wide; bracts in 4–7 series, lanceolate to linear, the margins scarious, ciliate, often suffused purple; rays 13–34, the corollas white, cream, or pink ventrally, sometimes lavender dorsally, 6–10 mm long, 1.2–2 mm wide; disk corollas yellow, 3–5 mm long; achenes pubescent with glochidiate hairs; ray

pappus 0.8–6.5 mm long; disk pappus like the ray pappus. Montane sagebrush and grass-forb communities, often on ridge crests and plateau margins at 2680 to 3145 m in Duchesne, Emery, Sanpete, and Summit counties (Uinta Mts. and Wasatch Plateau); Idaho and Montana, south to California, Nevada, and New Mexico; 7 (0).

Townsendia mensana Jones Perennial acaulescent herbs from a simple or more commonly branched caudex 1–2.5 cm high; herbage strigose; leaves 3–17 mm long, 0.6–1.3 mm wide, narrowly oblanceolate to linear; involucre 5–9 mm high, 7–10 mm wide; bracts in 4 or 5 series, lanceolate, the margin scarious and ciliate; rays 13–21, the corollas whitish, cream, or pinkish, glandular dorsally, 5–7.5 mm long, 0.9–1.4 mm wide; disk corollas yellow, 3.5–4.8 mm long; achenes pubescent with glochidiate hairs; ray pappus 2.5–4 mm long; disk pappus 5–6.5 mm long. Salt desert shrub, pinyon-juniper, and sagebrush communities, especially on barren and semibarren sites, at 1705 to 2715 m in Duchesne (type from near Duchesne, then Theodore) and Uintah counties; Colorado (?); a Uinta Basin endemic; 38 (v).

Townsendia montana Jones Perennial acaulescent or rarely subcaulescent herbs from a simple or branched caudex, sometimes with soboliferous rhizomatous branches, from a taproot, 2–6 cm high; herbage glabrate to strigose; leaves 5–40 mm long, 2–8 mm wide, spatulate, thickish; involucre 6–12 mm high, 8–20 mm wide; bracts in 3–6 series, oblong, obovate, oblanceolate or lanceolate, glabrous or sparingly strigose, the margins scarious; ciliate, often suffused with purple; rays 12–30, the corollas blue, pink, lavender, or white, 6–12 mm long, 1–3.5 mm wide; achenes 3.7–5.2 mm long, glabrous or sparingly pubescent with bifurcate or glochidiate hairs; ray and disk pappus alike, 3–5.5 mm long. Three more or less distinctive varieties are present.

1. Heads usually sessile; leaves mainly 1–3.5 mm wide, rather abruptly obtuse apically; plants of Garfield and Kane counties *T. montana* var. *minima*
- Heads usually at least shortly pedunculate; leaves mainly broader (at least some), rounded to obtuse; plants not of Garfield or Kane counties 2
- 2(1). Leaves rounded apically, broadly spatulate; plants of calciferous outcrops in southern Duchesne, Wasatch, and Sanpete counties *T. montana* var. *caelilimensis*
- Leaves obtuse to subacute apically; plants of various substrates in the Uinta and Wasatch mts. *T. montana* var. *montana*

Var. caelilimensis Welsh Pinyon-juniper, spruce-fir, and limber pine communities on Flagstaff Limestone and Green River formations at 2135 to 3735 m in southern Duchesne, Wasatch, and Sanpete counties; endemic; 13 (i).

Var. minima (Eastw.) Beaman [*T. minima* Eastw., type from Bryce Canyon; *T. alpigena* var. *minima* (Eastw.) Dorn]. Ponderosa pine, western bristlecone, limber pine, and Douglas fir-white fir communities, on white and pink members of the Cedar Breaks Formation, at 2375 to 3115 m in Garfield and Kane counties; endemic; 14 (i).

Var. montana [*T. dejecta* A. Nels., type from Dyer Mine]. Spruce-fir and lodgepole pine communities at 3050 to 3510 m in Cache, Juab, Salt Lake (type from Alta), Summit, and Uintah counties; Idaho, Montana, and Wyoming; 3 (0).

Townsendia scapigera D. C. Eaton in Wats. Acaulescent or subcaulescent, caespitose, biennial or short-lived perennial herbs, mainly 2–7 cm tall, from a simple or branched caudex; herbage strigose to strigulose; leaves mainly 1–7 cm long, 2–9 mm wide, spatulate, obtuse or mucronate to emarginate; heads pedunculate to subsessile; involucre 7–14 mm high, 12–32 mm wide; bracts in 3 or 4 (5) series, lanceolate, acute, the margins lacerate-ciliate, scarious, strigose; rays 18–35, the corollas white to pink, glandular dorsally, 7–15 mm long; disk corollas yellow, 3.5–5.4 mm long; achenes 2-ribbed, pubescent with bifurcate hairs, 3.8–5.6 mm long; ray pappus 3.1–6.2 mm long; disk pappus 5–7.2 mm long. Sagebrush community to alpine tundra at ca 1525 to 3175 m in Millard County; California and Nevada; 1 (0).

Townsendia strigosa Nutt. [*T. incana* var. *prolixa* Jones, type from Duchesne Valley]. Caulescent biennial herbs; stems branched from the base and above, 3–15 cm long; herbage strigose to strigulose; basal leaves 1.2–4.5 cm long, 1.2–7 mm wide, oblanceolate to spatulate, more or less persistent; cauline leaves mostly smaller and narrower, often clustered below and overtopping the heads; involucre 5–10 mm high, 7–20 mm wide; bracts in 3 or 4 series, lance-ovate to lanceolate, the margins scarious, ciliate, strigose; rays 12–30, the corollas white to pink, sometimes darker dorsally, 5–14 mm long, 1.5–3 mm wide; disk corollas 3.3–5 mm long; achenes pubescent with glochidiate hairs; ray pappus 0.5–1.6 mm long; disk pappus 3.3–5 mm long; n = 9. Salt desert shrub, mixed desert shrub, and pinyon-juniper communities at 1460 to 1895 m in Daggett, Duchesne, and Uintah counties; Wyoming; 14 (ii).

Tragopogon L.

Biennial (annual or perennial) herbs from thickened taproots, the juice milky; leaves alternate, entire, clasping basally; heads solitary or few and corymbose; flowers all raylike, perfect, yellow or purple; involucre cylindrical or campanulate; bracts uniseriate, equal; receptacle naked; pappus of plumose bristles united at the base; achenes 5- to 10-nerved, slender-beaked or the outer beakless.

Ownbey, M. 1950. Natural hybridization and amphiploidy in the genus *Tragopogon*. Amer. J. Bot. 37: 487–499

1. Peduncles scarcely if at all inflated, even in fruit; achenes 15–25 mm long (including the beak); bracts subequal to the rays; plants rare in Utah *T. pratensis*
- Peduncles strongly inflated apically; achenes 25–36 mm long (including the beak); bracts usually longer than the rays; plants locally common 2
- 2(1). Rays purple; involucre bracts mainly 8 or 9. *T. porrifolius*
- Rays yellow; involucre bracts usually 13 *T. dubius*

Tragopogon dubius Scop. Biennial herbs; stems erect, 3–10 dm tall, simple or branched; leaves mainly 5–25 cm long, linear-subulate from an expanded base, floccose, becoming glabrate; peduncles enlarged and fistulose below the heads; involucre cylindrical to campanulate; bracts commonly 13 (8 on later heads), 2.5–4 cm long in flower, 4–7 cm long in fruit; rays pale lemon yellow, shorter than the bracts; achenes 25–36 mm long; pappus whitish to tawny. Disturbed soils and in low quality range sites at 1370 to 3205 m in all Utah counties; widely distributed in the U. S.; adventive from Europe; 58 (vi).

Tragopogon porrifolius L. Oyster-plant; Salsify. Biennial herbs; stems erect, 3–10 dm tall, simple or branched above; leaves mainly 5–30 cm long, linear-subulate, the apex not recurved; peduncles enlarged and fistulose below the heads; involucre cylindrical to campanulate; bracts commonly 8 (5–11), 2.5–4 cm long in flower, 4–7 cm long in fruit; rays purple, subequal to or shorter than the bracts; achenes 25–35 mm long; pappus brownish; $n = 6$. Cultivated plants, escaping and persisting on canal banks, in moist meadows, and along roadsides at 1370 to 2595 m in Cache, Carbon, Millard, Salt Lake, Sanpete, Summit, Washington, and Weber counties; widespread in much of the U. S.; introduced from Europe; 10 (0).

Tragopogon pratensis L. Biennial herbs; stems erect, 1.5–8 dm tall, simple or branched; leaves mainly 5–30 cm broad, tapering from a broadly expanded base to 2 cm wide, recurved apically; peduncles not especially enlarged in flower or in fruit; involucre campanulate; bracts commonly 8, 12–24 mm long in flower, 18–38 mm long in fruit; rays chrome-yellow, equaling or surpassing the bracts; achenes 15–25 mm long; pappus off-white; $n = 6$. Disturbed sites in Rich, Salt Lake, and Summit counties; widespread in the U. S.; adventive from Europe; 2 (0).

Vanlecceea Greene

Shrubs; branchlets glutinous-resinous, green to tan, finally white to gray barked; leaves alternate, sessile, entire or serrate, falcately curved; heads discoid, yellow, solitary or cymose; involucre campanulate; bracts in 4 or 5 series, imbricate, glutinous; receptacle naked, resinous; styles long-exserted, the branches flattened, papillose; achenes clavate, 5-angled; pappus of 12–16 linear persistent slender scales.

Vanlecceea stylosa (Eastw.) Greene Resinbush. [*Grindelia stylosa* Eastw., type from San Juan County]. Shrubs, mainly 5–12 dm tall; branchlets glutinous-resinous; bark tan to white or grayish black in age; leaves 0.6–3.5 cm long, 1–9 mm wide, narrowly lanceolate to oblong or elliptic, commonly entire, attenuate to a spinulose tip; heads solitary or more commonly few to many in corymbose or cymose clusters; involucre 8–10 mm high, 9–15 mm wide; bracts lanceolate to lance-attenuate, sometimes abruptly acuminate and recurved apically, resin coated; corollas yellow to cream, 6–7 mm long; achenes 4–5 mm long, compressed, glutinous and spreading hairy. Four-wing saltbush, ephedra, sand dropseed, Indian ricegrass, blackbrush, and juniper communities, in sand, at 1125 to 1620 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona (a Colorado Plateau endemic); 32 (viii). The genus is monotypic.

Verbesina L.

Annual (biennial or perennial?) herbs; leaves opposite, at least below, simple, toothed; heads radiate, showy; involucre biseriate, about equal, herbaceous; receptacle convex, chaffy, the bracts enfolding the achenes; rays yellow or yellow orange, pistillate; disk flowers perfect, fertile; anthers subtire basally; style branches with hispidulous appendages; pappus of 2 slender awns; achenes flattened, 2-winged.

Verbesina encelioides (Cav.) Benth. & Hook. Crownbeard. [*Ximenesia encelioides* Cav.]. Annual herbs; stems 4–10 dm tall, cinereous-strigose, often branched above; lowest leaves opposite, alternate upward, petiolate, often

with stipulelike appendages at base; blades 1.2–10 cm long, 0.7–6 cm wide, ovate to lanceolate, acute to attenuate, irregularly toothed, strigose beneath, green and sparingly strigose above; involucre 7–12 mm high, 15–25 mm wide; bracts lance-ovate to lance-linear, herbaceous, strigose; rays 10–15, yellow or yellow-orange, 8–20 mm long; pappus of 2 short slender awns; achenes thickly 2-winged, pubescent; $n = 17$. Sagebrush, rabbitbrush, saltgrass, pinyon-juniper, and ponderosa pine communities, often in disturbed sites, at 1280 to 2260 m in Beaver, Garfield, Grand, Juab, Kane, San Juan, and Washington counties; Montana to California and Texas; 20 (v). Most of our material belongs to var. *exariculata* Robins. & Greenm. The bright flowers contrast sharply with the grayish strigose pubescence, resulting in a strikingly beautiful plant.

Viguiera H.B.K.

Annual or perennial herbs; leaves opposite (at least below), simple; heads radiate, solitary or cymose; involucre 2- or 3-seriate; rays yellow, neuter, pubescent dorsally; receptacles chaffy, the chaffy bracts clasping the achenes; disk flowers fertile; pappus none; achenes laterally compressed, 4-angled.

1. Plants perennial, widespread in montane habitats, less commonly in saline low elevation sites *V. multiflora*
- Plants annual, restricted in low elevation saline habitats 2
- 2(1). Plants subscaPOSE, with long naked peduncles; leaves ovate to lanceolate *V. soliceps*
- Plants caulescent, the peduncles bracteate or leafy; leaves linear 3
- 3(2). Leaves canescent with appressed hairs; plants of southern Utah *V. longifolia*
- Leaves hispidulous; plants of central and western Utah *V. ciliata*

Viguiera ciliata (Robins. & Greenm.) Blake Hairy Goldeneye. [*Heliomeris multiflora* var. *hispidula* Gray; *H. hispidula* (Gray) Cockerell; *Gymnolomia hispidula* var. *ciliata* Robins. & Greenm., type from Utah]. Annual herbs; stems simple or variously branched, 10–70 cm tall, hispidulous; leaves 0.6–9 cm long, 1–3 mm wide, linear, hispid and hispid-ciliate, acute; heads solitary or 2–5 or more; disks 7–15 mm wide, the corollas yellow; rays ca 9–15, yellow, 6–13 mm long; involucre bracts 5.5–10 mm long, lance-attenuate, hispid and coarsely ciliate; pappus lacking; achenes ca 2.5 mm long, glabrous; $n = 8$. Saline marshes and meadows at ca 1300 to 1470 m in Millard, Salt Lake, and Utah counties; Arizona, New Mexico, and Mexico; 9 (ii).

Viguiera longifolia (Robins. & Greenm.) Blake [*Gymnolomia longifolia* Robins. & Greenm.; *Heliomeris longifolia* (Robins. & Greenm.) Cockerell]. Annual herbs; stems simple or variously branched, 14–60 cm tall, strigose; leaves 1–6 cm long, 1.2–7.5 mm wide, linear to oblong, strigose, rarely hispid-ciliate near the bases, acute; heads solitary, or 2 to numerous; disks 7–10 mm wide, the corollas yellow; rays ca 8–10, yellow, 6–12 mm long; involucre bracts lance-acuminate to -attenuate, strigose, not especially ciliate; pappus lacking; achenes 2–2.5 mm long, brown, glabrous; $n = 8$. Salt desert shrub and pinyon juniper communities at 1150 to 1525 m in Kane and Washington counties; Arizona to Texas and

Mexico; 7 (iii). Our material is assignable to var. *annua* (Jones) Welsh comb. nov. [based on: *Gymnolomia multiflora* var. *annua* Jones Proc. Calif. Acad. II. 5: 698. 1895, type from Utah?; *Helomeris longifolia* var. *annua* (Jones) Yates; *V. annua* (Jones) Blake].

Viguiera multiflora (Nutt.) Blake Showy Goldeneye. [*Helomeris multiflora* Nutt.]. Perennial herbs, from a woody taproot and pluricipital caudex; stems 2–10 (13) dm tall, strigose to scabrous-puberulent; leaves lanceolate to linear, mainly opposite, entire or serrate, 1–8 (10) cm long, 2–20 (25) mm wide, short-petiolate, plane or revolute, acute to obtuse; heads commonly 2 to several; disk 6–14 mm wide; involucre bracts linear or narrowly lanceolate, strigose; rays 10–14, yellow, 7–18 mm long; pappus lacking; achenes 1.2–1.8 mm long, brown, glabrous; n = 8, 9. Two weakly discernible varieties are included in our material.

- 1. Leaves commonly over 5 mm wide, plane; plants of mesic montane sites *V. multiflora* var. *multiflora*
- Leaves commonly less than 5 mm wide, the margins revolute; plants of arid plains and mountains *V. multiflora* var. *nevadensis*

Var. *multiflora* Sagebrush, juniper, cottonwood, pinyon-juniper, aspen, and spruce-fir communities, often in riparian sites, at 1340 to 2870 m in all Utah counties; Montana south to California, Arizona, and New Mexico; 137 (xvi).

Var. *nevadensis* (A. Nels.) Blake [*Gymnolomia nevadensis* A. Nels.; *Helomeris multiflora* var. *nevadensis* (A. Nels.) Yates; *G. linearis* Rydb., type from near St. George]. Shadscale, mat-atrplex, pinyon-juniper, and mountain brush communities at 1370 to 2135 m in Grand, Juab, Uintah, and Washington counties; Nevada; 13 (i).

Viguiera soliceps Barneby Tropic Goldeneye. [*Helomeris soliceps* (Barneby) Yates]. Annual herbs, 10–41 cm tall; stems branched below, terminating in subscapose, merely bracteate peduncles that overtop the foliage; leaves opposite below, the blades 15–38 mm long, 6–20 mm wide, ovate to lanceolate, strigose, 3-nerved, petiolate, obtuse to cuneate, becoming smaller upwards; peduncles 7–28 cm long; involucre biseriate, the bracts lance-acuminate, acute, 5–6 mm long, strigose; rays 10–12, yellow, 10–15 mm long; pappus lacking; achenes 2.8–3.3 mm long, blackish. Matsaltbush community on Tropic Shale Formation at 1400 to 1470 m in Kane (type from Cottonwood Canyon) County; endemic. This is a striking species, forming masses of yellow blossoms in years of adequate rainfall; 5 (ii).

***Wyethia* Nutt.**

Perennial herbs from thick taproots; stems erect or ascending; leaves alternate, simple; heads large, solitary or several, radiate; involucre bracts in 2–4 series, herbaceous or coriaceous; receptacle convex, chaffy, the bracts folded, persistent; rays yellow, pistillate, fertile; disk flowers perfect, yellow; pappus a crown of scales or lacking; achenes trigonal or 4-angled, glabrous or pubescent.

Weber, W. A. 1946. A taxonomic and cytological study of the genus *Wyethia*, family Compositae, with notes on the related genus *Balsamorhiza*. Amer. Midl. Naturalist 35: 400–452.

- 1. Leaves mainly cauline, the basal reduced or lacking, scabrous-roughened; plants of sandy desert shrublands *W. scabra*

- Leaves basal and cauline, the basal often larger than the cauline ones, smooth or, if rough-hairy, not of lower elevations 2

- 2(1). Herbage glabrous, resinous; upper leaves rounded and clasping basally *W. amplexicaulis*

- Herbage hirsute to glabrate; upper leaves petiolate *W. arizonica*

Wyethia amplexicaulis (Nutt.) Nutt. Mulesears. [*Espeletia amplexicaulis* Nutt.]. Perennial herbs; stems mostly 2.5–9 dm tall, glabrous; basal leaves 12–40 cm long, 2–15 cm wide, entire or dentate, petiolate, resinous; cauline leaves smaller, sessile, rounded and clasping basally; heads large, solitary or several; involucre hemispheric, 25–35 mm high, 25–50 mm wide; outer bracts foliaceous, subequal; rays 6–16, yellow, 2.5–4.5 cm long; pappus a crown, sometimes prolonged into filiform awns; achenes 8–10 mm long, glabrous; n = 19. Sagebrush, oak, pinyon-juniper, aspen-fir, and forb-grass communities at 1525 to 2745 m in Box Elder, Cache, Juab, Millard, Morgan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington, and Weber counties; Washington to Montana, south to Nevada and Colorado; 38 (ii).

Wyethia arizonica Gray Perennial herbs; stems mainly 30–80 cm tall, spreading hairy, especially upward; basal leaves 15–40 cm long or more, 3–15 cm wide, petiolate, the blades oblanceolate to elliptic or lanceolate; cauline leaves smaller, attenuate basally to a short petiole; heads large, solitary or several; involucre hemispheric or campanulate, 20–30 mm high, 15–40 mm wide; outer bracts foliaceous, subequal; rays 6–16, yellow, 2.5–4 cm long; pappus a crown, sometimes prolonged into filiform awns; achenes 8–10 mm long, glabrous; n = 19. Pinyon-juniper, oak, and ponderosa pine communities at 1430 to 2440 m in Grand, Kane, San Juan, and Washington counties; Colorado, New Mexico, and Arizona; 9 (0).

Wyethia scabra Hook. Rough Mulesears. Robust, clump-forming perennial herbs; stems several to many, 1.5–6 dm high or more, scabrous and hispidulose; leaves mainly cauline, the lower ones rudimentary, 3–15 cm long, 3–17 mm wide, elliptic to oblong or linear, scabrous; heads solitary or few, terminating stems and branches; involucre hemispheric, 20–40 mm high, 20–55 mm wide; bracts lanceolate to linear, attenuate to caudate-attenuate; rays 10–23, yellow, 18–40 mm long; pappus a crown; achenes 6–8 mm long, glabrous. Three almost completely confluent varieties are present. Diagnostic features are based on the nature of surface and habit of the involucre bracts, which in the typical, common phase is almost sufficiently variable as to include the others. The following arbitrary key segregates specimens, if not taxa.

- 1. Involucre bracts long-attenuate from short dilated bases, ciliate with multicellular hairs, glabrous but with shiny resin droplets dorsally; plants of Kane County *W. scabra* var. *attenuata*

- Involucre bracts variable in shape, ciliate or not, scabrous to pubescent and more or less glandular dorsally, but seldom if ever with resin droplets 2

- 2(1). Involucre bracts closely imbricate, the outer recurved-spreading, pubescent with short fine hairs; plants of San Juan, Grand, and eastern Kane counties *W. scabra* var. *canescens*

— Involucral bracts various, scabrous to long-hairy dorsally; plants rather widely distributed *W. scabra* var. *scabra*

Var. *attenuata* W. A. Weber Ponderosa pine, oak, and pinyon-juniper (less commonly in desert shrub) communities, in sand, at 1370 to 1985 m in Kane County (type from north of Kanab); Arizona; 13 (iii). This handsome plant is a botanical motif of the Coral Pink dunes area, and is also present on East Clark Bench.

Var. *canescens* W. A. Weber Warm desert shrub and mixed desert shrub communities at 1125 to 1680 m in Grand, Kane, and San Juan counties; Colorado, Arizona, and New Mexico; 4 (i). This is a variable entity transitional to the typical variety, especially in Grand and eastern Kane counties.

Var. *scabra* Blackbrush, Vanclveva-ephedra, other mixed desert shrub, pinyon-juniper, and ponderosa pine communities at 1220 to 2625 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, and Uintah counties; Wyoming; 48 (vii).

***Xanthium* L.**

Annual herbs with fleshy large cotyledons and a taproot; leaves alternate, petiolate, the blades broad, rough-hairy; heads unisexual, discoid, or the corolla lacking; staminate heads uppermost, many-flowered; involucre bracts in 1–3 series, separate; receptacle cylindrical, chaffy; filaments monadelphous, the anthers separate; pistil vestigial, the styles unbranched; involucre of pistillate heads enclosing the 2 flowers, forming a 2-chambered bur armed with hooked prickles, the corolla lacking; achenes large, solitary in each chamber; pappus none.

***Xanthium strumarium* L.** Cocklebur. [*X. italicum* Moretti; *X. pennsylvanicum* Wallr.]. Annual monoecious herbs; stem 1.5–10 dm tall or more, simple or branched, scabrous, often purple mottled; leaves petiolate, the blades mainly 2–12 cm long and about as broad, ovate to oval or orbicular, obtuse to cuneate or cordate basally, scabrous, dentate and often lobed; heads in few to many short axillary clusters; burs broadly cylindrical to ovoid, 1–3.5 cm long, with 2 more or less incurved beaks apically, covered with stout hooked prickles; 2n = 36. Weedy species of cultivated and other disturbed lands, at 850 to 1925 m in much of Utah; adventive (?) from the eastern U. S.; 33 (iii). The seedlings are poisonous to livestock, and they produce dermatitis in some people. *X. spinosum* L. was recently discovered in Utah County. It has prominent 3-forked yellow spines 1–2 cm long.

***Xylorhiza* Nutt.**

Subshrubs or suffrutescent perennial herbs; branchlets green to straw colored or whitish; leaves alternate, simple; heads solitary at branch ends; involucre campanulate to hemispheric; bracts imbricate in several series, herbaceous to largely scarious, erect; ray flowers pistillate, fertile, yellow; achenes somewhat compressed, hairy; pappus of tawny to whitish capillary bristles. Note: Members of this genus are all primary or secondary selenium indicators.

Cronquist, A. and D. D. Keck. 1957. A reconstitution of the genus *Machaeranthera*. *Brittonia* 9: 231–239.

Watson, T. J. 1977. The taxonomy of *Xylorhiza* (Asteraceae-Astereae). *Brittonia* 29: 199–216.

- 1. Leaves linear to linear-filiform, the margins entire and more or less involute; plants of Kane and Garfield counties *X. confertifolia*

— Leaves serrate to serrate-dentate, or, if entire, of other distribution (except *X. cronquistii*) 2

2(1). Leaves serrate to serrate-dentate (at least some); plants of south central and southwestern Utah canyons of the Colorado 3

— Leaves entire; plants of eastern Utah 4

3(2). Leaves only sparingly serrate, linear-oblong to elliptic; involucre bracts shortly attenuate, short-villous dorsally; plants of north central Kane County *X. cronquistii*

— Leaves sharply serrate-dentate, narrowly oblanceolate, elliptic, oblong, or lanceolate; involucre bracts long-attenuate, glandular or villous-pilose dorsally; plants of canyons of the Colorado and southwestern Utah *X. tortifolia*

4(2). Peduncles mainly less than 5 cm long; stems usually leafy to much above the middle *X. glabriuscula*

— Peduncles mainly more than 5 cm long; stems usually to the middle or below *X. venusta*

***Xylorhiza confertifolia* (Cronq.) T. J. Watson** Henrieville Woodyaster. [*Machaeranthera glabriuscula* var. *confertifolia* Cronq., type from NE of Henrieville]. Perennial herbs from a woody caudex and taproot, with rootstocks sometimes developed; stems 9–23 cm high, sparingly pilose to glabrate and sparingly to densely stipitate-glandular; leaves 1–4.5 cm long, 1–2.5 mm wide, linear, pilose to glabrate, commonly involute; peduncles 1.8–14 cm long; involucre 9–12 mm high, 12–18 mm wide; bracts lanceolate to lance-acuminate, pilose to glabrate and glandular; rays 4–12, white, 9–18 mm long, 2–4 mm wide; disk flowers yellow, the corollas 6–9 mm long; pappus of capillary bristles to 6.5 mm long; achenes 3.5–6 mm long, pubescent; 2n = 12. Salt desert shrub and pinyon-juniper communities at 1675 to 1985 m in Garfield and Kane counties; endemic; 6 (i).

***Xylorhiza cronquistii* Welsh & Atwood** in Welsh Cronquist Woodyaster. Subshrubs, forming rounded clumps, from a stout taproot; stems numerous, whitish, ca 30 cm tall, villous at the nodes, almost glabrous otherwise; leaves 2.5–5 cm long, 2.5–5 mm wide, linear-lanceolate, sparingly serrate-dentate to entire, sparsely villous, ciliate, the midrib prominent; heads solitary on branches; involucre 10–12.5 mm high, 13–19 mm wide; bracts oblanceolate to lance-attenuate, acute to acuminate, herbaceous above the middle, chartaceous below, short-villous and glandular dorsally; rays white, 14–16, 20–25 mm long; achenes compressed, villous; pappus of capillary bristles to 7.2 mm long. Pinyon-juniper community, on the Kaiparowits Formation, at 1890 to 2075 m in Kane (type from Horse Mt.) County; endemic; 1 (0).

***Xylorhiza glabriuscula* Nutt.** Smooth Woodyaster. Subshrubs or suffrutescent perennial herbs from a woody caudex and taproot; stems 7–37 cm tall, villous to glabrous; leaves 1–7.5 cm long, 1–9 mm wide, villous to glabrate, lanceolate to narrowly lanceolate or oblanceolate; heads solitary at branch ends; involucre 9–13 mm high, 15–27 mm wide; bracts lanceolate, attenuate to acute or acuminate, herbaceous above the middle, scarious below, villous to glabrous; rays 10–22, white to bluish or purplish, 11–20 mm long; achenes compressed, villous; pappus of capillary bristles to 5 mm long. Two allopatric varieties are present.

- 1. Leaves with attenuate bases; rays white; plants of Daggett County *X. glabriuscula* var. *glabriuscula*

- Leaves with truncate or rounded bases; rays bluish, purplish, or white; plants of San Juan County
 *X. glabriuscula* var. *linearifolia*

Var. *glabriuscula* [*Aster glabriuscula* (Nutt.) T. & G.; *Machaeranthera glabriuscula* (Nutt.) Cronq. & Keck]. *n* = 12. Salt and mixed desert shrub communities at ca 1525 to 2135 m in Daggett County; Colorado, Montana, South Dakota, and Wyoming; 0 (0).

Var. *linearifolia* T. J. Watson *n* = 6, 12. Salt desert shrub community, mainly on Chinle and Moenkopi formations, in Grand (type from 6 mi NW of Moab) and San Juan counties; endemic; 3 (iii).

Xylorhiza tortifolia (T. & G.) Greene Hurtleaf Woodyaster. Subshrubs; stems 15–50 cm tall or more, villous or tomentose and more or less stipitate-glandular; leaves 1–10 cm long, 4–20 mm wide, lanceolate to elliptic or oblanceolate, villous to tomentose and glandular, spinulose-dentate; heads terminating branches; involucre mainly 12–20 mm high and 15–30 mm wide; bracts narrowly lance-attenuate to acuminate, herbaceous above, scarious below; rays 17–60 or more, bluish or purplish to white, 10–33 mm long, 1.8–5.5 mm wide; pappus of capillary bristles to 9 mm long; achenes compressed, pilose. Two varieties are present.

1. Involucres merely glandular dorsally; plants of canyons of the Colorado *X. tortifolia* var. *imberbis*
 — Involucres villous-pilose as well as glandular; plants of Washington County *X. tortifolia* var. *tortifolia*

Var. *imberbis* (Cronq.) T. J. Watson [*Machaeranthera tortifolia* var. *imberbis* Cronq., type from W of Moab]. *n* = 6. Blackbrush, pinyon-juniper and sagebrush communities at 1220 to 2290 m in Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona (Colorado canyons endemic); 32 (viii).

Var. *tortifolia* [*Haplopappus tortifolius* T. & G.; *Aster abatus* Blake; *Machaeranthera tortifolia* (T. & G.) Cronq. & Keck; *Xylorhiza lanceolata* Rydb., type from St. George]. *n* = 6, 12. Blackbrush and other warm desert shrub communities at 760 to 1010 m in Washington County; Arizona, Nevada, and California; 10 (i).

Xylorhiza venusta (Jones) Heller Cisco Woodyaster. [*Aster venustus* Jones, type from Cisco]. Suffrutescent to herbaceous perennial herbs from a woody caudex and taproot; stems mainly 10–40 cm tall, glabrous to densely pilose; leaves 2.4–9 cm long, 2–17 mm wide, oblanceolate to spatulate, villous to glabrate, attenuate basally; heads terminating branches; peduncles 5–20 cm long; involucre 10–18 mm high, 18–50 mm wide; bracts lance-attenuate to caudate-acuminate, herbaceous above, scarious below; rays 12–36, white or bluish to purplish, 12–27 mm long; pappus bristles to 10 mm long; achenes sericeous; *n* = 6, 12. Salt desert shrub communities at 1250 to 1985 m in Carbon, Daggett, Emery, Garfield, Grand, San Juan, Uintah, and Wayne counties; Colorado (a Colorado Plateau endemic); 99 (xv).

CONVOLVULACEAE A. L. Juss.

Morning Glory Family

Annual or perennial herbs, vines, or shrubs; leaves simple or compound, alternate, entire or lobed, without stipules; flowers solitary or cymose, axillary or terminal,

perfect; sepals 5, equal or unequal, separate or united near the base; corolla sympetalous, regular or nearly so, 5-angled to deeply 5-lobed; stamens 5, epipetalous; pistil 1, the ovary superior, 2 (1–5)-loculed; fruit a capsule, with 1 to several seeds; *x* = 7–15+.

1. Stigmas linear to oblong, more than twice as long as abroad 2
 — Stigmas globose to reniform or flat-topped, as broad as long or broader 4
 2(1). Corolla nearly rotate when fully expanded, 5–18 mm wide *Evolvulus*
 — Corolla funnelliform to campanulate, 16–80 mm wide . . . 3
 3(2). Calyx not enclosed by large bracts; stigmas linear, flattened *Convolvulus*
 — Calyx enclosed by 2 large bracts; stigmas oblong, slightly or not at all flattened *Calystegia*
 4(1). Corollas imbricate in bud, white; styles 2, entire; stigmas capitate *Cressa*
 — Corollas plicate-convolute in bud; style 1; stigma 1, globose or essentially so *Ipomoea*

Calystegia R. Br.

Prostrate or twining perennial herbs; leaves petiolate, glabrous, entire or lobed, sagittate to hastate basally; flowers axillary, usually solitary, bracts 2, mostly large and leaflike; sepals 5, enclosed by bracts; corolla campanulate to funnelliform, white or pink, with 5 stripes on the outside; stigmas 2-lobed, lobes mostly oblong or elliptic; ovary 1-loculed; fruit a capsule.

1. Calyx enclosed or closely subtended by a pair of large sepaloid bracts; plants introduced *C. sepium*
 — Calyx subtended by more remote bracts, these not especially sepaloid; plants indigenous *C. longipes*

Calystegia longipes (Wats.) Brummitt [*Convolvulus longipes* Wats.]. Perennial herbs; stems woody at the base, branched, erect to ascending, glabrous, slender, 3–10 dm long; leaves remote, linear to lance-hastate, 1–3 (5) cm long, the upper gradually reduced to linear bracts; peduncles slender, 1- or 2-flowered, 5–18 cm long; bracts lance-linear, adjacent to or remote from the calyx; sepals broadly oval, rounded and mucronate apically, unequal, 6–10 mm long; corolla white to cream, often with lavender veins, 2.5–3.5 cm long; stigmas linear-oblong; seeds dark. Mixed desert shrub communities below 1300 m in Washington County; Nevada, Arizona, and California; 3 (ii).

Calystegia sepium (L.) R. Br. [*Convolvulus sepium* L.]. Perennial herbs from elongate rootstocks; stems trailing and twining, to 2 m long; leaves long-petiolate, cordate at base, acuminate apically; flowers axillary, solitary or paired; peduncle short at anthesis, later elongating; floral bracts 2, elliptic-ovate, laterally overlapping, 12–25 mm long, ca twice longer than the calyx and enclosing it; corolla funnelliform, 5-angled, 4–8 cm long, white; ovary 1-loculed; style simple; capsule 2- to 4-seeded; *n* = 11, 12. Moist sites along streams and lakes at 1270 to 1590 m in Cache, Salt Lake, Uintah, Utah, and Weber counties; adventive from Europe, now widely naturalized in the U. S.; 10 (0).

Convolvulus L.

Annual or perennial herbs; stems ascending to trailing or twining; leaves petiolate to sessile, entire or lobed;

flowers axillary, solitary or in loose or congested cymes, both pedunculate and pedicellate; calyx with small slender bracts or none; corolla funnellform, 5-angled or shallowly lobed, white, pink, or suffused with purple; ovary 2-loculed; style simple; stigmas 2, linear, more or less flattened; capsule 2- to 4-seeded.

1. Calyx 3-5 mm long, inconspicuously pubescent or glabrate; perennial from deeply set creeping rootstocks, forming extensive beds; plants broadly distributed *C. arvensis*
 — Calyx 6-12 mm long, densely pubescent; perennial from a taproot, not creeping; plants of Washington County *C. equitans*

***Convolvulus arvensis* L.** Bindweed. Deeply rooted perennial with trailing or twining stems to 1 m or more long, glabrous or somewhat hairy; leaves variable in form, but usually oblong-elliptic to deltoid-ovate, mostly 1.5-3.5 cm long, the petioles slender; flowers solitary, on peduncles subequal to the leaves; pedicels shorter than the peduncles; sepals elliptic-orbicular, obtuse, ca 3 mm long; corolla open funnellform, white or occasionally pink or lavender pink on the outside with broad vertical stripes, 1.5-2 cm long; $n = 12, 24, 25$. This is a pestiferous weed of roadsides, railroads, fields (especially so in dry farming grain areas), gardens, and waste places at 930 to 2800 m in probably all Utah counties; adventive from Eurasia, of cosmopolitan distribution; 72 (iii).

***Convolvulus equitans* Benth.** [*C. incanus* authors, not Vahl.; *C. hermannioides* Gray]. Stems radiating from a root crown, prostrate and elampering or rarely twining, densely pubescent; leaf blades 1-7 cm long, 0.2-4 cm wide, ovate-elliptic, triangular-lanceolate, or narrowly oblong, the hastate bases entire or variously lobed or toothed, the hairs mostly appressed; flowers solitary or 2 or 3; peduncles mainly 2-8 cm long; pedicels shorter than the peduncles; sepals more or less aurieled basally; corolla funnellform, 5-angled, 1.5-3 cm long, pink or white, the center often red. Joshua tree and creosote bush communities at ca 1342 m in the Beaver Dam Mts., Washington County (S L & E R Welsh 23038 BRY); Colorado and Kansas, south to Mexico and Texas; 2 (i).

***Cressa* L.**

Low, densely appressed-pubescent perennials with deep vertical or obliquely branching rhizomes, forming colonies; stems erect or decumbent, freely branched; leaves sessile, small, entire; flowers axillary, solitary, short-pedicellate; sepals 5, united at base, laterally overlapping, elliptic; corolla white, funnellform, 5-lobed, surpassing the calyx; stamens exerted; styles 2; stigma capitate; capsule 1- to 4-seeded.

***Cressa truxillensis* H.B.K.** [*C. erecta* Rydb., type from Becks Hot Springs, Salt Lake County]. Low, tufted, gray woolly-villous herbs, 1-2 dm tall; leaves oblong-ovate, sessile, 5-10 mm long; flowers solitary, axillary, small; sepals 4-5 mm long, anescent; corolla ca 6 mm long, the ovate-lanceolate spreading or reflexed lobes ca 2 mm long and 1-1.5 mm wide; ovary and capsule pubescent. Saline or alkaline habitats below 1600 m in Box Elder, Davis, Garfield, Juab, Millard, Salt Lake, Tooele, Utah, Washington, and Weber counties; California to Oregon, Arizona, and Mexico; 30 (ii).

***Evolvulus* L.**

Low perennials with erect to ascending stems; leaves sessile or subsessile, entire; flowers axillary, solitary or

few in cymes; sepals 5; corolla rotate to shallowly funnellform, 5-angled or lobed, blue to lavender or white; styles 2, each with 2 branches; stigmas filiform; ovary 1- or 2-loculed; capsule 1- to 4-seeded.

***Evolvulus nuttallianus* Schultes in R. & S.** [*E. pilosus* Nutt.]. Stems 5-25 cm long, usually many from a shortly creeping root crown, densely pilose; leaf blades lanceolate to elliptic-oblong, 6-20 mm long, 1-8 mm wide, exceeding the flowers; peduncles absent; pedicels shorter than the calyx; corolla lavender to nearly white. Rocky or sandy sites in mixed desert shrub communities at 1430 to 1900 m in Kane, San Juan, Tooele, and Wayne counties; Arizona to Montana, south to Texas; 12 (ii).

***Ipomoea* L.**

Annual or perennial herbs or vines; stems usually trailing, creeping, or twining; leaves sessile to petiolate, simple or palmately compound, entire or toothed to lobed; flowers axillary or terminal, solitary to numerous; sepals 5, commonly laterally overlapping; corolla 5-angled or shallowly 5-lobed, salverform to funnellform, or campanulate, showy; variously colored; stamens included or exerted; ovary 1- to 3-loculed; style simple; stigma globose or with 2 or 3-lobes; capsule 1- to several-seeded.

1. Pedicels and peduncles with reflexed or spreading hairs *I. purpurea*
 — Pedicels and peduncles glabrous or nearly so *I. batatas*

***Ipomoea batatas* (L.) Lam.** Sweet Potato, Yam. [*Convolvulus batatas* L.]. Glabrous, trailing or twining herbs, from tuberous roots; leaf blades variable, deltoid-ovate in outline, mostly indented at base, entire to deeply 3- to 5-lobed, 4-10 cm long and wide; peduncles 1- to several-flowered; sepals oblong-lanceolate, acuminate; corolla pink to purplish, 4-7 cm long; $2n = 90$. Sparingly cultivated plant in lower elevation regions of Utah; introduced from tropical regions; 2 (i).

***Ipomoea purpurea* (L.) Roth** Morning-glory. [*Convolvulus purpureus* L.]. Annual twining, hairy herbs; leaves broadly cordate-ovate, 7-12 cm long, entire, short-acuminate, pubescent; peduncles bearing 1-5 flowers; sepals lanceolate to oblong, acute, 12-16 mm long, pubescent; corolla funnellform, purple to blue, pink, or white, 5-6 mm long; $2n = 30, 32$. Cultivated ornamental, persisting, escaping, and established along fence rows, city dumps, and waste places mainly below 1500 m in Salt Lake, Utah, and Washington counties; widely grown in the U. S.; 3 (i).

CORNACEAE Dumort.

Dogwood Family

Shrubs; leaves opposite, entire, simple; inflorescences cymose or capitate, often involucrate; flowers regular, perfect; sepals 4 or 5, small or lacking; petals 4 or 5, distinct; stamens 4 or 5 and alternate to the petals; pistil 1, the ovary inferior, mostly 2-loculed and with 1 ovule per locule; style 1; fruit a drupe, with 1 or 2 seeds; $x = 8-13, 19$.

***Cornus* L.**

Shrubs with stems red to purplish or yellowish; leaves ovate to elliptic or obovate; flowers in corymbose cymes,

small; sepals 4, very small, greenish to white and sometimes with a purple tip; stamens 4; fruit white. Note: The yellow-flowered *C. mas* L. (Cornelian cherry) is sparingly cultivated in Utah. It flowers very early, typically in March and April. And, the showy dogwood, *C. florida* L. is likewise present in both white and lavender flowered phases.

Cornus sericea L. Red-osier Dogwood; Kinnikinnik; American Dogwood. *Thelycrania sericea* (L.) Dandy; *C. stolonifera* Michx.; *C. sericea* ssp. *stolonifera* (Michx.) Fosberg f. *stolonifera* (Michx.) Fosberg; *Suida stolonifera* (Michx.) Rydb.]. Clump-forming shrubs, mainly 1.5–4 m tall, and often as broad, with branches red to purplish or yellowish, subglabrous to strigulose, the older stems grayish green and mostly glabrous; leaves 1–12 cm long, lanceolate to ovate or elliptic, acute to acuminate, green above, pale beneath, sparingly strigulose; flowers numerous, in cymes, strigose; sepals ca 0.5 mm long; petals white to cream, 2–3.5 mm long; styles 1.5–3 mm long; drupes white, 7–9 mm thick, sparsely strigulose; $2n = 22$. Streambanks and other moist sites at 1370 to 3050 m in all Utah counties; widespread in North America; 130 (ii). Our plants belong to var. *sericea*. Under stipulations of the Sydney version of International Code of Botanical Nomenclature there seems to be no alternative to the use of *C. sericea* L. for our distinctive plant, which has gone for so long under the name *C. stolonifera*. Some of our material, especially specimens from the Pine Valley Mts., approaches var. *occidentalis* T. & G. in being densely villous-pilose in the inflorescence.

CRASSULACEAE A. DC. in Lam. & DC.

Stonecrop Family

Plants perennial or annual, succulent herbs; leaves alternate or opposite, simple, fleshy, entire or toothed; flowers perfect or imperfect, regular, borne in cymose clusters or solitary in leaf axils; sepals 4 or 5, distinct or basally connate; petals 4 or 5, distinct; stamens 4, 8, or 10; pistils 4 or 5, distinct or connate at the base, superior, each 1-carpeled, the styles 1 per pistil; fruit a follicle; $x = 4-22+$.

1. Plants diminutive annuals; flowers solitary, axillary; stamens usually 4 *Tillaea*
- Plants small to moderate perennials; flowers borne in terminal, cymose clusters; stamens 8 or 10 2
- 2(1). Flowering stems lateral, arising from axils of leaves of the basal rosette; petals brick red *Dudleya*
- Flowering stems terminal, the leaves borne at the base of the stem; petals typically yellow or whitish *Sedum*

Dudleya Britt. & Rose

Perennial herbs; leaves mainly in basal rosettes, fleshy, flattened; flowering stems axillary, with cauline leaves much reduced; flowers in terminal paniculate or cymose clusters; calyx deeply 5-lobed, with erect lance-linear segments; corolla of 5 petals united above the base; stamens 10, borne on the corolla tube; carpels 5, more or less united below; seeds numerous.

Dudleya pulverulenta (Nutt.) Britt. & Rose Live-forever. [*Echeveria pulverulenta* Nutt. in T. & G.]. Plants mainly 2–4 dm tall, typically orange-red and transitional to purplish upward; herbage coated with a white

mealy powder throughout; caudex 4–9 cm thick; rosette leaves several, 8–25 cm long, 4–10 cm wide, obovate-spatulate, spreading; cauline leaves many, broadly ovate, cordate-clasping, acute; inflorescence branches 1–4 dm long, each with 10–30 flowers; pedicels slender, 5–30 mm long; calyx segments lanceolate, acute, 4–8 mm long; petals red, 12–18 mm long, connate nearly to the middle; carpels more or less distinct, 7–8 mm long. Crevices in limestone at ca 1070 m in the Beaver Dam Mts., Washington County; Arizona and California; 3 (i). Our materials belong to var. *arizonica* (Rose) Welsh stat. nov. [based on *Dudleya arizonica* Rose Addisonia 8: 35. 1923; *Echeveria arizonica* (Rose) Kearney & Peebles; *D. pulverulenta* ssp. *arizonica* (Rose) Clokey]. This plant was discovered in the Beaver Dam Mts. by Larry C. Higgins in the spring of 1986. The Utah materials represent a disjunction from the species distribution in Arizona.

Sedum L.

Perennial herbs from taproots and caudices, the caudex branches often subrhizomatous or stoloniferous; stems decumbent to ascending or erect; leaves alternate or opposite, subterete to flattened, entire or toothed; flowers showy, borne in subcapitate to paniculate cymes; sepals usually 5, persistent; petals usually 5, yellow, greenish yellow, pink, or dark purple; pistils usually 5; follicles erect.

1. Flowers white, 2.5–3 mm long; calyx ca 1 mm long; plants cultivated and escaping *S. album*
- Flowers yellow, cream, pink, or purple, usually 5–10 mm long or more; calyx 1–6 mm long; plants indigenous 2
- 2(1). Flowers yellow or cream; leaves subterete 3
- Flowers pink to purple or white; leaves flattened 4
- 3(2). Leaves opposite or subopposite; petals connate at the base *S. debile*
- Leaves alternate; petals distinct *S. lanceolatum*
- 4(3). Flowers pink, borne in elongate, capitate clusters; plants of the Uinta Mts. and high central plateaus *S. rhodanthum*
- Flowers dark purple, borne in capitate cymes as broad as long or broader; plants of the Raft River and Deep Creek mts. *S. rosea*

Sedum album L. Plants caespitose, the caudex branches prostrate, more or less rhizomatous or stoloniferous; flowering stems erect or ascending from decumbent bases, mostly 8–20 cm tall; leaves alternate, 2–15 mm long, subterete, sessile; flowers numerous in open, corymbiform cymes; calyx 5-lobed, ca 1 mm long; corolla white 2.5–3.5 mm long; stamens subequal to the corolla lobes. Cultivated ornamental, escaping and persisting in Utah County; introduced from Eurasia; 2 (0).

Sedum debile Wats. Opposite Stonecrop. Plants caespitose, the rhizomatous to stoloniferous caudex branches prostrate; flowering stems erect from a decumbent base, mainly 4–12 cm tall; leaves opposite (or nearly so), subterete, fleshy, sessile, easily deciduous, 3–8 mm long; flowers few to many in loose, terminal cymes; calyx usually 5-lobed, 2.5–3.5 mm long; corolla yellow to cream, the petals 5–8 mm long, connate basally; stamens 10, shorter than the petals; pistils surpassing the petals; follicles connate basally; $2n = 14-18$. Mountain brush, Douglas fir-white fir, ponderosa pine, aspen, and alpine tun-

dra communities, often on rock outcrops and talus, at 1575 to 3115 m in Box Elder, Cache, Davis, Duchesne, Juab, Millard, Piute, Salt Lake, Sanpete, Summit, Tooele, Utah, Wasatch, Washington, and Weber counties; Oregon and Idaho, south to Nevada and Wyoming; 43 (iv).

Sedum lanceolatum Torr. Common Stonecrop. [*S. stenopetalum*, authors, not Pursh, misapplied; *S. meehanii* Gray (?), type from City Creek Canyon]. Plants caespitose, the subrhizomatous or stoloniferous caudex branches prostrate; flowering stems erect from decumbent bases, mostly 4–25 cm tall; leaves alternate, subterete, sessile, easily deciduous, 3–20 mm long; flowers few to many in loose to compact, terminal cymes; calyx usually 5-lobed, 2.5–4 mm long; corolla yellow, the petals 5–8 mm long, distinct; stamens usually 10, subequal to the petals; follicles connate at the base; $n = 8$. Sagebrush, pinyon-juniper, mountain brush, aspen, lodgepole pine, and spruce-fir communities at 1765 to 3660 m in all Utah counties; Alaska and Yukon, south to California, Arizona, New Mexico, and Nebraska; 90 (xi).

Sedum rhodanthum Gray Pink Stonecrop. Perennial herbs from a taproot and simple or branched caudex, this clothed with marcescent, brown leaf bases; stems erect or more or less decumbent at the base, mostly 5–35 (40) cm tall; leaves alternate, flat, sessile, 6–30 mm long, 2–6 mm wide, entire (or somewhat toothed), persistent; flowers numerous, borne in compact, terminal, usually elongate, cymose inflorescences; calyx 5-lobed, 4–6 mm long, usually tinged pink; corolla of 5 distinct petals, 8–12 mm long, pink to rose or white; stamens shorter than the petals; follicles connate at the base; $2n = 14$. Spruce-fir and alpine tundra communities, often in damp meadows and talus, at 2745 to 3600 m in Beaver, Daggett, Duchesne, Iron, Garfield, Sevier, Summit, and Uintah counties; Montana to Arizona and Colorado; 26 (viii).

Sedum rosea (L.) Scop. Roseroot. [*Rhodiola rosea* L.]. Perennial herbs from a taproot and vertical caudex, this clothed with persistent, scalelike leaves; stems erect or ascending, usually simple, 3–30 (45) cm tall; leaves alternate, flat, ovate to elliptic or oblanceolate, reduced and scalelike below, becoming larger upward, 4–40 mm long, 2–15 mm wide, toothed to entire; sepals 1.2–2 mm long, persistent, distinct, dark purple; petals distinct, 1–3 mm long, dark purple; stamens longer than the petals, the filaments purple or yellow, lacking in pistillate flowers; follicles erect, distinct; $2n = 22, 33, 36$. Talus slopes in alpine tundra at ca 2925 to 3050 m in Box Elder (Raft River Mts.) and Juab (Deep Creek Mts.) counties; Alaska and Yukon, east to the Atlantic, south to California, Nevada, Colorado, and Maine; 2 (0). Our material belongs to var. *integrifolium* (Raf.) Berger (*Rhodiola integrifolia* Raf.; *S. integrifolium* (Raf.) Hulten].

Tillaea L.

Diminutive, annual herbs from taproots; stems prostrate, ascending, or erect; leaves opposite, flattened, entire; flowers minute, solitary in leaf axils; sepals usually 4, persistent; petals usually 4, whitish; pistils commonly 4; follicles erect.

Tillaea aquatica L. Pygmyweed. Stems typically prostrate and more or less stoloniferous, 1–8 cm long; leaves linear to narrowly oblanceolate, 1–6 mm long, 0.2–1 mm wide, flattened, entire, connate-sheathing basally; sepals 0.5–1 mm long, connate to near the middle; petals 1–2

mm long, whitish, membranous; stamens shorter than the petals; follicles distinct; $2n = 42$. Shallow water in a wet meadow at ca 2100 m in Uintah County (Neese 13963 BRY); widespread in North America; circumboreal; 1 (0).

CRUCIFERAE A. L. Juss.

Mustard Family

Annual to perennial herbs or subshrubs, often with pungent watery juice; leaves alternate or basal and still alternate, simple to compound, stipulate; flowers perfect, regular or nearly so, hypogynous, borne in racemes, spikes, or corymbs; sepals 4, greenish to colored, the outer 2 often somewhat gibbous at the base; petals 4, rarely lacking, yellow, white, or pink to blue or purple, commonly clawed, the blade spreading in the form of a cross (hence Cruciferae); stamens 6, with the outer 2 shorter than the other 4 (tetradynamous), rarely 4 or 2; nectar glands commonly 4; ovary superior, 2-loculed or, less commonly, only 1-loculed, usually with a thin partition (replum) between the 2 marginal placentae from which, when mature, the valves usually separate; stigma rather small, entire to shallowly 2-lobed; fruit sessile or stipitate, typically dehiscent or, if indehiscent, constricted between the seeds (torulose) and sometimes breaking transversely, several times longer than broad (silique) or 1 to 3 times as long as broad (silicle), the sides flattened or compressed parallel with the replum or, less commonly, flattened contrary to the replum; seeds (1) 2 to several in a single row per locule (uniserial) or more or less distinctly arranged in 2 rows (biseriate), smooth to striate or pitted and plump to flattened or even wing-margined, exalbuminous; $x = 5-12+$ [Brassicaceae Burnett].

Welsh, S. L. and J. R. Reveal. 1977. Utah flora: Brassicaceae (Cruciferae). Great Basin Naturalist 37: 279–365.

1. Plants with cauline leaves both sessile and auriculate (at least some), or auriculate and petiolate (in some *Barbarea*, *Nasturtium*, and *Rorippa*) 2
 - Plants without cauline leaves or with cauline leaves not both auriculate and sessile, either petioled or merely sessile 4
- 2(1). Petals yellow; plants glabrous or with simple hairs, rarely with some malpighian hairs in *Thelypodopsis* Key 1
 - Petals white, pink, lavender, chestnut, or purple, but not yellow (cream colored in *Camelina* and *Arabis*); plants glabrous or variously pubescent 3
- 3(2). Plants glabrous or with simple trichomes only Key 2
 - Plants pubescent with at least some malpighian, branched, or stellate hairs Key 3
- 4(1). Petals yellow, sometimes fading white or pinkish to purplish 5
 - Petals white, pink, lavender, purple, or chestnut, but not yellow 6
- 5(4). Plants glabrous or with simple hairs only Key 4
 - Plants pubescent with malpighian, branched, or stellate hairs Key 5
- 6(4). Plants glabrous or with simple hairs only Key 6
 - Plants pubescent with at least some malpighian, branched, or stellate hairs Key 7

Key 1.

Cauline leaves auriculate; petals yellow.

1. Uppermost cauline leaves falsely perfoliate-clasping; basal leaves finely dissected, usually lacking at anthesis; seeds 2, one in each locule; siliques about as broad as long (*L. perfoliatum*) *Lepidium*
- Uppermost cauline leaves various, but not perfoliate-clasping, more than twice as long as broad; basal leaves pinnatifid to dentate or subentire; seeds several to many, or reduced to 1 in *Isatis*; fruit more than twice as long as broad 2
- 2(1). Cauline leaves lyrate-pinnatifid or falsely petiolate above the auriculate base 3
- Cauline leaves entire, ovate to oblong or lanceolate, undulate or rarely toothed, sessile 4
- 3(2). Styles (0.5) 1–2 mm long or more, abruptly contracted at the stigma; fruit 15 mm long or more, many times longer than broad; plants not rhizomatous *Barbarea*
- Styles 0.5–0.8 (1.3) mm long or, if longer, the plants rhizomatous, tapering to the stigma; fruit less than 10 mm long (rarely longer), 1 to several times longer than broad *Rorippa*
- 4(2). Cauline leaves hastately lobed; pedicels deflexed in fruit; siliques cuneate, winged-flattened, 1-seeded, 1-loculed *Isatis*
- Cauline leaves clasping-auriculate; pedicels spreading-ascending to ascending in fruit; siliques linear, not or only somewhat flattened, not winged, many-seeded, 2-loculed 5
- 5(4). Cauline leaves broadly rounded to truncate apically, strictly entire, elliptic or oblong to lance-oblong *Conringia*
- Cauline leaves rounded to acute apically, more or less dentate to entire, tapering from base to apex 6
- 6(5). Plants biennial; weeds of cultivated or disturbed sites; basal leaves lyrate pinnatifid (*B. campestris*) *Brassica*
- Plants perennial or biennial, rarely annual; indigenous plants of clay soils; basal leaves dentate to entire 7
- 7(6). Stamens exerted, siliques long-stipitate, the stipe 1–2 cm long or more (*S. viridiflora*) *Stanleya*
- Stamens included; siliques sessile or only short-stipitate *Thelypodiopsis*

Key 2.

Cauline leaves auriculate; petals white, pink, lavender, or chestnut; herbage glabrous or with simple trichomes only.

1. Leaves pinnately compound or pinnatifid; plants aquatic, glabrous (or nearly so); flowers white. . . *Nasturtium*
- Leaves simple, entire or merely toothed, plants terrestrial; flowers white, pink, lavender, or chestnut 2
- 2(1). Uppermost cauline leaves commonly rounded to emarginate or truncate apically, the lower ones dentate apically; flowers chestnut to brown purple or purple; siliques 3–5 (6) mm broad *Streptanthus*
- Uppermost cauline leaves attenuate to acute apically, the lower ones various but not apically dentate only; flowers white, pink, or lavender 3
- 3(2). Plants annual or winter annual, pedicels recurved in fruit; fruit indehiscent, winged-flattened, 1-seeded, 1-loculed, restricted to Washington County *Thysanocarpus*
- Plants annual, biennial, or perennial; pedicels spreading-ascending to erect, rarely descending in some *Thlaspi*; fruit dehiscent, or indehiscent in *Cardaria*, winged-flattened to subterete, 2 or more seeded; distribution various 4

- 4(3). Limb of petal 4–6 (7) mm long; sepals mostly 4–7 mm long; siliques often more than 5 cm long . . . *Thelypodiopsis*
- Limb of petal 2–3 mm long or less; sepals mostly 2–4 (7) mm long, fruit less than 5 cm long, except in *Arabis* 5
- 5(4). Fruit 10–30 times longer than broad or more, linear or narrowly oblong in outline 6
- Fruit 1–4 times longer than broad or less, clavate to obovate, ovate, or cordate-reniform in outline 8
- 6(5). Pedicels mostly 8–12 mm long, erect or nearly so; plants of middle altitudes in mountains (*A. hirsuta*) *Arabis*
- Pedicels 2–7 mm long, spreading-ascending to descending; plants of low to moderate elevation 7
- 7(6). Plants 10 dm tall or more, biennial, the basal leaves often withered at anthesis; cauline leaves numerous, somewhat hastately and acutely auricled; known only from central northern Utah (*T. rollinsii*) . . . *Thelypodium*
- Plants 4 dm tall or less, annual or winter annual, the basal leaves not withered at anthesis; cauline leaves few to several, cordate-auricled to merely sessile; known only from Washington County (*C. cooperi*) . . . *Caulanthus*
- 8(5). Seeds and ovules 3 to many per fruit, usually 2 or more in each locule; fruit conspicuously winged or more than twice as long as broad *Thlaspi*
- Seeds and ovules 2 per fruit, 1 in each locule; fruit not or only somewhat winged 9
- 9(8). Fruit broader than long, indehiscent; upper cauline leaves ovate; racemes 2–5 cm long in fruit, numerous *Cardaria*
- Fruit longer than broad, dehiscent; upper cauline leaves lanceolate; racemes 5–10 cm long or more in fruit, few (*L. campestre*) *Lepidium*

Key 3.

Cauline leaves auriculate; petals white, pink, or lavender (except in *Camelina* and *Arabis*); herbage with malpighian, branched, or stellate hairs.

1. Plants indigenous biennials or perennials of broad distribution in native plant communities; fruits siliques, several to many times longer than broad; flowers pink, lavender, or white (cream in *Arabis glabra*) 2
- Plants adventive annuals or winter annual of disturbed or cultivated places; fruits siliques, less than 3 times longer than broad; flowers usually white 3
- 2(1). Plants pubescent with mixed simple, forked, and branched hairs, known from north-central and north-eastern Utah; siliques subquadrangular *Halimolobos*
- Plants variously pubescent but not as above or of that distribution; siliques distinctly flattened *Arabis*
- 3(1). Plants flowering in early springtime; siliques triangular-obcordate, compressed *Capsella*
- Plants flowering in late springtime and summer; siliques obovoid, terete or nearly so *Camelina*

Key 4.

Cauline leaves sessile or petiolate, not auriculate or, if hastately lobed, petiolate; flowers yellow; herbage glabrous or with simple hairs only.

1. Cauline leaves both hastately lobed and petiolate, the leaf blades triangular-ovate or lanceolate, entire; plants mostly 8 dm tall or more, of middle elevations often in dense vegetation *Chlorocrambe*
- Cauline leaves pinnatifid to entire, the leaf-blades not hastately lobed, plants low to tall but, if tall, seldom if ever of middle elevations in dense vegetation 2

- 2(1). Leaves all simple and entire or sparingly toothed; plants perennial from a caudex 3
 - Leaves (at least some) pinnatifid or definitely and regularly toothed (or, if all entire, then plant not arising from a caudex); plants annual, biennial, or perennial, sometimes with a distinct caudex 5
- 3(2). Plants low, less than 1 dm tall; cauline leaves lacking; siliques lanceolate in outline, 1–4 times longer than broad (*D. densifolia*) *Draba*
 - Plants 1–5 dm tall or more; cauline leaves present; siliques linear, many times longer than broad 4
- 4(3). Stamens long-exserted from the flower; pedicels spreading, siliques stipitate, the stipes 10–25 mm long or more *Stanleya*
 - Stamens not exserted beyond the flower; pedicels ascending to suberect, siliques sessile or subsessile, or the stipe less than 1 mm long *Schoenocrambe*
- 5(2). Plants growing in mud, along beaches, or in or near streams; petals usually less than 3 mm long; siliques usually less than 12 mm long *Rorippa*
 - Plants seldom if ever in perennially moist sites, petals more than 4 mm long or siliques more than 12 mm long, or both 6
- 6(5). Leaves glaucous, thickened, perennial herbs from an often woody caudex; stamens long-exserted; siliques stipitate, the stipes 10–25 mm long *Stanleya*
 - Leaves not glaucous or, if so, not especially thickened; annual, biennial, or perennial herbs without a distinct caudex (except *Schoenocrambe*); stamens not exserted; siliques not stipitate 7
- 7(6). Plants perennial, rhizomatous, indigenous, of lower elevations in native plant communities *Schoenocrambe*
 - Plants annual or biennial, adventive, of disturbed or cultivated places 8
- 5(7). Fruits dehiscent to the apex; pedicels spreading-ascending or, if erect (as in *S. officinalis*), the petals only 3–4 mm long *Sisymbrium*
 - Fruits with long, indehiscent sterile apices; pedicels ascending or, if appressed (as in *B. nigra*), the petals 5–8 mm long or more 9
- 9(8). Plants mostly 2–5 dm tall; leaves mainly basal; fruiting racemes longer than the leafy stems; seeds biseriate *Diplotaxis*
 - Plants mostly 4–10 dm tall or more; leaves basal and cauline; fruiting racemes shorter than the leafy stems, seeds uniseriate *Brassica*

Key 5.

Cauline leaves sessile, petiolate, or lacking; petals yellow; herbage pubescent with malpighian, branched, or stellate hairs.

- 1. Leaves once to twice or rarely thrice pinnately dissected or compound; plants annual or winter annual *Descurainia*
 - Leaves simple and entire or merely toothed or lobed; plants annual, biennial, or perennial 2
- 2(1). Cauline leaves lacking, all leaves basal *Draba*
 - Cauline leaves present, at least one, the basal leaves present or absent 3
- 3(2). Plants pubescent with appressed, Y-shaped and/or malpighian hairs; siliques many times longer than broad *Erysimum*
 - Plants pubescent with branched, dendritic, or appressed stellate hairs; siliques from about as broad as long to ca 5 times longer than broad 4

- 4(3). Pubescence of branched or dendritic hairs, rarely with some stellate; siliques lance-ovate to oblong or elliptic, usually more than twice as long as broad *Draba*
 - Pubescence of appressed stellate hairs only (except for *Alyssum saxatile*); siliques orbicular in outline or subglobose to bladderly inflated, not over twice as long as broad 5
- 5(4). Siliques compressed, lens-shaped; plants annual *Alyssum*
 - Siliques either subglobose or greatly inflated and terete or didymous; plants annual, biennial, or perennial 6
- 6(5). Basal leaf blades often more than 20 mm wide; siliques (excluding style) 5–10 mm long or more, didymous and bladderly inflated, cordate at the base *Physaria*
 - Basal leaf blades rarely to 20 mm wide; siliques (excluding style) 3–6 mm long, not didymous, seldom bladderly inflated, not cordate at the base *Lesquerella*

Key 6.

Cauline leaves sessile, petiolate, or lacking; petals white, pink, lavender, purple, or chestnut; herbage glabrous or with simple hairs only.

- 1. Herbage stipitate-glandular, or glabrous and the plants scapose and with large flowers; plants either alpine perennials or winter annuals of low elevations 2
 - Herbage glabrous or with simple hairs; plants of various habits, habitats, and duration 3
- 2(1). Plants scapose alpine perennials; leaves basal; petal blades 5–10 mm long or more; siliques flattened, dehiscent *Parrya*
 - Plants winter annuals; leaves cauline and basal; petal blades 2–4 mm long; siliques terete, indehiscent *Chorispora*
- 3(1). Blades of cauline leaves hastately lobed, otherwise entire, triangular-ovate to triangular-lanceolate; plants 5–10 dm tall or more; siliques stipitate, the stipe 2–7 mm long *Chlorocrambe*
 - Blades of cauline leaves, if any, not both hastately lobed and entire; plants low to tall, fruit subsessile or sessile on the pedicel (except in *Lunaria*) 4
- 4(3). Plants dwarf scapose perennials; leaves often less than 10 mm long; scapes often less than 10 cm tall *Draba*
 - Plants caulescent, at least some leaves cauline; leaves mostly more than 10 mm long; stems usually over 10 cm tall 5
- 5(4). Plants slender annuals, 1–2.5 dm tall; leaves entire or merely serrate (at least the cauline ones); fruits obovate in outline and several-seeded or, if linear, less than 15 mm long 6
 - Plants annual, biennial, or perennial, 1.5–10 dm tall or more; leaves variously toothed, lobed, or entire; fruits obovate in outline and 2-seeded, or lance-ovoid, or, if linear, mostly more than 15 mm long 7
- 6(5). Petals 1.2 mm long or less; siliques obovate, compressed, 2–3 mm long *Hutchinsia*
 - Petals 2–2.9 mm long; siliques linear, terete, 9–14 mm long *Arabidopsis*
- 7(5). Basal leaves long-petiolate, the blades oblong to lanceolate, mostly 10–30 (50) cm long or more; cauline leaves lance-oblong, irregularly crenate-serrate; petals white; siliques less than twice longer than broad, abortive; plants cultivated but escaping and often persistent *Armoracia*

- Basal leaves sessile, poorly developed or, if long-petiolate, the blades seldom as above, usually less than 10 cm long; cauline leaves not both lance-oblong and irregularly crenate-serrate; petals pink, white, or chestnut purple; fruit various; plants indigenous or cultivated 8
- 8(7). Petal blades 8–12 mm long, pink to lavender; siliques more than 20 mm wide; style 6–8 mm long; leaves cordate-ovate, irregularly toothed *Lunaria*
- Petal blades usually less than 8 mm long; fruit much less than 10 mm wide; style less than 3 mm long; leaves various but not cordate-ovate (except in *Cardamine cordifolia*) 9
- 9(8). Seeds and ovules 2, 1 in each locule; siliques obcordate, orbicular, or elliptic, usually about as long as broad *Lepidium*
- Seeds and ovules more than 2, usually more than 2 in each locule; siliques lance-oblong or siliques linear and 3 to many times longer than broad 10
- 10(9). Plants annual, with thickened tuberous roots; flowers white or pink, the petal limb more than 5 mm long; siliques terete, indehiscent *Raphanus*
- Plants perennial, biennial, or, if annual, not from thickened roots; flowers variously colored but, if white or pink, the petal limb less than 5 mm long; fruit terete or flattened, dehiscent 11
- 11(10). Cauline leaves ovate, cordate-ovate, or pinnately compound; flowers white; plants of moist sites *Cardamine*
- Cauline leaves pinnatifid or entire to subentire and linear to elliptic, cordate-deltoid, or deltoid, but not as above; flowers white or brown purple, lavender or with purple veins; plants of various habitats 12
- 12(11). Flowers minute, less than 1.2 mm long; siliques lance-oblong, less than 10 mm long; leaves lyrate-pinnatifid (*R. tenerrima*) *Rorippa*
- Flowers 2–6 mm long or more; siliques linear to oblong, much more than 10 mm long; leaves pinnatifid to toothed or entire 13
- 13(12). Flowers subsessile, the pedicels less than 2 (4) mm long; leaves, at least some, definitely pinnatifid; petals mostly brown purple *Caulanthus*
- Flowers pedicellate, the pedicels usually over 2 mm long, or the leaves entire; petals variously colored, but, if brown purple, the pedicels definitely longer than 2 mm 14
- 14(13). Basal leaves long-petiolate, the blades reniform; cauline leaves becoming short-petiolate upward, the blades cordate-deltoid to deltoid, irregularly toothed or lobed; plants with odor of garlic *Alliaria*
- Basal leaves variously petiolate to sessile, the blades various but seldom if ever as above; cauline leaves often sessile throughout, usually entire; plants not smelling of garlic 15
- 15(14). Plants annual, pedicels curved-descending, siliques compressed, the sutures parallel, not torulose *Streptanthella*
- Plants biennial or perennial; pedicels spreading to spreading-ascending (declined in *Thelypodium wrightii*); siliques with parallel sides or else torulose 16
- 16(15). Petals strongly purple-veined, leaves linear or oblong; plants from a caudex, known from Emery and Uintah counties *Schoenocrambe*
- Petals not or seldom purple veined; leaves various; plants with or without a caudex, of various distribution 17

- 17(16). Plants erect biennials; basal rosette prominent, but usually withered at anthesis; pedicels spreading or declined; siliques torulose; flowers numerous to very numerous *Thelypodium*
- Plants ascending to erect perennials; basal rosette not especially prominent; pedicels spreading-ascending; siliques with parallel sides; flowers several to many (*A. Nuttallii*) *Arabis*

] Key 7.
Plants with cauline leaves sessile, petiolate, or lacking; petals white, pink, lavender, or purple; herbage pubescent with malpighian, branched, or stellate hairs.

- 1. Leaves pinnately lobed; herbage cinereous pubescent; plants of high elevations *Smelowskia*
- Leaves entire to serrate or sinuate-dentate; herbage green or glaucous (cinereous in *Dithyrea*); plants of low to high elevations 2
- 2(1). Plants scapose, the leaves basal, mostly less than 1 dm tall *Draba*
- Plants with at least some leaves cauline, often more than 1 dm tall 3
- 3(2). Petal blades more than 6 mm long; sepals definitely saccate, 6–8 mm long, cauline leaves sinuate-dentate; plants 5–10 dm tall or more, cultivated and frequently escaping *Hesperis*
- Petal blades less than 6 mm long; sepals not especially saccate, 1–6 mm long, cauline leaves entire or sinuate-dentate; plants (0.5) 1–4 dm tall, indigenous or adventive, not cultivated (except *Lobularia*) 4
- 4(3). Style (1.5) 2–3 mm long; ovaries appressed stellate pubescent, about twice as long as broad, dehiscent; seeds several *Berteroa*
- Style 0.2–1 (1.5) mm long; ovaries variously pubescent but, if appressed stellate, much broader than long, dehiscent or indehiscent; seeds 1 to many 5
- 5(4). Pedicels 5–21 mm long, spreading; siliques with stellate or dendritic pubescence, more than twice as broad as long, 2-seeded *Dithyrea*
- Pedicels less than 8 mm long or not spreading, or, if spreading, the fruit not with stellate or dendritic hairs and broader than long; seeds 1, 2, or more 6
- 6(5). Petals minute, less than 2 mm long; seeds 1 or 2; fruit indehiscent; plants annual or winter annual 7
- Petals mostly 2–10 mm long or more; seeds 2 to many; plants annual, biennial, or perennial 8
- 7(6). Ovary and fruit with dendritic pubescence; fruit ovoid, with a curved styler beak up to 1 mm long, 2-seeded *Euclidium*
- Ovary and fruit with simple hairs; fruit orbicular, compressed, lacking a styler beak, 1-seeded; plant only recently known from Washington County *Athysanus pusillus* (Hook.) Greene
- 8(6). Pedicels less than 2 mm long, appressed or ascending; leaves sinuate-dentate; siliques ascending, 33–63 mm long, pubescent with dendritic or branched hairs, the stigma oblique *Malcolmia*
- Pedicels 2–10 mm long, descending to spreading or ascending; fruit various, sometimes pubescent with dendritic or branched hairs, the stigma terminal 9
- 9(8). Pedicels descending, fruit pendulous, 13–65 mm long; plants perennial *Arabis*
- Pedicels spreading to ascending; fruit erect or spreading to ascending, 2–14 mm long; plants annual or perennial 10

- 10(9). Leaves mainly cauline, strigose with malpighian hairs; fruit about as broad as long; seeds 2; plants cultivated and often escaping *Lobularia*
- Leaves mainly basal, with stalked dendritic or stellate hairs; seeds usually more than 2; plants indigenous or adventive 11
- 11(10). Fruit linear to narrowly oblong, terete or subterete, less than 1 mm broad; plants slender annuals *Arabidopsis*
- Fruit lance-ovate to lanceolate or oblong in outline, flattened, 1.5–3 mm broad; plants annual or perennial *Draba*

Alliaria Adanson

Plants glabrous or pubescent with simple hairs, biennial or annual, with odor of garlic; stems erect, simple or branched from the base; leaves alternate, the blades reniform to deltoid, long-petiolate below, becoming short-petiolate to sessile upward; flowers borne in racemes; sepals 4, deciduous; petals white, spatulate, short-clawed; stamens 6; style short; stigma capitate; fruit a sessile silique, linear, 4-angled, the valves 3-veined.

Alliaria officinalis Andr. Garlic Mustard. [*Erysimum alliaria* L.; *Sisymbrium alliaria* (L.) Scop.; *Alliaria alliaria* (L.) Britt.]. Herbs from a taproot, almost glabrous or sparsely pubescent with simple hairs; stems erect, 3–10 dm tall; leaves petiolate, the basal often withered by anthesis, the blades reniform; cauline leaves with cordate-deltoid to deltoid blades 1.5–6 cm wide, coarsely and irregularly toothed to sinuate-dentate; racemes simple (sometimes branched), often bracteate basally; pedicels 2–6 mm long; petals white, 5–6 mm long, much surpassing the sepals; siliques spreading, arched upward, 4–6 cm long, more or less quadrangular, somewhat torulose; seeds ca 3 mm long, black; 2n = 16, 18, or ca 21. Disturbed sites in Park City, Summit County; sporadic in North America; adventive from Eurasia; 2 (0).

Alyssum L.

Stellate-pubescent annuals or perennials from taproots; leaves alternate, simple, entire, tapering to base, not auriculate; flowers in racemes, the pedicels spreading-ascending to ascending or erect, not subtended by bracts; sepals 4, deciduous or persistent; petals 4, yellow (often fading cream or white), emarginate; stamens 6, at least the 2 shorter filaments with a whitish process near base; style slender; stigma capitate; fruit a sessile silicle, less than twice longer than broad, broadly elliptic to oval in outline, compressed parallel to the septum; valves veinless; seeds 1 or 2 per locule.

- 1. Cauline leaves, at least some, more than 4 cm long; flowers bright yellow, fading cream; petal blades obovate, about as broad as long; plants perennial, cultivated and occasionally escaping *A. saxatile*
- Cauline leaves less than 4 cm long; flowers pale yellow (fading white); petal blades cuneate, much longer than broad; plants adventive annuals of arid sites 2
- 2(1). Siliques glabrous or essentially so, orbicular in outline; style 0.5–0.8 mm long, persistent *A. desertorum*
- Siliques stellate-pubescent, orbicular to elliptic in outline; style various 3
- 3(2). Siliques 4–5 mm broad; style 0.8–1.2 mm long; pubescence of coarse spreading-ascending stellate hairs *A. minus*

- Siliques 2.8–4 mm broad; style 0.3–0.6 mm long; pubescence of delicate appressed-stellate hairs 4
- 4(3). Siliques emarginate at the style, about as broad as long; hairs of fruit minute, not or seldom overlapping *A. alyssioides*
- Siliques truncate at the style, longer than broad; hairs of fruit ample, usually overlapping *A. szowitzianum*

Alyssum alyssioides (L.) L. *Alyssum*. [*Clypeola alyssioides* L.]. Annual, the stems ascending to erect, simple or branched from near base, (3) 6–25 cm tall; leaves spatulate to oblanceolate, 5–20 (37) mm long, 2–6 mm broad, stellate and green on both surfaces; pedicels spreading-ascending, 1.5–4 (5) mm long; sepals 2.1–2.8 (3) mm long, green, stellate-pubescent, persistent; petals 3–4.2 mm long, yellow, fading white, cuneate, surpassing sepals; siliques 3–4 mm long and almost as broad; valves minutely stellate-pubescent, emarginate at the style; style persistent, mostly 0.3–0.6 mm long; n = 12, 16. Bunchgrass, sagebrush, pinyon-juniper, and mountain brush communities at 1370 to 2440 m in Box Elder, Cache, Millard, Salt Lake, Tooele, Utah, Wasatch, and Weber counties; widespread in North America; adventive from Europe; 27 (0).

Alyssum desertorum Stapf Desert *Alyssum*. Annual, the stems decumbent to ascending or erect, simple or branched from near the base, (3) 4–20 cm tall; leaves spatulate to oblanceolate or almost linear, 4–22 mm long, 2–3 mm wide, stellate and green on both surfaces; pedicels spreading-ascending, 1.8–2.5 mm long; sepals 1.2–1.9 mm long, often suffused with red, stellate-pubescent; petals 2.3–2.8 mm long, yellow, fading white, cuneate, surpassing the sepals; siliques 2.9–3.8 mm long and about as broad, the valves glabrous or rarely with scattered stellate hairs, emarginate at the style, this persistent, 0.5–0.8 mm long; 2n = 16, 32. Mixed desert shrub, sagebrush, bunchgrass, pinyon-juniper, ponderosa pine, and aspen communities at 1280 to 2200 m in Beaver, Box Elder, Carbon, Davis, Juab, Millard, Morgan, Salt Lake, Sanpete, Tooele, Utah, and Weber counties; Washington, Oregon, Idaho, and Montana; adventive from Asia Minor and adjacent southeastern Europe; 24 (v).

Alyssum minus (L.) Roth [*Clypeola minor* L.]. Annual, the stems ascending to erect, simple or branched from near the base, 0.9–2.5 dm tall; leaves spatulate to oblanceolate, 4–25 mm long, 2–7 mm broad, coarsely stellate and green on both surfaces; pedicels spreading-ascending, 2.8–4.9 mm long; sepals (1.5) 1.7–2.5 mm long, often suffused with red, stellate-pubescent, caducous; petals 2.7–3.6 mm long, yellow, fading white, surpassing the sepals; siliques (3.5) 4–5.2 mm long and about as broad or broader, the valves coarsely stellate with ascending rays, emarginate at the style, this persistent, 0.8–1.2 mm long; 2n = 16, 48. Sagebrush, mountain brush, and pinyon-juniper communities at 1525 to 1895 m in Grand, Salt Lake, and Uintah counties; California and Colorado; adventive from the Old World; 5 (0).

Alyssum saxatile L. Sweet *Alyssum*. Annual, the stems sprawling- decumbent to ascending or erect, branched from the base and above, 20–35 cm tall; leaves oblanceolate to elliptic or oblong, 90–135 mm long, 2–17 mm wide, minutely stellate and with long, forked, and simple hairs, and green on both surfaces; pedicels spreading-ascending, 3.5–8 mm long; sepals 1.7–3 mm long, green or

cream, loosely stellate to glabrate, caducous; petals 4–5 mm long, yellow, fading cream, much surpassing the sepals; siliques 3.5–4.5 mm long or more and almost as broad; valves glabrous, truncate to rounded at style, this persistent, 0.5–1 mm long; 2n = 16. Cultivated ornamental, occasionally escaping; introduced from southern Europe; 4 (0).

Alyssum szowitzianum Fisch. & Mey. Szowitz Alyssum. Annual, the stems decumbent-ascending to erect, usually branched from near the base, 5–15 cm tall; leaves oblanceolate, 8–25 mm long, 1–5 mm broad, stellate and green or suffused with red on both surfaces; pedicels ascending to erect, 2.7–4.2 mm long; sepals 0.9–1.2 (2) mm long, often suffused with red, stellate-pubescent, caducous; petals 1.7–2 mm long, yellow, fading white, only slightly surpassing the sepals; siliques 4–5 (6) mm long, longer than broad; valves densely stellate, truncate at style, this persistent, 0.5–0.6 mm long; 2n = 16. Bunchgrass, sagebrush, and mountain brush communities at 1340 to 1922 m in Millard and Salt Lake counties; adventive from Europe; 7 (0).

Arabidopsis (DC.) Schur

Annual, glabrous, or pubescent with simple or branched hairs, from taproots; leaves alternate or basal (and still alternate), simple, entire, or remotely serrate, tapering to the base, not auriculate; flowers in racemes; pedicels spreading-ascending, not subtended by bracts; sepals 4, deciduous; petals 4, white, not emarginate; stamens 6, at least the 2 shorter filaments subtended by a semicircular gland; style very short, tapering, the stigma not enlarged; silique sessile, several times longer than broad, subterete; valves with conspicuous mid-nerve; seeds several to many in each locule.

Arabidopsis thaliana (L.) Schur Mouse-ear Cress. (*Arabis thaliana* L.). Slender annuals; stems erect or nearly so, usually branched throughout, 8–30 (40) cm tall; leaves mainly basal, spatulate to oblong, 3–30 (50) mm long, 2–8 mm broad, remotely toothed to subentire, pubescent with simple or 2- to 4 (5)-rayed hairs, green; cauline leaves much smaller than the basal ones, lance-oblong, sessile or nearly so, 5–20 mm long, 2–5 mm wide; pedicels very slender, 2.5–10 mm long; sepals 1.2–1.7 mm long, green to cream or reddish tinged, sparingly long-hairy; petals 2–2.9 mm long, white, spatulate, surpassing the sepals; siliques 9–14 mm long, 0.5–0.8 mm broad; valves glabrous; style 0.2–0.3 mm long; n = 5, 7. Bunchgrass, sagebrush, and mountain brush communities at 1310 to 2135 m in Davis, Morgan, Salt Lake, Tooele, and Weber counties; widespread in temperate North America; adventive from Europe; 8 (0).

Arabis L.

Biennial or perennial, glabrous or pubescent with simple, branched, or stellate hairs; leaves alternate and basal, simple, entire, dentate, serrate, or sinuate, tapering to the base or the cauline blades sessile and usually auriculate; flowers in racemes; pedicels erect, ascending, spreading-ascending, spreading, descending, or reflexed, not subtended by bracts; sepals 4, deciduous; petals 4, white, pink, lavender, or purple (cream in *A. glabra*); stamens 6, at least the 2 shorter filaments subtended by glands; style prominent to lacking; stigma entire to lobed; fruit a sessile or substipitate silique many times longer than broad, laterally flattened; valves usually with a midnerve; seeds numerous.

Rollins, R. C. 1941. Monographic study of *Arabis* in western America. *Rhodora* 43: 289–325, 348–411, 425–481.

- 1. Cauline leaves usually attenuate to rounded basally, either petiolate or sessile but not auriculate (rarely so in *A. demissa*) 2
- Cauline leaves auriculate, at least some 6
- 2(1). Petals 9–18.5 mm long; petal limb divaricate; ovary and silique densely pubescent; herbage pubescent with minute dendritic hairs *A. pulchra*
- Petals (4.5) 5–8 (9) mm long; petal limb ascending to erect; ovary and siliques glabrous or sparingly hairy only; herbage glabrous or with simple or branched hairs 3
- 3(2). Pedicels divaricate to descending; siliques descending to pendulous 4
- Pedicels spreading-ascending to erect; siliques ascending to erect 5
- 4(3). Tufts of basal leaves mostly 3–4 cm long; siliques typically hairy; plants of the northern Wasatch Mts. and in Box Elder County *A. lasiocarpa*
- Tufts of basal leaves mostly less than 3 cm long; siliques glabrous; plants not of the northern Wasatch, seldom of Box Elder County *A. demissa*
- 5(3). Pedicels and siliques erect; siliques 3–6 cm long; plants widespread in northern and central Utah ... *A. hirsuta*
- Pedicels and siliques merely ascending; siliques 1–3 cm long; plants known from Cache and Wasatch Counties *A. nuttallii*
- 6(1). Lower leaves and/or stems pubescent exclusively with malpighian hairs (at least some); flowers white to pink; pedicels and siliques erect; plants widespread *A. drummondii*
- Lower leaves and/or stems glabrous or variously pubescent but not exclusively of malpighian hairs or, if so, otherwise various; flowers white, pink, lavender, or purple (cream in *A. glabra*); pedicels and siliques variously disposed but sometimes erect 7
- 7(6). Basal leaves more or less hirsute and usually ciliate with long simple or forked hairs, not both hirsute and with dendritic hairs on the blade surfaces 8
- Basal leaves more or less densely pubescent with dendritic (rarely malpighian) hairs, rarely also with a few long simple or forked hairs along the leaf bases .. 12
- 8(7). Leaves of basal tuft linear, thinly pubescent with dendritic and simple or forked hairs; plants known from Garfield County *A. schistacea*
- Leaves of basal tuft broader than linear, variously pubescent; plants of various distribution 9
- 9(8). Flowers cream to white or pinkish; pedicels and siliques ascending to erect 10
- Flowers pink to lavender or purple, rarely white; pedicels and siliques spreading to descending 11
- 10(8). Stigma expanded, 0.8–1.1 mm broad, much wider than the style base; outer sepals not gibbous at the base; petals cream to rarely pinkish; siliques not strongly compressed; plants from Sevier County northward *A. glabra*
- Stigma not obviously expanded, 0.3–0.6 mm broad, not much wider than the style base; outer sepals gibbous at the base; petals white to pink; siliques definitely compressed; plants of broader distribution *A. hirsuta*
- 11(9). Stems solitary or few, 2.5–6 dm tall, cauline leaves 1–4 cm long; seeds biseriate *A. holboellii*

- Stems several to many, 1–3 dm tall, cauline leaves 0.5–1 cm long; seeds uniseriate *A. demissa*
- 12(7). Fruiting pedicels (but not necessarily the siliques) ascending to erect; siliques erect to spreading or even curved pendulous 13
- Fruiting pedicels spreading to descending, pendulous, or appressed downward along the axis of the raceme 18
- 13(12). Leaves, stems, and pedicels (and sometimes also the siliques) hoary with minute soft hairs; plants of central western Utah *A. shockleyi*
- Leaves variously pubescent; stems and pedicels glabrous or puberulent, or the stems hairy near the base only; plants of various distributions 14
- 14(13). Pedicels erect; siliques erect or steeply ascending; plants 0.5–2.5 dm tall, of alpine sites at high elevations *A. lyallii*
- Pedicels spreading-ascending to ascending; siliques spreading to more or less pendulous. plants (2) 2.5–5 dm tall or more, of moderate to low elevations 15
- 15(14). Plants forming broad mats or carpets, the caudex branches numerous, persistent for several years, with successive branches clothed with marcescent leaf bases; plants of northeastern Uintah County *A. tivarimensis*
- Plants seldom if ever mat-forming, the caudex branches typically lacking or short and not with successive branches clothed with marcescent leaf bases; plants of various distribution 16
- 16(15). Stems usually solitary, 3–10 dm tall (usually pubescent with malpighian hairs); cauline leaves 10 or more, well developed, closely positioned, and often overlapping *A. holboellii*
- Stems usually more than one, 2.5–5 dm tall; cauline leaves usually fewer than 8, poorly developed, commonly widely spaced and only the lowermost overlapping 17
- 17(16). Stems arising from between the basal rosette and a tuft of ascending leaves; basal leaves mostly 2.5–5 cm long or more *A. selbyi*
- Stems arising from the basal rosette, a secondary tuft of leaves lacking or poorly developed; basal leaves mostly 0.5–2.5 cm long *A. microphylla*
- 18(12). Lowermost leaves entire, poorly developed, smaller than the main cauline ones; cauline leaves linear to narrowly oblong; siliques more or less finely pubescent *A. pulchra*
- Lowermost leaves in a rosette, more or less well developed, usually oblanceolate to spatulate and broader than the main cauline ones, often toothed; siliques not or rarely pubescent (except in *A. puberula*) 19
- 19(18). Stems usually 3 or more, arising between basal rosette and an ascending-erect tuft of leaves *A. perennans*
- Stems usually solitary, rarely 3 or more but then branches not arising from between a basal rosette and a tuft of ascending leaves; lowermost leaves entire or toothed 20
- 20(19). Leaves, stems, pedicels, and fruit densely pubescent with minute hairs; plants of western and northwestern Utah *A. puberula*
- Leaves, stems, and pedicels variously pubescent but seldom if ever all of them hairy at once 21
- 21(20). Stems usually numerous, less than 2 dm tall; flowers bright pink to lavender or purple; plants of high elevations in Wasatch and Uinta mts. *A. lemmonii*

- Stems usually solitary or, if more, over 3 dm tall; flowers pale pink to lavender or white; plants of lower to moderate elevations, not of alpine sites 22
- 22(21). Petals 8–12 mm long or more; pedicels and siliques merely spreading, plants evidently uncommon in northern Utah *A. sparsiflora*
- Petals 4–9 mm long, pedicels and siliques spreading-descending to reflexed *A. holboellii*

Arabis demissa Greene [*Boechera demissa* (Greene) W. A. Weber; *A. demissa* var. *russeola* Rollins, type from 18 mi N of Vernal; *A. rugocarpa* Osterh.; *A. aprica* Osterh. ex A. Nels. in Coult. & Nels.; *A. pendulina* Greene; *B. pendulina* (Greene) W. A. Weber; *A. setulosa* Greene, type from near Marysvale, Piute County; *A. diehlii* Jones, type from Mt. Belknap, Beaver County; *A. nevadensis* Tidestr.]. Perennial, the stems 0.6–3.5 (4) dm tall, (1) several to many from a simple or branched caudex, arising from between the basal rosette and a usually well-developed tuft of ascending leaves, hirsute with simple hairs below or glabrous throughout; basal leaves 0.8–4 cm long, 1–10 mm wide, spatulate to narrowly oblanceolate, entire, ciliate and hairy on one or both surfaces with long simple or forked hairs or totally glabrous; cauline leaves much shorter than the internodes, few, 0.3–1.2 cm long, 0.1–0.6 cm broad, oblong to lanceolate, entire, sessile and auriculate or typically not auriculate (but sometimes slightly clasping), hairy or the upper glabrous; pedicels 3–6 (10) mm long, arched downward, glabrous; sepals 2.5–3.6 (4) mm long, usually purplish; petals 4.5–6.8 mm long, pink to lavender or white, spatulate, erect or ascending; siliques (10) 13–40 mm long, 1.5–2.3 (3) mm wide, pendulous, the valves glabrous, nerved below the middle; style obsolete or very short, the stigma not enlarged; seeds biseriate or uniseriate. Pinyon-juniper, sagebrush, grassland, mountain brush, ponderosa pine, Douglas fir, white fir, and aspen communities at 1670 to 2930 m elevation in Beaver, Box Elder, Daggett, Duchesne, Emery, Garfield, Kane, Millard, Piute, Sevier, Tooele, Uintah, Wasatch, Washington, and Wayne counties; Nevada east to Colorado and Wyoming; 55 (viii). There does not appear to be any basis for segregation of *A. pendulina* or any of the proposed infraspecific taxa in this species. The taxon is more broadly distributed in Utah than first thought, and all diagnostic features used to segregate *A. demissa* from *A. pendulina*, and the infraspecific taxa proposed in each, fail singly and together. And, there is no apparent geographic correlation.

Arabis drummondii Gray [*Turritis stricta* Graham, not *A. stricta* Hudson; *Streptanthus angustifolius* Nutt. ex T. & G., not *A. angustifolia* Lam.; *Boechera drummondii* (Gray) Love & Love; *A. connexa* Greene; *A. oxyphylla* Greene; *A. albertina* Greene; *A. philonipha* A. Nels. ex Rydb.; *T. drummondii* (Gray) Lunell; *A. drummondii* var. *connexa* (Greene) Fern.; *A. drummondii* var. *oxyphylla* (Greene) Hopkins]. Biennial or short-lived perennial, the stems (0.8) 1.2–9 (9.7) dm tall, solitary or 2 to several from a simple or branched caudex, not arising from between basal rosette and tuft of ascending leaves, usually glabrous throughout or strigose with malpighian hairs at base only; basal leaves (1.1) 1.5–7 (8) cm long, 0.2–1.2 cm wide, oblanceolate, entire, subglabrous or pubescent with malpighian hairs; cauline leaves usually longer than the internodes, numerous, (1) 1.5–6 cm long, 0.2–1.5 cm wide, oblong to lanceolate, usually entire, sessile and auriculate, usually glabrous; pedicels 7–15

mm long in fruit, erect, glabrous; sepals (3) 3.3–5.7 mm long, glabrous; petals 6.5–10.5 mm long, white to pink, spatulate, ascending to erect; siliques (27) 35–95 (110) mm long, (1.2) 1.5–2 (3) mm wide, erect; valves glabrous, nerved to middle or above; style short or obsolete; seeds biseriate; $n = 7$. Sagebrush, aspen, lodgepole pine, and spruce-fir communities at 2315 to 3815 m in probably all Utah counties; Alaska and Yukon east to the Atlantic, south to California, Arizona, and New Mexico; 136 (xxiii).

Arabis glabra (L.) Bernh. Tower Mustard. Biennial or rarely perennial; stems 3–8 (10) dm tall, solitary or 2 or 3, from a taproot, not arising from between the basal rosette and a tuft of ascending leaves, usually hirsute with simple or forked hairs, rarely with appressed dendritic hairs at base only; basal leaves 3–10 (15) cm long, 0.8–3.5 (5) cm wide, oblong-oblancoleolate to spatulate, sinuate-dentate to entire, more or less ciliate with forked or dendritic hairs, the surfaces (especially the veins) hirsute with simple or forked hairs; cauline leaves usually longer than internodes (at least below), numerous, 1.5–9 (12) cm long, 0.4–2.3 (3.5) cm wide, lanceolate, denticulate to entire, sessile and auriculate, glabrous at least above; pedicels 4–12 mm long in fruit, erect, often appressed, glabrous; sepals 3.3–4.5 mm long, glabrous, often tinged reddish purple; petals 4.7–6 (7) mm long, cream or rarely pinkish, narrowly spatulate, ascending to erect; siliques 40–90 mm long, 1–1.5 mm wide, strictly erect; valves glabrous, nerved to the middle or above; style ca 0.5 mm long; stigma 0.8–1.1 mm broad; seeds more or less biseriate; $n = 6$. Sagebrush, pinyon-juniper, mountain brush, white fir, aspen, and spruce-fir communities at 1525 to 3205 m in Box Elder, Cache, Daggett, Duchesne, Iron, Juab, Millard, Morgan, Salt Lake, San Juan, Sevier, Summit, Tooele, Uintah, Utah, and Weber counties; widespread in North America; Europe; 28 (vi). Two varieties have been recognized in Utah: var. *furcatipilis* Hopkins (type from Logan Canyon), with hairs at stem base appressed and several-branched, and var. *glabra* [*Turritis glabra* L.; *A. perfoliata* Lam.; *T. macrocarpa* Nutt. ex T. & G.; *A. macrocarpa* (Nutt.) Torr.], with stem base hirsute with simple or merely forked hairs.

Arabis hirsuta (L.) Scop. Hairy Rockcress. [*Turritis hirsuta* L.; *T. ovata* Pursh; *A. h. var. ovata* (Pursh) T. & G.?.; *A. pycnocarpa* Hopkins; *A. h. var. pycnocarpa* (Hopkins) Rollins; *A. h. var. laevis* Tuzon, type from American Fork Canyon]. Biennial or perennial; stems (0.9) 1.5–6 (7) dm tall, solitary or more commonly 2–6 or more, from a simple or branched caudex, not arising from between the basal rosette and a tuft of ascending leaves, hirsute with simple or forked hairs, at the base at least; basal leaves (0.8) 1.5–6 (8) cm long, 0.3–1.8 (3) cm wide, elliptic to oblong or oblanceolate, entire or more or less dentate, ciliate with simple or forked hairs, the surfaces glabrous or more or less hirsute with simple or forked hairs; cauline leaves usually longer than the internodes at least below, numerous, (0.6) 1–5 cm long, 0.2–2 cm wide, oblong to lanceolate, toothed to entire, sessile and auriculate, rarely merely sessile, hirsute or glabrous; pedicels 3–18 mm long in fruit, erect, appressed, glabrous; sepals 2.2–4 (4.5) mm long, glabrous or sparingly hairy, seldom tinged reddish purple; petals 3.2–7 (9) mm long, white or pink, oblong to spatulate, ascending to erect; siliques 30–55 (60) mm long, 1–1.5 (2) mm wide; valves glabrous, erect, nerved to above the middle; style 0.3–1 mm long; stigma 0.3–0.7 mm broad; seeds uniseriate;

ate; $n = 16$. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and Douglas fir communities at 1645 to 3205 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, Rich, Salt Lake, Sevier, Summit, Uintah, Utah, and Wasatch counties; Alaska and Yukon east to the Atlantic and south to California, Arizona, and New Mexico; circumboreal; 34 (ix). Two varieties have been proposed but they are completely transitional in Utah and it seems best to regard all of our material as belonging to var. *glabrata* T. & G. [*Turritis spathulata* Nutt. ex T. & G.; *A. rupestris* Nutt. ex T. & G.; *A. pycnocarpa* var. *glabra* (T. & G.) Hopkins].

Arabis holboellii Hornem. Holboell Rockcress. [*Boechea holboellii* (Hornem.) Love & Love; *Turritis brachycarpa* T. & G.; *A. drummondii* var. *brachycarpa* (T. & G.) Gray; *A. confinis* var. *brachycarpa* (T. & G.) Wats. & Coult.; *A. brachycarpa* (T. & G.) Britt., not Rupr.; *A. confinis* Wats.; *A. divaricata* A. Nels.; *A. stokesiae* Rydb., type from Parleys Canyon]. Biennial or perennial; stems (1) 2–11.5 dm tall, solitary or less commonly 2–6, from a simple or branching caudex, not arising from between the basal rosette and a tuft of ascending leaves, pubescent with appressed or spreading hairs, at least at the base; basal leaves (1) 1.5–5.5 (7) cm long, 0.2–8 mm wide, elliptic to oblanceolate, entire to dentate, with dendritic hairs on margins and usually on the surfaces, rarely with some simple or forked hairs near petiole base, or exclusively hairy with simple or forked trichomes; cauline leaves usually longer than internodes, at least below, numerous, (0.5) 1.2–6.5 cm long, 0.2–0.9 cm wide, oblong to lanceolate, entire or some toothed, sessile and auriculate, pubescent to glabrous; pedicels 4–23 mm long in fruit, reflexed to loosely descending or spreading-ascending, glabrous or pubescent; sepals 2.3–5 mm long, pubescent or glabrous, often tinged reddish; petals 4–9 (10) mm long, pink to lavender or white, spatulate, erect or ascending; siliques (20) 25–70 (85) mm long, 1–2.5 mm wide, reflexed to loosely pendulous or spreading, the valves glabrous, nerved to below or above middle; style obsolete or very short; stigma not much enlarged; seeds uni- or biseriate; $2n = 22$. Included here, and possibly keying mostly to var. *pinetorum*, are the specimens previously regarded in Utah as *A. confinis* Wats. [*A. divaricata* A. Nels.]. The specimens keyed arbitrarily to that name are scattered throughout the state, but seem not to represent a taxon; rather, they are an assemblage arrived at arbitrarily. Three more or less intergrading varieties are recognized.

1. Basal leaves more or less hirsute and usually ciliate with long, simple or forked hairs, not both hirsute and with dendritic hairs on the blade surfaces *A. holboellii* var. *fendleri*
- Basal leaves more or less densely pubescent with dendritic hairs, rarely also with a few long, simple or forked hairs along the leaf bases 2
- 2(1). Pedicels gently curved downward; pods pendulous, often somewhat curved inward. *A. holboellii* var. *pinetorum*
- Pedicels abruptly curved at the base, deflexed; siliques strictly reflexed to descending and often straight *A. holboellii* var. *secunda*

Var. *fendleri* Wats. in Gray [*Boechea fendleri* (Wats.) W. A. Weber; *A. spatifolia* Rydb.; *A. fendleri* var. *spatifolia* (Rydb.) Rollins]. Pinyon-juniper, ponderosa pine,

mountain brush, aspen, Douglas fir, and spruce-fir communities at (1220) 2010 to 3145 m in Beaver, Carbon, Duchesne, Emery, Garfield, Iron, Kane, Millard, Piute, San Juan, Sevier, Wasatch, and Washington counties; Wyoming and Colorado, west to Nevada, south to Texas and Mexico; 26 (viii). This taxon has been traditionally treated at specific rank, but morphological intermediates occur between it and the following varieties. And, general aspect of this variety agrees with those of *A. holboellii* generally.

Var. *pinetorum* (Tidestrom) Rollins [*A. pinetorum* Tidestrom; *A. lignifera* A. Nels.]. Sagebrush, pinyon-juniper, mountain brush, cottonwood, ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 1280 to 2810 m in probably all Utah counties; Saskatchewan to British Columbia south to California, Colorado, and Nebraska; 171 (xvii). A dwarf phase, mainly 0.8–2.5 dm tall, occurs in the northern tier of counties and has been designated var. *pendulocarpa* (A. Nels.) Rollins [*A. pendulocarpa* A. Nels.]. I can find no morphological criteria that distinguish *A. lignifera* from *A. holboellii* var. *pinetorum*, at least in Utah specimens.

Var. *secunda* (Howell) Jepson [*A. retrofracta* Graham; *Boechera retrofracta* (Graham) Love & Love; *Turritis retrofracta* (Graham) Hook.; *Streptanthus virgatus* Nutt. ex T. & G.; *A. secunda* Howell; *A. arcuata* var. *secunda* (Howell) Robins.; *A. holboellii* var. *retrofracta* (Graham) Rydb.; *A. rhodantha* Greene; *A. exilis* A. Nels.; *A. tenuis* Greene; *A. lignipes* A. Nels.; *A. consanguinea* Greene; *A. kockii* Blank., not Jordan; *A. sparsiflora* var. *secunda* (Howell) Piper; *A. caduca* A. Nels.; *A. macdougallii* Rydb.]. *n* = 7, 8. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and lodgepole pine communities at 1495 to 2870 m in all Utah counties, except Grand, Iron, Kane, and Wayne; Quebec to Alaska and British Columbia, south to California and Colorado; 46 (ix). This entity is transitional, at least in part, with var. *pinetorum*.

Arabis lasiocarpa Rollins Wasatch Rockcress. Perennial, the stems 1–2.5 dm tall, few to several from a branching, typically elongate caudex, arising at the base of tufts of ascending to erect leaves, pubescent with minute dendritic or stellate hairs; basal leaves mainly 1–4 cm long, 1.5–5 mm wide, spatulate to oblong, usually entire, pubescent overall with minute dendritic or stellate hairs; cauline leaves shorter than the internodes, few, 0.8–1.6 cm long, 1.5–5 mm wide, elliptic to oblong or lanceolate, sessile, not auriculate, pubescent like the lower leaves; pedicels 4–9 mm long, curved descending, pubescent; sepals 3.5–4.5 mm long, erect, pubescent; petals 7–8 mm long, erect, spatulate, purple; siliques mainly 3–5 cm long, 1.5–2 mm wide, nerved near the base, pubescent with forked or stellate hairs, or rarely glabrous. Sagebrush, mountain brush, aspen, and spruce-fir communities at ca 1830 to 2900 m in Box Elder, Cache, Rich (type from 6 mi W of Garden City), and Salt Lake counties; endemic; 5 (0).

Arabis lemmonii Wats. Lemmon Rockcress. [*A. canescens* var. *latifolia* Wats.; *A. latifolia* (Wats.) Piper; *A. bracteolata* Greene; *A. egglestonii* Rydb.]. Perennial, the stems 0.5–2 dm tall, several to many from a branching typically subterranean caudex, often with tufts of ascending leaves, pubescent to glabrous; basal leaves 0.8–2 (2.5) cm long, 0.2–0.5 cm wide, spatulate to oblanceolate, usually entire, marginally pubescent with dendritic hairs,

rarely with some hairs simple or forked on the petiole bases, surfaces densely pubescent with dendritic hairs; cauline leaves shorter or longer than the internodes, few, 4–15 mm long, 1–3 mm wide, elliptic-oblong to lanceolate, entire, sessile and auriculate (at least some), pubescent to glabrous; pedicels 2–6 mm long in fruit, ascending to spreading, glabrous or pubescent; sepals 2–3.5 mm long, glabrous or pubescent, often purplish; petals 4–5.5 (6) mm long, pink to lavender, spatulate, erect to ascending; siliques mostly 20–50 mm long, (1.5) 2–2.5 (3) mm wide, ascending, spreading or somewhat pendulous; valves glabrous, nerved to middle; seeds uniseriate. Alpine tundra, often in talus or rock stripes, at 2440 to 3965 m elevation, in Box Elder, Cache, Duchesne, Garfield, Juab, Summit, and Salt Lake counties; Alaska and Yukon south to California, Colorado, and Montana; 9 (0). Our plant is var. *lemmonii*.

Arabis lyallii Wats. Lyall Rockcress. [*A. drummondii* var. *alpina* Wats.; *A. oreophila* Rydb., type from Salt Lake County; *A. armerifolia* Greene; *A. densa* Greene; *A. multiceps* Greene; *A. drummondii* var. *lyallii* (Wats.) Jepson; *A. drummondii* var. *oreophila* (Rydb.) Hopkins]. Perennial; stems 3–25 cm tall, few to many from a branching, often subterranean, caudex, often with tufts of ascending leaves, glabrous; basal leaves 5–25 mm long, 2–6 mm wide, oblanceolate to spatulate, entire, glabrous or the margin and surfaces sparingly pubescent with dendritic hairs; cauline leaves shorter to longer than the internodes, few, 6–20 mm long, 2–6 mm wide, ovate to lanceolate or oblong, entire, sessile and at least some auriculate, usually glabrous; pedicels 4–10 (13) mm long, erect-ascending, glabrous; sepals 3.3–4.5 mm long, glabrous, not or only slightly gibbous, often purplish; petals 7–9 (10) mm long, bright pink to lavender, spatulate, erect or ascending; silique 20–60 mm long, 2–3 mm wide, erect-ascending; valves glabrous, nerved to the middle; style short, stigma not or slightly enlarged; seeds uniseriate or more or less biseriate. Alpine tundra, krummholz, glacial moraines and among subalpine conifers, at 3050 to 3815 m elevation in Daggett, Duchesne, Salt Lake, Uintah, Utah, Wasatch, and Weber counties; Yukon and British Columbia south to California, Nevada, and western Wyoming; 13 (ii). Our material is var. *lyallii*.

Arabis microphylla Nutt. ex T. & G. Small-leaf Rockcress. Perennial; stems 0.5–3 (5) dm tall, several to many from a branching, often subterranean or elongate caudex, with tufts of ascending leaves lacking or poorly developed, or produced on innovations, glabrous throughout or hairy below with simple or forked hairs; basal leaves 7–25 mm long, 2–5 mm wide, oblanceolate to spatulate, entire or rarely toothed, the margins with dendritic or merely sessile and forked hairs, densely pubescent with minute dendritic hairs; cauline leaves often shorter than the internodes, few, 6–20 mm long, 1–6 mm wide, oblong to lance-linear, entire or some toothed, sessile and auriculate, glabrous or the lowermost pubescent; pedicels 4–13 (15) mm long, ascending to spreading-ascending, glabrous or pubescent; sepals 2.5–4 mm long, glabrous or pubescent, often purplish; petals 5–8 mm long, pink to lavender, spatulate, ascending to erect; siliques (20) 25–60 mm long, 1.2–2 mm wide, erect to spreading, nerved at the base only; style developed or obsolete; stigma not expanded; seeds uniseriate; *n* = 7, 14. Sagebrush, mountain brush, pinyon-juniper, aspen,

white-fir and Douglas fir communities at 1370 to 2990 m Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Garfield, Juab, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Uintah, Utah, and Weber Counties; British Columbia to Montana, south to Oregon, Nevada, and western Wyoming; 28 (iii). Our material has been segregated into two varieties; var. *macounii* (Wats.) Rollins [*A. macounii* Wats.; *A. densicaulis* A. Nels.], with stems 2.5–5 dm tall and with both pedicels and siliques spreading, and var. *microphylla* [*A. tenuicola* Greene], with stems less than 2 dm tall and with pedicels divaricate but siliques erect. They are totally confluent and only arbitrarily separable.

Arabis nuttallii Robins. in Gray Nuttall Rockcress. [*A. spathulata* Nutt. ex T. & G., not DC.; *Erysimum nuttallii* (Robins.) Kuntze; *A. bridgeri* Jones; *A. macella* Piper]. Perennial; stems 0.9–3 dm tall, several to many from a branching caudex, tufts of ascending leaves lacking, glabrous throughout or hirsute below with simple or forked hairs; basal leaves 1–4 cm long, 4–12 mm wide, oblanceolate, usually entire, ciliate and hairy on lower surface (at least) with long simple and often some forked hairs; cauline leaves shorter than the internodes, few, 5–20 mm long, 1–7 mm wide, elliptic to oblong, lanceolate or oblanceolate, entire, sessile or subsessile, not auriculate, hairy or the upper glabrous; pedicels 5–20 mm long, spreading-ascending, glabrous; sepals 3–4 mm long, glabrous or sparingly hirsute, usually green or cream; petals (5) 6–8 mm long, white or lavender, spatulate, more or less spreading; siliques (8) 12–20 mm long, 1–1.5 mm wide, erect to spreading; valves glabrous, nerveless or faintly nerved; style ca 1 mm long; stigma not especially expanded; seeds uniseriate. Meadows, typically in sagebrush and aspen communities at 1370 to 2960 m in Cache and Wasatch counties; Alberta south to Wyoming; 5 (0).

Arabis perennans Wats. Common Rockcress. [*Boechera perennans* (Wats.) W. A. Weber; *A. arcuata* var. *perennans* (Wats.) Jones; *A. gracilentia* Greene; *A. eremophila* Greene; *A. recondita* Greene; *A. angulata* Greene ex Woot. & Standl.; *A. falactoria* Rollins, type from south of Lynn, Box Elder County]. Perennial; stems 0.9–5.5 (6) dm tall, (1) several to many from simple or branching herbaceous to woody caudex, typically arising from between basal rosette and a tuft of ascending leaves; basal leaves pubescent with dendritic hairs on margin and on surfaces, rarely with simple or forked hairs along petiole base; cauline leaves longer than the internodes at least below, several, 0.7–4 cm long, 2–8 mm wide, oblong to lanceolate, entire to toothed, hairy or the upper glabrous; pedicels 4–24 mm long, spreading to arched downward, glabrous or pubescent; sepals 3–4 (4.5) mm long, often purplish, usually dendritic hairy; petals 5–7 (9) mm long, pink to lavender, spatulate, erect or spreading; siliques (20) 27–55 (60) mm long, 1.2–2 mm wide, spreading to pendulous; valves glabrous, nerveless or nerved at the base; style obsolete or very short; stigma not enlarged; seeds uniseriate. Warm and salt desert shrub, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, and aspen communities at 915 to 3050 m in all Utah counties, except Weber, Cache, Rich, and Summit; Colorado and New Mexico to Nevada, California, and Baja California; 180 (xxxviii). Specimens of the wide-ranging *A. perennans* are transitional to other species contacted, especially *A. microphylla* and *A. holboellii*. The phase of

the species known as *A. falactoria* is evidently intermediate between *A. perennans* and *A. demissa*.

Arabis puberula Nutt. ex T. & G. Puberulent Rockcress. [*A. beekwithii* Wats.; *Erysimum puberulum* (Nutt.) Kuntze; *A. subpinnatifida* var. *beekwithii* (Wats.) Jepson; *A. arida* Greene; *A. lignipes* var. *impar* A. Nels.; *A. sabulosa* Jones; *A. sabulosa* var. *frigida* Jones; *A. sabulosa* var. *colorata* Jones; *A. subpinnatifida* var. *impar* (A. Nels.) Rollins]. Perennial or infrequently biennial; stems (7) 10–30 cm tall or more, solitary or few from a simple caudex, not arising from between a basal rosette and a tuft of ascending leaves, pubescent throughout with dendritic hairs, rarely glabrous above; basal leaves 1–2.5 (3) cm long, 2–6 mm wide, oblanceolate, entire or toothed, pubescent with minute dendritic hairs; cauline leaves usually longer than internodes, several to many, 1–3 cm long, 2–8 mm wide, toothed to entire, sessile and at least some auriculate, hairy like the basal leaves; pedicels 2–7 mm long, arched downward, pubescent; sepals 3.5–6 mm long, dendritic hairy; petals 7–11 mm long, pink to white, spatulate, erect or ascending; siliques (25) 30–50 (60) mm long, 2–3 mm wide, pendulous to reflexed; valves copiously hairy to glabrate, nerved to below the middle; style obsolete; stigma not enlarged; seeds uniseriate. Sagebrush and mountain brush communities at ca 1555 to 1830 m in Box Elder and Juab (?), counties; Washington and Idaho south to California and Nevada; 1 (0). A closely related species, *A. cobrensis* Jones, is to be sought in extreme northern Utah. The species occurs just north of the state line in Uinta County, Wyoming, and in northeastern Elko County, Nevada, but as yet it is not known from Utah. *A. cobrensis* is a well-defined perennial with a much-branched caudex, the basal leaves are only 1–3 mm wide, the few cauline leaves are remote and only 1–3 mm wide, and the petals are 4–6 mm long. It is to be sought in Daggett and Box Elder counties.

Arabis pulchra Jones Pretty Rockcress. Perennial; stems 1.5–6 dm tall, solitary or several from a branching herbaceous to woody caudex, not arising from between the basal rosette and a tuft of ascending leaves, pubescent with dendritic hairs throughout or glabrous above; basal leaves in poorly developed rosettes, 1–6 cm long, 2–6 mm wide, narrowly oblanceolate to spatulate, entire, densely hairy with minute hairs; cauline leaves shorter or longer than the internodes, many, 1.2–6 cm long, 1–5 mm wide, entire, sessile and mostly not auriculate, hairy like the basal leaves; pedicels 5–18 mm long, recurved to pendulous in fruit, pubescent to glabrate; sepals 5–8.2 mm long, more or less gibbous, dendritic-pubescent, often purplish; petals 9–18.5 mm long, pale pink to white or pink to lavender or purple, spatulate to obovate-spatulate, spreading or ascending to erect; siliques 35–55 (65) mm long, 1.8–2.5 (3) mm wide, pendulous to reflexed; valves copiously hairy to glabrate, nerved to middle or above; style obsolete or very short, not expanded; seeds biseriolate; $n = 21$. Two distinctive varieties are known in Utah.

1. Flowers lavender to purple, 9–11 mm long; petals ascending to erect *A. pulchra* var. *munciensis*
- Flowers pale pink or white, less commonly lavender, 10–18.5 mm long; petals spreading *A. pulchra* var. *pallens*

Var. *munciensis* Jones Joshua tree, creosote bush, blackbrush, pinyon-juniper, and sagebrush communities

at 790 to 1770 m in Beaver, Juab, Iron, Kane, Millard, Tooele, and Washington counties; Nevada and California; 15 (iv).

Var. *pallens* Jones [*A. formosa* Greene]. Desert shrublands and pinyon-juniper community at 1130 to 2075 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand (type from Westwater), Kane, San Juan, Uintah, and Wayne counties; Colorado, New Mexico, and Arizona; 83 (xiii). A phase of var. *pallens* from Duchesne County with spreading siliques has been designated as var. *duchesnensis* Rollins (type from 3.8 mi E of Duchesne). In my view, it is taxonomically negligible.

***Arabis schistacea* Rollins** Schist Rockcress. Perennial, the stems 1–2 dm tall, usually several from a branching caudex, arising between a basal rosette and an ascending tuft of leaves, glabrous; basal leaves 1–3.5 cm long, 1–2 mm wide, linear to narrowly spatulate, entire, sparingly hairy with dendritic or simple hairs on the margin and surfaces, the petiole bases with simple or forked hairs; cauline leaves shorter than the internodes, few to several, 5–15 mm long, 1–2.5 mm wide, narrowly oblong to linear, entire, glabrous, auriculate; pedicels 3–7 mm long in fruit, curved descending; sepals 2.5–3.5 mm long, often purplish, glabrous; petals 4–6 mm long, whitish, spatulate, erect or ascending; siliques 15–35 mm long, 1–1.8 mm wide, pendulous, the valves glabrous, nerved at the base or nerveless; style very short, the stigma not expanded. Sagebrush community at ca 2440 m in Garfield County; Nevada; a Great Basin endemic; 1 (0).

***Arabis selbyi* Rydb.** Selby Rockcress. [*Boechera selbyi* (Rydb.) W. A. Weber]. Perennial, the stems 1.5–4 (5) dm tall, usually several from a simple or branching caudex, arising from between basal rosette and an ascending tuft of leaves, pubescent below with dendritic or forked hairs; basal leaves 1.5–4 (6) cm long, 0.2–1 cm wide, oblanceolate to spatulate, usually entire, densely to sparsely pubescent with dendritic hairs on the margin and surfaces, sometimes with simple or branched hairs along the petiole base; cauline leaves usually shorter than internodes, few to several, 0.3–2.5 (3) cm long, 1–4 mm wide, narrowly oblong to lanceolate, entire, hairy or glabrous; pedicels 4–15 mm long in fruit, spreading-ascending, glabrous or pubescent; sepals 2.6–3.5 (4) mm long, often purplish, usually dendritic hairy; petals 5–7 (8) mm long, pink to lavender, spatulate, erect or ascending; siliques 30–55 (60) mm long, 1.2–1.8 mm wide, spreading-ascending to more or less pendulous; valves glabrous, nerved at base or nerveless; style obsolete or very short; stigma not enlarged; seeds uniseriate. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and Douglas fir communities mostly at 1500 to 2625 m elevation in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Uintah, Utah, and Wayne counties; western Colorado and northwestern New Mexico; 40 (vii). Only the slightly more ascending pedicels and usually entire or subentire leaves serve to distinguish this entity from *A. perennans*. Possibly, it would be treated better at infraspecific level within that species.

***Arabis shockleyi* Munz** Shockley Rockcress. [*A. inyoensis* Rollins?]. Perennial or infrequently biennial; stems 1.2–3.5 (4) dm tall, solitary or 2–4 from a simple or branching caudex, not arising from between a basal rosette and a tuft of ascending leaves, densely pubescent throughout with minute dendritic hairs, often somewhat

less densely so above; basal leaves 1.6–3 (3.5) cm long, 5–9 mm wide, oblanceolate to spatulate, entire, densely pubescent throughout with dendritic hairs only; cauline leaves much longer than internodes, numerous, 1.2–3 cm long, 5–12 mm wide, ovate-lanceolate to lance-attenuate, entire or nearly so, sessile and auriculate, hairy as on the basal leaves; pedicels 12–17 mm long in fruit, ascending, pubescent; sepals 5.5–7 mm long, often reddish, dendritic hairy; petals 7.5–10 mm long, pink to lavender, spatulate, erect or ascending; siliques 42–65 mm long, 1.2–1.8 mm wide ascending to spreading; valves glabrous, nerved to about middle; style up to 0.8 mm long; stigma not much expanded; seeds biseriate. Desert shrublands and pinyon-juniper communities mostly 1430 to 1900 m in Juab, Millard, and Tooele counties; Nevada and California; 16 (iv).

***Arabis sparsiflora* Nutt. ex T. & G.** Sickle Rockcress. Perennial; stems 2.3–10 dm tall, solitary or less commonly 2 or more from a simple or branching caudex, not arising from between the basal rosette and a tuft of ascending leaves, pubescent with appressed or spreading hairs at least below; basal leaves 3–7 (9) cm long, 3–6 (9) mm wide, oblanceolate, entire or dentate, pubescent with coarse dendritic hairs usually on both surfaces; cauline leaves longer than the internodes, numerous, 1.5–6 cm long or more, 3–7 mm wide, oblong to lanceolate, entire or the lower toothed, sessile and auriculate, hairy like the basal leaves or wholly glabrous; pedicels 5–15 mm long, ascending-spreading, glabrous or pubescent; sepals 4.7–6 mm long, dendritic hairy; petals 8–12 mm long, pink to lavender or purple, spatulate, ascending to erect; siliques 6–10 (12) cm long, 1.2–2 mm wide, ascending to curved-descending; style obsolete or nearly so; stigma not expanded; seeds uniseriate; $n = 21, 22$. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, and aspen communities at 1675 to 2685 m in Box Elder, Cache, Davis, Duchesne, Emery, Rich, Salt Lake, Sanpete, Uintah, Utah, and Weber counties; British Columbia and Alberta south to California and Wyoming; 13 (iii). Plants with entire leaves and spreading-ascending pedicels have been designated as var. *sparsiflora* [*A. peramoena* Greene; *A. sparsiflora* var. *peramoena* (Greene) Rollins], and those with dentate leaves and spreading pedicels are known as var. *subvillosa* (Wats.) Rollins [*A. arcuata* var. *subvillosa* Wats.; *A. perlegans* A. Nels. in Coult. & Nels.].

***Arabis vivariensis* Welsh** Park Rockcress. Perennial, forming mats or carpets to 1 m wide or more, the caudex branches bearing marcescent leaf bases, the branches of several seasons evident back from the branch ends, horizontally spreading to decumbent, finally erect and bearing flowering stems of the season or terminating in leafy rosettes, the flowering stems mainly 8–32 cm tall, puberulent with minute dendritic trichomes or glabrous above; basal leaves and those of the innovations 0.7–3 cm long, 1.2–4 mm wide, oblanceolate to elliptic, the blade tapering to a long, slender petiole, green to gray, pubescent overall with minute dendritic hairs, acute; cauline leaves 3–13 mm long, 1–2.5 mm wide, oblong to lanceolate or lance-subulate, puberulent to glabrous, much reduced upward; pedicels ascending to erect, 5–15 mm long in fruit, glabrous or minutely puberulent; sepals 2.5–4.5 mm long, the outer pair gibbous at the base, the inner ones less so, commonly purplish, glabrous to puberulent; petals 7–9 mm long, tapering to a basal claw,

purplish; siliques 3–7 cm long, 1–1.5 mm wide, glabrous, nerved at the base, erect-ascending, typically curved or contorted, the style to 0.5 mm long; seeds uniseriate, ca 1.2 mm long, narrowly winged apically. Limestone and sandstone outcrops in mixed desert shrub and pinyon-juniper communities at 1525 to 1830 m in Uintah (type from Jones Hole) County; endemic (?); 5 (iv). This plant is closely similar to *A. fernaldiana* Rollins from Nevada, differing from the type variety of that species in smaller flowers and from the species generally in the shorter style.

Armoracia Gaertner

Plants glabrous perennials from tuberous-thickened taproots; leaves alternate, simple, crenately toothed or lobed, petiolate to subsessile, not auriculate; flowers racemose, the pedicels ascending, not subtended by bracts; sepals 4, deciduous; petals 4, white, not emarginate; stamens 6, at least the 2 short stamens subtended by glands; style short, the capitate stigma hemispheric; fruit a silicle, bilocular, about as long as broad, obovoid-ellipsoid, the valves with an inconspicuous midnerve; seeds apparently never developing.

Armoracia rusticana Gaertner Horse-radish. [*Cochlearia armoracia* L.; *Nasturtium armoracia* (L.) Fries; *Rorippa armoracia* (L.) A. S. Hitchc.; *Radical armoracia* (L.) Gray; *A. armoracia* (L.) Cockerell]. Perennial; stems 6–10 dm tall or more, few to many arising from summit of root crown; basal leaves oblong to oblong-lanceolate, the blades 15–50 cm long, 10–15 cm wide, base cordate to rounded; petioles 0.6–4 dm long or more; cauline leaves reduced and only short-petiolate to subsessile upwards, lanceolate to elliptic and crenately toothed to lobed, glabrous; pedicels mostly 8–11 mm long, ascending in fruit; sepals 2–2.5 mm long, caducous, greenish, glabrous; petals 4.2–4.5 (5) mm long, white, obovate-spatulate, surpassing the sepals; silicles 3–6 mm long and about as wide; valves glabrous; style 0.2–0.3 mm long, hemispheric stigma to 0.5 mm broad or more; $n = 32$. Cultivated and occasionally escaping and established at 1370 to 1985 m in Cache, Salt Lake, Summit, Utah, and Weber counties, and most likely elsewhere in agricultural regions of the state; widespread in North America; introduced from Eurasia; 2 (0).

Barbarea R. Br.

Plants glabrous to sparsely hirsute biennials or rarely annuals from taproots; leaves alternate, lyrate-pinnatifid to pinnately compound, the cauline ones auriculate-clasping and often falsely petiolate above a clasping base; flowers ebracteate racemes, the pedicels erect; sepals 4, deciduous; petals 4, yellow, truncate to rounded apically; stamens 6, the filaments lacking glandular processes; style stout, abruptly contracted to capitate stigma; fruit a silique, many times longer than broad, linear, only slightly compressed, more or less contracted between the seeds; valves 1-nerved; seeds numerous, uniseriate.

1. Style 2–3 mm long, long-beaked *B. vulgaris*
— Styles 0.5–2 mm long, short-beaked *B. orthoceras*

Barbarea orthoceras Ledeb. Wintercress. [*B. americana* Rydb.; *Campe orthoceras* (Ledeb.) Heller; *B. orthoceras* var. *dolichocarpa* Fern.]. Stems erect, 1.5–10 dm tall, glabrous; basal leaves lyrate-pinnatifid to pin-

nately compound, rarely reduced to the terminal lobe, mostly (1.5) 4–15 (20) cm long, 1–2.5 (4) cm wide, glabrous or petiole and lower lobes sparsely hirsute; cauline leaves reduced upwards, auriculate-clasping; pedicels 2–4 mm long, glabrous, ascending; sepals 2.5–3.5 mm long, yellowish, glabrous; petals 4–5.5 mm long, yellow, spatulate to oblanceolate, ascending-spreading; siliques (15) 20–50 mm long, 1.5–2.5 mm wide, erect or ascending; valves glabrous, prominently nerved to apex; style beaklike, (0.5) 1–2 mm long, abruptly contracted to the stigma; seeds uniseriate, pitted; $n = 8$. Moist meadows and riparian habitats in pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 1350 to 3235 m in Box Elder, Cache, Daggett, Davis, Duchesne, Juab, Rich, Salt Lake, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Weber counties, and to be expected almost throughout the state; Alaska and Yukon east to the Atlantic and south to California, Nevada, and Colorado; Eurasia; 24 (ii).

Barbarea vulgaris R. Br. [*Erysimum barbarea* L.]. Stems erect, 1.5–10 dm tall, glabrous; basal leaves generally lobed, mostly 2–15 cm long and 1–3 cm wide, glabrous; cauline leaves reduced upward, auriculate clasping; pedicels 2–5 mm long, glabrous, ascending; sepals 3–4 mm long, yellowish, glabrous; petals 6–8 mm long, yellow, spatulate, to oblanceolate, ascending-spreading; siliques 10–30 mm long, 1–2 mm thick, erect or ascending, the valves glabrous, prominently nerved; style definitely beaklike, 2–3 mm long; $n = 8$. Riparian or other moist sites in shadscale, sagebrush, sedge-rush, and aspen communities at 1350 to 2290 m in Davis, Juab, Salt Lake, Summit, Utah, Wasatch, and Weber counties; adventive from Eurasia; 8 (i)

Berteroa DC.

Stellate-pubescent annuals or infrequently winter annuals from taproots; leaves alternate and basal, simple, entire, reduced upwardly and sessile, not auriculate; flowers in ebracteate racemes, the pedicels erect-ascending; sepals 4, deciduous; petals 4, white, deeply emarginate and often bilobed; stamens 6, the filaments lacking glandular processes; style long, slender, the stigma capitate; fruit a silicle, 1–3 times longer than broad, compressed parallel to the septum; valves 1-nerved or nerveless; seeds several.

Berteroa incana (L.) DC. [*Alyssum incanum* L.]. Stems erect, 3–10 dm tall or more, appressed stellate-hairy; basal leaves oblanceolate, 3–5 cm long, entire, petiolate, usually withered at anthesis; cauline leaves reduced upwards, sessile or short-petiolate below, stellate-hairy; pedicels erect or ascending, 4–10 mm long, stellate and sometimes more or less hirsute; sepals 2–3 mm long, greenish to whitish, stellate-hairy; petals 4–6 mm long, white, deeply bilobed; silicles 5–7 mm long, 2–3 mm wide, moderately inflated, stellate hairy; style (1.5) 2–3 mm long, persistent; $n = 8$. Roadsides and other disturbed places in Daggett and San Juan counties; widespread in North America; Europe; 2 (0).

Brassica L.

Glabrous or hirsute annuals from taproots; leaves alternate and basal, variously lobed to entire, basal ones often lyrate-pinnatifid, reduced upwardly and petiolate to sessile or auriculate; flowers in ebracteate racemes, the

pedicels erect or ascending; sepals 4, deciduous; petals 4, yellow; stamens 6, the filaments lacking glandular processes; style slender to thick, mostly well developed; stigma capitate; fruit a silique, several to many times longer than broad, linear, terete or nearly so, often more or less constricted; valves 1- to 3-nerved, the apical portion produced into a stout 1- to 3 (5)-nerved beak; seeds several to many, uniseriate. Note: Several cultivated members of this genus are present in our region in addition to the weedy adventives distinguished below. They are: *Brassica caulorapa* Pasquale (kohlrabi); *B. napobrassica* Miller (rutabaga); *B. oleracea* L. var. *botrytis* L. (cauliflower), var. *capitata* L. (cabbage), var. *gemifera* Zenker (brussel sprout), and var. *italica* Plenck (broccoli); and *B. rapa* L. (turnip).

- 1. Cauline leaves sessile, auriculate-clasping, glaucous and entire or nearly so *B. campestris*
- Cauline leaves petiolate and not auriculate or, if rarely so, falsely petiolate above the clasping base 2
- 2(1). Valves of fruit, and often the pedicels and raceme rachis, hirsute with course, spreading hairs; plants cultivated and escaping *B. hirta*
- Valves of fruit, pedicels, and raceme rachis glabrous; plants adventive weeds 3
- 3(2). Silique with a flattened, 2-edged or angular beak, the valves and beak strongly 3 (5)-nerved *B. kaber*
- Silique with a cylindrical or rarely slender-conic beak, the valves and beak with 1 nerve (rarely 2 additional delicate ones) 4
- 4(3). Pedicels 2-6 mm long; siliques 1-2.5 cm long, 1-1.8 mm wide, ascending-appressed *B. nigra*
- Pedicels mostly (5) 10-15 mm long; siliques 2-4 cm long, 2-3 mm wide, ascending to erect but not appressed *B. juncea*

Brassica campestris L. Rape. [*B. rapa* authors, not L.; *B. napus* authors, not L.]. Stems erect, glabrous or with very few hairs, 2.5-10 dm long or more, simple or branched; basal leaves lyrate-pinnatifid, 5-18 cm long, the terminal lobe mostly 2-5 cm wide, crenate-dentate; lower cauline leaves similar to the basal ones, reduced upwards, becoming auriculate-clasping and dentate to entire; pedicels 7-20 mm long, slender, ascending, glabrous; sepals 4.5-6 mm long, yellowish to greenish; petals 6-10 mm long, yellow; siliques 30-70 mm long, (1.5) 2.5-3.5 mm thick, the beak 8-15 mm long, 1-nerved; valves conspicuously 1-nerved and with 2 more or less delicate lateral nerves, glabrous; n = 10, 11. Cultivated fields, roadsides, fence rows, saline saltgrass meadows, sedge-rush, and other plant communities at 975 to 3020 m in Box Elder, Cache, Davis, Duchesne, Rich, Sanpete, Summit, Utah, Washington, and Weber counties; widespread in temperate regions of the world; adventive from Europe; 11 (ii).

Brassica hirta Moench White Mustard. [*Sinapsis alba* L.; *B. alba* (L.) Rabenh., not Gilib.] Plants erect, pubescent with coarse, descending hairs at least below, the stems 2-10 dm tall, usually branched; basal leaves lyrate-pinnatifid, mostly 5-15 cm long, the terminal lobe 3-10 cm wide, obscurely crenate-dentate; cauline leaves reduced upwards, usually all petiolate, becoming merely lobed, not auriculate; pedicels 5-10 mm long, slender or stout, spreading, often hirsute; sepals 4-5 mm long, yellowish, glabrous; petals 7-10 mm long, yellow; siliques (20) 30-50 mm long, 3-4.5 mm wide, the beak 8-16 mm

long, 3 (5)-nerved, the valves conspicuously 3-nerved, hirsute; n = 12. Cultivated white mustard of commerce and rarely escaping, but potentially a noxious weed of cultivated land and to be expected in agricultural regions of the state; widespread in the western U. S.; adventive or introduced from Europe; 1 (i).

Brassica juncea (L.) Czernj. Indian Mustard. [*Sinapsis juncea* L.]. Erect, glabrous or hirsute, the stems 3-10 dm tall or more, usually branched; basal leaves lyrate-pinnatifid, 8-25 cm long, terminal lobe 5-15 cm wide, crenate to dentate or lobed; cauline leaves reduced upwards, short-petiolate to sessile, not auriculate-clasping; pedicels 8-17 mm long, slender to stout, ascending, glabrous; sepals 4-6 mm long, yellowish, glabrous; petals (5.5) 7-12 mm long, yellow; siliques 20-50 mm long, 2-3 mm wide, the beak 6-12 mm long, 1-veined; valves 1 (or lightly 3)-nerved, glabrous; n = 18. Weedy species of disturbed soils at 825 to 2595 m in Box Elder, Duchesne, San Juan, and Washington counties, but not yet common in the state; introduced from Asia; 4 (0).

Brassica kaber (DC.) L. Wheeler Charlock. [*Sinapsis arvensis* L.; *B. arvensis* Rabenh., not L.; *S. kaber* DC.] Erect, pubescent with coarse spreading hairs at least below; stems 3-10 dm tall or more, simple or branched; basal leaves lyrate-pinnatifid to merely dentate, 5-20 cm long, 3-10 cm wide; cauline leaves reduced upwards, short-petiolate or sessile, not auriculate-clasping or, if apparently so, falsely petiolate or leaves sinuate-dentate; pedicels 2-6 mm long, ascending, stout, glabrous; sepals 4-5 mm long, yellowish, glabrous; petals 8-14 mm long, yellow; siliques 30-50 mm long, 2-3 mm thick, the beak 7-15 mm long, 3-veined; valves 3 (5)-nerved, glabrous; n = 9. Roadsides, fields, and ditch banks at 825 to 1985 m in Box Elder, Cache, Juab, Salt Lake, Sevier, Summit, Utah, and Washington counties; widespread in temperate portions of the world; adventive from Europe; 9 (iii).

Brassica nigra (L.) Koch in Roehl. Black Mustard. [*Sinapsis nigra* L.]. Plants erect, glabrous or more usually sparsely to densely hirsute-hispid at least near the base; stems 3-12 dm tall or more, usually branched; basal leaves lyrate-pinnatifid to lobed or serrate-dentate, 5-25 cm long, 2-15 cm wide; cauline leaves reduced upwards, short-petiolate to sessile, not auriculate; pedicels 2-6 mm long, erect, stout, glabrous; sepals 3-4 mm long, yellowish, glabrous; petals (5) 7-12 (15) mm long, yellow; siliques 10-25 mm long, 1-2 mm wide, the beak 1-5 mm long, 1-veined; valves with 1 mid-nerve and 2 faint lateral ones, glabrous; n = 8, 16. Roadsides, fields, and other disturbed places at 1280 to 2260 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Garfield, Juab, Rich, Salt Lake, San Juan, Sanpete, Utah, Wasatch, Washington, Weber, and perhaps all Utah counties; widespread in North America; adventive from Europe; 30 (iii).

Camelina Crantz

Pubescent with forked or stellate hairs, annual, from taproots; leaves alternate, simple, entire, auriculate-clasping basally; flowers racemose in ebracteate racemes, the pedicels ascending; sepals 4, deciduous; petals 4, pale yellowish; stamens 6, the filaments lacking glandular processes; style slender, the stigma capitate; fruit a silicle less than twice longer than broad, obovoid, somewhat compressed parallel to the septum; valve 1-nerved; seeds several per locule, biseriate.

Camelina microcarpa Andr. ex DC. Falseflax. Stems erect, (0.8) 1.5-8 dm tall or more, hirsute to subap-

pressed with simple and forked to stellate hairs at least near base; leaves mainly cauline, the basal mostly 1-7 cm long, entire or obscurely toothed, usually withered by late anthesis; cauline leaves reduced upward, at least the upper ones auriculate; pedicels spreading-ascending, (6) 8-18 mm long, glabrous; sepals 2-2.7 mm long, often reddish, more or less villous; petals 3-4 (5) mm long, white or nearly so, rounded apically; silicle 5-6.5 mm long, 3-4 mm wide, moderately inflated, glabrous; style 1-2 (2.5) mm long, persistent; n = 20. Roadsides, foothills, gardens, and other disturbed moist to dry sites at 1280 to 2745 m in probably all Utah counties; widespread in North America; adventive from Asia; 61 (iv).

Capsella Medicus

Stellate-pubescent and often with coarse simple hairs also, annual from taproots; leaves alternate or basal, simple, dentate or variously toothed or lobed to entire, the cauline ones auriculate-clasping; flowers in ebracteate racemes the pedicels spreading-ascending; sepals 4, deciduous; petals 4, white; stamens 6, the filaments lacking glandular processes; style short, the stigma capitate; fruit a silicle, less than twice longer than broad, cuneate-obcordate in outline, compressed at right angles to the septum; valves reticulately veined, strongly keeled; seeds many per locule.

Capsella bursa-pastoris (L.) Medicus Shepherds Purse. [*Thlaspi bursa-pastoris* L.; *Bursa pastoris* Weber in Wiggers; *B. bursa-pastoris* (L.) Britt.]. Stems erect, 1-5 dm tall, stellate-pubescent and more or less hirsute; basal leaves oblanceolate in outline, 2.5-16 (20) cm long, 0.5-2.8 (4) cm wide, lyrate-pinnatifid to merely toothed or subentire; cauline leaves much reduced upwards, sessile and auriculate; sepals 1.2-2.5 mm long, often reddish, pubescent or glabrous; petals 2-4 mm long, white to pinkish, apex rounded; silicles 4.5-8 mm long, 3-5 (6) mm wide, cuneate-obcordate, glabrous; style 0.3-0.6 (1) mm long, persistent; n = 16, 20. Disturbed sites at 850 to 2930 m probably in all Utah counties; widespread in North America; introduced from Europe; 55 (v). We may have, in our material from Utah, two other species from Europe which are infrequently recognized; flowers pinkish (*C. rubella* Reuter) and a white flowered form with the style 0.5-1 mm long (*C. thracica* Velen.).

Cardamine L.

Annual, biennial, or perennial from taproots or rhizomes, glabrous or with simple hairs; leaves alternate, sometimes with basal rosettes, simple to pinnately compound, petiolate, not auriculate; flowers racemose or rarely subcorymbose, the pedicels spreading-ascending to ascending, not subtended by bracts; sepals 4, deciduous; petals 4, white to pinkish; stamens 6, the filaments lacking glandular processes; style stout; stigma capitate; fruit a silique, several to many times longer than broad, slightly compressed parallel to septum; valves obscurely 1 (3)-nerved or nerveless; seeds several to many, uniseriate.

Schulz, O. E. 1903. Monographie der Gattung *Cardamine*. Bot. Jahrb. Syst. 32:250-623.

- 1. Leaves all simple, cordate-ovate to orbicular; petals 7-12 mm long; plants of stream and seep margins at middle and higher elevations *C. cordifolia*

- Leaves pinnately compound, at least the lower ones; petals 2-7 mm long; plants of spring and seep margins, occasionally elsewhere, mainly at middle to low elevations 2
- 2(1). Leaflets usually 3-5, the terminal leaflet, at least, more than 10 mm wide; upper leaves simple, with broadly ovate blades; petals 3-7 mm long; siliques 1-2 mm wide *C. breweri*
- Leaflets usually 6-11 (rarely 3-5), the terminal leaflet usually less than 10 mm wide, upper leaves compound; petals 2-3 mm long; siliques 0.7-1 mm wide 3
- 3(2). Cauline leaves mostly 2-4 cm long, with narrow, non-decurrent lateral segments 1-3 mm wide, linear to linear-spatulate or narrowly oblong; plants rare *C. parviflora*
- Cauline leaves mostly longer than 4 cm, or the lateral leaflets broader than 3 mm; plants locally common 4
- 4(3). Lateral leaflets, at least of the lower cauline leaves, obovate to oblanceolate; siliques usually more than 1 mm broad *C. oligosperma*
- Lateral leaflets of cauline leaves linear to oblong or oblanceolate; siliques usually less than 1 mm broad *C. pensylvanica*

Cardamine breweri Wats. Brewer Bittercress. [*C. vallicola* Greene]. Perennial, rhizomatous, erect or descending; stems (2) 2.5-5 (6) dm tall, glabrous or pubescent with simple hairs near the base; leaves mostly cauline, pinnately compound with 3-5 (rarely more in ours) leaflets, or basal and upper ones simple, mostly 1-7 cm long, the lateral leaflets mostly 10-25 mm long and 0.4-1.2 mm wide, the terminal segment 12-35 mm long and 13-30 mm wide, subentire to sharply toothed, ovate to orbicular, glabrous or sparsely hirsute; pedicels 4-10 mm long or more, glabrous, ascending; sepals 1.5-2.5 mm long, whitish, glabrous or sparingly simple-hairy; petals 3-7 mm long, white, rarely pinkish, spatulate-obovate, spreading; siliques 17-30 mm long, 1-1.8 mm wide, erect or ascending; valves glabrous, obscurely 1 (3)-nerved; style 0.5-2 mm long, tapering to stigma; seeds 1-1.5 mm long, smooth; 2n = 24. Stream sides and seep margins at 1370 to 2440 m in Tooele, Salt Lake, Summit, Wasatch, Utah, and Weber counties; Alaska and British Columbia south to California, Nevada, and Colorado; 6 (i). Our plant is var. *breweri*.

Cardamine cordifolia Gray Heartleaf Bittercress. [*C. cordifolia* var. *pubescens* Gray, type from Thousand Lake Mt.; *C. infausta* Greene; *C. uintahensis* F. Hermann, type from Mt. Elizabeth Ridge, Summit County]. Perennial, rhizomatous, erect or ascending; stems (1.5) 2-8 dm tall, glabrous to more or less densely pubescent with simple hairs near the base; leaves mostly cauline, all simple, the blade mostly (1.5) 2-6 (8) cm long, 1.3-5 (7) cm wide, cordate-ovate or broader, usually sinuate-crenate, glabrous or rarely pubescent; pedicels mostly 10-20 mm long, glabrous or hairy, ascending-spreading; sepals 3-5 mm long, greenish, glabrous or sparingly hairy; petals 7-12 mm long, white, obovate-spatulate, spreading; siliques 20-35 mm long, (1) 1.5-3 mm wide, ascending to erect; valves glabrous, obscurely 1-nerved; style 0.5-2 mm long, or more; seeds 1.5 mm long or more, smooth. Stream sides and seeps in aspen, spruce-fir, and alpine tundra communities at 1675 to 3600 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington,

Wayne, and Weber counties; British Columbia to Wyoming south to California, Nevada, and New Mexico; 101 (xvii). Our plants belong to var. *cordifolia*.

Cardamine oligosperma Nutt. ex T. & G. Nuttall Bittercress. Annual or biennial (short-lived perennial?), with taproots, but sometimes rooting from the lower nodes; stems (4) 10–45 cm tall, pubescent with spreading hairs to glabrate or glabrous; basal leaves with (1–3) 7–11 oval to ovate leaflets, the lateral leaflets 3–20 mm long, 2–15 cm wide, entire or lobed, the terminal leaflet 3–23 mm long, 4–16 mm broad, reniform and entire to cuneate-ovate or orbicular and lobed, glabrous or pubescent; cauline leaves reduced upward; pedicels 4–15 mm long, spreading-ascending to suberect, glabrous; sepals 1.5–2 mm long, glabrous, greenish or purplish; petals 3–5 mm long, white; siliques 15–30 mm long, 1.2–2 mm wide, glabrous, erect, the style 0.4–1 mm long. Weedy plants of gardens and other cultivated lands and in native plant communities at 1370 to 3390 m in Cache, Salt Lake, Summit, and Utah counties; Alaska and Yukon, south to California; Asia; 9 (0). This taxon is sometimes transitional to *C. pensylvanica*, and both are portions of the *C. hirsuta* L. complex. None of our material exactly matches *C. hirsuta* as it occurs in the eastern U. S.

Cardamine parviflora L. Smallflower Bittercress. Annual or biennial from a taproot, the stem erect, usually solitary, 10–30 cm tall, glabrous; basal leaves with 3–5 pairs of oblong to cuneate-obovate, lateral leaflets 2–4 (5) mm long, and 2–3 mm wide, these entire or slightly lobed, the terminal leaflet broadly cordate to orbicular, 3–8 (10) cm long and 5–10 (12) mm wide; cauline leaves reduced upward, mostly 2–4 cm long, with 3–6 pairs of lateral leaflets, the segments similar to the basal ones, only the lateral ones slightly narrower, linear to linear-spatulate or narrowly oblong, entire or toothed, 5–12 mm long and 1–3 mm wide, not decurrent; pedicels 3–7 mm long, spreading-ascending, glabrous; sepals 1.2–1.6 mm long, greenish, glabrous; petals 2–3 mm long, white, oblanceolate, spreading; siliques 12–30 mm long, 0.5–1 mm wide, erect or nearly so, glabrous; style 0.3–0.6 mm long; seeds 1–1.5 mm long, smooth. Moist sites at ca 2440 m in Duchesne County; widespread and common in the eastern U. S.; Europe; 1 (0).

Cardamine pensylvanica Muhl. ex Willd. Muhlenberg Bittercress. [*C. flexuosa* ssp. *pensylvanica* (Muhl.) Schulz; *C. hirsuta* var. *pensylvanica* (Muhl.) Graf]. Annual or biennial from a taproot; stems erect, usually solitary, 1.5–3.5 dm tall, glabrous or pubescent; basal leaves with 7–11 pairs of oval to lanceolate or oblanceolate leaflets, the lateral leaflets 3–15 mm long and 2–12 mm wide, entire or lobed, the terminal leaflet orbicular to cuneate-oblanceolate, 4–20 mm long and 3–15 mm wide; cauline leaves reduced upwards, mostly 4–8 cm long, with 3–5 pairs of lateral leaflets, these broadly oblong to oval, the terminal one cuneate-obovate, entire or toothed, (0.5) 1–3 cm long and 0.5–2 cm wide, decurrent; pedicels 3–10 mm long, spreading-ascending, glabrous; sepals 1.2–1.8 mm long, pinkish, glabrous; petals 2–3 mm long, white, oblanceolate, spreading; siliques 15–30 mm long, 0.7–1 mm wide, erect, glabrous; style 0.4–0.8 mm long; seeds 1–1.5 mm long, smooth; 2n = 32. Stream sides and other moist areas at 1555 to 2475 m in Box Elder, Cache, Duchesne, Salt Lake, Summit, and Uintah counties; widespread in North America; 9 (i).

Cardaria Desv.

Pubescent rhizomatous perennials; leaves alternate, sinuate-dentate, auriculate-clasping; flowers in ebracteate clustered (paniculate) racemes; pedicels spreading-ascending; sepals 4, caducous; petals 4, white, the apex rounded; stamens 6, the filaments lacking glandular processes; style slender, prominent; stigma capitate; fruit a silicle, usually broader than long, compressed at right angles to septum, indehiscent or tardily so; valves reticulately veined; seeds 1 (rarely 2) per locule.

Rollins, R. C. 1940. On two weedy crucifers. *Rhodora* 42: 302–306.

- 1. Silicles obcordate in outline, glabrous; plants widespread and common *C. draba*
- Silicles orbicular in outline, pubescent or glabrous; plants uncommon 2
- 2(1). Silicles puberulent, 1.5–2.5 mm long and about as wide *C. pubescens*
- Silicles glabrous, 3–4 mm long and about as wide *C. chalepense*

Cardaria chalepensis (L.) Hand.-Mazz. [*Lepidium chalepense* L., *L. draba* ssp. *chalepense* (L.) Thell., *C. draba* ssp. *chalepense* (L.) Schulz]. Plants decumbent to ascending or erect, 2–6 dm tall, glabrous; leaves elliptic to oblong or lanceolate, 0.8–10 cm long, 3–20 mm wide, sinuate-dentate to entire, the upper sessile and auriculate; pedicels 2–8 mm long in fruit, spreading-ascending, glabrous; sepals 1.2–1.8 mm long, greenish to whitish, glabrous; petals 2–3 mm long, white, spatulate, spreading; silicles (excluding the style) 3–4 mm long, 3–4 mm wide, erect, glabrous; style 0.7–1 mm long; seeds 1 or 2. Moist soil, at 1280 to 1891 m in disturbed sites in Daggett, Davis, Salt Lake, San Juan, and Weber counties; adventive from Europe; 5 (i).

Cardaria draba (L.) Desv. Whitetop. [*Lepidium draba* L.; *Cochlearia draba* (L.) L.; *Physolepidium repens* Schrenk ex Fisch. & Mey.; *L. repens* (Schrenk) Boiss.; *C. repens* (Schrenk) Jarm.]. Plants decumbent to ascending or erect; stems (1.2) 1.5–6 dm tall, puberulent to hirtellous with usually descending simple hairs; leaves elliptic to oblong, ovate, or oblanceolate, 0.9–9.8 cm long, 0.6–3.5 cm wide, sinuate-dentate to irregularly toothed, the lower ones petiolate, the upper sessile and auriculate, puberulent to hirtellous with usually retrorse simple hairs; pedicels 5–12 mm long in fruit, spreading-ascending, glabrous or puberulent; sepals 1.2–2 mm long, greenish, usually glabrous; petals 2–3.5 (4) mm long, white, broadly spatulate, spreading; silicles (excluding the style) 2–3.8 mm long, 3.5–5.7 mm wide, erect, glabrous; style 0.6–1.2 mm long; seeds 1–2 mm long; n = 31, 32. Cultivated and waste places at 1260 to 2684 m in Beaver, Cache, Davis, Duchesne, Iron, Juab, Millard, Piute, Salt Lake, Sanpete, Sevier, Tooele, Utah, Washington, and Weber counties; widespread in the U. S. and Canada; adventive from Europe; 55 (ii).

Cardaria pubescens (C. A. Mey.) Jarm. Hairy White-top. [*Hymenophysa pubescens* C. A. Mey. in Ledeb.]. Plants ascending to erect; stems 1.5–4 dm tall, puberulent to hirtellous with usually descending simple hairs; leaves elliptic to oblong or oblanceolate, 0.6–6 cm long, 3–15 mm wide or longer, irregularly sinuate-dentate, the lower petiolate, the upper sessile and auriculate, puberulent to hirtellous with usually simple hairs; pedicels 6–10 mm long in fruit, ascending, hairy; sepals 1.8–2 mm long,

greenish, hairy; petals 3.5–4 mm long, white, broadly spatulate, spreading; silicles (excluding the style) 1.5–2.5 mm long and about as wide, erect, puberulent; style 0.7–1.2 mm long. Agricultural lands and disturbed places at 1645 to 2260 m in Box Elder, Daggett, Rich, Salt Lake, and Summit counties; widespread in the U. S. and Canada; adventive from Asia; 9 (ii). Our plants are var. *elongata* Rollins. As here defined, the genus *Cardaria* includes *Hymenophysa*. Except for an occasional publication, this seems to be strictly an American concept as most workers in Europe and Asia prefer to distinguish between the two.

Caulanthus Wats.

Annual to perennial, from taproots, glabrous or with simple or malpighian hairs; leaves alternate or mostly basal, simple, lyrate-pinnatifid, pinnatifid, toothed or subentire, petiolate or sessile and auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white, yellow, or chestnut brown to purple; stamens 6, the filaments lacking glandular processes; style obsolete or slender and conspicuous; stigma capitate and sometimes distinctly bilobed; fruit a sessile or subsessile siliqua, many times longer than broad, terete or more or less compressed; valves 1 (3)–nerved; seeds several to many uniseriate.

Payson, E. B. 1922. A monographic study of *Thelypodium* and its immediate allies. *Ann. Missouri Bot. Gard.* 9: 233–324.
Rollins, R. C. 1971. Protogyny in the Cruciferae and notes on *Arabis* and *Caulanthus*. *Contr. Gray Herb.* 201: 3–10.

1. Cauline leaves sessile and auriculate at the base; plants of southwestern Utah *C. cooperi*
- Cauline leaves petiolate or sessile but not auriculate; plants of broad distribution, sometimes of southwestern Utah 2
- 2(1). Stems usually conspicuously inflated, glabrous or nearly so; plants perennial *C. crassicaulis*
- Stems not inflated; hispid (at least below); plants annual or biennial 3
- 3(2). Pedicels very short, 1–2 mm long, soon recurved; siliques up to 4 cm long, descending; plants known only from Washington County *C. lasiophyllus*
- Pedicels 3–7 mm long, spreading-ascending; siliques 4.5–13.5 cm long, ascending to curved-pendulous; plants known from Beaver, Millard, and Tooele counties *C. pilosus*

Caulanthus cooperi (Wats.) Payson [*Thelypodium cooperi* Wats.; *Guillenia cooperi* (Wats.) Greene]. Annual, erect or sprawling; stems not inflated, 1–7.5 dm tall, glabrous and often glaucous or sparsely pubescent with simple or malpighian hairs; leaves mainly cauline, the lower ones 1–7 cm long, 0.4–2 cm wide or more, obscurely sinuate-dentate, glabrous, the cauline ones reduced upwardly, mostly 1–7.5 cm long and 2–12 mm wide, mostly entire with at least the uppermost auriculate; pedicels 1–4 mm long, soon recurved, glabrous; sepals 5–6.5 (7) mm long, green or reddish, glabrous; petals 6–9 mm long, yellowish, suffused with purple, narrowly spatulate, ascending; anthers 1–1.3 mm long; siliques 20–45 mm long, 2–3 mm wide, sessile, descending, compressed, glabrous; style 1–2.5 mm long; stigma not expanded, shortly bilobed; n = 14. Creosote bush and Joshua tree communities at 760 to 855 m in Washington County; Arizona, Nevada, and California; 4 (ii).

Caulanthus crassicaulis (Torr.) Wats. Spindlestem. Perennial, erect; stems usually strongly inflated, (2) 3.2–9.7 (10.8) dm tall, glabrous and glaucous; leaves mainly basal, the lower ones 3–12 (17) cm long, 0.3–3 cm wide, lyrate-pinnatifid to entire, glabrous, the cauline ones much reduced upwardly, linear to narrowly oblanceolate, petiolate and not auriculate; pedicels 1–4 mm long, stout, ascending, glabrous or more commonly hirsute at least apically; sepals (7) 9–13 mm long, brown to brown purple, narrowly spatulate, spreading-ascending; anthers 3.9–6.3 mm long; siliques 7–14 cm long, 1.5–2 mm wide, sessile, ascending to erect, glabrous; style obsolete; stigma more or less expanded, the lobes up to 0.8 mm long; n = 12.

1. Sepals more or less hirsute; plants of broad distribution *C. crassicaulis* var. *crassicaulis*
- Sepals glabrous or with a few hairs; plants of various distributions 2
- 2(1). Stigmas deeply divided; plants common *C. crassicaulis* var. *glaber*
- Stigmas shallowly lobed; plants evidently rare *C. crassicaulis* var. *major*

Var. *crassicaulis* [*Streptanthus crassicaulis* Torr., type from Great Salt Lake; *C. senilis* Heller]. Salt desert shrub, blackbrush, sagebrush, pinyon-juniper, and ponderosa pine communities at 1525 to 2870 m in Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Juab, Kane, Sanpete, Sevier, and Uintah counties; Idaho, Nevada, Colorado, Arizona, and California; 53 (viii).

Var. *glaber* Jones [*C. glaber* (Jones) Rydb.]. Sagebrush, pinyon-juniper, ponderosa pine, white fir, aspen, and spruce-fir communities at 1310 to 3050 m in in Beaver, Duchesne, Emery, Garfield, Kane (type from Sink Valley), Millard, Piute, San Juan, and Washington counties; southern Nevada; 36 (xiii). This taxon is questionably distinct from the former variety and the following, differing from the first in being glabrous and from the second in the less deeply lobed stigma. The plants are mostly allopatric with var. *crassicaulis*, but sympatric with var. *major*.

Var. *major* Jones [*C. major* (Jones) Payson; *C. procerus* authors, not Wats.]. Sagebrush, ponderosa pine, aspen, and fir communities at 2500 to 3175 m in the Henry Mts. (type locality), Garfield County; Nevada and California; 3 (0).

Caulanthus lasiophyllus (H. & A.) Payson [*Turritis lasiophylla* H. & A.; *Thelypodium lasiophyllum* (H. & A.) Greene; *Sisymbrium lasiophyllum* (H. & A.) M. Brandege; *Guillenia lasiophylla* (H. & A.) Greene]. Annual; stems not inflated, 1–8 (12) dm tall, more or less hirsute with simple or rarely forked hairs; leaves mainly cauline, these 0.7–15 cm long, 0.1–5.5 cm wide, irregularly pinnatifid, petiolate and not auriculate; pedicels 1–2 mm long, deflexed in fruit, glabrous or sparingly hirsute; sepals 2–3 mm long, often purplish, glabrous; petals 3–5 mm long, yellowish, oblong-spatulate, not constricted at juncture of blade and claw, ascending-spreading; anthers 0.6–1 (1.5) mm long; siliques 25–45 (60) mm long, 0.8–1.1 mm wide, sessile, terete, reflexed-descending, glabrous; style 0.8–1.3 mm long, the stigma small, obscurely lobed. Creosote bush, Joshua tree, and blackbrush communities at 790 to 1040 m in Washington County; California, Nevada, and Arizona; 9 (iii). Our material has been designated as var. *utahensis* (Rydb.)

Payson [*Thelypodium utahense* Rydb., type from St. George; *T. lasiophyllum* var. *utahense* (Rydb.) Jepson].

Caulanthus pilosus Wats. [*Streptanthus pilosus* (Wats.) Jepson]. Biennial or infrequently annual; stems not inflated, mostly 4–10 dm tall or more, hirsute with simple hairs at least below; leaves mostly basal, these 3–15 cm long, 0.5–3.5 cm wide, irregularly pinnatifid, hirsute, the cauline ones only slightly reduced and shorter upwardly, petiolate and not auriculate; pedicels 4–9 mm long, spreading-ascending, glabrous or nearly so; sepals 5–7 (9) mm long, often purplish, glabrous or hairy; petals 7.5–9 (10) mm long, white, suffused with purple or pink, spatulate-lanceolate, constricted at juncture of blade and claw, ascending-spreading; anthers 2–4 mm long; siliques 7–11.5 cm long, 0.8–1 (1.5) mm wide; style short, the stigma bilobed. Shadscale-winter fat and other cool desert shrub and grass communities at 1370 to 1770 m in Beaver, Millard, and Tooele counties; Oregon and Idaho south to California and Nevada; 13 (j).

Chlorocrambe Rydb.

Glabrous perennials from a stout caudex; leaves alternate and mainly cauline, simple, more or less hastate, entire or sinuately lobed, petiolate, not both sessile and auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white; stamens 6, the filaments lacking glandular processes; style obsolete or up to 0.5 mm long; stigma small, entire; fruit a stipitate silique, many times longer than broad, subterete; valves 1 (3–5) –nerved; seeds uniseriate.

Chlorocrambe hastatus (Wats.) Rydb. [*Caulanthus hastatus* Wats., type from Wasatch Mts.]. Stems erect, 6–18 dm tall, usually simple, glabrous and glaucous; leaves with slender petioles 1–16 cm long, the blades hastate to ovate or lanceolate, 3–13.5 cm long, 1–8.5 cm wide, more or less hastate, entire or sinuate-lobed; pedicels spreading to reflexed, 5–10 mm long, glabrous; sepals usually surpassing the petals, their tips coiled, yellowish green, glabrous; petals 4.5–8 mm long, white, mostly 4–6 mm long, the blade constricted at juncture with claw, ascending-spreading; siliques 4–10.5 cm long, 1.8–2.5 mm wide, spreading to curved descending, glabrous; stipe 2–7 mm long; style to 0.5 mm long; stigma not lobed. Mountain brush, aspen, white fir, Douglas fir, and spruce-fir communities at 1800 to 3050 m in in Cache, Davis, Morgan, Salt Lake, Tooele, Utah, Wasatch, and Weber counties; Wallowa Mts., Oregon; 21 (i).

Chorispora R. Br.

Annuals from taproots, stipitate-glandular, sometimes also hirsute; leaves alternate and basal, simple, sinuate-dentate to pinnatifid or entire, the cauline ones petiolate to sessile but not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, pink to lavender; stamens 6, the filaments lacking glandular processes; style apical on a slender sterile beak, the stigma minute, bilobed; fruit a silique, many times longer than broad, terete, indehiscent, breaking at maturity into 1-seeded segments; valves 1 (3 or more) –nerved; seeds uniseriate.

Chorispora tenella (Pallas) DC. Musk-mustard. [*Raphanus tenellus* Pallas; *Chorispermum tenellum* (Pallas) R. Br. ex Ait.]. Stems decumbent-ascending to erect, 0.2–4.5 dm tall, simple or branched from the base, stipitate-glandular and often simple hirsute at least at the base; leaves mainly cauline, 0.5–8.5 cm long, 0.1–2.8 cm

wide, sinuate-dentate, pinnatifid, or entire, petiolate or sessile but not auriculate; pedicels spreading-ascending, 2–6 mm long, stipitate-glandular and often sparingly hirsute; sepals 4.4–6.7 mm long, reddish or purplish, stipitate-glandular; petals 9–12.5 mm long, pink to lavender, rounded apically, spreading; siliques 3–4.5 cm long, curved-ascending, stipitate-glandular, the beak 8–22 mm long; style obsolete or very short, the stigma minute; $n = 7$. Roadsides, fields, and other disturbed sites at 1370 to 2320 m probably throughout the state; Washington and Idaho south to California, Arizona and Colorado; adventive from Asia; 55 (x). The musky odor is evident even when driving along roads where the plant is abundant as a weed.

Conringia Adanson

Glabrous and glaucous annuals or biennials, from taproots; leaves alternate and basal (and still alternate), simple, entire, tapering to the base or cauline, sessile, and auriculate-clasping; flowers in ebracteate racemes, the pedicels ascending to curved-erect; sepals 4, deciduous; petals 4, yellow or cream; stamens 6, the filaments lacking glandular appendages; style stout, the stigma lobed; fruit a sessile, slender silique many times longer than broad, quadrangular, the valves 1– to 3–nerved; seeds numerous, uniseriate.

Conringia orientalis (L.) Dumort. Hares-ear Mustard. [*Brassica orientalis* L.]. Annual or winter annual; stems 1.9–5 (7) dm tall, solitary or 2 or 3 from the base, glabrous; basal leaves 3–6 (9) cm long, 1.2–3 cm wide, entire, glabrous; cauline leaves several, 1.7–12 cm long, 0.8–5.7 cm wide, ovate to oblong to elliptic, shorter to longer than internodes, glabrous, entire; pedicels 5–14 mm long, ascending to curved-erect, glabrous; sepals 4.3–6 (8) mm long, glabrous, often reddish tinged, acute; petals 6.2–10 (12) mm long, yellow to cream, spatulate, spreading-ascending; siliques 7–10 (13) cm long, 1.5–2 mm thick, erect; valves glabrous; style up to 1 mm long; stigma small; seed numerous; $n = 7$. Disturbed sites in meadow, pinyon-juniper, sagebrush, and mountain brush communities at 1370 to 2170 m in Box Elder, Cache, Juab, Kane, Rich, Salt Lake, San Juan, Sanpete, Utah, and Washington counties; widely distributed in North America; adventive from Europe; 14 (i).

Descurainia Webb

Stellate-pubescent, stipitate-glandular, or glabrate annuals or biennials from slender to stout taproots; leaves basal and cauline, alternate, 1–3 times pinnately compound or pinnatifid, not auriculate basally, flowers in ebracteate racemes; sepals 4, deciduous; petals 4, yellow to cream; stamens 6, the filaments lacking glandular processes; style short or obsolete, stigma capitate; fruit a silique more than (3) 5 times longer than broad, linear to oblong or clavate, terete or nearly so; valves 1–nerved, glabrous; seeds several to many, uniseriate or biseriate.

Detling, L. E. 1939. *Descurainia* in North America. Amer. Midl. Naturalist 22: 451–520.

Schulz, O. E. 1924. *Descurainia*. Pflanzenr. IV. 105 (Heft 86): 481–520.

1. Upper leaves bi- or tripinnate; siliques narrowly linear, mostly about 20 (10–30) mm long; seeds usually more than 20, uniseriate; replum 2- to 3-nerved; tall to low plants of low elevations *D. sophia*

- Upper leaves once-pinnate; siliques clavate, elliptic, or, if linear, less than 20-seeded and less than 15 mm long; replum nerveless or 1-nerved 2
- 2(1). Siliques clavate or linear to elliptic, rounded to pointed above; seeds often in 2 rows or at least partially so; replum usually nerveless; plants of middle to lower elevations *D. pinnata*
- Siliques linear or elliptic, usually pointed above; seeds in one row; replum 1-nerved; plants of middle and higher elevations 3
- 3(2). Siliques 7–14 mm long, linear or less commonly ellipsoid; pedicels appressed-erect or ascending; seeds mostly 4–10 per locule *D. richardsonii*
- Siliques 3.3–7.2 mm long, ellipsoid; pedicels ascending to spreading; seeds mostly 1–3 per locule *D. californica*

Descurainia californica (Gray) Schulz California Tansymustard. [*Smelowskia californica* Gray]. Annual or winter annual to biennial; stems 4–13 dm tall or more, simple or more commonly profusely branching from most of upper leaf and bract axils, minutely dendritic-stellate pubescent to almost or quite glabrous below, glabrous above; leaves basal and cauline, 2–7 cm long, the lower once-pinnately compound with 2–4 pairs of entire to incised pinnae, the upper reduced, once-pinnate or pinnatifid; pedicels 3–7 mm long, spreading to spreading-ascending, glabrous; sepals spreading, 0.8–1.3 mm long, yellow or greenish, glabrous; petals 1.1–1.6 mm long, yellow; siliques 3.3–7.2 mm long, 0.9–1.3 mm wide, erect or ascending, not appressed; style 0.3–0.7 mm long; seeds uniseriate, 1–3 per locule; n = 14. Juniper, sagebrush, Douglas fir, white fir, aspen, and spruce-fir communities at 1645 to 3450 m in probably all Utah counties; Wyoming, Colorado, and New Mexico westward to California; 87 (xx). This taxon is a mirror-image congener of *D. richardsonii* (q. v.), especially of those taxa of that species with ascending pedicels.

Descurainia pinnata (Walter) Britt. Pinnate Tansymustard. [*Erystrinum pinnatum* Walter; *Sisymbrium pinatum* (Walter) Greene; *Sophia pinnata* (Walter) Howell]. Annual or winter annual; stems 1–10 dm tall, stellate-pubescent and sometimes also stipitate-glandular at least below, simple or highly branched above; leaves basal and cauline, 2–10 cm long, once to twice pinnatifid, the segments linear to oblong, often toothed, the upper reduced and usually once pinnatifid; pedicels 3–23 mm long spreading, stellate-pubescent to glabrous; sepals 1–2.2 mm long, yellowish to greenish or violet, stellate-pubescent to glabrous; petals 1.5–3 mm long, cream to yellow; siliques 3–15 (rarely 20) mm long, 1–2 mm wide, clavate to oblong or linear, very rarely ellipsoid; style up to 0.3 mm long; seeds 1–20 per locule, biseriate in part; n = 7, 14, 21. This polymorphic species occurs in all Utah counties. The morphology is sufficiently variable as to invite segregation of infraspecific taxa, and the work of Detling (l.c.) is classic and instructive. In spite of his careful work, I have synonymized some of the segregates recognized by Detling, because of nearly identical overall nature of the plants, otherwise set apart by minute and inconsistent diagnostic characters. The proposed segregates intergrade endlessly, and there is no apparent geographical or ecological correlation of the diagnostic features. The following key gives the impression of such a correlation, in part, but the characters are applied arbitrarily. Possibly trends are indicated, and for that reason, I retain the key to varieties.

- 1. Pedicels (17) 18–24 mm long; siliques mostly 12–18 mm long; petals yellow, over 2 mm long; terminal leaflet of uppermost leaves linear, entire, and more than 2 cm long; plants of Grand, San Juan, and Uintah counties *D. pinnata* var. *paysonii*
- Pedicels usually less than 15 mm long; siliques often less than 12 mm long (up to 20 mm in var. *filipes*); terminal leaflet various but not or seldom as above; petals yellow to cream, shorter or longer than 2 mm in length; distribution various 2
- 2(1). Stems moderately to densely stipitate-glandular 3
- Stems stellate-hairy or glabrous, not at all, or seldom stipitate-glandular 4
- 3(2). Flowers with calyx usually rose colored; corolla 1.5–2 (2.2) mm long; siliques usually 10 mm long or less *D. pinnata* var. *osmiarum*
- Flowers with calyx yellowish; corolla 2–3 mm long; siliques often more than 10 mm long *D. pinnata* var. *filipes*
- 4(2). Siliques usually shorter than pedicels, mostly 10–21 mm long, not or only somewhat clavate in outline *D. pinnata* var. *osmiarum*
- Siliques usually subequal to or longer (rarely shorter) than pedicels, mostly 3–12 mm long, more or less clavate or elliptic in outline 5
- 5(4). Siliques 3–8 mm long, borne on pedicels 4–12 mm long; plants of warm deserts in Washington County *D. pinnata* var. *glabra*
- Siliques 8–10 mm long, or, if only 4–8 mm long, not of Washington County; pedicels various 6
- 6(5). Pedicels 4–6 (8) mm long; flowers 1–1.5 mm long *D. pinnata* var. *nelsonii*
- Pedicels (6) 8–12 mm long; flowers 2–3 mm long *D. pinnata* var. *intermedia*

Var. *filipes* (Gray) Peck [*Sisymbrium incisum* var. *filipes* Gray; *Sisymbrium longipedicellata* Fourn.; *Sophia filipes* (Gray) Heller; *Sisymbrium gracilis* Rydb.; *D. rydbergii* var. *eglandulosa* Schulz; *D. longipedicellata* (Fourn.) Schulz; *D. longipedicellata* var. *glandulosa* Schulz; *Sisymbrium glandifera* Osterh.; *Sisymbrium longipedicellata* var. *glandulosa* (Schulz) St. John; *D. pinnata* ssp. *filipes* (Gray) Detl.]. Creosote bush, blackbrush, pinyon-juniper, and ponderosa pine communities at 975 to 2300 m in Beaver, Davis, Emery, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; British Columbia and Alberta south to California, Arizona, and Colorado; 44 (viii).

Var. *glabra* (Woot. & Standl.) Shinn. [*Sophia glabra* Woot. & Standl.; *D. pinnata* ssp. *glabra* (Woot. & Standl.) Detl.]. Creosote bush, Joshua tree, blackbrush, and pinyon-juniper communities at 750 to 1220 m elevation in Washington County; Arizona and New Mexico west to California and northern Mexico; 7 (iv). Plants similar to those designated within this species occur elsewhere in Utah, but are arbitrarily assigned to other taxa, especially to var. *nelsonii* or var. *intermedia*.

Var. *intermedia* (Rydb.) C. L. Hitchc. [*Sophia intermedia* Rydb.; *D. intermedia* (Rydb.) Daniels; *Sisymbrium intermedium* (Rydb.) Garrett; *D. pinnata* ssp. *intermedia* (Rydb.) Detl.]. Mixed desert shrub, pinyon-juniper, sagebrush, and upward to montane communities at 1125 to 2745 m elevation in Garfield, Kane, Millard, Uintah, and Wayne counties; British Columbia and Alberta south to California, Nevada, and Colorado; 15 (iv).

Var. *nelsonii* (Rydb.) Peck [*Sophia nelsonii* Rydb.; *D. brachycarpa* var. *nelsonii* (Rydb.) Schulz]. Shadscale, other salt desert shrub, blackbrush, other warm desert shrub, pinyon-juniper, mountain brush, and aspen communities at 1160 to 3250 m elevation in Carbon, Duchesne, Garfield, Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, and Wasatch counties; Washington east to Montana, south to Nevada, and Colorado; 20 (iv).

Var. *osmiarum* (Cockerell) Shinn. [*Sophia andrenarum* var. *osmiarum* Cockerell; *S. halictorum* Cockerell; *S. andrenarum* Cockerell; *Sisymbrium halictorum* (Cockerell) K. Schum.; *D. halictorum* (Cockerell) Schulz; *D. halictorum* var. *andrenarum* (Cockerell) Schulz; *D. halictorum* var. *osmiarum* (Cockerell) Schulz; *D. andrenarum* (Cockerell) Cory; *D. pinnata* ssp. *halictorum* (Cockerell) Detl.]. Shadscale, other salt desert shrub, blackbrush, other warm desert shrub, cool desert shrub, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 750 to 2930 m in probably all Utah counties; Oregon to Wyoming south to Mexico, Oklahoma, and Arkansas; 120 (xxiv). As interpreted here, var. *osmiarum* is expanded to include the concept of *Sophia halictorum* Cockerell, which differs from var. *osmiarum* only in lacking glandular hairs. The plants are identical otherwise. Too, the smaller flowers and pinkish calyces of var. *osmiarum* are transitional with the larger flowers with yellowish calyces of var. *filipes*.

Var. *paysonii* (Detl.) Welsh & Reveal [*D. pinnata* ssp. *paysonii* Detl.]. Uncommon in pinyon-juniper and sagebrush zones at lower elevations in Grand, San Juan, and Uintah counties; Wyoming and Colorado south into Arizona; 4 (0). Only the longer pedicels keep this out of var. *osmiarum* in a broad sense.

Descurainia richardsonii (Sweet) Schulz Richardson Tansy-mustard. [*Sisymbrium canescens* Richards., not *D. canescens* Nutt., *S. richardsonii* Sweet; *S. canescens* var. *major* Hook.; *Sophia richardsoniana* Rydb.]. Annual or winter annual to biennial; stems (1.5) 3–12 dm tall or more, simple or more commonly profusely branching from upper leaf and bract axils, minutely dendritic-stellate pubescent and sometimes also minutely stipitate-glandular to almost or quite glabrous below, glabrous or glandular above; leaves basal and cauline, 1.5–8 cm long, the lower 1- to 2-pinnatifid with 2–4 pairs of toothed or lobed or subentire pinnae, the upper reduced and only once-pinnatifid; pedicels (2.5) 3–9 mm long, spreading to erect, pubescent or glabrous; sepals spreading, 0.9–1.7 mm long, yellow or greenish, glabrous or hairy; petals 1.3–2.8 mm long, yellow; siliques 7–14 mm long, 0.8–1.2 mm wide, ascending or erect, often appressed; style 0.2–0.6 mm long; seeds uniseriate, (1–3) 4–10 per locule; $n = 7, 14, 21$. Three weakly defined variants can be at least arbitrarily distinguished as in the following key:

1. Pedicels and siliques erect, more or less appressed to raceme axis *D. richardsonii* var. *brevipes*
- Pedicels ascending, siliques erect or ascending, neither one appressed to raceme axis 2
- 2(1). Plants not glandular *D. richardsonii* var. *sonnei*
- Plants stipitate-glandular *D. richardsonii* var. *viscosa*

Var. *brevipes* (Nutt.) Welsh & Reveal [*Sisymbrium canescens* var. *brevipes* Nutt. ex T. & G.; *Sophia procera* Greene; *Sisymbrium procerum* (Greene) K. Schum.; *Sophia brevipes* (Nutt.) Rydb.; *D. richardsonii* var.

macrosperma Schulz, type from Alta, Salt Lake County; *D. richardsonii* ssp. *procera* (Greene) Detl.; *D. richardsonii* var. *procera* (Greene) Breitung]. Aspen, lodgepole pine, spruce-fir, and alpine communities at 2105 to 3480 m elevation in Cache, Duchesne, Garfield, Iron, Piute, Salt Lake, Summit, and Wasatch counties; Idaho and Montana south to New Mexico; 30 (x).

Var. *sonnei* (Robins.) C. L. Hitchc. [*Sisymbrium incisum* Engelm. in Gray; *D. incisum* (Engelm.) Britt.; *S. incisum* var. *sonnei* Robins.; *Sophia sonnei* (Robins.) Greene; *Sophia incisum* (Engelm.) Greene; *S. leptophylla* Rydb.; *S. serrata* Greene; *S. purpurascens* Rydb.; *Sisymbrium leptophyllum* (Rydb.) Nels. & Macbr.; *D. serrata* (Greene) Schulz; *D. incisum* var. *leptophylla* (Rydb.) Schulz; *D. richardsonii* ssp. *incisum* (Engelm.) Detl.]. Sagebrush, aspen, and alpine communities at 1890 to 3185 m elevation in Cache, Duchesne, Garfield, Grand, Iron, Salt Lake, Sevier, Uintah, Utah, and Wasatch counties; Idaho and Montana south to Mexico; 26 (i). This phase of *D. richardsonii* closely simulates *D. californica* (q.v.).

Var. *viscosa* (Rydb.) Peck [*Sophia viscosa* Rydb.; *Sisymbrium viscosum* (Rydb.) Blank.; *D. rydbergii* Schulz; *D. richardsonii* ssp. *viscosa* (Rydb.) Detl.]. $n = 7$. Alder, aspen, and spruce-fir communities at 2450 to 3050 m in Duchesne and Wasatch counties; British Columbia and Alberta south to California, Arizona, and New Mexico; 5 (0). The var. *richardsonii* is known to occur just north and east of Utah in southwestern Wyoming and northwestern Colorado. It differs from var. *brevipes* in being canescent as opposed to moderately pubescent to nearly glabrous.

Descurainia sophia (L.) Webb ex Prantl [*Sisymbrium sophia* L.; *Sophia sophia* (L.) Britt.; *S. parviflora* Standley]. Annual or infrequently winter annual; stems 1.7–8.5 (10) dm tall or more, simple or more commonly branched above, softly dendritic-hairy or with mixed simple and dendritic trichomes at least below; leaves basal and cauline, 1–12 cm long, the lower 2–3 times pinnately compound to pinnatifid, with 2–6 pairs of pinnatifid pinnae, the upper ones smaller and usually twice pinnately compound or pinnatifid; pedicels 4–17 mm long, ascending, puberulent or glabrous; sepals erect, 2–3.1 mm long, yellowish, glabrous or hairy; petals 2.2–3 mm long, cream; siliques (10) 12–27 (30) mm long, 0.8–1.2 mm wide, ascending-erect; style 0.1–0.3 mm long; seeds uniseriate, mostly 10–25 mm long; $n = 10, 14, 28$. Roadsides, corrals, agricultural lands, and other disturbed sites at 700 to 2450 m in all Utah counties; widespread in North America; adventive from Europe; 90 (xiv).

Diplotaxis DC.

Glabrous or simple-hirsute annuals or biennials, from taproots; leaves alternate, mostly basal, pinnatifid to irregularly toothed, reduced upwards and petiolate to merely sessile but not auriculate; pedicels ascending or ascending-spreading, ebracteate; sepals 4, deciduous; petals 4, yellow or sometimes fading rose; stamens 6, the filaments lacking glandular processes; style stout, well developed; stigma capitate; fruit a silique, many times longer than broad, linear, somewhat flattened parallel to partition, valves 1- to 3-nerved; beak not nerved; seeds numerous, biseriata.

Diplotaxis muralis (L.) DC. [*Sisymbrium murale* L.]. Erect or ascending, pubescent with coarse, descending

hairs at least below; stems 0.7–5 dm tall, usually branched; basal leaves lyrate-pinnatifid to irregularly lobed, mostly 2.5–9.5 cm long, 0.5–3.5 cm wide; cauline leaves usually much reduced upwards, all petiolate, not auriculate; pedicels 6–23 mm long or more, slender, ascending to spreading-ascending, often hirsute; sepals 3–4.5 mm long, purplish tinged, glabrous or hirsute; petals 4.5–7.5 mm long, yellow or sometimes fading rose; siliques 17–33 mm long, 1.5–2.8 mm wide; style 1.5–2.5 mm long; valves glabrous, lightly 1- to 3-nerved; 2n = 42. Fields and disturbed sites in Cache, Salt Lake, and Utah counties; scattered in North America; adventive from Europe; 3 (0).

Dithyrea Harv.

Stellate- or dendritic-hairy annual or winter annual from a taproot; leaves alternate, simple, subentire to toothed, lobed or pinnatifid, petiolate to sessile but not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white; stamens 6, the filaments lacking glandular processes; style broad and stout; stigma enlarged-capitate; fruit a silicle, more than twice longer than broad, spectaclelike, compressed at right angles to the replum; valves reticulately veined; seeds 1 per locule [*Dimorphocarpa* Rollins].

Dithyrea wislizenii Engelm. in Wisliz. Spectacle-pod. [*Dimorphocarpa wislizenii* (Engelm.) Rollins]. Erect or ascending, pubescent with soft stellate or dendritic hairs; stems 0.7–5 dm tall, simple or branched; basal leaves often withered by anthesis; cauline leaves 1.2–9.5 cm long, 2–25 mm wide, pinnatifid, sinuately dentate, irregularly lobed, or entire, moderately to densely hairy like stems, reduced upward; pedicels 5–21 mm long in fruit, spreading, dendritic-hairy; sepals 3–5.5 mm long, greenish, yellowish, or purplish, usually dendritic-hairy; petals 4.8–8 mm long, white, the claws occasionally lavender, the blades orbicular to spatulate, 2.5–5.5 mm wide; siliques 4–6.5 mm long (from apex of the short stipe), 9–14 mm wide; valves pubescent; seeds 1 per locule; 2n = 18. Sandy dunes and other sandy sites in warm or mixed desert shrub, pinyon-juniper, and ponderosa pine communities at 820 to 2135 m in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Nevada, Colorado, Arizona, New Mexico, and Mexico; 87 (x). Segregation of *D. wislizenii* and related species within *Dimorphocarpa* is based on dissimilarities of about the same order of magnitude as occur within other genera in this family, where generic lines are notoriously indistinct.

Draba L.

Plants with stellate, dendritic, forked, or simple hairs, or glabrate, annual, biennial, or perennial, from taproots and often with well-developed caudices; leaves all basal or some cauline, alternate, simple, entire or toothed, tapering to the base or rounded, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white, yellow or cream, rounded to bifid apically; stamens 6, the filaments lacking glandular processes; style obsolete to prominent and slender; stigma obscurely bilobed; fruit a silicle or infrequently a short silique, mostly 1–10 times longer than broad, oval to ovate, lanceolate, or linear, compressed parallel to the septum, plane or twisted, straight or curved; valves obscurely 1-nerved or nerveless; seeds biseriate, usually numerous.

Hartman, R. L., et al. 1975. Biosystematics of *Draba cuneifolia* and *D. platycarpa* (Cruciferae) with emphasis on volatile and flavonoid constituents. *Brittonia* 27: 317–327.
 Hitchcock, C. L. 1941. A revision of the *Drabas* of western North America. Univ. Washington Publ. Biol. 11: 1–132.
 Payson, E. B. 1917. The perennial scapose *Drabas* of North America. *Amer. J. Bot.* 4: 253–267.

- 1. Plants scapose; leaves all basal, mostly depressed-caespitose perennials (except in *D. verna*, which has deeply bilobed petals) Key 1
- Plants with 1 to many cauline leaves in addition to basal ones, annual (and the petals not bilobed), biennial, or perennial. Key 2

Key 1.

Plants scapose.

- 1. Plants annual, flowering in spring; style scarcely if at all evident (up to 0.1 mm long) *D. verna*
- Plants perennial, flowering in spring and in summer; style 0.2–2.5 mm long 2
- 2(1). Petals white 3
- Petals yellow 7
- 3(2). Plants pubescent throughout with doubly pectinate hairs; plants of Daggett and Uintah counties *D. oligosperma*
- Plants variously hairy, but either stellate or with simple or forked hairs only, seldom or rarely pubescent throughout; plants known from Raft River, Uinta, and Wasatch mts. and plateaus of southern Utah. 4
- 4(3). Leaves with simple hairs only; petals 2–3 mm long; style up to 0.2 mm long *D. fladnizensis*
- Leaves variously pubescent; petals mostly 3–5 mm long; style 0.2–1.5 mm long 5
- 5(4). Leaves cinereous with appressed hairs, sometimes stellate; plants of various distribution .. *D. lonchocarpa*
- Leaves glabrous above and below, or pubescent with simple or forked hairs and similarly ciliate; plants of the Raft River Mts. and plateaus of southern Utah ... 6
- 6(5). Styles mainly 0.5 mm long or shorter; seeds 6–12 per silicle; plants of mountains and plateaus of southern Utah *D. subalpina*
- Styles 0.5–1.5 mm long; seeds 1 or 2 per silicle; plants of the Grouse Creek Mts. *D. douglasii*
- 7(2). Leaves glabrous or with unforked hairs only, often merely ciliate 8
- Leaves pubescent, at least some of the hairs forked, stellate, or doubly pectinate 10
- 8(7). Styles 1–2.5 mm long; petals 5–6 mm long; plants of Box Elder, Cache, and Weber counties ... *D. maguirei*
- Styles usually less than 1 mm long; petals less than 5 mm long; distribution various 9
- 9(8). Styles not over 0.2 mm long; plants biennial or short-lived perennial; leaves not densely imbricated; petals 1.5–3 mm long *D. crassifolia*
- Styles 0.2–1 mm long; plants perennial, densely caespitose, with closely imbricated leaves; petals often more than 3 mm long *D. densifolia*
- 10(7). Lower side of leaves (at least) with appressed, pectinately branched hairs *D. oligosperma*
- Lower side of leaves glabrous or pubescent but, if so, with merely stellate or forked hairs, not pectinate ... 11
- 11(10). Leaves almost glabrous, ciliate with forked or dendritic hairs; plants of Box Elder and Weber counties *D. maguirei*

- Leaves more or less pubescent on one or both surfaces 12
- 12(11). Stems glabrous, at least above 13
- Stems pubescent throughout 14
- 13(12). Basal leaves 10–35 mm long, 3–10 mm wide; silicles 7–14 mm long, 2–4 mm wide; plants mainly of western Kane and eastern Washington counties *D. asprella*
- Basal leaves 6–12 mm long, 9–14 mm wide; silicles 4–10 mm long, 1.5–3 mm wide; plants of Box Elder, Cache, and Weber counties *D. maguirei*
- 14(12). Leaves densely cinereous pubescent, individual hairs almost indistinguishable; plants known from Uinta Mts. *D. rentosa*
- Leaves not densely cinereous pubescent, individual hairs apparent; plants of Beaver and Piute counties *D. sobolifera*
- Plants with caudex not well developed, or if so, seldom if ever as above, and not or seldom of the Deep Creek Mts. 12
- 12(11). Styles obsolete or nearly so, up to 0.2 mm long *D. stenoloba*
- Styles 0.2–2.5 mm long 13
- 13(12). Petals 2.8–3.8 mm long; pubescence of leaves of stiff, stalked, 2- to 5-rayed hairs; silicles pubescent with simple or stalked and forked hairs *D. brachystylis*
- Petals (3.8) 4–8 mm long; pubescence of leaves various; silicles glabrous or pubescent with stellate to simple hairs 14
- 14(13). Leaf surfaces glabrous, ciliate or not; silicles glabrous *D. crassa*
- Leaf surfaces with stalked 2- to 4-rayed, forked, or simple hairs, margins ciliate or not; silicles glabrous or hairy 15
- 15(14). Leaves solitary, subtending lowermost flower or branch of inflorescence; plants of Box Elder and Cache counties *D. incerta*
- Leaves 2–20; plants of various distribution 16
- 16(15). Leaves bright green to somewhat grayish; cauline leaves often denticulate; silicles plane or slightly contorted; plants of Grand and San Juan counties *D. spectabilis*
- Leaves grayish green; cauline leaves entire; silicles usually contorted; plants of broad distribution *D. aurea*

Key 2.

Plants with 1 or more cauline leaves.

- 1. Plants annual; style obsolete or rarely up to 0.2 mm long 2
- Plants biennial or perennial; style mostly 0.2–1 mm long or more 7
- 2(1). Upper portion of stem, including pedicels, pubescent 3
- Upper portion of stem glabrous 4
- 3(2). Flowers white; plants widely distributed at low elevations *D. cuneifolia*
- Flowers yellow; plants of montane regions in northern Utah *D. rectifruca*
- 4(2). Upper leaf surfaces usually glabrous; cauline leaves 1 or 2, rarely lacking *D. crassifolia*
- Upper leaf surfaces usually pubescent; cauline leaves 1–5 or more 5
- 5(4). Petals white; leaves entire or nearly so; silicles less than 2 mm wide; plants of low elevations ... *D. reptans*
- Petals yellow, sometimes fading whitish; silicles at least 2 mm wide or the plants of montane places 6
- 6(5). Pedicels usually at least 1.5 times longer than the silicles; plants usually of low elevations *D. nemorosa*
- Pedicels rarely up to 1.5 times longer than the silicles; plants usually of montane places *D. stenoloba*
- 7(1). Petals white; plants of high elevations 8
- Petals yellow or cream, sometimes fading whitish; plants of low to moderate or high elevations 10
- 8(7). Styles obsolete or nearly so, less than 0.2 mm long *D. fladnizensis*
- Styles 0.2–0.8 mm long 9
- 9(8). Silicles glabrous or merely ciliate; cauline leaves 1 or 2 *D. lonchocarpa*
- Silicles pubescent on valves; cauline leaves 1–10 *D. lanceolata*
- 10(7). Cauline leaves solitary; plants of low elevations, restricted to Kane and Washington counties (disjunct in western Juab County) *D. asprella*
- Cauline leaves usually 2–20 or, if solitary, not of the above counties 11
- 11(10). Plants with a definite caudex, the branches densely clothed with threadlike grayish leaf bases; plants of the Deep Creek Mts. *D. kassii*
- *Draba asprella* Greene Zion Draba. Perennial, caespitose; stems 0.5–1.4 (2) dm tall, arising from a branching caudex, hirsute with mixed simple and forked to denticric hairs; leaves all basal, rarely with 1 cauline, 1–3.5 cm long, 0.3–1 cm wide, oblanceolate to spatulate, entire or obscurely denticulate, green, the surfaces more or less pubescent with usually stalked and 4-rayed hairs; racemes simple, 10- to 30-flowered, elongating in fruit; pedicels 3–15 mm long, ascending, glabrous; sepals 1.8–2.5 mm long, greenish, stellate-hairy; petals 3.4–5 (6) mm long, yellow to yellow orange, obovate-spatulate, rounded; silicles 7–14 mm long, 1.5–4 mm wide, lance-elliptic, glabrous or ciliate; style 0.8–1.1 mm long; seeds 12–20. Mixed warm desert shrub, mountain brush, and ponderosa pine-manzanita communities at 1050 to 2600 m elevation in western Juab, western Kane, and eastern Washington counties; Arizona; 12 (ii). Our material belongs to var. *zionensis* (C. L. Hitchc.) Welsh & Reveal [*D. zionensis* C. L. Hitchc., type from Zion Canyon]. The var. *asprella* is restricted to Arizona.
- *Draba aurea* Vahl in Hornem. Golden Draba. [*D. luteola* Greene; *D. surculifera* A. Nels.; *D. aureiformis* Rydb.; *D. uber* A. Nels.; *D. mccallae* Rydb.; *D. decumbens* Rydb.; *D. aurea* var. *luteola* (Greene) Schulz; *D. aurea* var. *aureiformis* (Rydb.) Schulz; *D. aurea* var. *decumbens* (Rydb.) Schulz; *D. aureiformis* var. *leiocarpa* Payson & St. John]. Perennial, not caespitose; stems 0.7–4 (5) dm tall, simple or few from a branching caudex, pubescent throughout with simple hairs often intermixed with forked ones; basal leaves 0.8–4 cm long, 2–13 mm wide, oblanceolate, entire or serrulate, green or grayish, the surfaces pubescent with stalked 4-rayed hairs; cauline leaves mostly 3–20, lanceolate to ovate or oblanceolate, 0.5–3 cm long, 3–12 mm wide, entire or less commonly denticulate, pubescent like the basal ones; racemes simple or branched, several- to many-flowered,

much elongating in fruit; pedicels 3–15 (20) mm long, ascending to erect, pubescent; sepals 2–3.5 mm long, greenish, pubescent; petals (3.5) 4–6 mm long, yellow, spatulate to obovate, rounded to emarginate; fruit 8–17 mm long, plane or more commonly contorted, 2–4 mm wide, ovate-lanceolate to lanceolate or elliptic, pubescent with simple, branched, or stellate hairs; style (0.3) 0.8–1.3 (1.5) mm long; seeds 20–50; $n = 32$. Sagebrush-grass, aspen, Douglas fir, lodgepole pine, spruce-fir, and alpine tundra at 2300 to 3815 m in Beaver, Carbon, Daggett, Duchesne, Garfield, Iron, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, and Utah counties; Alaska and Yukon east to Labrador and Greenland, south to Arizona and New Mexico; 63 (xii). This is a highly variable taxon in our region.

Draba brachystylis Rydb. Wasatch *Draba*. Biennial (annual) or short-lived perennial, not caespitose; stems (1) 1.3–2.5 (3) dm tall, usually branched, pubescent throughout with simple, branched, or stellate hairs; basal leaves 1–5.3 cm long, 3–15 mm wide, oblanceolate, entire or denticulate, the surfaces pubescent with stalked 2- to 5-rayed hairs; cauline leaves (1) 2–8, ovate to obovate, elliptic, or lanceolate, 6–28 mm long, 2–11 mm wide, denticulate to entire, pubescent like the basal ones; racemes simple or branched, several- to many-flowered, elongating in fruit; pedicels 1–10 mm long, spreading to spreading-ascending, pubescent; sepals 2–2.7 mm long, yellowish, pubescent; petals 2.8–3.8 mm long, yellow, spatulate, rounded to emarginate; fruit (7) 10–15 mm long, 2–3.5 mm wide, plane, obliquely oblong-elliptic, pubescent with simple and branched hairs; style 0.4–0.8 mm long; seeds 20–30. Aspen and white fir-Douglas fir communities at 1675 to 2990 m in Duchesne, Salt Lake, and Utah counties; Spring Mt., Clark County, Nevada; 5 (i). This is a poorly known and rarely collected plant with affinities to both *D. aurea* and *D. rectifracta*. The type is from the Wasatch Mts.

Draba crassa Rydb. Thick *Draba*. [*D. chrysantha* var. *crassa* (Rydb.) Schulz]. Plants not caespitose, the stems 8–18 cm tall, arising from a thickened caudex clothed with numerous marcescent leaf-bases, moderately hairy with simple or branched hairs, at least below; basal leaves 1.5–8 cm long, 3–12 mm wide, elliptic to oblanceolate, entire or obscurely toothed, glabrous or merely ciliate; cauline leaves 2–8, ovate to elliptic or obovate, 0.5–2 cm long, 2–8 mm wide, entire or nearly so, usually glabrous; racemes few- to many-flowered, elongating in fruit; pedicels 3–10 mm long, ascending, softly villous; sepals 2.3–3 mm long, greenish, suffused with purple, pubescent; petals 4–8 mm long, yellow, obovate, rounded; silicles 8–15 mm long, 2.5–4 (5) mm wide, plane or contorted, ovate to lanceolate or elliptic, glabrous; style 0.8–1.2 mm long; seeds 14–26. Alpine tundra, typically in talus or rock stripes, at 3355 to 3965 m in the Uinta Mts., Duchesne and Summit counties; Montana, Wyoming, and Colorado; 2 (0).

Draba crassifolia Graham Hairy *Draba*. [*D. parryi* Rydb.; *D. crassifolia* var. *parryi* (Rydb.) Schulz]. Biennial (annual) or short-lived perennial, not caespitose, the stems 2–12 (20) cm tall, arising from a rosulate tuft of leaves, usually glabrous except for a few hairs near base; basal leaves 3–15 (23) mm long, 1–3 mm wide, narrowly spatulate, entire, surfaces usually glabrous, sometimes ciliate; cauline leaves lacking or 1 or 2, very small; racemes 2- to several-flowered, congested or elongating

in fruit; pedicels 2–10 mm long, curved-ascending, glabrous; sepals 1–1.4 mm long, greenish, glabrous; petals 1.7–2.5 mm long, yellow but rarely fading white, elliptic-spatulate, emarginate; silicles 5–10 mm long, 1.5–2.5 mm wide, plane, glabrous, lance-elliptic; style to 0.5 mm long; seeds 10–60; $n = 20$. Spruce-fir, lodgepole pine, and alpine tundra, often in talus or in rock stripes, at 3050 to 3800 m in Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, and Wayne counties; widespread from Alaska and Yukon east to Greenland and south to California, Arizona, and Colorado; Europe; 13 (iii). This entity apparently intergrades with some phases of *D. stenoloba* in Utah, from which it is difficult, if not impossible, to segregate all specimens.

Draba cuneifolia Nutt. ex T. & G. Wedgeleaf. Annual, not caespitose, 1–15 (20) cm tall, the very short leafy stems arising from a taproot, simple or branched, pubescent with dendritic hairs almost throughout; basal leaves 0.5–4 cm long, 2–27 mm wide, suborbicular to oblanceolate or cuneate-spatulate, dentate to entire, the surfaces hirsute with stalked 2- to 4-rayed hairs, sometimes intermixed with simple hairs; cauline leaves few to several, usually much reduced, pubescent like the basal ones; racemes 3- to many-flowered, congested or elongating in fruit; pedicels 1–7 mm long, spreading to ascending, dendritic-hairy; sepals 1.5–2.5 mm long, greenish, pubescent; petals 3–4.5 (5) mm long, occasionally small or even lacking in cleistogamous flowers, white, spatulate, rounded to emarginate; silicles 4–13 (15) mm long, 1.8–3.8 (5) mm wide, plane, strigose, oblong-elliptic; style up to 0.2 mm long; seeds 20 or more. Warm desert shrublands upward to mountain brush, pinyon-juniper, and ponderosa pine communities, at 750 to 2535 m in Beaver, Box Elder, Emery, Grand, Iron, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, and Washington counties; Washington and Idaho south to Mexico, Texas, and Arkansas; 72 (ix). Two varieties are present. The bulk of our material has racemes seldom half as long as the plant height and is assignable to var. *cuneifolia* [*D. helleri* Small; *D. amophila* Heller; *D. cuneifolia* var. *helleri* (Small) Schulz; *D. cuneifolia* var. *leiocarpa* Schulz]. Some of the specimens from Washington County have the racemes elongated to half or more the plant height and are included within var. *platycarpa* (T. & G.) Wats. [*D. platycarpa* T. & G.; *D. viperensis* St. John].

Draba densifolia Nutt. ex T. & G. Rockcress *Draba*. Perennial, pulvinate-caespitose and matted, scapose, arising from compacted caudex branches clothed with marcescent leaf-bases; stems 5–15 cm tall, glabrous to pubescent throughout; leaves 2–9 mm long, mostly 1–3 mm wide, oblong to oblanceolate, the surfaces glabrous or with few-forked or dendritic hairs beneath, more or less ciliate with stiff, coarse, simple or forked hairs; racemes 2- to 10 (or more)-flowered, not elongated in fruit; pedicels 0.5–2 mm long, ascending, glabrous; sepals 2–3 mm long, greenish, glabrous or pubescent; petals 2–6 mm long, yellow, obovate, truncate to emarginate; silicles 2–7 mm long, 2–3.5 mm wide, ovate to elliptic, glabrous; styles 0.2–1 mm long; seeds 2–12. Alpine tundra, often in rock stripes, talus, or meadows, less commonly in spruce-fir communities at 3140 to 3815 m in the Wasatch and Uinta mts. in Daggett, Duchesne, Juab, Salt Lake, Summit, Uintah, and Utah counties;

British Columbia and Montana south to California, Nevada, and Wyoming; 16 (0). Two weakly defined, sympatric variants are recognized.

1. Styles 0.2–0.5 mm long; plants glabrous except for cilia of the leaves *D. densifolia* var. *apiculata*
- Styles 0.5–1 mm long; plants sometimes hairy on the lower leaf surfaces and on the scape *D. densifolia* var. *densifolia*

Var. *apiculata* (C. L. Hitchc.) Welsh [*D. apiculata* C. L. Hitchc., type from Uinta Mts., Summit County]. *D. apiculata* var. *daviesiae* C. L. Hitchc.; *D. densifolia* var. *daviesiae* (C. L. Hitchc.) Welsh & Reveal]. This is a poorly differentiated phase of alpine sites in Duchesne, Salt Lake, Summit (type from LaMotte Peak), and Uintah counties; Wyoming and Montana.

Var. *densifolia* [*D. glacialis* var. *pectinata* Wats.; *D. mulfordae* Payson; *D. nelsonii* Macbr. & Payson; *D. globosa* Payson; *D. sphaerula* Macbr. & Payson; *D. pectinata* (Wats.) Rydb.; *D. caeruleomontana* Payson & St. John; *D. caeruleomontana* var. *piperi* Payson & St. John; *D. densifolia* f. *nelsonii* (Macbr. & Payson) Schulz; *D. globosa* var. *sphaerula* (Macbr. & Payson) Schulz]. This is the common phase of the species in alpine sites of Daggett, Duchesne, Salt Lake, Summit, and Uintah counties; distribution of the species.

Draba douglasii Gray Douglas *Draba*. Tufted perennial from a stout taproot; leaves basal, thick, leathery, oblanceolate, the midrib prominent, 5–12 mm long, 1–2 mm broad, ciliate with simple or forked hairs and often pubescent with unbranched or forked hairs; scapes 1–3 cm tall, softly pubescent with simple or forked hairs; pedicels hairy like the scapes, subequal to the fruits; sepals 2–2.5 mm long, glabrous or sparingly pubescent; petals 4–5 mm long, white; silicles ovoid, the valves thick and leathery, little flattened, mainly 3–7 mm long, pubescent with short, retrorsely pubescent hairs; style 0.5–1.5 mm long, slender; ovules 4, the seeds 1 or 2, ca 2 mm long. Windswept ridge crests at ca 2440 m in Box Elder County (Goodrich & Atwood 17127); Washington to California and Nevada; 1 (0). Our material belongs to var. *douglasii*.

Draba fladnizensis Wulfen in Jacq. Arctic *Draba*. [*D. pattersonii* Schulz; *D. pattersonii* var. *hirticaulis* Schulz; *D. pattersonii* var. *dasycarpa* Schulz]. Perennial, not caespitose, the stems 2–9 dm tall, glabrous or pubescent at least near the base with simple or forked hairs; basal leaves 3–10 mm long, 1–2 mm wide, oblanceolate, the surfaces glabrous or moderately hairy with simple or 2–forked hairs, ciliate; cauline leaves 1 or 2, greatly reduced; racemes 3– to several-flowered; pedicels 1–3 mm long, ascending to spreading, glabrous; sepals 1.2–1.8 mm long, greenish, glabrous; petals 1.8–2.5 mm long, white (rarely pink), spatulate, rounded to retuse; silicles 3–6 mm long, 1.2–2 mm wide, oblong-ovate, glabrous; style essentially lacking; seeds 10–20; $n = 8$. Alpine tundra in Uinta and La Sal mts. above 3100 m in Daggett (?), Grand, San Juan, and Uintah (?) counties; Alaska to Mackenzie south to Colorado; 4 (0). Our material is difficult to interpret from the dwarf alpine specimens of *D. stenoloba* (q.v.), but apparently the white petals are diagnostic.

Draba incerta Payson [*D. laevicapsula* Payson; *D. incerta* var. *laevicapsula* (Payson) Payson & St. John]. Perennial, caespitose but loosely so, 2–15 (20) cm tall;

stems pubescent with stellate or dendritic and sometimes simple hairs; basal leaves 5–18 (25) mm long, 1–3 mm wide, narrowly oblanceolate, surfaces with at least some doubly pectinate hairs, often intermixed with other types of pubescence, ciliate with simple to pectinately branched hairs; cauline leaves 1 or lacking; racemes 5– to many-flowered, elongating in fruit; pedicels 2–12 mm long, ascending, usually hairy; sepals 2.5–3.5 mm long, greenish or suffused with purple, pubescent; petals 4–5.5 mm long, yellow but fading cream, cuneate-obovate, broadly emarginate; silicles 6–10 mm long, 2.5–3.5 mm wide, ovate to lanceolate, plane, pubescent or glabrous; seeds 8–14. Ridge crests and talus at ca 2980 to 3050 m in the Raft River and northern Wasatch mts., Box Elder and Cache counties; Alaska and Yukon south to Washington and Wyoming; 2 (0).

Draba kassii Welsh Kass Rockcress. Perennial, caespitose, from a definite, branching, subligneous caudex, this clothed with persistent, filiform, threadlike, leaf bases; stems 2–13 cm tall, glabrous or sparingly hirsute with mixed simple and forked to dendritic hairs; leaves all basal, rarely with 1 cauline, 1.8–4.8 cm long, 2–6 mm wide, narrowly oblanceolate to spatulate, entire or obscurely and sparingly denticulate, green, the surfaces glabrous or pubescent with forked hairs, sparingly ciliate with simple or forked hairs; racemes simple, 2– to 9-flowered, elongating in fruit; pedicels 2–10 (15) mm long, ascending, glabrous; sepals 1.5–2.4 mm long, greenish, sparingly hairy, with simple or forked hairs; petals 4.6–5.9 mm long, yellow, obovate-spatulate, rounded; silicles 3–10 (14) mm long, 0.8–2.5 mm wide, elliptic to oblong, glabrous; style 1–2 mm long; seeds 2–14. Pinyon-juniper, white fir, and mountain brush communities, mainly in crevices in granite, at 2135 to 2440 m in the Deep Creek Mts., Tooele County; endemic; 3 (0).

Draba lanceolata Royle [*D. cana* Rydb.; *D. valida* Goodding, type from Uintah County]. Perennial, loosely caespitose; caudex simple or branched, the stems 0.5–3.5 dm tall, pubescent throughout with soft many-branched hairs; basal leaves 0.5–4 cm long, 1–4 mm wide, oblanceolate, entire, pubescence of overlapping, stellate or branched hairs; cauline leaves several, commonly toothed; racemes several- to many-flowered, sometimes with solitary flowers in upper leaf axils; pedicels 2–9 mm long, erect, usually appressed to rachis, pubescent; sepals 1.5–2 mm long, sparsely pilose; petals 2.2–4 mm long, white, cuneate-obovate, more or less emarginate; silicles 5–12 mm long, 1.5–2.5 mm wide, narrowly lanceolate to oblong, plane or contorted, softly pubescent, rarely glabrous; style 0.2–0.8 mm long; seeds 20 or more; $2n = 32$. Spruce-fir and alpine tundra communities, often in talus or rock stripes, at 3200 to 3910 m in Daggett, Duchesne, Juab, Piute, Salt Lake, Summit, Uintah, and Utah counties; Alaska and Yukon, south to Nevada and Colorado; 12 (0).

Draba lonchocarpa Rydb. Perennial, loosely to densely caespitose; caudex usually branched, scapose or rarely with one cauline leaf, the scape 1–12 cm tall, glabrous or pubescent with soft many-branched hairs; leaves 5–15 mm long, 1–4 mm wide, pubescent with usually overlapping or stellate (or rarely some simple) hairs, ciliate with stellate (or with some simple) hairs; racemes 3– to 12-flowered, contracted or elongating in fruit; pedicels 1–6 (11) mm long, ascending to erect,

glabrous; sepals 1.5–2 mm long, glabrous or pubescent; petals 2.5–4 mm long, white; silicles 5–14 mm long, 1–2 mm wide, linear to lance-linear or oblong, plane or twisted, glabrous or pubescent; style 0.2–0.5 mm long; seeds 8–30; $n = 8$. Spruce-fir and alpine tundra, often in talus or rock stripes, at 3050 to 3910 m in Box Elder, Daggett, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Summit, Uintah, and Utah counties; Alaska and Yukon south to Oregon and Colorado; 22 (ii). Our material has been treated as portions of an expanded *D. nivalis* Lilj., from which it differs in technical features of pubescence and silicle characteristics. Two sympatric variants have been designated among the Utah material.

1. Silicles mostly less than 7 mm long, elliptic to linear . . .
 *D. lonchocarpa* var. *exigua*
- Silicles mostly more than 10 mm long, linear to narrowly elliptic *D. lonchocarpa* var. *lonchocarpa*

Var. *exigua* Schulz [*D. nivalis* var. *exigua* (Schulz) C. L. Hitchc.]. Alpine tundra in Uinta and La Sal mts., Duchesne, Grand, and Summit counties; Wyoming and Colorado.

Var. *lonchocarpa* [*D. nivalis* var. *elongata* Wats.; *D. lonchocarpa* var. *dasycarpa* Schulz; *D. lonchocarpa* var. *vestita* Schulz; *D. lonchocarpa* var. *semitonsa* St. John]. Alpine sites from 3050 to 3900 m elevation in the Wasatch, Uinta, and La Sal mts. of Cache, Duchesne, Grand, Salt Lake, San Juan, and Summit counties; Alaska south to Oregon and Wyoming.

Draba maguirei C. L. Hitchc. Maguire Draba. [*D. maguirei* var. *burkei* C. L. Hitchc., type from Wellsville Mts., Box Elder County]. Perennial, caespitose, with substoloniferous branches, scapose; scapes 2–20 cm tall, glabrous or with a few forked hairs near base; leaves 3–15 mm long, 1–4 mm wide, oblong-oblancheolate to obovate-oblancheolate, the surfaces glabrous or nearly so, ciliate with simple, forked, or 4-rayed, shortly stalked hairs; racemes few- to several-flowered, elongating in fruit; pedicels 2–10 (15) mm long, ascending, glabrous; sepals 2–3 mm long, yellowish, glabrous; petals 4.5–6 mm long, yellowish, spatulate, rounded; fruit 4–9 mm long, 2–3.5 mm wide, ovate to lanceolate, oblique, glabrous or scaberulous; style 1–1.5 mm long; seeds 2–8. Talus slopes and rocky outcrops in Douglas fir and mixed conifer communities at 1830 to 2930 m in Box Elder, Cache (type from Mt. Naomi), and Weber counties; endemic; 5 (0).

Draba nemorosa L. Woods Draba. [*D. dictyota* Greene]. Annual, from a slender taproot; stems simple or branched, 0.5–2.5 dm tall, pubescent with mixed forked and stellate hairs, or less commonly with some simple ones, or even glabrate; leaves 3–30 mm long, 2–8 mm wide, oblanceolate to lanceolate, ovate or oblong, entire or toothed, pubescent with branched or simple hairs; racemes few- to many-flowered, much elongating in fruit; pedicels 5–26 mm long, spreading-ascending, glabrous; sepals 1–1.5 mm long, green to yellowish or suffused purple, pilose to glabrous; petals 1.2–4 mm long, yellow to white; silicles 4–10 mm long, 1.5–3 mm wide, oblong to oblanceolate or elliptic, plane, glabrous; style obsolete; seeds 25 or more; $n = 8$. Bunchgrass, sagebrush, mountain brush, ponderosa pine, and white fir communities, mainly in exposed, disturbed sites, at 1280 to 2475 m elevation in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Grand, Juab, Millard, Morgan, Salt Lake,

Summit, Uintah, Utah, and Weber counties; common throughout much of North America and Eurasia; 33 (iii).

Draba oligosperma Hook. Doublecomb Draba. Perennial, caespitose, the caudex much branched, scapose, the scapes 1–10 cm tall, pubescent throughout with pectinate or stellate hairs or glabrous, at least below; leaves 3–12 mm long, 1–2 mm wide, linear to spatulate or oblong, surfaces (one or both) pubescent with sessile, appressed, doubly pectinate hairs, commonly ciliate with at least some pectinately branched hairs; racemes 2– to 15-flowered, only moderately elongating in fruit; pedicels 1–10 mm long, ascending, glabrous or pubescent; sepals 1.5–2.5 mm long, yellowish, pubescent; petals 3–5 mm long, yellow or white, obovate, rounded to emarginate; silicles 3–8 mm long, 2–4 mm wide, ovate to oval or oblong, plane, glabrous to pubescent; style 0.1–1.2 mm long; seeds 2–10. Two rather weakly separable but geographically correlated varieties are present.

1. Petals yellow; pubescence of silicles, when present, of simple or forked hairs only; plants widespread
 *D. oligosperma* var. *oligosperma*
- Petals evidently white; pubescence of silicles at least in part of doubly pectinate hairs; plants of Daggett and Uintah counties *D. oligosperma* var. *juniperina*

Var. *juniperina* (Dorn) Welsh [*D. juniperina* Dorn; *D. oligosperma* var. *pectinipila* authors, not *D. pectinipila* Rollins]. Pinyon-juniper, sagebrush, mountain brush, ponderosa pine, and Douglas fir communities at 1920 to 3205 m in Daggett and Uintah counties; Wyoming; a Bridger Basin—Uinta Mt. endemic; 17 (v).

Var. *oligosperma* [*D. oligosperma* var. *andina* (Nutt.) ex T. & G.; *D. andina* (Nutt.) A. Nels.; *D. saximontana* A. Nels.; *D. oligosperma* var. *microcarpa* Blank.; *D. oligosperma* var. *saximontana* (A. Nels.) Schulz; *D. oligosperma* var. *leiocarpa* Schulz]. Sagebrush, white fir, spruce-fir, and alpine tundra communities at 2135 to 3815 m in Box Elder, Cache, Daggett, Duchesne, Juab, Rich, Salt Lake, Sanpete, Summit, and Utah counties; British Columbia and Alberta south to California, Nevada, and Colorado; 25 (iii).

Draba rectifruca C. L. Hitchc. Mountain Draba. [*D. montana* Wats., not Bergeret]. Annual, from a slender taproot, the stems simple or branched, 1–22 cm tall, pubescent throughout, although sparsely so above, in some with branched and/or simple hairs; leaves 5–30 mm long, 1–7 mm wide, lanceolate to oblanceolate, entire, pubescent with branched and simple hairs intermixed; racemes several- to many-flowered, much elongating in fruit; pedicels 2–6 mm long, spreading to curved-ascending, pubescent; sepals 1.2–1.7 mm long, greenish, pubescent; petals 2–4 mm long, yellow, narrowly spatulate, usually emarginate; silicles (4) 6–10 mm long, 2–2.5 mm wide, obliquely oblong, pubescent; style obsolete; seeds 40 or more. Sagebrush, ponderosa pine, aspen, lodgepole pine, spruce-fir, and alpine meadow communities at 2135 to 3205 m in Carbon, Duchesne, Garfield, Grand, Juab, Piute, Salt Lake, Salt Lake, Sevier, Summit, and Wasatch counties; Colorado, New Mexico, and Arizona; 21 (ii).

Draba reptans (Lam.) Fern. Dwarf Draba. Annual, from a slender taproot, 2–10 (20) cm tall, with the very short leafy stem simple or sometimes branched, pubescent with simple to stellate hairs below, glabrous

above; basal leaves 3–18 mm long, 1–10 mm wide, spatulate to ovate or obovate, usually entire, the surfaces pubescent with branched or forked hairs or upper surface with simple hairs only; cauline leaves few, usually reduced, pubescent like basal ones, or upper surface with simple hairs; racemes (1) several- to many-flowered, compact in fruit; pedicels 1–6 mm long, ascending, glabrous; sepals 1.5–2.5 mm long, greenish or yellowish, usually pubescent; petals 3–5 mm long, white, ovate, rounded, sometimes smaller or lacking in cleistogamous flowers; silicles 5–20 mm long, 1–2 mm wide, oblong, nearly erect, pubescent or glabrous; style up to 0.15 mm long; seeds 15 or more. Shadscale, other salt desert shrub, bunchgrass, sagebrush, mountain brush, and pinyon-juniper communities at 1280 to 2200 m in Beaver, Box Elder, Cache, Daggett, Grand, Millard, Salt Lake, San Juan, Tooele, Uintah, Utah, and Washington counties; widespread in the U. S.; 29 (ii). Two completely confluent and sympatric varieties have been recognized; those with leaves predominantly forked or branched are var. *reptans* [*Arabis reptans* Lam.; *D. caroliniana* Walter; *D. micrantha* Nutt. ex T. & G.; *D. coloradoensis* Rydb.; *D. reptans* var. *micrantha* (Nutt.) Fern.], and those with leaf hairs predominantly forked or branched are var. *stellifera* (Schulz) C. L. Hitchc. [*D. caroliniana* f. *stellifera* Schulz; *D. caroliniana* ssp. *stellifera* (Schulz) Payson & St. John]. They do not seem to represent taxa. *Draba reptans* is similar to and not always distinct from *D. cuneifolia* (q.v.).

Draba sobolifera Rydb. Creeping Draba. [*D. uncinialis* Rydb., type from Tate Mine, Tushar Mts., Piute County]. *D. sobolifera* var. *uncinialis* (Rydb.) Schulz; *D. ramulosa* Rollins, type from Mt. Belknap]. Perennial, caespitose, the caudex with elongate, soboliferous branches, scapose or with some leaves; scapes 1–8 cm tall, pubescent with intermixed stellate, branched, and simple hairs; leaves 5–20 mm long, 2–5 mm wide, obovate to oblanceolate, pubescent with stalked stellate or 4-rayed hairs at least beneath, and usually ciliate with simple hairs at base; racemes (2) 5- to 20-flowered, compact to elongating in fruit; pedicels 3–8 mm long, stellate or with branched hairs; sepals 1.8–2.5 (3) mm long; petals 4–5 mm long, yellow, obovate; silicles 3–8 mm long, 2.5–4 mm wide, ovate to elliptic, pubescent to glabrous; style 0.4–1 mm long; seeds 4–12. Alpine tundra and spruce-fir communities at 3050 to 3695 m in the Tushar Mts., Beaver and Piute counties; endemic; 14 (vi). The types of both *D. sobolifera* and *D. uncinialis* were collected by M. E. Jones in the Delano Peak (Tate Mine) area west of Marysville, Piute County. It is remarkable that three names are based on specimens from the Tushar Mts. The species is allied to *D. ventosa* Gray, q.v.

Draba spectabilis Greene Splendid Draba. [*D. spectabilis* var. *glabrescens* Schulz, type from the La Sal Mts.]. Perennial, not caespitose, the caudex branched; stems mostly 1–4 dm tall, usually simple, pubescent with simple or forked hairs; basal leaves (0.5) 1–4 cm long, 2–10 mm wide, obovate to spatulate, subtentire to denticulate, green, surfaces with subsessile 4-rayed or forked hairs, infrequently with the upper surface glabrous; cauline leaves mostly 3–15, ovate to lanceolate, subtentire to sharply toothed, 5–20 mm long, 2–15 mm wide, pubescent like basal ones; racemes several- to many-flowered, much elongating in fruit; pedicels 5–15 mm long or more, ascending, glabrous or hairy; sepals 2–3.5 mm

long, yellowish, pubescent; petals 4.5–7 mm long, yellow but fading white, elliptic, rounded; silicles 5–14 mm long, 2–3 mm wide, lanceolate to ovate, plane, glabrous or pubescent; style 0.8–2.5 mm long; seeds 10–20. Mountain brush, white fir, ponderosa pine, spruce-fir, and alpine tundra communities at 3050 to 3660 m in the La Sal and Abajo mts., Grand and San Juan counties; Colorado, New Mexico, Arizona; 13 (0). Our material is assignable to var. *spectabilis*.

Draba stenoloba Ledeb. Alaska Draba. [*D. nemorosa* var. *stenoloba* (Ledeb.) Jones; *D. nitida* Greene; *D. deflexa* Greene; *D. nitida* var. *nana* Schulz; *D. nitida* var. *praelonga* Schulz]. Plants (annual?) biennial or short-lived perennial, from a taproot, the caudex more or less developed; stems 3–25 cm tall, glabrous or sometimes hirsute below; basal leaves 0.3–4 cm long, 2–8 mm wide, entire to denticulate, pubescent with simple to forked or branched hairs, or with one or both surfaces glabrous on some leaves; cauline leaves (0) 1–8, ovate to lanceolate or elliptic, entire or denticulate, similar to the basal ones in all respects; racemes several- to many-flowered, elongating in fruit; pedicels 1–14 mm long, ascending, glabrous; sepals 1–2.2 mm long, greenish, glabrous; petals 2–4.5 mm long, yellow to cream or fading white, spatulate, rounded to emarginate; fruit 6–18 mm long, 1.5–2.2 mm wide, linear to oblong or elliptic, usually glabrous; style up to 0.2 mm long; seeds 16 or more; $n = 20$. Aspen, lodgepole pine, spruce-fir, grass-forb, and alpine tundra communities at 1830 to 3510 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Wayne counties; Alaska and Yukon south to California, Nevada, and Colorado; 77 (xv).

Draba subalpina Goodman & Hitchc. Breaks Draba. [*D. oriebata* authors, not Macbr. & Payson]. Perennial, caespitose, the caudex simple or branched, clothed with marcescent leaves, scapose; scapes 1–12 cm tall, rarely with one cauline leaf, glabrous throughout or pubescent with simple or forked hairs at least near base; leaves 3–18 mm long, 1–4 mm wide, oblong to spatulate, surfaces glabrous or sparingly hirsute, ciliate with coarse simple or less commonly forked or branched hairs; racemes few- to many-flowered, only moderately elongating in fruit; pedicels (1) 2–10 mm long, usually purplish, glabrous; petals 4–5 mm long, white, cuneate-spatulate, emarginate; silicles 3–8 mm long, 2–4 mm wide, ovate to elliptic, plane or more or less contorted, glabrous; style 0.6–1 mm long; seeds 6–12. Ponderosa pine, pinyon-juniper, Douglas fir, bristlecone pine, and spruce-fir communities, on the Pink and White Limestone members of the Wasatch Formation, from 2130 to 3295 m in Garfield, Iron (type from Cedar Breaks), Kane, and Millard counties; endemic; 42 (vi).

Draba ventosa Gray Tundra Draba. Perennial, caespitose, the caudex usually branched, more or less clothed with marcescent leaves, scapose; scapes 2–6 cm tall, pubescent with simple and forked or sometimes stellate hairs; leaves 5–12 mm long, 2–4 mm wide, elliptic to lanceolate, surfaces pubescent with simple, forked, or branched to stellate hairs; racemes 3- to many-flowered, little elongating in fruit; pedicels mostly 4–8 mm long, ascending, densely pilose to stellate; sepals 2–2.5 mm long, greenish or yellowish, pilose; petals 4–5 mm long, yellow, obovate; silicles 5–8 mm long, 3.5–5.5 mm wide,

oval to ovate, plane, densely hairy; style 0.6–1.2 mm long; seeds 10–16. Alpine tundra and talus at 3050 to 3800 m in the Uinta Mts., Duchesne and Summit counties; Wyoming; 2 (0). Utah plants are assignable to var. *ventosa*.

Draba verna L. Spring Draba. Diminutive annual from a slender taproot, scapose; scapes 2–5 (12) cm tall, glabrous throughout or pubescent near the base only; leaves 3–10 (20) mm long, 0.8–3 mm wide, spatulate to oblanceolate, entire or toothed, pubescent with branched hairs; racemes few- to many-flowered, elongating in fruit; pedicels 2–12 mm long, ascending, glabrous; sepals 0.6–1.1 mm long, greenish or tinged purplish, glabrous or pubescent; petals 1.5–2.5 mm long, white, deeply bilobed; silicles 2–10 mm long, 1–4 mm wide, elliptic to obovate, glabrous; style up to 0.2 mm long; n = 7, 12, 15, 16, 17, 18, 19, 20, 26, 27, 28, 29, 30, 31, 32, 47. Dry open, commonly disturbed, sites at 1375 to 2440 m in Cache, Davis, Duchesne, Juab, Rich, Salt Lake, Utah, Wasatch, and Weber counties; widespread in North America; Asia; 15 (0). Our material cannot be segregated into the two variants reported for North America.

Erysimum L.

Plants pubescent with 2- or 3 (4)-rayed hairs, annual to perennial, from taproots; leaves alternate or basal and still alternate, simple, entire to toothed, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, yellow to orange or burnt-orange to purple; stamens 6, the filaments lacking glandular processes; style prominent, short to elongate; stigma bilobed; fruit a silique, many times longer than broad, compressed parallel to the partition or subterete; valves 1- to several-nerved; seeds uniseriate, many per locule.

Roszbach, G. B. 1958. The genus *Erysimum* (Cruciferae) in North America north of Mexico—A key to species and varieties. Madrono 14: 261–267.

- 1. Petals (10) 12–20 mm long or more; style mostly 1.5–3 mm long; plants biennial or perennial, widespread in indigenous plant communities *E. asperum*
- Petals 3.5–11 mm long; style usually less than 1.5 mm long (longer in *E. repandum*); plants annual or biennial to short-lived perennial, restricted and weedy sites or less commonly in indigenous plant communities 2
- 2(1). Petals 3.5–5 mm long; siliques 12–27 mm long, plants uncommon, annual weeds of moist sites *E. cheiranthoides*
- Petals mostly 5–11 mm long; siliques (15) 25–100 mm long; plants common, annual, biennial or perennial, of various habitats 3
- 3(2). Pedicels usually more than 5 mm long, more slender than fruit; siliques ascending to erect, less than 50 mm long; plants indigenous biennial or short-lived perennial *E. inconspicuum*
- Pedicels 2–5 mm long, almost or quite as thick as fruit; siliques spreading to curved-ascending, at least some often more than 50 mm long; plants adventive, annual weeds *E. repandum*

Erysimum asperum (Nutt.) DC. Wallflower; Pretty Wallflower. [*Cheiranthus asper* Nutt.; *Cheirinia brachycarpa* Rydb., type from the Abajo Mts.; *Cheiranthus capitatus* Dougl. ex Hook.; *E. elatum* Nutt. ex T. & G.; *E. capitatum* (Dougl.) Greene; *C. clatus* (Nutt.) Greene; *C. asperrimus* Greene; *C. argillosus* Rydb.; *C. bakeri*

Greene; *Cheirinia elata* (Nutt.) Rydb.; *E. asperrimum* (Greene) Rydb.; *E. oblanceolatum* Rydb.; *E. bakeri* (Greene) Rydb.; *E. aridum* A. Nels.; *E. capitatum* var. *argillosum* (Greene) R. J. Davis; *E. asperum* var. *purshii* Durand, type from near Great Salt Lake; *E. asperum* var. *amoenum* (Greene) Reveal; *Cheiranthus nivalis* var. *amoenus* Greene; *Cheirinia amoena* (Greene) Rydb.; *E. wheeleri* Rothr.; *Cheirinia wheeleri* (Rothr.) Rydb.]. Biennial or short-lived perennial, with simple or less commonly branched caudex; stems 1.2–8.5 (10) dm tall or more; basal leaves 2–10 (12) cm long, 2–14 mm wide, sublinear to elliptic or spatulate, entire or denticulate, grayish to green, pubescent with malpighian or Y-shaped appressed hairs; cauline leaves 1.1–10.4 cm long, 1–15 mm wide, much reduced to little if at all reduced upward, variously shaped, entire or toothed, pubescent like basal ones; racemes much elongating in fruit; pedicels 3–17 mm long, spreading-ascending to ascending, usually more slender than the fruit; sepals 7.5–14 mm long, yellowish or purplish; petals 12–28 mm long, yellow to yellow orange or burnt-orange; siliques (1.7) 2–11.5 cm long, 1–2.5 mm thick, subquadrangular to somewhat flattened, ascending to erect or less commonly spreading-ascending; style 1–4 (5) mm long; seeds wingless or winged only near tip, 1.5–2.3 mm long; n = 18. Warm desert shrub, cool desert shrub, mountain brush, pinyon-juniper, ponderosa pine, aspen, Douglas fir, and spruce-fir to alpine tundra communities, at 760 to 3800 m throughout Utah; Yukon Territory south to California and Arizona, and eastward to Oklahoma, Kansas, and Minnesota; 295 (xxxvii). This pretty wallflower demonstrates greater ecological latitude than any other Utah plant. Our tremendously variable material does not lend itself to infraspecific segregation.

Erysimum cheiranthoides L. Treacle. [*Cheirinia cheiranthoides* (L.) Link; *Cheiranthus cheiranthoides* (L.) Heller]. Annual, with stems simple or branched, 2–12 dm tall; leaves 2–8 cm long, 2–15 mm wide, linear to oblong, lanceolate, or oblanceolate, entire or denticulate, green, pubescent with malpighian or Y-shaped hairs; racemes much elongating in fruit; pedicels 4–15 mm long, spreading-ascending, very slender; sepals 2–3 mm long, yellowish or greenish; petals 3–6 mm long, pale yellow; siliques 12–27 mm long, ca 1 mm wide, subterete, ascending to erect; style 0.8–1 mm long; seeds 1–1.2 mm long, not winged; n = 8. Moist places, in meadows and along roadsides, mainly in sagebrush, grass, aspen, and spruce-fir communities, at 1430 to 2625 m in Cache, Davis, Duchesne, Juab, Rich, Salt Lake, Utah, Wasatch, and Weber counties; widespread in North America; adventive from Eurasia; 8 (0).

Erysimum inconspicuum (Wats.) MacMillan Lesser Wallflower. [*E. asperum* var. *inconspicuum* Wats.; *E. parviflorum* Nutt. ex T. & G., not Pers.; *E. syrticum* Sheldon; *Cheiranthus inconspicuum* (Wats.) Greene; *Cheirinia inconspicua* (Wats.) Rydb.; *C. syrticola* (Sheldon) Rydb.]. Biennial or short-lived perennial with usually unbranched caudex; stems mostly 2–10 dm tall, usually simple; leaves 1.5–8 cm long, 2–8 cm wide, linear to oblong, elliptic, lanceolate or oblanceolate, pubescent with malpighian or Y-shaped hairs; racemes elongating in fruit; pedicels 3–8 mm long, ascending; sepals 4–7 mm long, greenish or purplish; petals (6) 7–10 (11) mm long, pale to bright yellow; siliques 15–50 mm long, 1–2 mm thick, quadrangular, erect or ascending; style 1–1.5 mm

long; seeds ca 1.5 mm long, not winged; $n = 8$. Sagebrush, aspen, and spruce-fir communities at 1370 to 2745 in Duchesne, Garfield, Sevier, Summit, Tooele, and Wasatch counties; Alaska and Yukon south to Oregon, and Colorado, and east to central Canada and the north-central U. S.; 20 (0). This species resembles *E. asperum* in general habit, but is more restricted in its distribution in Utah.

Erysimum repandum L. Spreading Wallflower. [*Cheirimia repanda* (L.) Link]. Annual; stems 0.8–3 (5) dm tall, simple to much-branched; leaves 0.7–11 (15) cm long, 1–8 (12) mm wide, oblong, oblanceolate to linear, pubescent with malpighian and Y-shaped hairs; pedicels 2–5 mm long, spreading, almost or quite as thick as the fruit; sepals 3.5–5.8 mm long, yellowish or greenish; petals 5.2–8 mm long, yellow; siliques 26–85 mm long, 0.9–1.5 mm thick, quadrangular, spreading to ascending, rarely descending; style 1–3 mm long; seeds ca 1 mm long, not winged; $n = 8$. Disturbed sites, mainly in bunchgrass, sagebrush, and pinyon-juniper communities, at 1310 to 2075 m in Beaver, Cache, Davis, Grand, Juab, Millard, Salt Lake, Sanpete, Sevier, Summit, Utah, and Washington counties; widespread in North America; adventive from Europe; 32 (v).

Euclidium R. Br.

Plants pubescent with forked hairs, annual, from taproots; leaves alternate, simple, entire to remotely serrulate, petiolate to subsessile, not auriculate; flowers solitary and axillary or subaxillary, or borne in elongate racemes; pedicels sometimes subtended by bracts; sepals 4, caducous; petals 4, white, minute; stamens 6; style very short atop beak of fruit, the stigma bilobed; fruit a silicle, bilocular, tardily dehiscent; seed 1 per locule.

Euclidium syriacum (L.) R. Br. Syria-weed. [*Anastatica syriaca* L.]. Plants 0.4–5 dm tall, simple to much-branched, pubescent with forked hairs; leaves mainly cauline, 0.7–6.5 cm long, 2–17 mm wide, oblanceolate to elliptic or lanceolate, pubescent; pedicels 0.5–1 mm long, ascending to erect, pubescent; sepals 0.7–0.9 mm long, tinged with purple; petals 0.8–1.1 mm long, white, spatulate, erect; silicles (including beak) 2.8–4 mm long, the body 1.2–2 mm wide, pubescent with simple or forked hairs, beak 1.2–1.5 mm long; style short or obsolete; $n = 7$. Roadsides, vacant lots, and dry foothills in Box Elder, Cache, Juab, Millard, Salt Lake, Sanpete, Summit, and Utah counties; Idaho, Washington; adventive from Europe; 14 (iii).

Halimolobos Tausch

Plants pubescent with simple, forked, and branched hairs, (annual) biennial or perennial, arising from a taproot; leaves alternate or basal and still alternate, simple, dentate to subentire, tapering basally or the cauline sessile and auriculate; flowers in ebracteate racemes; pedicels ascending; sepals 4; petals 4, white; stamens 6; style prominent; stigma small, entire; fruit a sessile, slender silique, many times longer than broad, terete to quadrangular, the valves strongly 1-nerved; seeds biseriata, numerous.

Rollins, R. C. 1943. Generic revisions in the Cruciferae: *Halimolobos*. Contr. Dudley Herb. 2: 241–265.

Rollins, R. C. 1952. A note on *Halimolobos*. *Rhodora* 54: 161–163.

Halimolobos virgata (Nutt.) Schulz Strietweed. [*Sisymbrium virgatum* Nutt. ex T. & G.; *Hesperis virgata*

(Nutt.) Kuntze; *Stenophragma virgatum* (Nutt.) Greene; *Arabis brebneriana* A. Nels.; *Pilosella virgata* (Nutt.) Rydb.; *P. stenocarpa* Rydb.; *Arabidopsis virgata* (Nutt.) Rydb.; *Arabidopsis stenocarpa* (Rydb.) Rydb.]. Biennial but occasionally flowering the first year; stems 1–3.5 dm tall, simple or branched, pubescent with mixed simple, forked, and branched hairs at least below; basal leaves 3–6 cm long, 5–18 mm wide, oblanceolate to lanceolate, denticulate to dentate, rarely entire; cauline leaves several, reduced upwardly, at least the uppermost both sessile and auriculate; pedicels 7–11 mm long, ascending, glabrous or puberulent; sepals 2.5–3 mm long, greenish, pubescent; petals 4–4.5 mm long, white, the veins often suffused with pink or purple, usually erect; siliques 15–40 mm long, mostly 1–1.5 mm wide, subquadrangular, erect; valves glabrous, strongly nerved; style 0.2–0.5 mm long; seeds irregularly biseriata. Sagebrush, meadows, and aspen communities at 2135 to 2745 m in Daggett, Millard, Wasatch, and Weber (?) counties; Colorado, Nevada, Wyoming, Idaho, and northward to Alberta and Saskatchewan; 4 (0). The number of generic segregates listed above are an indication of the difficulties involved in placing this unusual species in a genus. It simulates an *Arabis*, from which it is outwardly separable only with difficulty, but on technical grounds the plant is probably more closely allied to *Sisymbrium* in a broad sense. Our Utah material, and that from southwestern Wyoming, differs slightly from that found elsewhere and may deserve varietal recognition.

Hesperis L.

Plants pubescent with simple and forked hairs, perennial, from taproots; leaves alternate, simple, mainly cauline, petiolate to subsessile, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, pink to lavender or white; stamens 6, the filaments lacking glandular processes; style obsolete; stigma bilobed, massive; fruit a silique, many times longer than broad, subterete, tardily dehiscent; valves 1 (3)–nerved; seeds uniseriate.

Hesperis matronalis L. Dame's Violet; Sweet Rocket. Herbs with one to several stems, these simple or branched, mostly 5–12 dm tall or more, pubescent with mixed forked and simple hairs; leaves 2–15 (20) cm long, 0.6–3.5 (4) cm wide, ovate-lanceolate to elliptic or lanceolate, sinuate-dentate to serrate, pubescent; pedicels 8–21 mm long, ascending to spreading, pubescent; sepals 6.5–8 mm long, often suffused with red or purple, pubescent; petals 15–25 mm long, pink to lavender or white, obovate, spreading; siliques 3–10 cm long, 1–2 mm wide, subterete, erect or ascending, puberulent; style obsolete; stigma deeply bilobed; seeds numerous in each locule; $2n = 7, 12, 14$. Cultivated ornamental, persisting and escaping, now widely established in cultivated lands especially along irrigation canals at 1370 to 1895 m in Cache, Uintah, Utah, and Summit counties; introduced from Europe; 4 (i).

Hutchinsia R. Br.

Glabrous, annual or winter annual, from taproots; leaves alternate, simple, not auriculate; flowers borne in ebracteate racemes; sepals 4, deciduous; petals 4, white; stamens 6, the filaments lacking glandular processes; style obsolete or very short; stigma capitate, entire; fruit a silicle, only somewhat longer than broad, strongly compressed at right angles to septum; valves reticulately veined; seeds several.

Hutchinsia procumbens (L.) Desv. Slenderweed. [*Lepidium procumbens* L.; *Hymenolobus divaricatus* Nutt. ex T. & G.; *Hymenolobus erectus* Nutt. ex T. & G.]. Slender, diminutive annuals; stems glabrous, simple or more commonly branched, 0.5–3 dm long, erect or prostrate; leaves basal and cauline, 0.5–3 cm long, 1–13 mm wide, ovate to lanceolate, oblanceolate, or nearly linear, entire to pinnatifid, petiolate to sessile; pedicels 3–8 mm long, ascending to spreading-ascending, glabrous; sepals 0.7–1.1 mm long, greenish or purplish, glabrous; petals 0.8–1.3 mm long, white, spatulate, rounded to retuse; silicles 2.4–4.2 mm long, 1.5–2 mm wide, elliptic to obovate, truncate, rounded, or somewhat emarginate, glabrous; style to 0.2 mm long; seeds several per locule; n = 6, 12. Moist to dry sites, hanging gardens, drainage banks, sidewalks, roadsides, seeps, playas, and peat bogs from 850 to 2135 m in Beaver, Box Elder, Cache, Daggett, Davis, Garfield, Kane, Millard, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Washington, and Weber counties; widely distributed in North America; Eurasia; 30 (iii).

Isatis L.

Plants pubescent with long simple hairs at least below, biennial or short-lived perennial, from strong taproots; leaves simple, alternate, the basal petiolate, the cauline hastately-auriculate; flowers racemose or paniculate; pedicels not subtended by bracts; sepals 4, deciduous; petals 4, yellow; stamens 6, the filaments lacking glandular processes; style obsolete, bilobed; stigma sessile; fruit a silicle, samaroid, indehiscent, flattened at right angles to the plane of the partition (which is lacking), more or less reticulate; seed solitary.

Isatis tinctoria L. Dyer's Woad. Stems erect, 3.5–10 dm tall or more, glabrous throughout or hirsute with long simple hairs at base; basal leaves 3.5–15 (18) cm long, 0.8–4 cm wide, oblanceolate to elliptic, subentire to crenulate, ciliate to pilose with simple hairs; cauline leaves gradually reduced upwards, lanceolate to elliptic, entire, hastately-auriculate, glabrous or pilose on veins beneath and often ciliate; pedicels 4.5–9 mm long, reflexed, glabrous; sepals 1.8–2.3 mm long, yellowish, glabrous; petals 3–4.2 mm long, yellow, spatulate, rounded; silicles mostly 10–18 mm long, 4–7 mm wide, cuneate-oblong to oblanceolate, more or less truncate-rounded apically, glabrous; stigmas sessile; n = 13, 14. Roadsides, abandoned fields, and dry foothills in bunchgrass, sagebrush, and mountain brush communities, at 1310 to 2135 m in Box Elder, Cache, Daggett, Davis, Duchesne, Juab, Millard, Morgan, Salt Lake, Sanpete, Summit, Uintah, Utah, and Weber counties; widely established in the U. S.; adventive from Europe; 26 (ii). This plant is the source of a blue dye and was widely cultivated in the recent past. It seems to be spreading outwardly from its initial points of establishment in Box Elder County, where it has been established as a weed since at least 1947.

Lepidium L.

Plants glabrous or with simple hairs, annual, biennial or perennial, from taproots; leaves alternate or basal and still alternate, simple, entire or variously toothed or bi- or tripinnatifid, petiolate or sessile, auriculate in some; flowers in ebracteate racemes; sepals 4, caducous or persistent; petals 4, yellow or white, infrequently lacking; sta-

mens 6, rarely 2 or 4, the filaments lacking glandular processes; style obsolete or well developed; stigma capitate; fruit a silicle, usually less than twice longer than broad, compressed at right angles to septum, dehiscent; valves more or less reticulately veined; seeds 1 per locule. (Note: Measurement of silicle length includes the style.)

Hitchcock, C. L. 1936. The genus *Lepidium* in the United States. Madrono 3: 265–320.

- 1. Cauline leaves perfoliate-clasping or auriculate 2
- Cauline leaves petiolate to sessile but not auriculate or clasping 3
- 2(1). Petals 2–2.5 mm long, white; cauline leaves lanceolate to lance-oblong, merely auriculate *L. campestre*
- Petals 1–2 mm long, yellow; cauline leaves oval to ovate, pseudoperfoliate *L. perfoliatum*
- 3(1). Plants arising from thickened, well-developed caudices; leaves all entire; stems seldom more than 2.5 dm tall; plants rare, south-central to northern Utah 4
- Plants from root crowns, or from simple or branched caudices, these seldom thickened; leaves entire, toothed or pinnatifid; stems short to long; plants widespread 5
- 4(3). Leaves linear; petals more than 3 mm long; plants of xeric shales, known only from Duchesne County *L. barnebyanum*
- Leaves oblanceolate to elliptic; petals less than 3 mm long; plants of moist meadows from Beaver County northward but not of Duchesne County *L. integrifolium*
- 5(3). Plants 0.8–1.5 m tall or more; leaves entire or merely crenate-serrate; silicles 1.5–2 mm long; known mainly from riparian and palustine habitats *L. latifolium*
- Plants mainly less than 0.8 m tall, or if taller, the leaves typically pinnately lobed to pinnatifid; silicles mainly more than 2 mm long; plants of various habitats, sometimes riparian or palustrine 6
- 6(5). Styles 0.3–1 mm long; plants perennial or biennial 7
- Styles obsolete or only up to 0.3 mm long; plants annual, rarely if ever biennial 9
- 7(6). Plants pulvinate-caespitose, 1–5 cm tall, from a branching caudex clothed with marcescent leaf bases; leaves grayish puberulent, the basal ones 3- to 5-lobed; plants known from the San Francisco Mts. *L. ostleri*
- Plants various, seldom if ever pulvinate-caespitose, mainly over 5 cm tall, from a taproot or branching caudex, if the latter, not especially clothed with leaf bases; leaves green to grayish puberulent, the basal ones often more than 5-lobed; plants of various distribution 8
- 8(7). Stems woody well above the base; petals mostly 3 mm long or more; silicles 4.5–7.5 mm long, obovate; plants of Washington County *L. fremontii*
- Stems slightly if at all woody above the base; petals mostly less than 3 mm long (but sometimes longer); silicles 2–4 mm long, ovate; plants almost cosmopolitan in Utah *L. montanum*
- 9(6). Sepals persistent, enclosing the mature silicle, these plainly reticulate; pedicels narrowly wing-margined; plants evidently rare *L. strictum*
- Sepals deciduous at or shortly following anthesis; silicles plainly to slightly reticulate; pedicels terete to strongly flattened; plants at least locally common 10

- 10(9). Fruits emarginate and with prominent, acute, and divergent toothlike apices *L. dictyotum*
- Fruits emarginate but lobes on each side of sinus neither acute nor divergent 11
- 11(10). Pedicels much flattened, about twice broader than thick 12
- Pedicels not strongly flattened, not twice as broad as thick 13
- 12(11). Plants short-hirsute to hispid hairy; silicles pubescent *L. lasiocarpum*
- Plants softly hairy; silicles glabrous or pubescent *L. densiflorum*
- 13(11). Petals lacking or, if present, generally shorter than the sepals; silicles oblong-obovate to obovate *L. densiflorum*
- Petals present and usually surpassing the sepals; silicles elliptic-rotund to orbicular *L. virginicum*

Lepidium barnebyanum Reveal Ridgecress. [*L. montanum* ssp. *demissum* C. L. Hitchc. (type from Indian Canyon), not *L. demissum* C. L. Hitchc.]. Perennial, densely pulvinate-caespitose, from a thickened branched caudex, this clothed with marcescent leaf bases; stems erect, 7–12 cm tall, subglabrous or minutely recurved scaberulous, simple or branched from the upper axils; basal leaves 1–4 cm long, 1–2 (3) mm wide, somewhat flattened and minutely wing-margined, scaberulous; sepals 2–2.3 mm long, greenish, glabrous or puberulent; petals 3.5–4.2 mm long, white, obovate, spreading; stamens 6; silicles 3–6.2 mm long, 3–4 mm wide, lanceolate to elliptic, glabrous, plane, wingless; style 0.5–1.2 mm long. White shale outcrops, Uinta Formation, in a pinyon-juniper community at 1890 to 1985 m, growing with mound-forming species, mainly on ridge crests, Indian Canyon, Duchesne County; endemic; 10 (vii).

Lepidium campestre (L.) R. Br. Fieldcress. [*Thlaspi campestre* L.]. Annual, lacking a caudex; stems 1.5–6 dm tall, hirtellous throughout with simple hairs; basal leaves 3–12 cm long, 8–15 mm wide, oblanceolate, entire or variously lobed; cauline leaves numerous, reduced upwards, becoming sessile and auriculate, usually denticulate; pedicels mostly 4–7 mm long, spreading, slightly flattened, hirtellous; sepals 1.3–2 mm long, greenish or variously tinged, hirtellous; petals 1.7–2.5 mm long, white, spatulate, ascending; stamens 6; silicles 5–6 mm long, oblong-ovate, glabrous or puberulent, concave, wingless, slightly emarginate; style 0.2–0.6 mm long; 2n = 16, 32. Roadsides and other disturbed sites from 1370 to 2410 m in Cache, Salt Lake, San Juan, Sanpete, Summit, Uintah, and Utah counties; widely established in North America; Asia; 11 (0).

Lepidium densiflorum Schrader Densecress. Annual, lacking a caudex; stems 0.3–5 dm tall or more, densely finely hairy to puberulent throughout; basal leaves 1.2–11 cm long, 3–22 mm wide, oblanceolate, entire and more commonly pinnately lobed; cauline leaves several to many, reduced upwards, petiolate to sessile, not auriculate, lobed, toothed, or entire; pedicels 1.5–3 mm long, spreading to ascending, subterete to conspicuously flattened, glabrous to puberulent; sepals 0.6–1.1 mm long, often purplish, glabrous; petals 0.7–1 mm long, white, narrowly oblong, sometimes lacking; stamen 1; silicles 2.5–3.5 mm long and about as wide, elliptic to oval or obovoid, glabrous or rarely pubescent, shallowly notched apically, the teeth rounded; style lacking; n = 16. Our material is separable into three more or less distinctive variants.

- 1. Silicles pubescent; pedicels usually somewhat flattened, especially on lower side; plants evidently rare *L. densiflorum* var. *pubicarpum*
- Silicles glabrous, pedicels definitely flattened or else subterete; plants common 2
- 2(1). Pedicels subterete; silicles averaging less than 3 mm long; plants commonly of waste places *L. densiflorum* var. *densiflorum*
- Pedicels definitely flattened, especially on upper side; silicles averaging at least 3 mm long; plants often growing in indigenous communities *L. densiflorum* var. *ramosum*

Var. *densiflorum* [*L. neglectum* Thell.; *L. bourgeauanum* Thell.; *L. densiflorum* var. *bourgeauanum* (Thell.) C. L. Hitchc.; *L. densiflorum* var. *macrocarpum* Mulligan]. Warm desert shrub, salt desert shrub, salt grass, sagebrush, pinyon-juniper, ponderosa pine, aspen, and spruce-fir communities at 850 to 3020 m in most, if not all, Utah counties; widespread in North America; 64 (viii).

Var. *pubicarpum* (A. Nels.) Thell. [*L. pubicarpum* A. Nels.]. Uncommon in sage brush and mountain brush communities at 1370 to 1925 m in Box Elder, Salt Lake, Sanpete, Tooele, and Utah counties; Washington to Montana, south to California; 5 (0).

Var. *ramosum* (A. Nels.) Thell. [*L. ramosum* A. Nels.; *L. densiflorum* var. *pubicaule* Thell.]. Warm and salt desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 1129 to 2320 m in Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sanpete, Uintah, and Utah counties; Wyoming south to New Mexico, west to California; 33 (viii).

Lepidium dictyotum Gray [*L. dictyotum* var. *macrocarpum* Thell.]. Annual, lacking a caudex; stems 2–15 cm tall, pubescent; basal leaves usually pinnatifid with 2–5 pairs of linear lobes; cauline leaves mostly entire, linear, reduced upwards; pedicels 1.5–3.5 mm long, flattened, spreading to reflexed; sepals 0.7–1 mm long, greenish, pubescent; petals 1–1.2 mm long, white, oblong, or usually lacking; stamens typically 4; silicles 3.2–4.5 mm long, 2–2.5 mm wide, ovate, glabrous or hirtellous, notched apically, teeth prolonged and usually divergent, acute; style lacking. Evidently rare in Utah, known from greasewood communities at ca 4220 m in Salt Lake and Weber counties; Washington to Idaho, south to California; 2 (0).

Lepidium fremontii Wats. Subshrubs, definitely woody above base; stems mostly 3–8 dm tall, glabrous and glaucous; leaves cauline, mostly 1.5–5 (8) cm long, pinnatifid into linear-oblong acute lobes up to 2 mm wide, becoming simple above, not auriculate; bracts subtending branches of the inflorescence often more than 2 cm long, linear; pedicels 3–8 mm long, ascending to spreading or curved-ascending, glabrous; sepals 1.5–2.5 mm long, green or more or less hyaline, glabrous; petals 3–4.5 mm long, white, obovate; stamens typically 6; silicles 4.5–7.5 mm long, 5.2–6.5 mm wide, obovate, glabrous, slightly notched apically; style 0.4–1.3 mm long; n = 32. Blackbrush, creosote brush, and other warm desert shrub communities from 700 to 1525 m in Washington County; Arizona, Nevada, and California; 33 (ii). The long, straight lobes of leaves, typically not sinuately lobed, are more or less diagnostic from *L. montanum* var. *jonesii*, with which this species is partially sympatric in Washington County.

Lepidium integrifolium Nutt. [*L. utahense* Jones, type from Milford; *L. zionis* A. Nels., type from Richfield; *L. montanum* var. *integrifolium* (Nutt.) C. L. Hitchc.]. Perennial, caespitose, from a thickened, usually branched caudex, more or less clothed with marcescent leaf bases; stems decumbent-ascending, 1.5–2.5 dm tall, minutely puberulent, simple or branched from upper axils; basal leaves 3–8.5 cm long, 6–25 mm wide, elliptic to oblanceolate, entire; cauline leaves mostly 1–4 cm long, 2–12 mm wide, gradually reduced upward, glabrous or nearly so; pedicels 5–8.5 mm long, spreading to ascending, puberulent; sepals 1.5–2 mm long, greenish, glabrous or pubescent; petals 2.7–3.1 mm long, white, obovate; stamens typically 6; silicles 3–4.2 mm long, 1.7–2.7 mm wide, ovate to lance-ovate, glabrous, plane, wingless; style 0.4–0.7 mm long. Saline or cool wet meadows at 1260 to 1925 m in Beaver, Rich, Sanpete, Sevier, and Uintah counties; Wyoming; 6 (i). The populations in central Utah are known only from historic collections. This distinctive entity has been collected only rarely, possibly because the habitat type has been exploited as marginal pastureland in Utah and Wyoming, and probably because its habitat is now occupied by the similar *Cardaria draba*, which is bypassed by most collectors.

Lepidium lasiocarpum Nutt. ex T. & G. Hispidicress. Annual, lacking a caudex; stems 2–30 cm tall or more, hispidulous to distinctly hispid with simple hairs; basal leaves mostly 1–8.5 cm long, 3–9 mm wide, oblanceolate, pinnatifid or merely lobed or toothed; cauline leaves few to several, reduced upwards, petiolate to sessile, not auriculate; pedicels 1.5–5 mm long, spreading to ascending, conspicuously flattened, usually puberulent to hispidulous; sepals 1–1.2 mm long, greenish or reddish to purplish, glabrous; petals 1–1.3 mm long, white, narrowly oblong, sometimes lacking; stamens 2 or 4; silicles 3.4–4.5 mm long, 2.7–4 mm wide, elliptic to rotund or obovate, hispidulous, notched apically, the teeth sometimes elongate-winged, rounded; style lacking or nearly so. Plants with somewhat attenuate apical teeth on the silicles approach *L. dictyotum*, and possibly the account for some of the reports of that entity from Utah. Two scarcely distinguishable varieties are known from Utah.

1. Pedicels glabrous or merely puberulent on lower side; stems, at most, hispidulous. *L. lasiocarpum* var. *georginum*
— Pedicels hispidulous on lower side; stems definitely hispid *L. lasiocarpum* var. *lasiocarpum*

Var. *georginum* (Rydb.) C. L. Hitchc. [*L. georginum* Rydb., type from southern Utah; *L. lasiocarpum* ssp. *georginum* (Rydb.) Thell.]. Warm and salt desert shrublands and lower pinyon-juniper woodlands at 1155 to 1985 m in Beaver, Emery, Garfield, Grand, Juab, Kane, San Juan, Tooele, Uintah, and Washington counties; Arizona and California; 18 (iv).

Var. *lasiocarpum* [*L. palmeri* Wats.; *L. lasiophyllum* Brandegec; *L. lasiocarpum* ssp. *palmeri* (Wats.) Thell.; *L. lasiocarpum* ssp. *lasiophyllum* (Brandegec) Thell.]. Warm, salt, and cool desert shrublands and pinyon-juniper communities at 820 to 1770 m in Garfield, Kane, Millard, Tooele, Utah, and Washington counties; Arizona and California; 30 (ix).

Lepidium latifolium L. Perennial herbs; stems 8–15 dm tall or more, glabrous; leaves basal and cauline, 1–15 (30) cm long, (0.4) 1–8 cm wide, the basal ones petiolate,

orbicular to obovate, elliptic, or lanceolate, typically lacking at anthesis, the cauline becoming sessile upward, not auriculate, entire or irregularly crenate-serrate; bracts subtending branches of inflorescence 0.5–2 cm long; pedicels 1.5–4 mm long, spreading to ascending, glabrous; sepals ca 1 mm long, often tinged with blue or purple, glabrous or puberulent; petals ca 1.5 mm long, white, obovate; stamens typically 6; silicles 1.5–2 mm long, ca 1.5 mm wide, ovate, glabrous; style ca 0.2 mm long; $2n = 24, 48$. Riparian and palustrine habitats, or less commonly in dryish barrow pits and roadsides at 1250 to 2410 m in Daggett, Grand, Iron, Rich, Salt Lake, Uintah, Utah, Wasatch, Washington, and Weber counties; widespread in the U. S.; introduced from Eurasia; 26 (iv). This species was introduced into Utah sometime prior to 1970 and is now spreading rapidly over the state.

Lepidium montanum Nutt. Perennial or less commonly biennial herbs or rarely suffrutescent, seldom definitely woody above base; stems 0.3–12 dm tall or more, glabrous or variously puberulent to hirtellous; leaves basal or basal and cauline, 0.5–12.5 cm long, 3–25 mm wide, variously shaped, entire to pinnatifid, often at least uppermost cauline ones simple and entire; bracts subtending branches of inflorescence seldom more than 1 cm long; pedicels 3–8 mm long, spreading to ascending, straight, or more or less sigmoid-curved, glabrous or puberulent; sepals 1.2–1.7 mm long, green or variously tinged, glabrous or puberulent; petals 2.5–3.5 mm long, white, obovate to spatulate; stamens typically 6; silicles 2.8–4.1 mm long, 2.1–2.5 mm wide, ovate to elliptic, glabrous or rarely puberulent; style 0.3–0.9 mm long; $n = 16$. There is an amazing amount of variation within *L. montanum* as interpreted herein. The more stable phases have been treated previously either as species or as varieties. There is justification for recognizing all of these entities at the specific level, but the convenience of having an inclusive species with several variants seems to best represent the situation within Utah.

1. Plants mostly 6–12 dm tall, of eastern to southeastern Utah; cauline leaves simple, toothed or entire, often more than 4 mm wide; flowering from midsummer to autumn *L. montanum* var. *spatulatum*
- Plants usually less than 6 dm tall, of various distribution; cauline leaves various but, if simple and entire, usually less than 4 mm wide; flowering in springtime and midsummer (at higher elevations) 2
- 2(1). Basal leaves well developed, usually over 5 cm long and 0.6 cm wide; cauline leaves few, reduced upwards; plants usually montane 3
- Basal leaves poorly if at all developed (or rarely so), usually less than 5 cm long and 0.6 cm wide; cauline leaves numerous to few, gradually reduced upwards; plants seldom montane 4
- 3(2). Stems puberulent almost or quite throughout
..... *L. montanum* var. *alpinum*
- Stems glabrous almost or quite throughout
..... *L. montanum* var. *heterophyllum*
- 4(2). Stems glabrous or essentially so (rarely puberulent); plants somewhat woody at the base 5
- Stems puberulent almost or quite throughout; plants herbaceous or somewhat woody at the base 6
- 5(4). Basal leaves divided, not entire; plants (0.7) 1–6 (10) dm high, widespread in eastern, southeastern, and southern Utah *L. montanum* var. *jonesii*

- Basal leaves entire or some divided, plants 2–5 (7) cm high, rare and local, Aquarius and Pamsagunt plateaus, Garfield County *L. montanum* var. *neeseae*
- 6(4). Plants perennial, restricted to Kane County; caudex woody; silicles puberulent; stems 0.5–1 dm tall *L. montanum* var. *stellae*
- Plants biennial or perennial, widespread in western Utah; caudex lacking or only slightly woody; silicles glabrous; stems often over 1 dm tall *L. montanum* var. *montanum*

Var. *alpinum* Wats. [*L. scopulorum* Jones]. Sagebrush and spruce-fir communities at 1525 to 3050 m in Box Elder and Salt Lake (type from Cottonwood Canyon) counties; endemic; 4 (0).

Var. *heterophyllum* (Wats.) C. L. Hitchc. [*L. integrifolium* var. *heterophyllum* Wats.; *L. heterophyllum* (Wats.) Jones]. Mountain brush, aspen, and white fir communities at 1830 to 2320 m in Iron, Millard, Piute, and Sevier counties; endemic; 4 (i).

Var. *jonesii* (Rydb.) C. L. Hitchc. [*L. jonesii* Rydb.], type from St. George; *L. crandallii* Rydb.; *L. tortum* L. O. Williams; *L. alyssoioides* var. *jonesii* (Rydb.) Thell.; *L. alyssoioides* var. *stenocarpum* Thell.], $n = 16$. Shadscale, other salt desert shrub, warm desert shrub, cool desert shrub, sagebrush, and pinyon-juniper communities at 850 to 2135 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Utah, Washington, and Wayne counties; Arizona and Nevada, east to Colorado; 195 (xxix).

Var. *montanum* [*L. corymbosum* H. & A.; *L. utaviense* Regal; *L. brachybotryum* Rydb., type from Juab, Juab County; *L. philonitrum* Nels. & Macbr.; *L. albiflorum* Nels. & Macbr.; *L. montanum* var. *stenocarpum* Thell.; *L. scopulorum* f. *nanum* Thell.; *L. montanum* var. *canescens* (Thell.) C. L. Hitchc.]. Shadscale, other salt desert shrub, mixed desert shrub, and sagebrush communities at 1340 to 2135 m in Beaver, Box Elder, Cache (?), Duchesne, Iron, Juab, Millard, Piute, Rich, Sevier, Summit, Tooele, Utah, and Washington counties; Idaho and Wyoming south to Arizona, Nevada, and California; 68 (xv). The phase distinguished as var. *canescens* by Hitchcock passes into var. *montanum* through a series of morphological intermediates; thus it is placed here in synonymy with var. *montanum*. Nevertheless, the material is hardly uniform, with some individuals having strict branches and only sparingly puberulent vesture. Possibly additional segregation is advisable.

Var. *neeseae* Welsh & Reveal Ponderosa pine and spruce-fir communities mainly on the Pink and White Limestone members of the Wasatch Formation, but also on the Navajo Sandstone, at ca 2250 m in Garfield County; endemic; 4 (i).

Var. *spathulatum* (Robins.) C. L. Hitchc. [*L. scopulorum* var. *spathulatum* Robins.; *L. spathulatum* Vasey ex Robins., not Phil.; *Thelypodium crenatum* Greene; *L. crenatum* (Greene) Rydb.; *L. vaseyanum* Thell.; *L. montanum* var. *eastwoodiae* sensu Utah material; *L. montanum* var. *alyssoioides* sensu Utah material]. Riparian and pinyon-juniper communities at 1125 to 2260 m in Garfield, Grand, Kane, San Juan, and Uintah counties; Colorado; 38 (xvii). This is the tall phase of the species that flowers in midsummer and autumn in southeastern Utah, it is sufficiently distinct from the other varieties of *L. montanum* to be recognized at the specific level. If that is done, the correct name at the specific level would be *L. crenatum*.

Var. *stellae* Welsh & Reveal White silty barrens of the Winsor Formation, with mound-forming plants, in a sagebrush-juniper community at ca 1700 m elevation in Kane (type from SE of Cannonville) County; endemic; 3 (i).

***Lepidium ostleri* Welsh & Goodrich** Ostler Pepperplant. Perennial, pulvinate-caespitose herbs from a branching caudex, this clothed with marcescent gray leaf bases; stems erect, 1–3.5 (5) cm tall, hirsute; leaves 4–15 mm long, linear and entire or the basal ones 3– to 5-lobate, hirsute, the cauline lacking or few; racemes ca 1 cm long in flower and 1–2 cm long in fruit, 5– to 35-flowered; pedicels 2–3 mm long in fruit; sepals 1.3–2 mm long, obtuse, hyaline, roughly pilose, often purplish; petals 2–3 mm long, white or suffused with purple; silicle 2.5–3 mm long, 2.3–2.5 mm wide, broadly ovate, to 1 mm thick, the sinus 2 mm deep; style 0.4–0.7 mm long. Limestone outcrops typically in pinyon-juniper community at ca 1765 to 2075 m at Frisco (type locality), San Francisco Mts., Beaver County; endemic; 7 (iii). This is a dwarf plant of crevices in rocky outcrops.

***Lepidium perfoliatum* L.** Peppergrass. Annual, lacking a caudex; stems 0.7–4 (6) dm tall, hirtellous below, glabrous and glaucous above; basal leaves 0.8–15 cm long, 2–28 mm wide, bi- or tripinnatifid into narrow segments; cauline leaves with lowermost like the basal ones, these transitional upward into entire and falsely perfoliate-clasping ones; pedicels 3–6.5 mm long, spreading-ascending, glabrous, subterete; sepals 0.7–1.2 mm long, often purplish, glabrous or pubescent; petals 0.8–1.5 mm long, yellow, narrowly spatulate, ascending; stamens usually 6; silicles 3.5–4.3 mm long, 3.2–3.6 mm wide, oval to elliptic, glabrous, plane, wingless or essentially so, slightly emarginate; style 0.1–0.3 mm long; $n = 8$. Ruderal weed, often in disturbed sites, in creosote bush, blackbrush, other warm desert shrub, shadscale, greasewood, galleta, pinyon-juniper, and sagebrush communities at 850 to 2440 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Rich, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Washington, and Weber counties; widespread in the U. S.; adventive from Europe; 66 (iii).

***Lepidium strictum* (Wats.) Rattan** Erectcress. [*L. oxycarpum* var. *strictum* Wats.; *L. reticulatum* Howell; *L. pubescens* authors, not Desv.]. Annual, lacking a caudex; stems 0.5–2 dm long, prostrate to rarely erect, pubescent; basal leaves mostly 3–7 cm long, 1–2 cm wide, bipinnatifid; cauline leaves less divided, uppermost sometimes entire; pedicels mostly 2–3 mm long, ascending, flattened, and narrowly wing-margined; sepals 1–1.5 mm long, persistent, purplish-pubescent; petals minute or lacking; stamens 2; silicles 2.2–3.5 mm long, 2–3 mm broad, oval to oblong-ovate, planely reticulate, slightly winged, concave, notched apically; style lacking. Apparently rare in Utah and possibly not a part of the continuing flora; cited by Hitchcock (1936) from Castle Gate, Carbon County, collected by Grant in 1900; 0 (0).

***Lepidium virginicum* L.** Virginiacress. Annual, lacking a caudex; stems 1.5–7 dm tall, pubescent throughout or glabrous above; basal leaves 1.3–15 cm long, 0.3–3.5 (5) cm wide, coarsely toothed to lobed; cauline leaves reduced upwards, uppermost usually entire; pedicels 2–6 mm long, spreading, terete or nearly so, pubescent or glabrous; sepals 0.6–1 mm long; petals 0.7–1.5 (3) mm long, white, spatulate, rarely lacking; silicles 2.5–4 mm long, 2.2–3.5 mm broad, elliptic to orbicular, usually

glabrous, plane, notched apically; style lacking; n = 16. Joshua tree, creosote bush, other warm desert shrub, mixed desert shrub, pinyon-juniper, ponderosa pine, white fir, and spruce-fir communities at 915 to 2655 m in Beaver, Cache, Davis, Duchesne, Morgan, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Weber counties; widely distributed in North America; 29 (i). Our material belongs to var. *pubescens* (Greene) Thell. [*L. intermedium* var. *pubescens* Greene; *L. hirsutum* Rydb.].

Lesquerella Wats.

Stellate-pubescent, annual (biennial) or perennial herbs arising from taproots; leaves basal and cauline, alternate, simple, tapering to base or merely sessile, not auriculate; flowers racemose; pedicels straight, sigmoid, reflexed, spreading or ascending, not subtended by bracts; sepals 4, deciduous; petals 4, yellow, rounded; stamens 6, the filaments lacking glandular processes; style slender; stigma capitate; fruit a sessile to substipitate silicle, less than twice longer than broad, varying in outline, compressed parallel with or contrary to septum; valves veinless; seeds 2–10 per locule, biseriate.

Maguire, B., and A. H. Holmgren. 1951. Botany of the intermountain region - II. *Lesquerella*. Madrono 11: 172–184.
 Payson, E. B. 1921. A monograph of the genus *Lesquerella*. Ann. Missouri Bot. Gard. 8: 103–236.
 Rollins, R. C., and E. A. Shaw. 1973. The genus *Lesquerella* in North America. Cambridge, Mass.: Harvard University Press. 288 p.

- 1. Lowermost leaves narrow, mostly 1–5 mm wide, blade and petiole indistinct, or, if so, as in *L. rectipes*, the plants tall and of low elevations, tufted at stem base; basal and cauline leaves alike in general shape Key 1
- Lowermost leaves often over 5 mm wide, the blade distinct from petiole, forming a rosette; basal leaves clearly of a different shape from cauline leaves Key 2

Key 1.

Basal and cauline leaves alike.

- 1. Silicles and ovaries glabrous 2
- Silicles and ovaries stellate pubescent 4
- 2(1). Stems mostly 0.6–1.8 dm tall; silicle bodies 4 mm long or more; plants of San Juan County *L. fendleri*
- Stems 1–5 cm tall; silicle bodies usually less than 4 mm long; plants of south-central Utah 3
- 3(2). Plants densely pulvinate-caespitose, cushionlike, with usually numerous caudex branches; restricted to white shale outcrops southeast of Cannonville, Kane County *L. tumulosa*
- Plants caespitose in small compact to loose clumps, with one to several caudex branches; restricted to limestones on the Panguisagaunt Plateau *L. rubricundula*
- 4(1). Plants definitely pulvinate-caespitose, usually less than 1 dm tall; style mostly 1–2 mm long; known from Washington and Kane counties *L. arizonica*
- Plants various but, if pulvinate-caespitose and less than 1 dm tall, the style usually 2–4 mm long or more, or distribution otherwise 5
- 5(4). Plants usually less than 1 dm tall; basal leaves linear to narrowly spatulate; usually of middle to high elevations . . . 6
- Plants usually 1.5–2 dm tall or more; basal leaves spatulate to oblanceolate; usually of middle to lower elevations 7

- 6(5). Pedicels usually strongly S-shaped; inner basal leaves usually flat *L. alpina*
- Pedicels usually straight or only slightly curved; inner basal leaves usually involute *L. intermedia*
- 7(5). Pedicels generally recurved or arched in fruit, or less commonly almost straight; blades of basal leaves rarely more than 4 mm wide *L. ludoviciana*
- Pedicels more or less S-shaped; blades of basal leaves often more than 4 mm wide *L. rectipes*

Key 2.

Basal and cauline leaves different.

- 1. Plants slender annuals; stems erect or ascending, mostly 1–4 dm tall; known from Washington County *L. tenella*
- Plants caespitose perennials; stems decumbent to erect, mostly less than 1 (1.5) dm tall, distribution otherwise . . . 2
- 2(1). Plants with caudex definitely branched, known from low to moderate elevations of Duchesne, Emery, and Uintah counties *L. subumbellata*
- Plants with caudex simple or rarely branched; distribution various, but usually of higher elevation 3
- 3(2). Silicles ellipsoid to subglobose or obovate to obdeltoid, compressed contrary to the septum 4
- Silicles of various shape but, if as above, compressed parallel to the septum 5
- 4(3). Racemes loose to elongated in fruit, often secund; silicles sparingly pubescent with hairs 0.2–0.3 mm broad; plants of the Wasatch and Uinta mts. *L. utahensis*
- Racemes short and dense in fruit, not at all secund; silicles moderately pubescent with hairs 0.2–0.4 mm broad; plants of the Wasatch Plateau southward *L. uardii*
- 5(3). Silicles ovoid, compressed at apex or margins; plants from Beaver County northward *L. occidentalis*
- Silicles various but not compressed at the apex or margins; plants of various distribution 6
- 6(5). Basal leaves angular, the blades usually deltoid or hastate, narrowed abruptly to the petiole; plants of Rich and possibly Summit counties *L. prostrata*
- Basal leaves not angular, the blades elliptic to obovate, narrowed gradually to the petiole; plants of various distribution 7
- 7(6). Silicles either definitely compressed apically or truncate to emarginate apically; plants from Utah County southward 8
- Silicles more or less acute apically; plants from Utah County northward 9
- 8(7). Silicles obovate to obdeltoid, sparingly pubescent; largest basal leaves usually less than 1 cm wide; plants of Carbon, Emery, Sanpete, and Utah counties *L. hemiphysaria*
- Silicles ellipsoid, densely pubescent; largest basal leaves usually more than 1 cm wide; plants of western Utah *L. kingii*
- 9(7). Pedicels loosely S-shaped; silicles sparsely pubescent with appressed or erect hairs; caudex branches lacking conspicuous leaf scars and bases; plants of Cache and Rich counties *L. multiceps*
- Pedicels straight or curved; silicles densely pubescent with erect hairs; caudex branches with conspicuous scars and/or leaf bases; plants of Davis, Salt Lake, Utah, and Wasatch counties *L. garrettii*

Lesquerella alpina (Nutt.) Wats. Alpine Bladderpod. Perennial, arising from simple or branched caudices, these often clothed with marcescent leaf-bases; herbage pubescent with stellate, 4- to 7-branched hairs; stems 1-10 cm tall, rarely more, erect, simple; basal leaves mostly 0.5-5 cm long, 1-4 mm wide, linear to very narrowly spatulate, gradually narrowed to base; cauline leaves 5-20 mm long (or more), 1-3 cm wide; pedicels 4-10 mm long or more, straight, curved, or S-shaped; sepals 3.5-6 (7) mm long; petals 4-8 mm long, yellow, spatulate; silicles (excluding style) mostly 3-5 mm long, sessile or subsessile, ovoid, more or less compressed apically; valves pubescent externally and sometimes internally also; style mostly 2-4 mm long; ovules 2-6 per locule; n = 5. Two varieties which lack definite diagnostic criteria are represented among our materials.

- 1. Leaves spatulate, at least some; perhaps not distinct from the next *L. alpina* var. *alpina*
- Leaves uniformly narrow, linear to linear-spatulate *L. alpina* var. *parvula*

Var. *alpina* [*Vesicaria alpina* Nutt. ex T. & G.; *L. spatulata* Rydb.; *L. curtipendula* A. Nels.; *L. alpina* var. *spatulata* (Rydb.) Payson; *L. condensata* var. *laevis* Payson; *L. alpina* var. *laevis* (Payson) C. L. Hitchc.]. Sagebrush and juniper communities, often on ridgetops, at 2135 to 3050 m elevation in Daggett, Duchesne, Sanpete, and Uintah counties; widespread northward to Alberta and Saskatchewan; 8 (0).

Var. *parvula* (Greene) Welsh & Reveal [*L. parvula* Greene; *L. alpina* ssp. *parvula* (Greene) Rollins & Shaw]. Pinyon-juniper and Douglas fir communities at 1830 to 2960 m in Daggett and Wasatch counties; Colorado and Wyoming; 13 (ii). The var. *condensata* (A. Nels.) C. L. Hitchc. is to be sought in extreme northern Daggett County; it is currently known from just north of the Utah line in Uinta County, Wyoming. That variety consists of small, tufted plants with the stems barely exerted beyond the leaves.

Lesquerella arizonica Wats. Arizona Bladderpod. [*L. arizonica* var. *nudicaulis* Payson]. Perennial, more or less pulvinate-caespitose, with few to several (or many) caudex branches, these often with marcescent leaf-bases; herbage densely pubescent with stellate hairs; stems 2-10 cm tall, rarely more, erect, simple; basal leaves 0.5-3.5 cm long, 1-4 mm wide, oblanceolate to spatulate, gradually narrowed basally; cauline leaves 0.5-2.5 cm long or more, 1-3 mm wide; pedicels 3-10 mm long or more, straight or curved, ascending; sepals 4-6.5 mm long; petals 5.5-7 mm long, yellow, suborbicular; silicles (excluding style) 3-5 mm long, sessile or substipitate, ovoid to ellipsoid, rounded and compressed apically; valves pubescent externally; style 0.5-2 (4) mm long; ovules 2-5 (8) per locule; n = 5, 10. Mountain brush, sagebrush, and pinyon-juniper communities at 1280 to 2750 m in Kane and Washington counties; Arizona; 6 (0).

Lesquerella fendleri (Gray) Wats. Fendler Bladderpod. [*Vesicaria fendleri* Gray; *V. stenophylla* Gray; *L. folicacea* Greene; *L. stenophylla* (Gray) Rydb.; *L. praecox* Woot. & Standl.]. Perennial, caespitose, the caudex simple or few- to several-branched, the branches naked or with few marcescent leaf-bases; herbage usually densely pubescent with stellate hairs; stems 5-25 cm tall, rarely more, erect to decumbent, simple; basal leaves 1-4 cm long, 1-6 cm wide, elliptic to oblanceolate, gradually tapering to the base; cauline leaves 0.4-2 (2.5) cm long,

mostly 1-5 mm wide; pedicels 7-15 (20) mm long, straight or curved to S-shaped, spreading to suberect; sepals 4.5-8 mm long; petals 6-12 mm long, yellow, obovate; silicles (excluding style) 4.5-8 mm long, sessile or subsessile, ellipsoid to ovoid, rounded apically, the valves glabrous; style 2-6 mm long; ovules 6-16 per locule; n = 6. Shadscale, blackbrush, and juniper communities at ca 1700 m in San Juan County; Colorado and Arizona east to Texas and south to Mexico; 7 (i).

Lesquerella garretti Payson Garrett Bladderpod. Perennial, caespitose, the caudex simple or few- to several-branched, the branches clothed with marcescent leaf-bases and scars; herbage pubescent with stellate hairs; stems 5-15 cm tall, decumbent-spreading to suberect, simple; basal leaves 1-3.5 (4) cm long, 2-7 mm wide, elliptic to obovate, differentiated into blade and petiole; cauline leaves 3-13 mm long 1-4 mm wide; pedicels 3.5-7 mm long, straight or curved, spreading-ascending; sepals 4.5-6 mm long; petals 6-9 mm long, yellow, spatulate to obovate; silicles (excluding style) 3.5-4 mm long, short-stipitate, subglobose or obovoid, the valves pubescent externally, glabrous within; style 4-7 mm long; ovules 2-4 per locule. Spruce-fir and alpine tundra, often in talus or on rock outcrops, at 3050 to 3660 m in Davis, Salt Lake (type from Big Cottonwood Canyon), Utah, and Wasatch counties; endemic; 6 (0).

Lesquerella hemiphysaria Maguire Skyline Bladderpod. Perennial, caespitose, the caudex simple or few-branched, the branches more or less clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 3-10 (15) cm tall, decumbent-spreading or rarely erect; basal leaves 0.5-3.5 (5.5) cm long, 4-10 (15) mm wide, obovate to elliptic, differentiated into blade and petiole; cauline leaves 3-15 mm long, 2-5 mm wide; pedicels 3-7 mm long, spreading, ascending, or recurved, S-shaped or curved; sepals 4-7 mm long; petals 5-7 mm long, yellow, oblanceolate; silicles (excluding style) 3-7 mm long, sessile or substipitate, obcordate in outline, the valves more or less pubescent externally, glabrous within; style 3-6 mm long; seeds 4-8 per locule. Two scarcely differentiated varieties are known:

- 1. Silicles glabrous or nearly so; plants of the West Tavaputs Plateau *L. hemiphysaria* var. *lucens*
- Silicles uniformly pubescent throughout; plants of the Wasatch Plateau and southwestern rim of the Uinta Basin *L. hemiphysaria* var. *hemiphysaria*

Var. *hemiphysaria* Sagebrush, aspen, Douglas fir, and meadow communities at 2135 to 3355 m in Duchesne, Emery, Sanpete (type from Wasatch Plateau), Utah, and Wasatch counties; endemic; 31 (v).

Var. *lucens* Welsh & Reveal Sagebrush and spruce-fir communities at 2700 to 2800 m on the West Tavaputs Plateau (type from Range Creek), Carbon County; endemic; 4 (ii).

Lesquerella intermedia (Wats.) Heller Watson Bladderpod. [*L. alpina* var. *intermedia* Wats.]. Perennial, caespitose, the caudex simple or few-branched, the branches more or less clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 2-15 (25) cm tall, erect or ascending, simple; basal leaves 1-5 cm long, 1-2 mm wide, linear or only slightly expanded apically, the inner usually involute, tapering gradually to base; cauline leaves 0.8-3.5 cm long, 1-3 mm wide; pedicels 4-12 mm long, spreading to ascending, straight or

curved; sepals 2.8–6.5 mm long; petals 5.5–10.5 mm long, yellow, spatulate; silicles (excluding style) 4–7 mm long, sessile or substipitate, ellipsoid or ovoid, acute and somewhat flattened apically, pubescent externally, glabrous or pubescent within; style (2) 3–4.5 mm long; seeds (4) 6–8 (10) per locule; $n = 18$. Sagebrush, pinyon-juniper, ponderosa pine, aspen, and bristle-cone pine communities at 1525 to 2840 m in in Beaver, Duchesne, Emery, Garfield, Iron, Kane, Piute, Sanpete, Sevier, Washington, and Wayne counties; Arizona, New Mexico; 52 (ix). This taxon approaches *L. alpina* on the one hand and *L. rectipes* on the other. Definitive features to separate alpine phases of *L. intermedia* from *L. alpina* are subject to interpretation. Only arbitrary separation seems possible.

Lesquerella kingii Wats. King Bladderpod. Perennial, caespitose, the caudex usually simple, densely clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 3–18 dm tall, decumbent to suberect, simple; basal leaves 1.5–4.5 (6) cm long, 4–20 mm wide, the blade spatulate to oval, obovate or ovate, sharply differentiated from petiole; cauline leaves 0.5–2 cm long, 1–7 mm wide; pedicels 4–10 mm long or more, curved to straight or S-shaped, ascending to descending; sepals 4–8 mm long; petals 5.5–12 mm long, yellow, spatulate; silicles (excluding style) 3.5–9 mm long, sessile to substipitate, ellipsoid, compressed apically; valves pubescent externally, pubescent to glabrous within; style 2–5 mm long; seeds 4–8 per locule; $n = 5$. Shadscale, rabbitbrush, sagebrush, pinyon-juniper, and ponderosa pine communities at 1370 to 3450 m in Beaver, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, Sevier, Tooele, and Washington counties; Oregon, California, and Nevada; 26 (viii). Utah material, which is not always distinguishable from *L. wardii*, belongs to var. *parvifolia* (Maguire & Holmgren) Welsh & Reveal [*L. occidentalis* var. *parvifolia* Maguire & Holmgren; *L. latifolia* A. Nels.; *L. barnebyi* Maguire; *L. kingii* ssp. *latifolia* (A. Nels.) Rollins & Shaw]. The var. *cordiformis* (Rollins) Maguire & Holmgren is to be sought in the deserts of extreme western Utah.

Lesquerella ludoviciana (Nutt.) Wats. Silver Bladderpod. [*Myagrum argenteum* Pursh; *Alyssum ludovicianum* Nutt.; *L. argentea* (Pursh) MacMillan, not *L. argentea* (Schauer) Wats.]. Perennial, loosely caespitose, the caudex simple to many-branched, the branches clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 0.7–3 (4) dm tall, ascending to erect or the outer decumbent, simple; basal leaves 1–9 cm long, (1) 2–8 mm wide, spatulate to oblanceolate or appearing linear when folded; cauline leaves 1–6 cm long, 1–6 mm wide; pedicels 5–15 mm long or more, straight or curved, ascending to recurved; sepals 4–7 mm long; petals 5–10 mm long, yellow, oblanceolate to obovate; silicles (excluding style) 3–6 mm long, sessile or nearly so, subglobose or obovoid, the valves pubescent externally and usually pubescent within; style 3–5 mm long; seeds 2–8 per locule; $n = 5, 15$. Pinyon-juniper, sagebrush, and upward to spruce-fir communities at 1405 to 2750 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Kane, Uintah, and Wayne counties; Minnesota and Illinois, west to Montana, and south to Nevada, Colorado, and Kansas; 53 (vii).

Lesquerella multiceps Maguire Wasatch Bladderpod. Perennial, caespitose, the caudex simple or several-to

many-branched, more or less clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 3–20 cm long, rarely more, prostrate to erect; basal leaves 1–6 cm long, 4–15 (20) mm wide, blades elliptic to obovate, differentiated from long slender petioles; cauline leaves 0.4–2 cm long, 1–5 mm wide; pedicels 3–10 mm long, S-shaped; sepals 4.3–7 mm long; petals 5–10 mm long, yellow, spatulate; silicles (excluding style) 3–5.5 mm long, sessile or nearly so, ovoid; valves pubescent externally, glabrous within; style 3–6.5 mm long; ovules 2–4 per locule. Mountain brush and aspen communities at 1830 to 2960 m elevation in Cache (type from Tony Grove Lake) and Rich counties; Idaho, Wyoming; 6 (0).

Lesquerella occidentalis Wats. Western Bladderpod. Perennial, caespitose, the caudex simple or few-branched, more or less clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 2–15 cm long, rarely more, prostrate, decumbent, ascending or erect, usually simple; basal leaves 0.5–8 cm long, 3–15 mm wide, the blades spatulate to oval or obovate, differentiated from petioles; cauline leaves 4–15 mm long, 1–8 mm wide; pedicels 3–10 mm long or more, sigmoid or straight, ascending; sepals 4–7 mm long; petals 6–10 mm long, yellow, spatulate; silicles (excluding style) 4–6 mm long, ellipsoid, usually compressed apically, the valves pubescent externally and also within; style 2–4 mm long; seeds 2–8 per locule. Sagebrush, pinyon-juniper, aspen, Douglas fir, and alpine meadow communities, often in talus or on rock outcrops, at 2010 to 2355 m in Beaver, Box Elder, Davis, Juab, Millard, Tooele, and Weber counties; Idaho and Nevada to California and Oregon; 24 (0). Our material belongs to var. *cinerascens* Maguire & Holmgren [*L. occidentalis* ssp. *cinerascens* (Maguire & Holmgren) Rollins & Shaw; *L. goodrichii* Rollins, type from Millard County]. I can see no way to segregate our materials into additional subordinate taxa.

Lesquerella prostrata A. Nels. Rich Bladderpod. Perennial, caespitose, the caudex simple or few-branched, the branches more or less clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 3–15 cm tall, decumbent to ascending, simple; basal leaves 1–5 cm long, 5–10 (15) mm wide, the blades deltate to hastate, more or less angular, differentiated from slender petioles; cauline leaves 4–15 mm long, 1–5 cm wide; pedicels 4–10 mm long, curved to straight or S-shaped, spreading; sepals 5–6 mm long; petals 5–9 mm long, yellow, spatulate; silicles (excluding style) 4–7 mm long, sessile or nearly so, ovoid to ellipsoid, not flattened apically, the valves pubescent externally, glabrous or sparsely hairy within; style 3–6 mm long; seeds 2–4 per locule. Sagebrush, grass, and juniper communities at 1830 to 2135 m in Rich County; Wyoming and Idaho; 4 (i).

Lesquerella rectipes Woot. & Standl. Colorado Bladderpod. Perennial, loosely caespitose, the caudex simple or few-branched, more or less clothed by marcescent leaf-bases; stems 0.4–4 dm tall or more, decumbent to ascending or erect, simple or branched; basal leaves 1–8 (10) cm long, 3–12 mm wide, oblanceolate to elliptic, entire or toothed, tapering gradually to base; cauline leaves 0.6–3 cm long, 2–10 mm wide; pedicels 4–10 mm long or more, straight or S-shaped, spreading to ascending or recurved; sepals 4–8 mm long; petals 6–10 mm long or more, yellow, spatulate to obovate; fruit (excluding style) 4–7 mm long, substipitate to sessile, ovoid to ellipsoid, pubescent externally and glabrous or

pubescent within; style 2–7 mm long; seeds 4–8 per locule; $2n = 18$. Blackbrush, other warm desert shrub, pinyon-juniper, and ponderosa pine communities from 1125 to 2565 m Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Washington and Wayne counties; Arizona, Colorado and New Mexico; 63 (xviii). This is the most common of the tall species of *Lesquerella* in southeastern Utah.

Lesquerella rubicundula Rollins Breaks Bladderpod. [*L. hitchcockii* ssp. *rubicundula* (Rollins) Maquire & Holmgren]. Perennial, loosely caespitose, not matted, the caudex simple or with few to several branches, clothed with marcescent leaf bases; herbage pubescent with stellate hairs; stems 1–5 cm tall, erect, simple; leaves mainly basal, 3–12 mm long, 1–2 mm wide, not differentiated into blade and petiole; pedicels 1–6 mm long, straight or curved, ascending; sepals 3.2–4.5 mm long; petals 4.5–7 mm long, yellow, spatulate; silicles (excluding style) 3–5 mm long, sessile to substipitate, ovoid; valves glabrous externally and within; style 2.8–3.5 mm long; ovules 2–4 per locule. Ponderosa pine, bristlecone pine, and spruce-fir communities on the Pink and White Limestone members of the Wasatch Formation, at 2350 to 3355 m in Garfield (type locality at Red Canyon), Iron, and Kane counties; endemic; 22 (i).

Lesquerella subumbellata Rollins Rollins Bladderpod. Perennial, caespitose, the caudex several-branched, clothed with marcescent leaf bases and often with leaves as well; herbage pubescent with stellate hairs; stems 1–8 (10) cm tall, ascending to erect, simple; basal leaves 0.8–3 cm long, 2–6 (10) mm wide, at least outer and usually most of them obovate-spatulate, gradually tapering to petiole; cauline leaves 0.3–2 cm long, 1–4 mm wide; pedicels 2–5 mm long, straight or curved, ascending; sepals 3–4.5 mm long; petals 5–6 mm long, yellow, spatulate; silicles (excluding style) 3.5–5 mm long, subsessile, ellipsoid, the valves pubescent externally; style 1.5–2.5 mm long; seeds 2–6 per locule. Shadscale, pinyon-juniper, and sagebrush communities at 1645 to 2440 m in Duchesne, Emery, and Uintah (type locality 18 miles north of Vernal) counties; Colorado, Wyoming; 52 (v). Rollins and Shaw (1973) place this taxon within the range of variation of *Lesquerella alpina*. That disposition ignores the basic continuity of *L. subumbellata*, and likewise denies the apparent relationship of *L. alpina* in quite another direction, i.e., with *L. intermedia*. The uniformly broad blades of basal leaves, although tenuous as diagnostic features, are on the order of other such characters in this genus, with its critically defined species.

Lesquerella tenella A. Nels. Slender Bladderpod. [*L. gordonii* var. *sessilis* Wats., type from St. George; *L. palmieri* authors, not Wats.]. Annual, the herbage pubescent with stellate hairs; stems 1–5 dm tall or more, spreading-decumbent to erect, simple or branched; basal leaves 1.5–6 cm long, 2–15 mm wide, the blades elliptic, sometimes toothed, differentiated from the petiole; cauline leaves 0.4–4 cm long, 2–10 cm wide; pedicels 4–12 (18) mm long or more, S-shaped, spreading to recurved; sepals 3.5–7 mm long; petals 5–10 mm long, yellow to orange, orbicular to obovate; silicles (excluding style) 3.5–5 mm long, sessile to substipitate, globose to obovoid, the valves pubescent externally and internally; style 2–4.5 mm long; ovules 2–6 per locule; $2n = 10$. Blackbrush, creosote brush, and Joshua tree communities at 790 to 1130 m in Washington County; Nevada and California south to Mexico; 12 (ii).

Lesquerella tumulosa (Barneby) Reveal Kodachrome Bladderpod. [*L. hitchcockii* ssp. *tumulosa* Barneby, type from southeast of Cannonville]. Perennial, pulvinate-caespitose, and mound-forming, densely matted, the caudex many-branched, clothed with marcescent leaves and leaf bases; herbage pubescent with stellate hairs; stems 1–4 cm tall, erect, simple; leaves mainly basal, 2–10 (15) mm long, (0.7) 1–1.5 (2) mm wide, not differentiated into blade and petiole; pedicels 2–5 mm long, straight or S-shaped, spreading to ascending; sepals 2.8–4 mm long; petals 5–7 mm long, yellow, spatulate; silicles (excluding style) 2.7–3.8 mm long, substipitate, ovoid, the valves glabrous externally and internally; style 1.9–2.7 mm long; ovules 2–4 per locule. White, bare shale knolls (Winsor Member of the Carmel Formation) among scattered juniper in a *Bouteloua* grassland, Kane County; endemic; 8 (ii). This curious species grows with several other mound-forming plants at the type locality.

Lesquerella utahensis Rydb. Utah Bladderpod. Perennial, caespitose, the caudex usually simple, more or less clothed with persistent leaf-bases; herbage pubescent with stellate hairs; stems 2–15 cm tall or more, decumbent to ascending or erect; basal leaves 1.2–6.5 cm long, 1–5 mm wide; pedicels 3–10 mm long, sigmoid or curved, ascending; sepals 4.5–5.7 (7) mm long; petals 6.5–9 mm long, yellow, spatulate; silicles (excluding style) 3.5–4.5 (6) mm long, substipitate to sessile, globose-ellipsoid, compressed contrary to partition, the valves pubescent externally, glabrous internally; style 4–5.5 (6.5) mm long; seeds 3–6 per locule. Sagebrush, meadows, and spruce-fir communities at 2255 to 3355 m in Daggett, Duchesne, Salt Lake, Summit, Uintah, Utah (the type is from American Fork Canyon), and Wasatch counties; endemic; 26 (i).

Lesquerella wardii Wats. Ward Bladderpod. Perennial, the caudex usually simple, clothed with marcescent leaf-bases; herbage pubescent with stellate hairs; stems 2–20 cm tall, rarely more, decumbent to ascending or erect, simple; basal leaves 1–4.5 (6) cm long, 3–15 (20) mm wide, the blades deltoid to orbicular or elliptic, differentiated from slender petiole; pedicels 2–7 mm long, straight, curved, or S-shaped, ascending; sepals 4–6.3 (8) mm long; petals (5.5) 6–9 (11) mm long, yellow, spatulate; silicles (3.5) 4–6.8 (8) mm long, substipitate to sessile, ellipsoid or ovoid, not compressed apically, pubescent externally and usually so internally; style (1) 2.2–4 (7) mm long; seeds 2–8 per locule. Pinyon-juniper, mountain brush, sagebrush, meadow, and spruce-fir communities at 1890 to 3355 m in Beaver, Garfield (type area is Aquarius Plateau), Iron, Kane, Piute, Sanpete, and Wayne counties; endemic; 55 (xiv). The Ward bladderpod is most similar to the partially sympatric *L. kingii* var. *parvifolia* from which it is distinguished inter alia in the silicles being rounded, not compressed, apically.

Lobularia Desv.

Annual or rarely biennial herbs, pubescent with malpighian hairs, arising from taproots; leaves alternate, simple, entire, petiolate or sessile, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white, pink, or lavender; stamens 6, the filaments lacking glandular processes; style short, the stigma capitate; fruit a silicle, about as broad as long, compressed parallel to septum, dehiscent, valves 1–nerved; seeds 1 per locule.

Lobularia maritima (L.) Desv. Sweet Alyssum. [*Clypeola maritima* L.; *Alyssum maritimum* (L.) Lam.]. Annual,

the stems spreading-decumbent or ascending to erect, usually much branched, 0.8–3 dm long or more; leaves linear-ob lanceolate, 0.8–3 (4) cm long, 1–4 mm wide, strigose on both surfaces; pedicels spreading-ascending, 5–9 mm long; sepals 1–1.5 (2) mm long, green or purplish, pubescent; petals 2.5–4 mm long, white, pink or lavender, the blades obovate; silicles 2.5–3.5 mm long and about as broad; valves sparingly strigose; style 0.3–0.6 mm long. Ornamental border plant with sweetly scented flowers, escaping and occasionally persistent; introduced from Europe; 7 (0).

Lunaria L.

Annual or biennial herbs, pubescent with simple or with some forked hairs, arising from taproots; leaves usually alternate and basal, simple, dentate to lobed, petiolate, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, pink to lilac, blue, or purplish; stamens 6, the filaments lacking glandular processes; style elongate, persistent; stigma capitate, bilobed; fruit a stipitate silicle, about as broad as long, compressed parallel to septum, dehiscent; valves reticulately veined; seeds 3–5 per locule.

Lunaria annua L. Honesty; Moonwort; Satin-flower. Stems one to several, simple or branched, mostly 4–10 dm tall or more, pubescent with simple and rarely some forked, hairs; leaves 2.5–10 (15) cm long, 1.5–8 cm wide, rarely more, ovate to lance-ovate or cordate, dentate to lobed, pubescent with simple or rarely forked hairs; pedicels 10–22 mm long, spreading-ascending, pubescent; sepals 6–8 mm long, greenish or variously suffused, sparsely pubescent; petals 14–20 mm long, pink to lilac or blue to purplish, obovate; silicles 32–45 mm long, 25–35 mm wide, borne on stipes 7–12 mm long, much flattened, the valves glabrous; style 6–8 mm long; $2n = 30$. Ornamental, cultivated for the showy flowers and distinctive fruiting inflorescences, occasionally escaping and persisting in Cache, Salt Lake, and Utah counties; introduced from Europe; 8 (i).

Malcolmia (L.) R. Br.

Annuals, pubescent with forked or 3–rayed hairs, from taproots; leaves alternate and basal, simple, sinuate-dentate, the cauline ones petiolate to sessile, not auriculate; flowers racemose, pedicels seldom subtended by bracts; sepals 4, tardily deciduous; petals 4, pink to lavender; stamens 6, the filaments lacking glandular processes; style tapering; stigma oblique; fruit a silique, many times longer than broad, subterete, dehiscent; valves nerveless; seeds uniseriate.

Malcolmia africana R. Br. in Ait. African Mustard. Stems decumbent-ascending to erect, 3–40 cm tall, simple or branched almost throughout, pubescent with forked or 3–rayed hairs; leaves mainly basal to mainly cauline, 1.2–9 cm long, 0.3–2.3 cm wide, oblanceolate to elliptic, sinuate-dentate, petiolate to sessile, not auriculate; pedicels spreading, 1–2 mm long, pubescent; sepals 3.7–5.2 mm long, often reddish or purplish, pubescent; petals 6.2–9.5 mm long, pink to lavender, rounded apically, spreading; silicles 33–66 mm long, straight, pubescent; style to 1 mm long; stigma oblique; $2n = 28$. Roadsides, foothills, and other disturbed sites in many plant communities at 850 to 2685 m in most if not all Utah counties; widespread throughout the Great Basin and adjacent areas of the western U. S.; adventive from Africa,

83 (viii). This mustard lacks the distinctive musky odor of the look-alike *Chorispora tenella* q.v.

Nasturtium R. Br.

Glabrous perennials from subrhizomatous stolons; leaves alternate, simple or some pinnately compound, petiolate and auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white; stamens 6, the filaments lacking glandular processes; style stout, well developed, the stigma capitate, bilobed; fruit a silique, several times longer than broad, oblong, somewhat compressed parallel to septum, the valves 1–nerved; seeds several to many, biseriolate.

Nasturtium officinale R. Br. in Ait. Water Cress. [*Sisymbrium nasturtium-aquaticum* L.; *Rorippa nasturtium-aquaticum* (L.) Schinz & Thell.]. Plants submersed or emergent, with succulent stems (0.3) 1–8 (10) dm long or more, glabrous; leaves 1–10 cm long, with terminal lobe usually the largest, falsely petiolate and narrowly auriculate-clasping basally; pedicels 5–13 (20) mm long, spreading to spreading-ascending, glabrous or pubescent; sepals 2–3 mm long, green or with white tips, glabrous; petals 3–4.7 mm long, white, rarely with purplish veins, oblanceolate; silicles 10–18 (25) mm long, 1.8–2.4 mm wide; style 0.7–1.2 mm long; $n = 7, 14, 16$. Seeps, springs, and sluggish to swift streams, usually in flowing water at 850 to 2745 m in all Utah counties; widely established in North America; introduced from Europe; 72 (vii). The plant is eaten as a salad green, but poses health problems due to contamination with various infective organisms.

Parrya R. Br.

Perennial, glabrous, herbs, pubescent with stipitate-glandular hairs, arising from taproots and with simple to branched caudices; leaves mainly basal, simple, dentate, tapering basally, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, pink to lavender; stamens 6, the filaments lacking glandular processes; style stout, persistent, the stigma bilobed; fruit a silique, usually several times longer than broad, oblong, constricted between seeds, strongly compressed parallel to the septum; valves 1–nerved; seeds 1 to several per locule.

Parrya rydbergii Botsch. Uinta Parrya. [*P. platycarpa* Rydb., not Hook. f. & Thomas]. Rosulate low perennials, the caudex clothed with marcescent leaf bases; stems scapose, 7–12 cm tall, 2–8 cm to base of raceme, the herbage stipitate-glandular; leaves 3–10 cm long, 6–20 mm wide, oblanceolate to elliptic; racemes 3– to 10-flowered; pedicels 4–20 mm long, stout, steeply ascending; sepals 7.2–9.3 mm long, purplish, stipitate-glandular or glabrous; petals 16–23 mm long, pink to lavender, cuneate-spatulate, emarginate; silicles 25–47 mm long, 3–3.5 mm wide, straight or curved, the mid-nerve prominent, glabrous or stipitate-glandular; style 0.3–0.6 mm long; stigma deeply bilobed; seeds 1–4 per locule. Alpine tundra, usually in rock stripes and talus, at 3325 to 3965 m in the Uinta Mts., Daggett, Duchesne, Summit (type from Uinta Mts.), and Uintah counties; endemic; 13 (iii).

Physaria (Nutt.) Gray

Stellate-pubescent perennials, arising from taproots; leaves mainly basal, the cauline ones much reduced,

alternate, simple, tapering basally or merely sessile, not auriculate; flowers racemose; pedicels straight, curved, sigmoid, spreading or descending, not subtended by bracts; sepals 4, deciduous; petals 4, yellow, rarely purple, rounded; stamens 6, the filaments lacking glandular processes; style slender, the stigma capitate; fruit a sessile, bladderly-inflated silicle, often broader than long, varying in outline, compressed (if at all) contrary to septum, the valves veinless; seeds 2–6 per locule, biseriate. The diagnostic features used to segregate entities of this genus are mainly based on the shape of the mature silicle and the length of the style. These features are subject to variation within rather broad limits, and not all specimens will fit neatly into the taxa in the following key. Immature specimens are particularly difficult to place, and fruiting specimens are more easily distinguished than flowering ones.

Mulligan, G. A. 1967. Cytotaxonomy of *Physaria acutifolia*, *P. chambersii*, and *P. newberryi* (Cruciferae). *Canad. J. Bot.* 45: 1857–1895.
 Payson, E. B. 1915. Notes on certain Cruciferae, *Physaria*. *Ann. Missouri Bot. Gard.* 5: 143–147.
 Rollins, R. C. 1939. The cruciferous genus *Physaria*. *Ann. Missouri Bot. Gard.* 5: 143–147.
 Waite, S. B. 1973. A taxonomic revision of *Physaria* (Cruciferae) in Utah. *Great Basin Nat.* 33: 31–36.

- 1. Styles 2–3 (4) mm long, valves of silicles sharply angled at maturity; plants of Garfield, Grand, Kane, San Juan, and Washington counties *P. newberryi*
- Styles mostly 4–8 mm long or more; valves of silicles obtusely angled to rounded at maturity; distribution various 2
- 2(1). Basal leaves sinuate-dentate to lobed, sometimes entire; cauline leaves often toothed, plants of the Uinta Basin *P. floribunda*
- Basal leaves entire or less commonly sinuate-dentate; cauline leaves entire; plants of broad distribution 3
- 3(2). Sinuses of silicles indented above and below, when immature equally rounded to apex and base; valves rounded, not angled at maturity; plants mainly of the Colorado River drainage system *P. acutifolia*
- Sinuses of silicles only slightly indented to rounded below, deeply indented above, when immature tapering to base and orbiculate in outline; valves obtusely angled at maturity; plants mainly of Great Basin and valleys of Virgin River drainage system ... *P. chambersii*

***Physaria acutifolia* Rydb.** Rydberg Twinpod. [*P. australis* sensu Rollins]. Perennial, caespitose, the caudex usually simple, clothed with marcescent leaf bases; stems 0.3–2 (2.5) dm long, decumbent to ascending or erect, simple; basal leaves 1.7–9.5 cm long, 0.6–4.5 cm wide, the blade orbicular to ovate or obovate, less commonly lance-elliptic, entire, angular, or toothed to repand; cauline leaves greatly reduced; pedicels mostly 7–16 mm long, ascending to descending; sepals 5.2–8.7 mm long; petals 7.5–12.5 mm long, yellow or purple, spatulate; silicles bladderly-inflated, sinuses indented above and somewhat less so below, the valves 7–15 mm long in fruit, the surface rounded in cross-section, papery to membranous; style 3.8–7 mm long; $n = 5$. This taxon might best be regarded at infraspecific level, along with *P. chambersii*, in an expanded *P. newberryi*. The taxa differ in about the same magnitude as do varieties in other genera in this family. Three weakly differentiated and intergrading morphological subunits are recognized at varietal level.

- 1. Leaves of basal rosette, repand to sinuately lobed, plants of the rim of the Uinta Basin, especially along the south and southwest; flowers yellow or purple externally *P. acutifolia* var. *purpurea*
- Leaves of basal rosette entire or rarely somewhat sinuately lobed, plants of various distribution; flowers typically yellow 2
- 2(1). Plants often with a branching caudex, the branches commonly slender, leaves of basal rosette mostly less than 12 (15) mm wide; plants of high elevations in northwestern Duchesne and adjacent Wasatch counties ...
 *P. acutifolia* var. *stylosa*
- Plants seldom with a branching caudex, the branches, when present, typically thickened; leaves of basal rosette typically more than 12 mm wide; plants widespread *P. acutifolia* var. *acutifolia*

Var. *acutifolia* Salt desert shrub, mixed desert shrub, sagebrush-grass, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1130 to 2745 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Morgan, Rich, San Juan, Sevier, Summit, Uintah, and Wayne counties; Wyoming and Colorado; 173 (xxxii).

Var. *purpurea* Welsh & Reveal [*P. repandum* Rollins, type from Duchesne County]. Pinyon-juniper, sagebrush, ponderosa pine, Douglas fir, and limber pine communities at 2135 to 2870 m in Carbon, Duchesne, Grand (type from north of Thompson), Uintah, and Wasatch counties; endemic; 14 (v).

Var. *stylosa* (Rollins) Welsh [*P. stylosa* Rollins]. Spruce-fir communities and alpine tundra, mainly in talus slopes, at 2955 to 3450 m in northwestern Duchesne and adjacent Wasatch counties; endemic; 3 (0).

***Physaria chambersii* Rollins** Perennial, caespitose, the caudex usually simple, clothed with marcescent leaf bases; stems 0.3–2.5 dm long, decumbent to ascending or erect, simple; basal leaves 1–7.5 (13) cm long, 0.3–3.5 cm wide, the blade orbicular to ovate, obovate, elliptic or oblanceolate, entire or repand, angular, or toothed; cauline leaves greatly reduced; pedicels mostly 4–18 mm long, ascending to descending; sepals 6–7.2 mm long; petals 8–13 mm long, yellow, spatulate; silicles bladderly-inflated, the upper sinus deeply indented and with a broad, V-shaped sinus, the lower shallow or lacking; valves 11–17 mm long in mature fruit, the surface obtusely angled at edges, papery to membranous; style 4–8 mm long; $n = 4, 8, 12$. This entity is more or less confluent and partially sympatric with *P. acutifolia* eastward and with *P. newberryi* southward. Three weakly definable, morphologically intergrading and possibly taxonomically insignificant, varieties are recognized.

- 1. Plants with branching sobiliferous caudex branches (less commonly some single), growing on the Pink and White Limestone members of the Wasatch Formation *P. chambersii* var. *sobilifera*
- Plants with simple caudices, rarely some branching but seldom if ever especially sobiliferous, growing in various substrates, sometimes as above 2
- 2(1). Trichomes with peltate rays more or less confluent, disklike with rays projecting as teeth; plants of western Garfield and Kane counties, transitional to the next ...
 *P. chambersii* var. *membranacea*
- Trichomes with peltate rays more or less distinct, not disklike and with rays projecting as teeth; plants widely distributed *P. chambersii* var. *chambersii*

Var. *chambersii* Warm desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, bristlecone pine, and spruce-fir communities at 820 to 3420 m in Beaver, Boxelder, Cache, Carbon, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, Rich, Sanpete, Sevier, Summit, Tooele, Washington, and Wayne counties; Arizona and Utah west to California and Oregon; 188 (xxviii).

Var. *membranacea* Rollins [*P. lepidota* Rollins, type from west of Mt. Carmel]. Pinyon-juniper, salt desert shrub, mountain brush, ponderosa pine, and aspen communities at 1525 to 2440 m in Kane and Garfield (type from Red Canyon) counties; endemic; 18 (ii). Plants with the peculiar, gear-shaped trichomes grade by degree into the typical variety with which they are sympatric.

Var. *sobolifera* Welsh Ponderosa pine, bristlecone pine, and Douglas fir communities at 2135 to 2900 m in western Garfield County (type locality); endemic; 3 (0).

Physaria floribunda Rydb. Grand Junction Twinpod. [*P. grahamii* Morton, type from Chandler Canyon, Uintah County]. Perennial, caespitose, the caudex simple, clothed with marcescent leaf bases; stems 5–15 (20) cm long, ascending to erect, simple; basal leaves 2–15 cm long, 0.8–5 cm wide, blade oblanceolate to spatulate, toothed to pinnatifid; cauline leaves often toothed, much reduced; pedicels 5–20 mm long, ascending; sepals 4.5–7 mm long; petals 6.5–10 mm long, yellow, spatulate; fruit strongly inflated, cordate, 4–9 mm long, 3–10 mm wide; style 3.5–8 mm long. Mixed desert shrub, known from southern Uintah County; Colorado and New Mexico; 1 (0). I can find no reason for recognition of *P. grahamii* as distinct from *P. floribunda*.

Physaria newberryi Gray Newberry Twinpod. [*Coulterina newberryi* (Gray) Kuntze; *P. didymocarpa* var. *newberryi* (Gray) Jones; *P. newberryi* var. *racemosa* Rollins, type from 13.5 mi N of St. George]. Perennial, caespitose, the caudex simple, clothed with marcescent leaf bases; stems 4–22 cm long, decumbent to ascending or erect; basal leaves 2–7.5 cm long, 0.8–4 cm wide, the blade obovate to orbicular, ovate, or spatulate, angled, indistinctly toothed or more commonly entire; cauline leaves much reduced, entire; pedicels 5–17 mm long, ascending to descending; sepals 6–8.5 mm long; petals 6.5–12 mm long, yellow, spatulate; silicles bladderly-inflated, the upper sinus deeply indented, the lower one shallow or lacking; valves 8–11 mm long or more in fruit, sharply angled at the margins, papery; style 2–3.5 mm long; n = 8. Warm desert shrub, galleta-shadscale, other salt desert shrub, pinyon-juniper, and ponderosa pine communities at 885 to 2350 m in Garfield, Grand, Kane, San Juan, and Washington counties; Arizona and New Mexico; 20 (iv). The phase of the species known as var. *racemosa* is completely transitional with typical materials, and appears to be taxonomically negligible. Where this species contacts either *P. chambersii* or *P. acutifolia* there are transitional specimens. Style length forms a continuum from one entity to another, and errors in determination are possible, especially in material that lack mature fruits. A better course, perhaps would be to regard *P. acutifolia* and *P. chambersii* as infraspecific taxa within *P. newberryi*, a course not intended or implied herein. A quadrinomial hierarchy of categories would seem to best represent the taxa of this complex in Utah.

Raphanus L.

Pubescent annuals with simple hairs, from tuberous taproots; leaves alternate and basal, simple, lyrate-pin-

natifid, cauline ones petiolate to subsessile, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white or pink to lavender; stamens 6, filaments lacking glandular processes; style apical on a tapering sterile beak, the stigma minute, bilobed; fruit a silique, many times longer than broad, terete, indehiscent, breaking irregularly at maturity into segments; valves several-grooved; seeds uniseriate.

Raphanus sativus L. Radish. Plants erect, the stems mostly 4–10 dm tall, simple or more commonly branched, more or less hispid with simple hairs; leaves basal and cauline, mostly 2–18 cm long, 0.5–6.5 cm wide, lyrate-pinnatifid, hispid, the cauline ones reduced upwardly; pedicels 10–20 mm long or more, spreading to ascending; sepals 7–9 mm long, green to reddish or purplish, glabrous; petals 12–20 mm long, white to pink or lavender; siliques 30–60 mm long, 5–10 mm wide, the beak 10–25 mm long; n = 9. Cultivated for the edible roots, rarely escaping but usually not persisting; introduced from Europe; 1 (0). The yellow-flowered species, *R. raphanistrum* L., is an occasional weed that is to be expected in the state.

Rorippa Scop.

Plants glabrous to hirsute with simple hairs, annual, biennial or perennial, from taproots or rhizomes; leaves alternate and basal, lyrate-pinnatifid, sinuately toothed, lobed, or uppermost subtentire, petiolate to sessile, auriculate in some; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, yellow, fading pinkish in some, truncate to rounded apically; stamens 6, the filaments lacking glandular processes; style prominent to almost lacking, the stigma capitate; fruit a sessile silique or silicle from one to several times longer than broad, terete or somewhat flattened; seeds several to numerous, mostly biseri-ate.

Stuckey, R. L. 1972. Taxonomy and distribution of the genus *Rorippa* (Cruciferae) in North America. Sida 4: 279–430.

- 1. Plants perennial, with creeping rhizomes; petals 2.5–5 mm long 2
- Plants annual or biennial, rarely perennial, from taproots; petals 0.7–2.5 (3) mm long 4
- 2(1). Plants 2.5–6 dm tall; siliques 8–10 (15) mm long, fertile *R. sylvestris*
- Plants of various height but, if as above, the fruit globose and usually seedless 3
- 3(2). Plants 3–9 dm tall; sepals 1–2 mm long; fruit globose, usually seedless; introduced weeds of cultivated lands *R. austriaca*
- Plants 1–3 dm tall; sepals 2–4 mm long; fruit ovoid to oblong, bearing seeds; indigenous plants of saline valley bottoms *R. sinuata*
- 4(1). Siliques globose, 1–1.3 times longer than broad; partition circular in outline *R. sphaerocarpa*
- Siliques cylindroid or tapering at the apex, 2–5 times longer than wide or more; partition oblong to triangular in outline 5
- 5(4). Plants prostrate to decumbent; stems 2 dm long or less; siliques tapering to apex, minutely papillose *R. tenerrima*
- Plants prostrate to decumbent or erect; stems often over 2 dm long; siliques cylindroid or tapering to apex, smooth 6

- 6(5). Plants erect, stems mostly 3–10 dm long, pedicels usually as long as the fruit, mostly 4–12 mm long *R. islandica*
- Plants prostrate, decumbent, ascending, or erect, mostly 2–5 dm tall; pedicels usually shorter than the fruit, mostly 2–4 mm long *R. curvipes*

Rorippa austriaca (Crantz) Besser Austrian Field-cress. [*Nasturtium austriacum* Crantz; *Radicula austriaca* (Crantz) Small]. Perennial, from thickened rhizomes, the stems 3–9 dm tall, erect, slender, finely puberulent; leaves 3–6 cm long, oblong to oblong-ovate, unequally serrate, glabrous, narrowed to a petiolelike auriculate base; racemes 7–12 cm long, in terminal panicles; pedicels 4–10 mm long in fruit, spreading-ascending; sepals 1–2 mm long; petals 3–15 mm long, yellow; silicles subglobose, 1.5–3 mm long; $2n = 16$. Occasional to rare weed of cultivated places, reported for south-central Utah by Stuckey (1972); 0 (0).

Rorippa curvipes Greene Annual or short-lived perennial, arising from taproots; stems (1) 2–5 dm long, prostrate to decumbent, ascending or erect, glabrous; leaves (2) 4–8 (12) cm long, 3–15 mm wide, oblong, obovate, spatulate or oblanceolate, entire, crenate, irregularly serrate, or the lower ones pinnatifid, petiolate to sessile, often auriculate; racemes 4–15 cm long, in axillary and terminal racemes; pedicels mostly 2–5 mm long in fruit, spreading to ascending or descending; sepals 0.8–1.7 mm long; petals 0.5–2.8 mm long, yellow, rarely fading pinkish; silicles 1.8–8.7 mm long, 0.6–2.3 mm wide; style 0.2–1.3 mm long; $2n = 16$. Three morphologically intergrading phases are recognized. They might not represent taxa.

- 1. Petals 1.2–2.8 mm long, longer than the sepals; silicles usually acute; plants prostrate to decumbent *R. curvipes* var. *alpina*
- Petals mostly 0.5–1.5 mm long, about as long as or shorter than the sepals; silicles acute or obtuse; plants prostrate to decumbent or erect 2
- 2(1). Silicles 1.4–5 mm long, acute to somewhat obtuse; petals 0.5–1 (1.3) mm long *R. curvipes* var. *curvipes*
- Silicles 3.5–8 mm long or more, obtuse apically; petals 1–1.5 mm long *R. curvipes* var. *integra*

Var. alpina (Wats.) Stuckey [*Nasturtium obtusum* var. *alpinum* Wats., type from the Uinta Mts.; *R. obtusa* var. *alpina* (Wats.) Britt.; *R. alpina* (Wats.) Rydb.; *Radicula alpina* (Wats.) Greene]. Bogs and seeps, mainly in sagebrush and mountain brush communities upward to alpine tundra at 1370 to 3390 m in Cache, Daggett, Duchesne, Emery, Garfield, Summit, Uintah, and Utah counties; Idaho, Wyoming, and Colorado; 16 (ii).

Var. curvipes [*Cardamine palustris* var. *jonesii* Kuntze, type from City Creek Canyon; *Rorippa underwoodii* Rydb.; *Radicula curvipes* (Greene) Greene; *Radicula underwoodii* (Rydb.) Heller; *Rorippa obtusa* authors, not (Nutt.) Britt.; *Rorippa curvisiliqua* authors, not (Hook.) Bessey ex Britt.]. Ponds, streams, and seep margins in riparian, mountain brush, aspen, lodgepole pine, and spruce-fir communities, at 1370 to 3355 m in Beaver, Daggett, Duchesne, Garfield, Grand, Iron, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Uintah, Utah, Wasatch, Washington, and Wayne counties; Alberta and Saskatchewan east to Wisconsin and south to California, Arizona, New Mexico and Kansas; 50 (xi).

Var. integra (Rydb.) Stuckey [*R. integra* Rydb., type from Wasatch Mts.; *Radicula integra* (Rydb.) Heller; *Rorippa obtusa* var. *integra* (Rydb.) Marie-Victorin]. Stream banks and beaches, typically in spruce-fir communities, but sometimes much below them, at 2070 to 3390 m elevation in Box Elder, Daggett, Duchesne, Emery, Piute, Summit, Uintah, Utah, and Wasatch (the probable type area) counties; Alberta south to California and east to Montana and Wyoming; 16 (ii).

Rorippa islandica (Oeder) Borbas [*Sisymbrium islandicum* Oeder]. Annual or biennial, arising from taproots, the stems 3–10 dm tall, erect, glabrous or pubescent; leaves mostly 2–10 cm long, 0.6–2.5 cm wide, more or less pinnatifid, or cauline ones merely toothed, petiolate to sessile and more or less auriculate; racemes 3–10 cm long or more, both axillary and terminal; pedicels mostly 4–10 mm long in fruit, ascending to spreading or descending; sepals 1.2–2.5 mm long; petals 0.8–3.5 mm long, yellow, fading pinkish or purplish; silicles 3–8 mm long, rarely more, 2–3 mm wide; valves glabrous; style 0.2–1.2 mm long. Presented herein is a conservative approach to the species, maintaining *R. palustris* (L.) Besser [*Sisymbrium amphibium* var. *palustre* L.; *Sisymbrium palustre* (L.) Pollich; *Radicula palustris* (L.) Moench; *Nasturtium palustre* (L.) DC.] within the broad definition of *R. islandica*, thereby differing from the recent treatment of the species complex in North America by Stuckey (1972). Within the North American population, Stuckey recognizes several subspecies and varieties, denoting a bewildering array of morphological and geographically reinforced infraspecific variation. In Utah, we have only 2 of the 11 entities recognized.

- 1. Leaves glabrous beneath; stems glabrous or pubescent only at the base *R. islandica* var. *glabra*
- Leaves hairy beneath; stems pubescent usually to the apex *R. islandica* var. *hispida*

Var. glabra (Schulz) Welsh & Reveal [*Nasturtium palustre* var. *glabrum* Schulz; *Radicula glabra* (Schulz) Britt.; *R. palustris* ssp. *glabra* (Schulz) Stuckey]. Palustrine and riparian sites, often in mud, at 1280 to 3175 m in Box Elder, Cache, Duchesne, Garfield, Rich, Sevier, and Utah counties; Alberta south to New Mexico; Cuba (the type area); 13 (0).

Var. hispida (Desv.) Butters & Abbe [*Brachylobus hispidus* Desv.; *Sisymbrium hispidum* (Desv.) Poir.; *Nasturtium hispidum* (Desv.) DC.; *N. palustre* var. *hispidum* (Desv.) Gray; *Radicula hispida* (Desv.) Britt.; *R. palustris* var. *hispida* (Desv.) Robins.; *Rorippa palustris* ssp. *hispida* (Desv.) Jonsell]. Palustrine and riparian sites, often in mud, from 1280 to 2600 m in Cache, Davis, Duchesne, Grand, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, and Weber counties; widespread in North America; 20 (i).

Rorippa sinuata (Nutt.) A. S. Hitchc. [*Nasturtium sinuatum* Nutt. ex T. & G.; *Radicula sinuata* (Nutt.) Greene]. Perennial, arising from a slender rhizome; stems 0.8–5 dm long, often more or less decumbent, glabrous to minutely hairy; leaves (1) 2–8 cm long, oblong in outline, pinnatifid, petiolate to sessile and somewhat auriculate; racemes 3–15 (25) cm long, in axillary and terminal racemes; pedicels 5–11 mm long in fruit, ascending to recurved; sepals 2.7–4.5 mm long; petals 3.5–5.5 mm long, yellow, fading light yellow; silicles 5–12 mm long, ca 1.5 mm wide, glabrous to roughened,

narrowed to a style, this 1–2.5 mm long. Palustrine, riparian, and other moist, often saline, sites at 1125 to 1435 m in Uintah and San Juan counties; widespread in the western states; 6 (i).

Rorippa sphaerocarpa (Gray) Britt. [*Nasturtium sphaerocarpum* Gray; *N. obtusum* var. *sphaerocarpum* (Gray) Wats. ex Allen; *Radicula sphaerocarpa* (Gray) Greene; *R. obtusa* var. *sphaerocarpa* (Gray) Robins.; *Rorippa obtusa* var. *sphaerocarpa* (Gray) Cory]. Annual, arising from taproots; stems 1–4 dm long, decumbent to erect, sparingly hirsute below; leaves 3–10 cm long, 0.3–1.5 (3) cm wide, entire, crenate, serrate or pinnatifid; racemes 2–10 cm long, in axillary and terminal racemes; pedicels 1.5–4.2 mm long, ascending to recurved, often secund; sepals 0.7–1.3 mm long; petals 0.6–1.2 mm long, yellow, fading pinkish; fruit subglobose, 1–2.5 mm long and as wide or 1–1.3 times longer than broad; style 0.4–0.7 mm long. Moist sites at 1370 to 3050 m in Garfield and Utah counties where evidently rare; Arizona and New Mexico northward to Wyoming; 3 (0). This species approaches both *R. curvipes* and *R. islandica* var. *hispidula*. Despite the apparent convergences, *R. sphaerocarpa* appears to exist as a functional entity and not just as an extreme morphological phase of either of the two taxa it approaches.

Rorippa sylvestris (L.) Besser [*Sisymbrium sylvestre* L.]. Rhizomatous perennial; stems 2.5–6 dm tall, usually branched above, glabrous or hirsute below; leaves 4–10 cm long, ovate or oblong to oblanceolate or obovate, lobed to pinnatifid, the divisions narrow, incised or sharply toothed to entire, petiolate; pedicels spreading to ascending, typically 6–12 mm long; sepals 2–3 mm long, the outer pair not saccate; petals 3–4 mm long; siliques linear, 8–10 (15) mm long, usually not curved; style ca 1 mm long; n = 16, 20, 24. Mud of a lake shore at 1590 m in Wasatch County; widely distributed in the U. S.; introduced from Europe; 1 (0).

Rorippa tenerrima Greene [*Radicula tenerrima* (Greene) Greene]. Annual, arising from taproots, the stems 0.4–2 dm long, decumbent to prostrate, glabrous; leaves 1–5 (8) cm long, 5–15 mm wide, lyrate-pinnatifid to subentire; racemes 2–10 cm long, in axillary and terminal racemes; pedicels 1–3 (4) mm long, ascending to spreading; sepals 0.7–1.2 mm long; petals 0.6–0.8 mm long, yellow; siliques 3–8 mm long, 0.8–2 mm wide, tapering to apex; style 0.3–1 mm long. Palustrine and riparian sites at 1403 to 2990 m in Cache, Daggett, Emery, Garfield, Juab, Kane, Iron, Millard, Salt Lake, Sanpete, Sevier, and Washington counties; Washington eastward to North Dakota and southward to Mexico; 23 (iv).

Schoenrambe Greene

Glabrous, perennial, arising from a branching caudex or creeping rhizome; leaves alternate and some basal or all cauline, some pinnatifid or all entire, petiolate to sessile, not auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, yellow or white with purple veins, or lavender; stamens 6, the filaments lacking glandular processes; style almost lacking, the stigma expanded and bilobed or unexpanded and not bilobed; siliques many times longer than broad, terete or slightly flattened, valves 1-nerved; seeds uniseriate.

1. Flowers yellow; plants from rhizomes and/or caudices . . . 2
- Flowers lavender or white with purplish veins; plants from caudices 3
- 2(1). Plants clump-forming, arising from superficial caudices; known only from Uintah County *S. suffrutescens*
- Plants not clump-forming, arising from rhizomes and subterranean caudices; plants widespread *S. linifolia*
- 3(2). Cauline leaves linear to narrowly oblong; plants of Uintah County *S. argillacea*
- Cauline leaves elliptic to oblanceolate; plants of Emery County *S. barnebyi*

Schoenrambe argillacea (Welsh & Atwood) Rollins [*Thelypodopsis argillacea* Welsh & Atwood, type from Big Pack Mt., Uintah County]. Perennial, glabrous and glaucous herbs; stems 13–30 cm tall, simple or branched, arising from a branching, ligneous caudex; leaves 9–35 mm long, 0.8–2 mm wide, sessile throughout, the cauline not auriculate, linear, somewhat thickened, acute or rounded; racemes 5– to 22-flowered; pedicels 7–18 mm long, ascending; sepals 4.2–6.5 mm long, violet, with hyaline margins; petals 7.8–10.9 mm long, 2.5–3.2 mm wide, white or lilac, with conspicuous purple veins, the blade not distinguished from the claw; anthers 1.7–2.5 mm long; siliques 18–25 mm long, 1–1.2 mm wide, sessile, terete, ascending to erect, typically curved; style 0.5–1 mm long, obconic; stigma bilobed. Shadscale, Indian ricegrass, pygmy sagebrush, and other mixed desert shrub communities on the lower Uinta and upper Green River Shale formations at 1525 to 1720 m in Uintah County; endemic; 5 (0).

Schoenrambe barnebyi (Welsh & Atwood) Rollins [*Thelypodopsis barnebyi* Welsh & Atwood, type from San Rafael Swell, Emery County]. Perennial, hirtellous to glabrous and glaucous herbs; stems 10–25 cm tall, simple or branched, arising from a branching, ligneous caudex; leaves 13–51 mm long, 4–24 mm wide, petiolate, the petioles 0.4–10 mm long, the blades oblong to elliptic or oblanceolate, entire or incipiently toothed, not auriculate, rounded to obtuse apically; racemes 2– to 8-flowered (or more); pedicels 4–13 mm long in flower to 27 mm long in fruit, ascending to spreading; sepals 6–8 mm long, green to violet, with hyaline margins; petals 9.5–12 mm long, 2.5–3.5 mm wide, white or lavender, conspicuously purplish veined, the claw narrower than the blade; anthers 2.5–3 mm long; siliques 34–65 mm long, 1–2 mm wide, subsessile, terete, ascending to spreading; style 1–1.2 mm long, obconic; stigma bilobed. Mixed shadscale, eriogonum, and ephedra communities on the Chinle Formation at ca 1705 to 1740 m in Emery County; endemic; 7 (ii). This beautiful plant is a mirror-image congener of *S. argillacea* but differs in being larger in all its parts. The problem of generic disposition was discussed with the protologue of *Thelypodopsis barnebyi* (Brittonia 33: 301, 1981), where it was noted that the "ultimate disposition of these unique species awaits re-evaluation of generic relationships among primitive cruciferous genera. . . ." Placement within *Schoenrambe* by Rollins satisfies that requirement in part, at least, but leads to inclusion of *Glaucoarpum suffrutescens* in this genus also.

Schoenrambe linifolia (Nutt.) Greene [*Nasturtium linifolium* Nutt.; *N. pumilum* Nutt., not J. St. Hil.; *Sisymbrium linifolium* (Nutt.) Nutt. ex T. & G.; *Sisymbrium pygmaeum* Nutt. ex T. & G.; *Erysimum glaberrimum* H.

& A.; *Schoenocrambe pygmaea* (Nutt.) Greene; *S. pinnata* Greene, type from Garfield County?; *S. decumbens* Rydb.; *S. linifolia* var. *pinnata* (Greene) A. Nels. in Coult. & Nels.; *Sisymbrium decumbens* (Rydb.) Blank.; *S. linifolium* var. *pinnatum* (Greene) Schulz; *S. linifolium* var. *decumbens* (Rydb.) Schulz]. Perennial, glabrous and usually glaucous, arising from a simple or more usually branched caudex, this from a creeping, deeply placed rhizome; stems (1.5) 2–9 dm tall, erect or less commonly ascending to decumbent, simple or branched; leaves 1.3–9.3 cm long, 1–25 mm wide, entire to deeply pinnatifid, the basal ones often deciduous by midanthesis; pedicels 2–9 (10) mm long in fruit, ascending to spreading; sepals 4.3–6 mm long, yellowish; petals 7.5–11 mm long, yellow, spreading; siliques 25–65 (75) mm long, 0.8–1.2 mm wide, terete, sessile, erect or ascending; style 0.3–0.6 mm long; stigma bilobed; $2n = 14$. Salt desert shrub, sagebrush, piñon-juniper, mountain brush, and aspen communities at 1155 to 2690 m in all Utah counties, except Cache, Davis, Salt Lake, San Juan, Washington, and Weber; British Columbia east to Montana and south to Nevada and New Mexico; 131 (xix). Despite the widely sporadic distribution in the Great Basin, this is essentially a plant of the Colorado Basin in Utah. The indecision as to the generic position of this plant is indicated by the numerous generic names associated with it. The plants simulate both *Caulanthus* and *Sisymbrium* in a broad sense but do not show apparent relationship with the introduced annual or biennial weedy species of *Sisymbrium*. It seems best to place this plant within *Schoenocrambe*, even though the principle diagnostic features involve vegetative instead of floral characteristics.

Schoenocrambe suffrutescens (Rollins) Welsh & Chatterley [*Thelypodium suffrutescens* Rollins in Graham, type from Big Pack Mt., Uintah County; *Glaucocarpum suffrutescens* (Rollins) Rollins]. Perennial clump-forming herbs; stems herbaceous 1–25 dm tall, glabrous, arising from a stout taproot and branching subligneous caudex; leaves (7) 10–25 mm long, 3–10 mm wide, elliptic to lanceolate or oblanceolate, shortly petiolate to subsessile, not auriculate; pedicels (2.5) 3–12 mm long, curved-ascending to erect, glabrous; sepals 4–6 mm long, yellowish or greenish; petals 9–11 mm long, yellow, spatulate, ascending to spreading; siliques 10–20 mm long, 1.2–3 mm wide, flattened, erect, glabrous, strongly 1-veined; style (0.5) 1–2 mm long; stigma capitate, entire; seeds 4–8 per locule. Shadscale, pygmy sagebrush, mountain mahogany, juniper, and other mixed desert shrub communities at 1645 to 1830 m on calcareous shale of the Green River Formation, west of Willow Creek in the vicinity of Big Pack Mt., Uintah County and along the Wrinkles Road west of the Green River, Duchesne County; endemic; 15 (iv). In general aspect, involving nature of the caudex, habit, and arrangement of branches and leaves, this plant is essentially identical with *S. argillacea* and *S. barnebyi*. *S. suffrutescens* differs from the *S. argillacea* and *S. barnebyi* in about the same manner as they differ from *S. linifolia*. And, it seems probable that all will be differently placed in the future, possibly in an enlarged *Thelypodium* or *Caulanthus*. The feature of veination of the silique is reminiscent of that of *Streptanthus cordatus*.

Sisymbrium L.

Glabrous or hirsute annuals or rarely biennials, arising from taproots; leaves alternate and basal, variously lobed

to entire, the lower ones usually pinnatifid, reduced upwards, petiolate to sessile, not auriculate; flowers racemose; pedicels spreading to erect, not subtended by bracts; sepals 4, deciduous; petals 4, yellow; stamens 6, the filaments lacking glandular processes; style almost lacking, the stigma bilobed; fruit a sessile silique many times longer than broad, linear to tapering, terete, the valves usually 3-nerved; seeds several to many, uniseriate.

1. Leaves strongly dimorphic, the lower lyrate-pinnatifid, the uppermost with linear-filiform lobes; pedicels ascending; siliques 50–90 mm long, spreading-ascending to erect, not appressed, petals 6.3–8.5 mm long *S. altissimum*
- Leaves not dimorphic, the upper and lower lobed about the same; pedicels ascending to erect; siliques 10–45 mm long, erect or ascending, appressed or not; petals 2–4 mm long 2
- 2(1). Siliques and pedicels ascending to spreading, not appressed to the rachis; siliques (20) 25–45 mm long *S. irio*
- Siliques and pedicels appressed-erect, siliques 10–15 mm long *S. officinale*

Sisymbrium altissimum L. Jim Hill Mustard; Tumbling Mustard. [*Norta altissima* Britt.]. Annual; stems 2.5–10 dm tall or more, sparingly to densely hirsute near the base, usually glabrous above; leaves 1–20 cm long or more, petiolate, the lower ones pinnatifid or merely lobed, becoming pinnatifid into linear-filiform segments upwardly; pedicels 4–10 mm long, stout, almost or quite as thick as the silique, ascending to spreading; sepals 3.6–5 mm long, often yellowish; petals 6.3–8.5 mm long, yellow, fading white, obovate to spatulate, spreading; siliques 50–90 mm long, 1–1.5 mm wide, terete, spreading to ascending; valves evidently 3-nerved; $2n = 14$. Disturbed sites, but often in indigenous plant communities, at 820 to 2410 m in all Utah counties; widespread in North America; adventive from Europe; 104 (ix).

Sisymbrium irio L. [*Norta irio* (L.) Britt.]. Annual; stems 2–8 dm tall, erect, glabrous; leaves 1.5–10 (20) cm long, runcinate-pinnatifid, reduced upwardly; pedicels 6–10 mm long, slender, ascending; sepals 2–2.5 (3) mm long, greenish or yellowish; petals 3–4 mm long, yellow, oblanceolate, spreading-ascending; siliques (20) 25–45 mm long, 0.8–1 mm wide, ascending; $2n = 14, 28$. Weed of disturbed sites at 820 to 1680 m in San Juan, Utah, and Washington counties; California to Arizona; adventive from Europe; 8 (iii).

Sisymbrium officinale (L.) Scop. Hedge Mustard. [*Erysimum officinale* L.]. Annual; stems 2.5–8 dm tall or more, hispid-hirsute throughout; leaves 1.5–20 cm long or more, lyrate-pinnatifid to pinnatifid, not especially dimorphic, the upper ones merely reduced; pedicels 2–3 mm long, stout, erect, the tip about as thick as the silique; sepals 1.5–2.2 mm long, green or yellow; petals 3–4 mm long, yellow, fading white, narrowly oblanceolate, ascending; siliques 8–15 mm long, appressed-erect, tapering to a beaklike tip; valves 3-nerved; $2n = 14$. Uncommon weedy plant of disturbed sites in Utah and Salt Lake counties; widespread in North America; adventive from Europe; 2 (0).

Smelowskia C. A. Mey.

Pubescent pulvinately caespitose perennials, arising from a branching caudex, the pubescence with branched

and often with some simple hairs; leaves alternate or chiefly basal, usually pinnatifid, petiolate to sessile, not auriculate; flowers subcorymbose to racemose; pedicels not subtended by bracts; sepals 4, deciduous; petals 4, white rarely purplish; stamens 6, the filaments lacking glandular processes; style prominent; stigma expanded; fruit a silique, 3 to several times longer than broad, subterete or compressed; valves 1-nerved; seeds few to several per locule.

Drury, W. H. and R. C. Rollins. 1952. The North American representatives of *Smelowskia*. *Rhodora* 54: 85-119.

Smelowskia calycina C. A. Mey. Perennial, caespitose, with short to elongate caudex branches, these clothed with marcescent leaf bases; stems 4-20 cm tall, pubescent with short, branched and long, simple or branched hairs, or rarely glabrous; basal leaves 0.5-5 cm long, 4-16 mm wide, pinnately divided; cauline leaves reduced upwardly; pedicels mostly 3-8 mm long in fruit, ascending to spreading-ascending, pubescent; sepals 2-3.2 mm long, often tinged purplish, pubescent; petals 3-8 mm long, white to cream or tinged pink to lavender, ovate, spreading; siliques 5-9 mm long, slightly flattened parallel to the septum or terete; style 0.2-1 mm long; seeds 6-10; $2n = 12$. Alpine tundra, mainly in talus and rock stripes, at 2900 to 3965 m in Beaver, Daggett, Duchesne, Grand, Iron, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, and Utah counties; Alaska Yukon and Northwest Territories south to Nevada and Colorado; 66 (xii). Our material is *var. americana* (Regel & Herder) Drury & Rollins [*Hutchinsia calycina* var. *americana* Regel & Herder; *S. americana* (Regel & Herder) Rydb.; *S. lineariloba* Rydb.; *S. lineariloba* f. *virescens* Schulz].

Stanleya L.

Perennial, glabrous to simple pubescent herbs or subshrubs arising from taproots or caudices; leaves alternate and basal, pinnatifid to entire, petiolate to sessile, auriculate in some; flowers showy, racemose; pedicels not subtended by bracts; sepals 4, deciduous; petals 4, yellow to greenish yellow; stamens 6, the filaments lacking glandular processes, long-exserted; style lacking to prominent, the stigma small; fruit a long-stipitate silique, linear, terete to compressed; valves with 1 or more nerves; seeds numerous, uniseriate.

Rollins, R. C. 1939. The cruciferaceous genus *Stanleya*. *Lloydia* 2: 109-127.

1. Middle and upper cauline leaves sessile, auriculate; leaves all entire; petal-claw glabrous on both surfaces *S. viridiflora*
- Middle and upper cauline leaves petiolate to subsessile, not auriculate; leaves various; petal-claw pubescent on the inner or outer surfaces 2
- 2(1). Leaves entire or merely toothed, the basal ones ovate to elliptic, cauline ones ovate to lanceolate; plants of east-central and northeastern Utah *S. integrifolia*
- Leaves, at least some, pinnatifid, only the upper ones entire and usually lanceolate to lance-linear; distribution various 3
- 3(2). Plants woody at base, the caudex well developed, blades of petals mostly 1-3 mm wide; our most common and widespread species of the genus *S. pinnata*
- Plants herbaceous, the caudex not developed, blades of petals 3-6 mm wide or more; an uncommon to rare plant of southeastern Utah, if it occurs here at all *S. albescens* Jones

Stanleya integrifolia James [*S. pinnatifida* var. *integrifolia* (James) Robins.; *S. glauca* var. *latifolia* Cockerell; *S. pinnata* var. *integrifolia* (James) Rollins]. Perennial, the caudex well-developed and more or less woody; stems 2.5-9 dm tall or more, sparingly hairy, glaucous, simple or branched; leaves 0.8-12.3 cm long, 0.3-3.5 cm wide, elliptic to ovate or lanceolate, all entire or lower ones merely toothed, puberulent, glaucous; sepals mostly 9-19 mm long, yellowish, reflexed, glabrous; petals 10.5-15.5 mm long, the blade 1.4-2.6 mm wide, the claw hairy within; siliques 33-75 mm long, 1.2-1.8 mm wide, subterete; stipe 10-25 mm long. Shadscale, other salt and mixed desert shrub and pinyon-juniper communities at 1460 to 2745 m in Carbon, Daggett, Duchesne, Emery, Grand, Uintah, and Wayne counties; Wyoming east to Kansas; 28 (iii). Our material is distinctive and about equivalent in diagnostic features as exist among the other species of *Stanleya* in Utah.

Stanleya pinnata (Pursh) Britt. Prince's Plume. [*Cleome pinnata* Pursh; *S. pinnatifida* Nutt.; *S. heterophylla* Nutt. ex T. & G.; *S. fruticosa* Nutt.; *S. arcuata* Rydb.; *S. canescens* Rydb.; *S. glauca* Rydb.]. Perennial, the caudex well developed and slightly to very woody; stems (2.5) 3.5-12 (15) dm tall or more, glabrous to pilose, glaucous, simple or branched; leaves mostly 5-18 cm long, 2-5 cm wide or more, lanceolate to elliptic in outline, pinnatifid or the upper usually entire and narrowly lanceolate to elliptic, not auriculate, glabrous or sparsely pilose; pedicels 4-13 mm long, spreading; sepals 11-22 mm long, yellowish, reflexed, glabrous; petals 11-17 mm long, the blade 1-3.8 mm wide, the claw hairy within; siliques (30) 35-70 (80) mm long, 1.2-2 mm wide, subterete to flattened; stipe 12-24 mm long, puberulent at base; $n = 14$. Seleniferous soils derived from shales, mudstones, and siltstones in many geological formations, in salt desert shrub, mixed desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 915 to 2290 m in all Utah counties except Cache, Davis, Morgan, Salt Lake, Summit, Wasatch, and Weber; Idaho east to North Dakota south to California, Arizona, and New Mexico; 161 (xxvi). This plant is a primary indicator of the poisonous element selenium, the growth in any given place provides evidence of the presence of that element in the soil. Our material belongs to *var. pinnata*, but the *var. gibberosa* Rollins, known from Uinta County, Wyoming, is to be sought in Summit County, Utah. Its leaves are all bipinnate. The *var. inyoensis* (Munz & Roos) Reveal may be encountered in Washington County; it differs from *var. pinnata* in being a subshrub.

Stanleya viridiflora Nutt. ex T. & G. Desert Plume. [*S. collina* Jones]. Perennial, the caudex simple or branched, somewhat woody at base; stems 3-12 dm tall or more, glabrous and glaucous, simple or branched; leaves 7-30 cm long, the basal ones 1.8-8.7 cm wide, petiolate, the blades entire or somewhat runcinate-pinnatifid, the upper entire, sessile and auriculate, glabrous; pedicels mostly 6-12 mm long, spreading; sepals 11-20 mm long, yellow, reflexed, glabrous; petals 10-19 mm long, the blade 0.8-1.5 (3) mm wide, not much wider than the glabrous claw; siliques 35-70 mm long, subterete; stipe 14-25 mm long; $2n = 28$. Gypsiferous or clay substrates in sagebrush, wildrye, pinyon-juniper, and mountain brush communities at 1525 to 2745 m in Duchesne, Emery, Garfield, Salt Lake (?), Summit, Uintah, and Wayne counties; Idaho and Wyoming to Nevada and Oregon; 18 (iii).

Streptanthella Rydb.

Glabrous, annual or winter annual, arising from taproots; leaves alternate, entire to shallowly dentate, tapering to the base, not auriculate; flowers racemose; pedicels spreading-recurved to recurved, not subtended by bracts; sepals 4, deciduous; petals 4, white or purplish; stamens 6, the filaments lacking glandular processes; style obsolete, the small capitate stigma borne atop a beaklike extension of the fruit, this a subsessile, slender siliqua many times longer than broad, strongly compressed; valves 1-nerved, dehiscent at the base only; seeds several to many per locule, uniseriate.

Streptanthella longirostris (Wats.) Rydb. [*Arabis longirostris* Wats., type from Stansbury Island; *Streptanthus longirostris* (Wats.) Wats.; *Thelypodium longirostris* (Wats.) Jepson]. Annual, the stems erect or ascending, usually branched throughout, 1–5 dm tall; leaves 1.5–8.5 cm long, 1–12 mm wide, oblanceolate to elliptic or lance-linear, sinuate-dentate to entire, the lower usually deciduous by anthesis, reduced upwardly; pedicels 1.5–6 mm long curved in fruit; sepals 2–4.8 mm long, greenish or purplish, with scarious margins; petals 5–8 mm long, white with purplish veins; siliques 30–60 mm long, 1.5–2 mm wide, reflexed-descending; valves narrowed apically into an indehiscent beak 3–7 mm long; style obsolete; 2n = 28. Sandy, clayey, or gravelly soils in warm desert shrub, mixed desert shrub, pinyon-juniper, and low elevation grassland communities from 750 to 2350 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, Washington, and Wayne counties; Washington east to Wyoming and southward to Baja California and New Mexico; 137 (xxiii).

Streptanthus Nutt.

Glabrous, perennial, arising from taproots, rarely rhizomatous; leaves alternate and basal, simple, dentate to entire, the basal ones petiolate, the upper becoming sessile, entire, and auriculate; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, chestnut to brown purple or purple; stamens 6, often in 3 pairs as regards length and position, the filaments lacking glandular processes; style conspicuous, expanded; stigma bilobed; fruit a short-stipitate siliqua many times longer than broad, much flattened; valves with one main nerve and more or less reticulate lateral nerves; seeds several to many per locule, uniseriate.

Streptanthus cordatus Nutt. ex T. & G. [*Euklisia cordata* (Nutt.) Rydb.; *Cartiera cordata* (Nutt.) Greene; *S. crassifolius* Greene]. Perennial, the stems not inflated, 1.8–5.7 (8) dm tall, glabrous and glaucous; basal leaves 1.5–8 (15) cm long, 0.5–2 (5) cm wide, spatulate to obovate or oblanceolate, variously dentate, often sharply ciliate at least basally; cauline leaves becoming sessile and auriculate, ovate to oval or lanceolate; pedicels 4–9 mm long, ascending, glabrous; sepals (5) 7–10.5 mm long, usually purplish, glabrous except apically; petals 10–14.5 mm long, purple to chestnut, the broad claw not constricted at the juncture of blade, ascending to recurved; siliques 50–85 mm long, 3–5.8 mm wide, ascending to erect, glabrous; style 1–3 mm long, expanded upwards, the stigma bilobed; n = 14. Shadscale, greasewood, horsebrush, sagebrush, pinyon-juniper, mountain brush, and Douglas fir-white fir communities at 1065 to 2960 m in all Utah counties; Oregon to Wyoming south to Califor-

nia, Arizona, and New Mexico; 165 (xxix). A specimen collected near Kanosh, Millard County, by Pickford (130–OGDF) is definitely rhizomatous.

Thelypodopsis Rydb.

Glabrous or pubescent with simple hairs, annual or biennial to perennial, arising from taproots; leaves alternate or alternate and basal, simple, oblong-ob lanceolate to lanceolate or ovate, toothed to entire, petiolate or sessile and auriculate or merely sessile; flowers in racemes; pedicels ascending or spreading-ascending, not subtended by bracts except in some lowermost flowers; sepals 4, deciduous; petals 4, white, pink, lavender, or yellow; stamens 6, the filaments lacking processes; style expanded upwards; stigma bilobed or not; fruit a sessile to stipitate siliqua, many times longer than broad, subterete to terete; valves 1 (3–5) -nerved; seeds uniseriate. Note: The species included herein have been treated as members of *Streptanthus*, *Thelypodium*, an expanded *Sisymbrium*, and even *Caulanthus*. The generic problem has been reviewed by Al-Shebaz (1973; see *Thelypodium*), but the solution adopted by that author, and followed in part here, is not altogether acceptable for our species. *Thelypodium sagittatum* mirrors both *Thelypodopsis elegans* and *T. ambigua* and is again placed in this genus also.

1. Petals yellow 2
- Petals pink, lavender, or white 3
- 2(1). Pedicels, sepals, and siliques glabrous; petal blade not especially constricted at juncture with petaloid claw *T. aurea*
- Pedicels, sepals, and siliques sparingly villous; petal blade conspicuously constricted at juncture with broadened membranous claw *T. divaricata*
- 3(1). Style expanded, the stigma bilobed; plants of eastern Utah, and in Kane County 4
- Style not expanded or the stigma not bilobed, plants of the Great Basin or of montane sites 5
- 4(3). Pedicels, sepals, and siliques glabrous; basal leaves often over 6 times longer than broad; plants known from Kane County *T. ambigua*
- Pedicels, sepals, and siliques sparingly villous; basal leaves usually less than 5 times longer than broad, plants of eastern Utah *T. elegans*
- 5(3). Stigma not bilobed, the style not expanded; plants of moist sites from low to upper middle elevations in northern Utah *T. sagittata*
- Stigma bilobed or the style expanded (or both); siliques conspicuously torulose, often contorted, plants of xeric sites in western Utah *T. vermicularis*

Thelypodopsis ambigua (Wats.) Al-Shebaz [*Thelypodium ambiguum* Wats.]. Biennial or short-lived perennial; stems not inflated, 2–10 (12.5) dm tall, glabrous throughout; leaves basal and cauline, the basal ones 3–15 (20) cm long, 0.6–2.8 cm wide, sinuate-dentate to entire, the cauline reduced upwards, becoming entire and lance-ovate to lanceolate, 0.5–6.6 cm long, 0.3–1.8 cm wide, sessile and auriculate; pedicels 4–12 cm long, curved-ascending to spreading-ascending, glabrous; sepals 5–7 mm long, often pinkish-ylaline, glabrous, erect; petals 9–12 mm long, the blade 3–4 mm wide, pink to lavender or white, the claw broad, slightly constricted at juncture of blade; anthers 2.5–3.5 mm long; siliques 55–75 mm

long, 1.2–2 mm wide, short-stipitate, terete, ascending to erect; style 1–2.5 mm long, expanded upwards; stigmatic lobes developed. Pinyon-juniper community from 1530 to 1830 m in Kane (Eastwood & Howell 9300 US; Welsh & Atwood 9706 BRV) and Washington (Palmer 27, southern Utah, 1877 US) counties; Mohave County, Arizona; 3 (i).

Thelypodopsis aurea (Eastw.) Rydb. [*Thelypodium aureum* Eastw.; *Sisymbrium aureum* (Eastw.) Payson]. Biennial or rarely short-lived perennial; stems not inflated, 1–7 dm tall, glabrous throughout or somewhat pubescent below with flattened, flexuous hairs; leaves basal and cauline, the basal ones 2.5–6.5 cm long, 5–13 mm wide, irregularly toothed to subentire, the cauline reduced upwardly, becoming entire and lanceolate to ovate-lanceolate, 1.3–6.5 cm long, 4–23 mm wide, sessile and auriculate; pedicels 5–9 mm long, spreading-ascending, glabrous; sepals 5–9.3 mm long, yellowish, glabrous, ascending; petals 6.9–12.5 mm long, the blade not expanded, 1.5–3.5 mm wide, yellowish, the claw very broad, the ascending limb not especially constricted at juncture with claw; anthers 2.7–3.7 mm long; siliques 40–70 mm long, 1–1.5 mm wide, stipitate, the stipe 2–7 mm long, terete, ascending to erect, glabrous; style 1–3 mm long, expanded upwards; stigmatic lobes well developed; n = 11. Clay to sandy soils in semidesert shrub and pinyon-juniper communities at 1310 to 2135 m in San Juan County; Colorado and New Mexico; 11 (ii). This is a beautiful plant in full flower, with its bright golden flowers.

Thelypodopsis divaricata (Rollins) Welsh & Reveal [*Caulanthus divaricatus* Rollins, type from 10 mi E of Hite]. Biennial or winter annual, erect, simple; stems not inflated, 2–11 dm tall, the herbage more or less pubescent with long, tangled hairs, at least below; leaves basal and cauline, the basal ones 1.5–10 cm long, 4–28 mm wide, irregularly toothed or rarely pinnatifid, subentire or dentate at apex only, the cauline reduced upwardly, becoming entire and ovate-lanceolate, 0.7–9 cm long, 4–28 mm wide, sessile and auriculate; pedicels 5–21 mm long, spreading-ascending, sparingly villous to glabrate; sepals (3.5) 4.8–7 mm long, yellowish, sparingly villous; petals 7–10 mm long, yellowish, the claw very broad, the ascending limb constricted at juncture with the claw; anthers 2.5–3.8 mm long; siliques 40–80 (90) mm long, 1–1.5 mm wide, sessile or subsessile, terete, ascending to erect, sparingly villous when young, becoming glabrous with age; style 1–2 mm long, with the stigma reduced or expanded and lobes not or only moderately well developed; n = 11. Fine textured substrates in shadscale, blackbrush, and pinyon-juniper communities at 1220 to 2075 m in Carbon, Emery, Garfield, Grand, San Juan, and Wayne counties; endemic; 48 (ix). The tall branched stems persist for a while, standing ghostlike above the barren substrates of southeastern Utah.

Thelypodopsis elegans (Jones) Rydb. [*Thelypodium elegans* Jones, type from Westwater, Grand County; *Sisymbrium elegans* (Jones) Payson; *Streptanthus wyomingensis* A. Nels.; *Thelypodopsis wyomingensis* (A. Nels.) Rydb.]. Biennial, or rarely winter annual, or a short-lived perennial; stems 1.2–9.5 dm tall, almost or quite glabrous to densely pubescent below with flattened, flexuous hairs; leaves basal and cauline, the basal ones 1–6.5 cm long, 3–15 mm wide, sinuate-dentate to irregularly toothed or entire, the cauline reduced up-

wardly, becoming entire and lanceolate to ovate-lanceolate or oblong, 0.3–8.5 (12) cm long, 3–20 mm wide, sessile and auriculate; pedicels 5–18 mm long, curved-ascending to spreading-ascending, glabrous or sparingly villous, erect; sepals 4–8 mm long, usually purplish, glabrous; petals 11–14.5 mm long, the blade 3–6 mm wide, pink to lavender or white with pinkish veins, the claw very broad, not constricted at juncture with blade; anthers 2.6–3.2 mm long; siliques 45–75 mm long, 1.2–1.8 mm wide, sessile or subsessile, terete, ascending to erect, glabrous or sparingly villous; style 1.8–3 mm long, expanded upwards; stigmatic lobes well developed. Fine to coarse textured substrates in salt desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1280 to 2075 m in Duchesne, Grand, and Uintah counties; Wyoming and Colorado; 65 (xiii).

Thelypodopsis sagittata (Nutt.) Schulz Biennial or short-lived perennial; stems 2–10 dm tall, rarely more, simple or more usually branched, glabrous or hirsute with simple hairs below; basal leaves 2–25 cm long, 1–5 cm wide, ovate to oblanceolate or oblong, entire; cauline leaves 0.7–10 (14) cm long, 2–28 mm wide, ovate to lanceolate or lance-oblong, entire, glabrous or puberulent especially on the veins, auriculate; pedicels 2.5–15 (20) mm long, spreading to spreading-ascending; sepals 2.5–10 mm long, green to purplish, glabrous; petals 5–15 mm long, 1–4 mm wide, white to lavender or purple; anthers 1.5–5 mm long; siliques 10–65 mm long, 0.5–1.2 mm wide, stipitate, the stipes 0.3–2 mm long; style 0.5–3 mm long, more or less cylindrical; stigma not bilobed. This species simulates *T. elegans* and *T. ambigua* in some features and care should be taken in distinguishing them. The species is divisible into two distinctive varieties in Utah.

- 1. Petals linear to oblanceolate, 1.5 mm wide or less; pedicels 2.5–9 mm long; plants of southwestern Utah *T. sagittata* var. *ovalifolia*
- Petals oblanceolate to spatulate, 1–4 mm wide; pedicels 5–15 mm long or more; distribution various *T. sagittata* var. *sagittata*

Var. *ovalifolia* (Rydb.) Welsh [*Thelypodium ovalifolium* Rydb., type from Panguitch Lake; *T. palmeri* Rydb., type from southern Utah; *T. sagittatum* ssp. *ovalifolium* (Rydb.) Al-Shebaz; *T. sagittatum* var. *ovalifolium* (Rydb.) Welsh & Reveal]. n = 13. Saline meadows at 1585 to 2565 m in Garfield, Iron, Juab, and Kane counties; Nevada; a Great Basin endemic; 5 (0).

Var. *sagittata* [*Streptanthus sagittatus* Nutt; *Pachypodium sagittatum* (Nutt.) Nutt. ex T. & G.; *Thelypodium sagittatum* (Nutt.) Endl. in Walp.; *T. nuttallii* Wats.; *T. amplifolium* Greene; *T. torulosum* Heller; *T. macropetalum* Rydb., type from Davis County; *Thelypodopsis nuttallii* (Wats.) Schulz; *T. torulosa* (Heller) Schulz]. Clay or silty, often saline, soils in shadscale, greasewood, saltgrass, sedge grass, aspen, and sagebrush communities at 1280 to 2690 m in Box Elder, Cache, Davis, Duchesne, Emery, Juab, Millard, Salt Lake, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber, counties; Washington and Montana south to Nevada, Utah, and Colorado; 26 (i).

Thelypodopsis vermicularis (Welsh & Reveal) Rollins [*Thelypodium sagittatum* var. *vermicularis* Welsh & Reveal, type from 4 mi SE of Sigurd]. Biennial herbs; stems 8–60 cm tall, rarely more, simple or more usually

branched, glabrous or hirsutulous with simple hairs below; basal leaves 2–15 cm long, 1–4 cm wide, ovate to oblanceolate or oblong, entire or toothed; cauline leaves 0.7–9 cm long, 0.2–2.3 cm wide, ovate to lanceolate or lance-oblong, entire or less commonly toothed, glabrous, auriculate; pedicels 6–10 mm long, spreading to spreading-ascending; sepals 3–7 mm long, white to green or yellowish, glabrous; petals 7–12 mm long, 2–4 mm wide, white; anthers 2–3 mm long; siliques 22–39 mm long, 1–2 mm wide, stipitate, the stipes 0.3–2 mm long; style often expanded, 0.5–3 mm long, the stigma obscurely 2-lobed. Salt desert shrub communities at 1310 to 2200 m in Box Elder, Juab, Millard, Sanpete, Sevier, Tooele, and Utah counties; Nevada; a Great Basin endemic; 28 (v). Expansion of styles has been regarded as a fundamental feature in segregation of *Thelypodopsis* from *Thelypodium*. This species has the style only obscurely expanded and was therefore placed within *Thelypodium* initially. Failure of this feature as diagnostic has resulted in realignment of this taxon and of *T. sagittata*.

Thelypodium Endl.

Glabrous or pubescent with simple hairs, annuals, biennials, or short-lived perennials, arising from taproots; leaves alternate and basal, simple, lyrate-pinnatifid, toothed or entire, petiolate or sessile, auriculate in some; flowers racemose, pedicels not subtended by bracts; sepals 4, deciduous; petals 4, white, pink, lavender, or purple; stamens 6, the filaments lacking glandular processes; style slender to stout, cylindrical to somewhat expanded upwards, the stigma small, entire or somewhat bilobed; fruit a stipitate silique many times longer than broad, terete or somewhat flattened; valves 1 (3)-nerved; seeds uniseriate. Note: *Pennellia micrantha* (Gray) Nieuwl. [*Thelypodium micranthum* (Gray) Wats.; *Heterothrix micrantha* (Gray) Rydb.] has been repeatedly reported from Utah, but no specimens are definitely known from the state. It differs from the species of *Thelypodium* reported here in having stellately pubescent leaves.

Al-Shebaz, I. A. 1973. The biosystematics of the genus *Thelypodium* (Cruciferae). *Contr. Gray Herb.* 204:3–148.
 Payson, E. B. 1922. A monographic study of *Thelypodium* and its immediate allies. *Ann. Missouri Bot. Gard.* 9:233–324.

- 1. Cauline leaves definitely auriculate (see also *Thelypodopsis*) 2
- Cauline leaves petiolate or sessile but not auriculate ... 3
- 2(1). Inflorescence compact, not elongating in fruit, seldom more than 6 cm long; plants strict, known from south-central to southern and southeastern Utah ... *T. rollinsii*
- Inflorescence soon elongating, 5–20 cm long or more; plants ascending to erect, of greasewood bottoms in western Utah *T. flexuosum*
- 3(1). Plants robust biennials, mostly 5–15 dm tall or more; racemes borne in corymbose panicles *T. integrifolium*
- Plants various but, if (as rarely) as above, the racemes seldom if ever borne in corymbose panicles 4
- 4(3). Racemes mostly 1–8 dm long or more; petals 8 mm long or more, differentiated into a blade and claw; plants known only from Box Elder County *T. millefolium*
- Racemes mostly less than 1 dm long; petals 4–8 mm long, hardly differentiated into a blade and claw; plants not of Box Elder County 5
- 5(4). Sepals ascending to spreading; petals 1.5–3.5 mm wide; plants of eastern Utah *T. laxiflorum*

- Sepals spreading to reflexed; petals 1–2 mm wide; plants of the Henry Mts., Garfield County ... *T. wrightii*

Thelypodium flexuosum Robins. in Gray Perennial from a woody taproot and caudex, this simple or branched, clothed with persistent leaf bases; stems few to several, decumbent to erect, 1.5–6 dm tall; basal leaves petiolate, 2–12 cm long or more, 0.5–3 cm wide, lanceolate to oblong or oblanceolate, cuneate to attenuate at the base; cauline leaves linear to linear-lanceolate, or lanceolate, sagittate to clasping basally, glabrous, entire; inflorescence corymbose, elongating in fruit; sepals 3–4.5 mm long, green with white margins; petals lavender to white, 6–10 mm long, 1.5–3.5 mm wide; anthers 1–2.5 mm long; pedicels 3–10 (15) mm long, spreading to spreading-ascending; siliques 1.1–4.2 mm long, terete, torulose, straight or curved, erect to ascending; style 0.3–3 mm long; stigma entire; stipes 0.2–1 mm long; seeds uniseriate. Fine textured substrates in valley bottoms in greasewood communities at 1525 to 1650 m in Beaver and Tooele counties; Nevada, Idaho, Oregon, and California; 2 (0).

Thelypodium integrifolium (Nutt.) Endl. Biennial, the stems mostly 5–30 dm tall, simple or branched, glabrous, glaucous; basal leaves 5–30 cm long, 1.5–10 cm wide or more, spatulate to lanceolate, ovate or obovate, entire to denticulate; cauline leaves 2–12 (15) cm long, 2–20 mm wide, oblanceolate to elliptic or lanceolate, sessile, not auriculate; pedicels 3–10 mm long, variously spreading, strongly to moderately flattened at base; sepals 3–7 mm long, often purplish, glabrous; petals 5–10 mm long, mostly 1–2 mm wide, white to lavender or purple; anthers 1–3 mm long; siliques 10–45 mm long, 1–2 mm wide, stipitate, the stipes up to 2 mm long; style slender, 0.5–3 mm long; stigma entire; n = 13. Four poorly defined and arbitrarily separable varieties are present.

- 1. Mature fruiting pedicels whitish, stout; flowers white; plants of southwestern Utah ... *T. integrifolium* var. *affine*
- Mature fruiting pedicels not whitish or only seldom so, slender or stout; flowers pink to lavender or white; plants not of southwestern Utah 2
- 2(1). Mature fruiting pedicels not or only somewhat flattened at base; plants mostly of south-central to north-central Utah *T. integrifolium* var. *integrifolium*
- Mature fruiting pedicels strongly flattened at base; plants of eastern and southeastern or northwestern Utah 3
- 3(2). Racemes mostly 1–8 cm long in fruit; stipes often less than 1 mm long; plants of northwestern Utah *T. integrifolium* var. *complanatum*
- Racemes mostly more than 8 cm long in fruit; stipes often more than 1 mm long; plants of eastern and southeastern Utah *T. integrifolium* var. *gracilipes*

Var. affine (Greene) Welsh & Reveal [*Thelypodium affine* Greene; *T. rhomboideum* Greene; *Pleurophragma rhomboideum* (Greene) Schulz; *T. integrifolium* ssp. *affine* (Greene) Al-Shebaz]. Saline seeps, springs, irrigation canals, and stream sides from 850 to 1100 m elevation in Iron, Kane, Millard, and Washington counties; Nevada and California; 12 (iii).

Var. complanatum (Al-Shebaz) Welsh & Reveal [*T. integrifolium* ssp. *complanatum* Al-Shebaz]. Saline seeps and along streams at 1250 to 2075 m in Beaver, Box Elder, Juab, Millard, and Tooele counties; Nevada, California

and Oregon; 12 (ii). This taxon is completely transitional to var. *affine*, and might not be worthy of taxonomic consideration.

Var. *gracilipes* Robins. [*T. gracilipes* (Robins.) Rydb.; *Pleurophragma gracilipes* (Robins.) Rydb.; *P. platypodium* Rydb., the type is from Moab; *T. rhomboideum* var. *gracilipes* (Robins.) Payson; *T. integrifolium* ssp. *gracilipes* (Robins.) Al-Shebaz]. Canyon bottoms, terraces, and hanging gardens at 1125 to 2440 m in Carbon, Daggett, Duchesne, Garfield, Grand, Kane, San Juan, Uintah, and Wayne counties; Arizona, Colorado, and New Mexico; 31 (xv). This variety is completely transitional to var. *integrifolium*.

Var. *integrifolium* [Pachypodium integrifolium Nutt. ex T. & G.; *Pleurophragma integrifolium* (Nutt.) Rydb.; *T. lilacinum* Greene; *Pleurophragma lilacinum* (Greene) Rydb.; *T. lilacinum* var. *subumbellatum* Payson]. n = 13. Marshes, seeps, stream sides, and other moist sites in Cache, Garfield, Iron, Piute, Rich, Salt Lake, Sevier, and Utah counties; Washington east to the Dakotas and south to Oregon, Colorado, and Nebraska; 16 (iii).

***Thelypodium laxiflorum* Al-Shebaz** [*T. wrightii* var. *tenellum* Jones, type from Slate Canyon, Utah County; *Stanleyella wrightii* var. *tenella* (Jones) Payson]. Biennial; stems 1.5–15 dm tall or more, simple, glabrous throughout or hispid near base; basal leaves 3–15 cm long, 1–6 cm wide, pinnatifid to toothed; cauline leaves 3–9 cm long, 2–20 mm wide, subentire to entire, not auriculate; pedicels 4–13 mm long, spreading to descending, somewhat flattened at base; sepals 2.5–6 mm long, white to lavender, ascending to spreading; petals 4–8 mm long, 1.5–3.5 mm wide, white to lavender; anthers 1–3 mm long; siliques 20–75 mm long, 0.3–1.2 mm wide, stipitate, the stipes 0.2–2 mm long; style 0.5–2 mm long. Pinyon-juniper, mountain brush, ponderosa pine, aspen, Douglas fir-white fir, and spruce-fir communities at 1155 to 3050 m in Beaver, Carbon, Duchesne, Grand, Iron, Kane, San Juan, Utah, and Washington counties; Nevada to Colorado; 15 (vii). This species is closely related to *T. wrightii*.

***Thelypodium milleflorum* A. Nels.** [*T. laciniatum* var. *milleflorum* (A. Nels.) Payson]. Biennial, the stems mostly 4–12 dm tall, almost always hollow, simple or branched, glabrous and glaucous; basal leaves 6–15 cm long, 1–7 cm wide, oblong to lanceolate or ovate, toothed or pinnatifid; cauline leaves similar to the basal ones only gradually reduced upwardly, petiolate, not auriculate; pedicels 2–6 mm long, curved-ascending, slightly flattened at base; sepals 4–9 mm long, creamy white, glabrous; petals 8–15 mm long, 1–2 mm wide, white; anthers 2.5–5 mm long; siliques 25–85 mm long, 0.8–1.8 mm wide, stipitate, the stipes 0.5–5 mm long; style stout, 0.5–2 mm long; stigma entire; n = 13. Dry sites in sagebrush, juniper, and salt desert shrub communities at ca 1370 m in Box Elder County; British Columbia south to California and east to Idaho; 1 (0).

***Thelypodium rollinsii* Al-Shebaz** Biennial, the stems (4) 5–16 (20) dm tall, simple or branched, glabrous and glaucous; basal leaves 1.3–7 cm long, 4–18 mm wide, spatulate to oblanceolate, toothed to subentire; cauline leaves 1–6 cm long, 1–8 mm wide, linear to narrowly lanceolate or oblong, erect, not flattened; sepals 4–7 mm long, lavender to purplish, glabrous; petals 6–10 mm long, 1.2–3 mm wide, lavender to purplish; anthers 2–4 mm long; siliques 20–60 mm long, 0.7–1 mm wide, sti-

tate, the stipe 0.5–6 mm long; style 0.5–2 mm long; stigma entire; n = 13. Saline substrates in greasewood, saltgrass, and other salt tolerant communities at 1495 to 1650 m in Beaver, Carbon, Juab (type from 12 mi N of Scipio), Millard, Piute, Sanpete, and Sevier counties; endemic; 5 (iii).

***Thelypodium wrightii* Gray** [*Stanleyella wrightii* (Gray) Rydb.]. Biennial, the stems 1.5–10 dm tall or more, simple or more commonly branched, glabrous throughout or hispid near the base; basal leaves 3–15 cm long, 1–6 cm wide, pinnatifid to lyrate-pinnatifid; cauline leaves 3–9 cm long, 2–20 mm wide, pinnatifid to sinuate-dentate, rarely subentire, not auriculate; pedicels 4–13 mm long, spreading to descending, somewhat flattened at base; sepals 2.5–6 mm long, white to lavender, glabrous, spreading to reflexed; petals 4–8 mm long, 1–2 mm wide, white to lavender; anthers 1–3 mm long; siliques 20–75 mm long, 1–1.5 mm wide, stipitate, the stipes 0.2–2 mm long; style 0.5–1 mm long. Known in Utah only from a Jones collection from the Henry Mts., Garfield County; Colorado and Arizona east to Texas and northern Mexico; 0 (0). The Utah material, if it is properly identified, is far removed from the remainder of the species.

Thlaspi L.

Glabrous, annual or perennial, arising from taproots; leaves cauline or cauline and basal alternate, simple, entire to dentate or lobed; flowers in ebracteate racemes; sepals 4, deciduous; petals 4, white, sometimes pinkish or lavender; stamens 6, the filaments lacking glandular processes; fruit a sessile silicle, compressed contrary to septum, often more or less wing-margined; style obsolete or slender and conspicuous; stigma capitate; seeds 2 to several per locule, uniseriate.

Holmgren, P. K. 1971. A biosystematic study of North American *Thlaspi montanum* and its allies. Mem. New York Bot. Gard. 21:1–106.

Payson, E. B. 1926. The genus *Thlaspi* in North America. Univ. Wyoming Publ. Bot. 1:145–186.

1. Plants annual; style obsolete or to 0.2 mm long; fruit orbicular in outline, conspicuously winged *T. arvense*
- Plants perennial; style 0.3–2.5 mm long or more; fruit oblanceolate to obovate or obovate in outline, narrowly wing-margined or not winged at all *T. montanum*

***Thlaspi arvense* L.** Annual, the stems mostly 1–7 dm tall; basal leaves usually deciduous by anthesis; cauline leaves 1–8 cm long, 2–25 mm wide, elliptic to lanceolate or oblanceolate, sinuate-dentate to pinnatifid or subentire, the uppermost sessile and auriculate; pedicels 5–12 mm long or more, spreading to curved-ascending; sepals 1.5–2.5 mm long, green with whitish margins; petals 3–4.5 mm long, white; silicles 10–17 mm long, 7–12 mm wide, strongly compressed, wing-margined all around; style almost obsolete; n = 7. Weedy species of roadsides, meadows, fields, and other disturbed places, almost ubiquitous, at 1310 to 2745 m in all Utah counties except Carbon, Emery, Garfield, Kane, Piute, San Juan, and Wayne; widespread in North America; adventive from Europe; 23 (i).

***Thlaspi montanum* L.** [*T. alpestre* of authors, not L.; *T. cochleariforme* DC.; *T. nuttallii* Rydb.; *T. alpestre* var. *glaucum* A. Nels.; *T. glaucum* (A. Nels.) A. Nels.; *T. coloradoense* Rydb.; *T. purpurascens* Rydb.; *T. alpestre* var. *purpurascens* (Rydb.) Ostenf.; *T. glaucum* var. *pedunculatum* Payson; *T. glaucum* var. *hesperium* Payson;

T. hesperium (Payson) G. Jones; *T. fendleri* var. *coloradoense* (Rydb.) Maguire; *T. fendleri* var. *temuipes* Maguire, type from Sanpete County; *T. fendleri* var. *hesperium* (Payson) C. L. Hitchc.; *T. prolixum* A. Nels., type from near Marysville]. Perennial, with simple or branched caudex; stems 0.2–4 dm tall, basal leaves 0.9–3.5 cm long or more, 2–10 (15) mm wide, oval to oblong or spatulate-oblongate; cauline leaves 0.5–2.5 cm long, 1–12 mm wide, sessile and auriculate; pedicels 2–15 mm long, spreading or spreading-ascending; sepals 1.5–3.5 mm long, greenish to purplish; petals 3.5–7.5 mm long, white, pinkish or lavender, spatulate; silicles 3–8 mm long, rarely more, 1.5–5 mm wide, obovate to obcordate, winged or not; style 0.5–2.5 mm long; $n = 7, 14$. Sagebrush-grass, meadow, mountain brush, aspen, lodgepole pine, and spruce-fir communities at 1280 to 3815 m in all Utah counties; Washington east to Montana and south to California, Arizona, New Mexico, and Texas; Eurasia; 143 (xxi). Our material belongs to var. *montanum*. Some specimens from the southern part of the state approach the more southern var. *fendleri* (Gray) P. K. Holmgren, which has styles longer than 2.5 mm in length, petals 6–13 mm long, and silicles 7–16 mm long and 4–9 mm wide.

Thysanocarpus Hook.

Glabrous or pubescent with simple hairs, annual, arising from taproots; leaves cauline, alternate, simple, oblong-lanceolate to linear, toothed to entire; flowers in ebracteate racemes; pedicels curved; sepals 4, deciduous; petals 4, white or tinged pink or purple; stamens 6, the filaments lacking glandular processes; fruit a strongly compressed, unilocular, 1-seeded, indehiscent silicle, the margin winged.

Thysanocarpus curvipes Hook. [*T. trichocarpus* Rydb., type from Silver Reef, Washington County]. Annual, the stems 1–5 dm tall or more, simple or branched, sometimes hirsute below, otherwise glabrous; leaves 1.2–5 cm long, 1–10 mm wide, lance-oblong to elliptic or linear, sinuate-dentate to entire, transitional upwards to smaller sessile and auriculate blades; pedicels 3–7 mm long, recurved in fruit; sepals 1–1.5 mm long, often purplish; petals 1.5–2 mm long, white or tinged purplish or pinkish; silicles 4.5–8 mm long, 3–4 mm wide, ovate to obovate, often plano-convex, glabrous or pubescent, the wing crenate and sometimes perforate; style 0.4–0.6 mm long. Warm desert shrub communities from 670 to 1500 m in Washington County; British Columbia south to California and eastward to Arizona; 13 (iv). Our material belongs to var. *eradiatus* Jepson.

CUCURBITACEAE A. L. Juss.

Gourd Family

Trailing or climbing annual or perennial herbs typically with tendrils; leaves alternate, broad, usually simple but often deeply cut; tendrils simple or branched; flowers imperfect, the plants monoecious or sometimes dioecious; sepals 5; petals 5, connate or almost distinct; stamens 5, with 2 pairs often united, mostly connate by the anthers; ovary inferior; carpels 3; fruit a pepo or bladderly pod; $x = 7–14$.

- 1. Fruit fleshy, with a hard or firm rind, indehiscent, often edible 2

- Fruit berrylike, podlike, or bladderly, dry or fleshy, mostly inedible 5
- 2(1). Corolla bellshaped and distinctly united, 5-lobed to the middle or more *Cucurbita*
- Corolla variously shaped, the petals almost distinct or deeply parted 3
- 3(2). Tendrils unbranched *Cucumis*
- Tendrils branched 4
- 4(3). Leaves not lobed; flowers white, opening in the evening *Lagenaria*
- Leaves pinnatifid, flowers yellow, opening in the morning *Citrullus*
- 5(1). Staminal filaments connate; ovules erect *Echinocystis*
- Staminal filaments distinct, ovules various 6
- 6(5). Tendrils present, plants dioecious; fruit globular *Bryonia*
- Tendrils lacking, plants monoecious; fruit various *Ecballium*

Bryonia L.

Perennial, monoecious (or dioecious) herbs with tuberous roots; stems with simple tendrils; leaves angled or lobed; flowers small, the staminate in peduncled racemes or cymes, the pistillate solitary or in short axillary clusters; calyx short-campanulate, 5-lobed; corolla rotate or campanulate, 5-parted; pistillate flowers with 3–5 more or less obsolete stamens; staminate flowers with 3 stamens, the anthers distinct; style slender, 3-parted; stigmas simple or 2-lobed; fruit a spherical berry.

Bryonia alba L. Vines glabrous to hairy, mostly 1–2 m long; leaf blades 3–10 cm long, cordate to triangular-ovate, 5- to 7-lobed; staminate flowers 7–15 in racemes with peduncles to 20 cm long; pistillate flowers corymbiform on shorter peduncles in lower nodes; calyx lobes 1.5–2 mm long; corolla 4–5 mm long, bluish yellow or yellowish white with green nerves; fruit black, globose, 7–8 mm thick; $2n = 20$. Riparian areas and along fence rows or clambering on other plants, escaped from cultivation and established from 1470 to 1870 m in Box Elder, Cache, Summit, Utah, and Wasatch counties; introduced from Europe; 7 (0).

Citrullus Schrader

Monoecious annual herbs; stems procumbent or climbing; tendrils simple or branched; leaves pinnatifid, with the divisions again lobed; flowers solitary, yellow; corolla rotate, deeply parted; staminal filaments and anthers free; female flowers with 3 small staminodes; stigmas 3; fruit globular or oblong.

Citrullus lanatus (Thunb.) Mansfeld Watermelon. [*Momordica lanata* Thunb.; *C. vulgaris* Schrader]. Pubescent, sprawling herbs; leaves mainly 5–29 cm long, pinnately deeply divided; tendrils branched or less commonly simple; flowers solitary; corolla to ca 4 cm wide, rotate, the 5 lobes obovate, obtuse; fruit round to oblong, to 6 dm long or more, glabrous, green or variously striped, or whitish or yellowish, the flesh red, yellow, or greenish; seed compressed, black, white, or reddish; $2n = 22$. Widely grown and escaping along roadsides and sandbars of the Colorado River in Grand County, and elsewhere; introduced from Africa; 2 (i).

Cucumis L.

Annual or perennial, mostly monoecious, procumbent herbs; stems pubescent, climbing by unbranched ten-

drils; leaves entire or somewhat lobed; flowers yellow, the male usually in clusters, the pistillate solitary; corolla rotate or campanulate, deeply 5-parted; anthers free; stigmas 3-5; fruit globular to elongate, glabrous, pubescent, or echinate.

- 1. Fruit prickly at maturity, usually several times longer than broad *C. sativus*
- Fruit netted-ribbed and rough at maturity, usually more or less pubescent, only slightly longer than broad *C. melo*

***Cucumis melo* L.** Cantelope; Muskmelon. Stems pubescent, striate or angled; leaves orbicular-ovate to subreniform, mainly 4-13 cm wide, angled but not distinctly lobed, pubescent and scabrous; flowers ca 25 mm wide; corolla lobes obtuse; fruit mostly globular or ellipsoid, more or less furrowed, with yellow or greenish pulp; 2n = 24, 48. Cultivated fruit plant, sometimes escaping, especially in warmer portions of the state; introduced from tropical Africa and Asia; 1 (0).

***Cucumis sativus* L.** Cucumber. Stems pubescent, strongly angled; leaves triangular-ovate, angled or somewhat 3-lobed, mainly 6-14 cm long, the lobes acute; flowers ca 25-30 mm wide; corolla lobes acute; fruit cylindrical, usually several times longer than broad, prickly, green or pale whitish green, the pulp white to greenish; 2n = 14, 24. Cultivated fruit plant, occasionally escaping in Salt Lake and Utah counties; introduced from Asia; 3 (i).

***Cucurbita* L.**

Annual or perennial monoecious herbs; stems scabrous, long trailing or climbing with branched tendrils (except in some cultivars); leaves simple, commonly lobed, coarse and often scabrous; flowers solitary, large, the staminate ones long-peduncled; corolla yellow, campanulate, lobed to near the middle or less; stamens 3, the filaments free, the anthers united; pistillate flowers with small staminodes; ovary 1-loculed; stigmas 3-5, each 2-lobed; fruit smooth or roughened, fleshy, mostly with a hard rind.

- 1. Plants perennial, from a greatly thickened root; fruit 5-9 cm thick, globose or nearly so; striped or mottled with pale and dark green; indigenous in southern Utah 2
- Plants annual, from taproots; fruit various; grown for food and as ornamental plants 3
- 2(1). Leaf blades triangular-ovate, not especially lobed or cleft; 1-2.5 dm long; plants common in Washington County, less common elsewhere *C. foetidissima*
- Leaf blades palmately 5-lobed or cleft, less than 1 dm long; plants rare in Washington County *C. palmata*
- 3(1). Plants rough-hairy; leaves strongly lobed and triangular apically, dentate or serrate; peduncle expanded near the fruit, not flared; seeds thick-margined; buds pointed preceding anthesis; calyx lobes of staminate flowers foliaceous *C. pepo*
- Plants soft, variously pilose; leaves shallowly if at all lobed, round or triangular apically, mostly not or only obscurely serrate; buds various; calyx lobes of staminate flowers various 4
- 4(3). Seeds thin, with a hyaline ragged edge that often wears away; leaves broad-ovate to somewhat triangular, buds pointed in evening prior to anthesis; peduncle flared near fruit base; calyx lobes of staminate flowers often foliaceous *C. moschata*

- Seeds plump, the margins obtuse and more or less elevated; leaves circular to reniform; buds not pointed in evening prior to anthesis; peduncle short and spongy, nearly cylindrical, not flared near the fruit; calyx of staminate flowers not foliaceous *C. maxima*

***Cucurbita foetidissima* H.B.K.** Stinking Gourd; Stinking Cucumber. Plants robust, from a large, fusiform root to 10 kilograms or more; stems several from a root crown, to 6 m long or more; leaves coarse and thick, triangular-ovate, angulate or shallowly lobed, broadly rounded to cordate basally, acute to acuminate apically, 1-3 dm long or more, ill-scented, grayish green, scabrous; corolla 6-10 dm long or more, funnellform; fruit globose, green, with pale stripes, yellowish when ripe, to 8 cm thick. Wash bottoms, roadsides, and farmsteads in the creosote bush, Joshua tree, blackbrush, rabbitbrush, live oak, and pinyon-juniper communities at 830 to 1900 m in San Juan and Washington counties; Nevada and California, east to Missouri and south to Texas; 10 (vi). The fruit of this gourd was used by prehistoric peoples as a storage and drinking vessel. It occurred previously along Glen Canyon astride the Kane-San Juan county line, but is not known to have survived the filling of Lake Powell. It persists in the Needles section of Canyonlands National Park, above The Jump in Salt Canyon.

***Cucurbita maxima* Duchesne in Lam.** Fall Squash; Winter Squash; Pumpkin. Stems short or long-trailing, the pubescence soft to the touch; leaves not rigid, orbicular or nearly so, not lobed, the base deeply cordate, the margins shallowly serrate; corolla with broad, usually reflexed lobes; peduncle short and cylindrical or enlarged at middle, often spongy, not expanded at attachment; fruit glaucous or bluish, but variously colored and shaped; seeds plump, the margin obtuse. Cultivated, but seldom escaping, in much of Utah below 1830 m (less commonly above that elevation under glass); introduced from Central America; 1 (i). The Hubbard and turban squashes belong to this species.

***Cucurbita moschata* Duchesne ex Poir.** Cushaw; Butternut; Winter Crookneck. Stems long-trailing, soft to the touch; leaves limp, velvety, broadly ovate to nearly orbicular, not lobed; corolla with widely spreading crinkly lobes, the tube broad at the base and usually not bulging above; calyx lobes often long and expanded in fruit; seeds thin, the margin hyaline when fresh. Commonly and widely cultivated food plants in Utah; introduced from Central America; 3 (0).

***Cucurbita palmata* Wats.** California Gourd. [*C. californica* Torr. ex Wats.]. Stems 5-15 dm long; leaves grayish with whitish streaks along veins on the upper surface, palmately 5-lobed, 3-9 cm long and about as broad, the lobes triangular to deltoid-lanceolate; corolla yellowish, 4-6 cm long; fruit globose 6-9 cm in diameter, green with bands of greenish white not well defined; seeds white, narrow-ovate, 10-14 mm long. Dry sandy flats in creosote bush and blackbrush communities at 1050 m and lower in Washington County; Arizona and California; 4 (ii).

***Cucurbita pepo* L.** Field Pumpkin. Stems with stiff, translucent hairs; leaves stiff and rigid, erect, triangular or ovate-triangular, mainly 10-35 cm long, pointed, usually lobed and apiculate, the margins irregularly sharp-serrate; corolla with erect or spreading pointed lobes; peduncle strongly angled, expanded near the fruit; fruit large, orange, furrowed; n = 10. Widely grown food and

ornamental plants in Utah, seldom escaping; introduced from Central America; 3 (0). The shape and form of the fruit are highly variable. The cultivated varieties hybridize freely, and seed from them will often yield several kinds of fruit, most of them inferior to the cultivars from which they were derived. The var. *melopepo* Alef. includes the bush squashes, such as summer crookneck, warty, and zucchini squashes.

Echallium A. Rich.

Trailing monoecious perennials from a tuberous root, lacking tendrils; flowers yellow, pedunculate, the pistillate solitary and often in the same leaf axil with the staminate raceme; corolla rotate or campanulate, deeply 5-parted, the lobes acute; anthers free; style very short; stigmas 3, bilobed; fruit much elongated.

Echallium elaterium (L.) A. Rich. in Bory Squirting Cucumber. [*Momordica elaterium* L.]. Stems hairy, mainly 1.5–6 dm long; leaves long petiolate, the blades 4–10 cm long, cordate to triangular, entire, denticulate, or shallowly lobed, undulate, rather fleshy; corolla of staminate flowers 28–30 mm long; fruit 4–5 cm long, ca 2.5 cm thick, greenish, rough hairy, finally detaching from the peduncle and squirting brownish seeds from the basal aperture. Cultivated, botanical curiosity; introduced from Europe; 1 (0).

Echinocystis T. & G.

Annual, climbing or clambering, monoecious plants with branched tendrils; leaves lobed or angled; flowers white or whitish, small, usually numerous, the pistillate solitary, the staminate in racemes or panicles; corolla rotate, 5- or 6-lobed; filaments connate, the anthers connate or distinct; ovary usually 2-loculed; ovules erect, 2 per locule; fruit fleshy or dry.

Echinocystis lobata (Michx.) T. & G. Wild Cucumber. [*Sicyos lobata* Michx.]. Stems slender, angled, glabrous or hairy at the nodes, mainly 2–7 m long, with branched tendrils; leaves 7–12.5 cm long, cordate-ovate, shallowly 3- to 7-lobed, the lobes apiculate, the margins entire or sparsely serrate; pistillate flowers solitary, the staminate few to numerous; fruit ovoid, 3–5 cm long, ca 2.5 cm thick, bladdery or inflated, somewhat beaked and with weak glabrous prickles to ca 6 mm long, bursting irregularly near the apex; 2n = 32. Cultivated ornamental, escaping and established along fence rows, canal banks, and roadsides at 1380 to 2130 m in Salt Lake, Uintah, Utah, and Weber counties; widespread in the U. S.; 6 (ii).

Lagenaria Ser.

Annual, monoecious or rarely dioecious vines with branched tendrils; flowers solitary, white, showy, soon withering, vespertine, 5-merous, the staminate on very long peduncles; anthers weakly connate; fruit various, of many sizes and shapes, the exocarp hard and durable.

Lagenaria siceraria (Molina) Standley Bottle-gourd. [*Cucurbita siceraria* Molina]. Musky-scented, soft, viscid-pubescent plants; leaves ovate to ovate-reniform, cordate basally, 15–30 cm wide, usually not lobed, the margins apiculate-dentate; flowers white, 5–10 cm wide, the staminate on long peduncles that commonly surpass the leaves; anthers only slightly coherent; fruit to 3 dm long or more, varying from globular to bottle-shaped, dumbbell-shaped, or clublike, crookneck, or coiled; 2n = 22. Cultivated ornamental, grown for the fruit used as containers and decoration; probably of Old World origin, but grown in the New World since antiquity; 1 (i).

Rootless, twining, parasitic herbs, attached to a wide variety of herbaceous and woody hosts by means of discoid haustoria, mostly annual, achlorophyllous; stems glabrous, usually much branched and tangled, white to yellow to orange; leaves alternate, reduced to minute scales or lacking; inflorescence cymose, 1- to many-flowered; flowers perfect, 4- or 5-merous, white to yellowish, sessile or pedicelled, infrequently with subtending bracts; calyx united, rarely separate, persistent, usually glabrous, often pellucid; corolla tubular to campanulate to urceolate, usually whitish, glabrous, often persistent around the developing capsule, commonly with a ring of fringed, united scales attached to the inside of the corolla tube and alternate with the corolla lobes (infrastaminal scales); stamens alternate with and mostly shorter than the corolla lobes, inserted on the corolla tube below or at the sinuses; filaments mostly subulate, usually equaling the anthers; pistil 1, superior, 2-carpeled and 2-loculed, usually enlarging and distending or rupturing the perianth; styles 2, distinct, often unequal; stigmas capitate, occasionally linear; fruit a capsule, indehiscent or some basally circumscissile; seeds 1–4; embryo acotyledoneous; x = 17.

CUSCUTACEAE Dumort.

Dodder Family

Contributed by Gary I. Baird

The single genus has the characteristics of the family.

Cuscuta L.

- Yuncker, T. G. 1965. *Cuscuta*. North American Flora. Series II, part 4: 1–40.
- 1. Stigmas linear; capsule basally circumscissile; inflorescence a compact glomerule *C. approximata*
 - Stigmas capitate; capsule usually indehiscent, inflorescence compact to open but not a glomerule 2
 - 2(1). Infrastaminal scales lacking *C. occidentalis*
 - Infrastaminal scales present 3
 - 3(2). Sepals with a single, large projection; corolla very papillate; plants of Millard County *C. warneri*
 - Sepals and corolla various but not as above; plants common or uncommon but not limited to Millard County 4
 - 4(3). Flowers mostly 4-merous *C. cephalanthi*
 - Flowers rarely other than 5-merous 5
 - 5(4). Flowers closely subtended by 1–3 sepaloid bracts; sepals distinct to the base *C. cuspidata*
 - Flowers mostly ebracteate; sepals united, at least partly so at the base 6
 - 6(5). Capsule ovoid, either 1-seeded and small or seeds mostly 4 and the capsule greatly enlarged 7
 - Capsule globose, mostly 2- to 4-seeded, neither very small nor greatly enlarging 9
 - 7(6). Capsule large, ca 5 mm long and mostly 4-seeded; plants of montane areas *C. megalocarpa*
 - Capsule small, 1–3 mm long, 1-seeded; plants of desert and saline areas 8

- 8(7). Flowers 1–2 mm long, sessile, solitary or few in a group; sepal and petal lobes ovate-orbicular *C. denticulata*
 — Flowers 2–3 mm long, pedicelled, in cymose clusters; sepal and petal lobes lanceolate *C. salina*
- 9(6). Capsules circumscissile at the base; sepals carinate; plants of southern Utah *C. applanata*
 — Capsules indehiscent; sepals sometimes nerved but not carinate; plants mostly widespread 10
- 10(9). Corolla often nerved; capsule slightly crest-thickened; flowers sometimes bracteate *C. indecora*
 — Corolla not papillose-nerved; capsule mostly flattened to rounded on top, sometimes with thickened cells but not crested; flowers ebracteate 11
- 11(10). Capsule papillate-granular on upper half; corolla remaining about the expanded capsule; plants disjunct in the Uintah Basin *C. glabrior*
 — Capsule smooth to tuberculate-thickened apically; corolla remaining at the base of the expanded capsule; plants common throughout eastern and southern Utah *C. pentagona*

Cuscuta applanata Engelm. Wing Dodder. [*C. alata* Brandegee]. Stems medium, 0.3 mm in diameter (when dry); inflorescence a few-flowered, compact cluster; flowers 5–merous, 1–2 mm long, subsessile, often basally thickened; calyx united, the lobes 1 mm long, broadly triangular, obtuse to broadly acute, not or just overlapping, pellucid, irregularly carinate at the midrib and sinuses (or merely thickened), the carina extending down onto the very short pedicel, this equaling or exceeding the corolla tube; corolla campanulate, the lobes 1 mm long, broadly lanceolate, acute, the margins irregular, erect to spreading, slightly thickened at the midribs, somewhat saccate between the calyx lobes; stamens shorter than the corolla lobes; filaments slender, equaling or longer than the anthers; anthers ovate, 0.5 mm long; infrastaminal scales reaching the filaments, with the long fringe exerted; ovary globose; styles slender-subulate, 1–1.5 mm long; stigmas capitate; capsule flattened-globose, angled by the developing seeds, the apical depression evident, surrounded by the distended corolla, easily circumscissile by a definite or indefinite basal line, the septae remaining with the base; seeds 4, oval to wedge-shaped. On a variety of hosts; known in Utah from a single collection in Washington County (B. Albee 3374 UT); Arizona and New Mexico to Mexico; 1 (0).

Cuscuta approximata Babington Slender Dodder. [*C. planiflora* var. *approximata* Engelm.; *C. cupulata* Engelm.; *C. urceolata* Kuntze; *C. approximata* ssp. *approximata* Feinbrun; *C. gracilis* Rydb.; *C. antheri* A. Nels.]. Stems medium, to 0.3 mm in diameter (when dry), whitish to yellow (orange); inflorescence a few- to many-flowered glomerule; flowers sessile, 2.5–3 (3.5) mm long; calyx united, the lobes 1.5–2 mm long, usually as broad as long, pellucid, slightly overlapping, the apex slightly attenuate and thickened, often recurved; corolla campanulate, equal to or slightly exceeding the calyx, the lobes 1 mm long, obtusish, whitish, entire; stamens shorter than the corolla lobes; filaments subulate, equaling the anthers; anthers oval, 0.3 mm long, often with a purplish stripe; infrastaminal scales inserted, just reaching the filaments, apically fringed with short processes; ovary globose; styles 0.5 mm long, slender; stigmas linear, 0.5 mm long; capsule globose, the apical depression evident

or not, surrounded by the distended corolla, basally circumscissile along a definite line; seeds usually 4, oblong. On a variety of herbaceous plants, especially cultivated crops and particularly alfalfa in Cache, Grand, Salt Lake, Uintah, and Utah counties; introduced from the Mediterranean region of Europe; 21 (0).

Cuscuta cephalanthi Engelm. Slenderflower Dodder. [*C. tenuiflora* Engelm.; *Epithymum cephalanthi* (Engelm.) Nieuwl. & Lunell]. Stems medium, 0.3 mm in diameter (when dry), whitish to yellow; inflorescence a few- to many-flowered cluster; flowers mostly 4–merous, sessile, ca 2 mm long; calyx united, the lobes 1–1.5 mm long, overlapping, shorter than the corolla tube, pellucid, sometimes glanular; corolla tubular to campanulate, distended by the capsule and often persisting about the top, the lobes ovate, obtuse, 1–1.5 mm long, erect to spreading, entire; stamens equaling the corolla lobes, the filaments subulate and stout, equaling the anthers, these oval to round; infrastaminal scales inserted, shorter than or subequal to the filaments, shortly fringed; ovary globose; styles 0.5–1.5 mm long; stigmas capitate; capsule globose, apically depressed, not thickened around the aperture, indehiscent, often surrounded by the withered corolla; seeds usually 2, oval. Known from a variety of hosts, in Salt Lake County; Washington to California, east to the Atlantic and Gulf states; 1 (0).

Cuscuta cuspidata Engelm. Toothed Dodder. [*Grammica cuspidata* (Engelm.) Hadac & Chrtek]. Stems medium, 0.3 mm in diameter (when dry), yellowish (greenish); inflorescence a loose, many-flowered, paniculate cyme; flowers 5–merous, 2.5–4 (5) mm long, pedicelled, often closely subtended by 1–3 sepaloid bracts; calyx separate, the sepals 1.5–2 mm long, ovate to orbicular, the whole calyx becoming somewhat spherical, acutish and often cuspidate-mucronate, the margin serrulate to entire, strongly overlapping, midrib often nerved with large, thickened, linear cells; corolla tubular, the lobes 1.5 mm long, ovate to triangular, acute and sometimes cuspidate, the margin sometimes serrulate, midrib nerved as in calyx, spreading to reflexed; stamens shorter than corolla lobes; filaments subulate, shorter than the anthers, these oval to oblong, 0.6 mm long; infrastaminal scales inserted, not reaching the filaments, with a short irregular fringe; ovary globose; styles 1.5 mm long; stigmas capitate; capsule globose, the apical depression small, surrounded by the persistent perianth, indehiscent; seeds usually 4, obovate. On a variety of hosts, in Utah and Weber counties; North Dakota to Indiana, south to Texas and Louisiana; 2 (0).

Cuscuta denticulata Engelm. Smalltooth Dodder. [*Grammica denticulata* (Engelm.) W. A. Weber]. Stems slender, 1.5–2 mm diameter (when dry); inflorescence a single flower or sometimes a loose, few-flowered cluster; flowers 5–merous, 1.5–2 mm long, white, subsessile, often with a small bract(s); calyx united, at least near the base, the lobes 1.2–1.7 mm long, strongly overlapping, orbicular, the whole becoming spherical, denticulate to erose; corolla campanulate, becoming urceolate, the lobes to 1 mm long, oval to oblong, obtuse to rounded, spreading to less often erect, overlapping, white; stamens shorter than the corolla lobes; filaments subulate, equaling the anthers, these oval, 0.3 mm long; infrastaminal scales inserted, reaching the filaments, with an irregular, denticulate fringe; ovary ovoid to conical; styles 0.5 mm long; stigmas small, capitate; capsule ovoid to conical, the

apical depression not evident, surrounded by the persistent perianth, indehiscent; mostly 1-seeded, the seed globose-ovoid. This is a desert species found growing on several genera of desert shrubs, often germinating in place, in Box Elder, Duchesne, Emery, Grand, Juab, Kane, Tooele, Uintah, and Washington (type from Rio Virgin) counties; western U. S.; 12 (i).

Cuscuta glabrior (Engelm.) Yuncker Smooth Dodder. [*C. verrucosa* var. *glabrior* Engelm.; *C. verrucosa* Engelm., not Sweet; *C. arvensis* var. *verrucosa* (Engelm.) Engelm.; *C. pentagona* var. *verrucosa* (Engelm.) Yuncker; *C. glabrior* f. *pedicellata* Yuncker]. Stems medium, 0.3 mm in diameter (when dry); inflorescence a loose cymose cluster; flowers 5-merous, 2-3 mm long, pedicellate; calyx united, the lobes 1 mm long, triangular to obtuse, slightly overlapping, pellucid with chartaceous margins, equaling or surpassing the corolla tube; corolla campanulate, the lobes 1 mm long, triangular to broadly lanceolate, acute to slightly apiculate, entire, spreading to reflexed with inflexed tips; stamens shorter than the corolla lobes; filaments subulate, slightly shorter than the anthers, these oval, ca 0.5 mm long; infrastaminal scales inserted, just reaching the filaments, with a short fringe; ovary globose to obconic; styles ca 0.7 mm long; stigmas capitate; capsule globose to obconic, membranous, finely papillose-granular on the upper half, slightly thickened about the evident apical depression, the perianth persistent around the expanded capsule; seeds mostly 2, oval. On a variety of hosts, potentially, but known in Utah from near Ouray, Uintah County; New Mexico to Louisiana and southward into Mexico; 1 (0). This taxon is closely allied to *C. pentagona* Engelm. and very similar to it in habit.

Cuscuta indecora Choisy Plain Dodder. [*C. decora* Engelm.; *C. decora* var. *indecora* (Choisy) Engelm.; *C. decora* var. *subnuda* Engelm.; *C. indecora* var. *subnuda* (Engelm.) Yuncker; *Epithymum indecorum* (Choisy) Nieuwl. & Lunell; *Grammica indecora* (Choisy) W. A. Weber; *C. verrucosa* var. *hispidula* Engelm.; *C. hispidula* (Engelm.) Engelm.; *C. indecora* var. *hispidula* Yuncker; *C. neuropetala* Engelm.; *C. neuropetala* var. *minor* Engelm.; *C. neuropetala* var. *littoralis* Engelm.; *C. indecora* var. *neuropetala* (Engelm.) A. S. Hitchc.; *Grammica indecora* ssp. *neuropetala* (Engelm.) W. A. Weber; *C. pulcherrima* Scheele; *C. decora* var. *pulcherrima* (Scheele) Engelm.; *C. indecora* var. *bifida* Yuncker]. Stems medium to coarse, 0.3-0.5 mm in diameter (when dry), yellowish; inflorescence a many-flowered, loose panicle cyme; flowers 5-merous, pedicellate, 3-4 mm long, commonly granular, mostly ebracteate; calyx united, the lobes 1.5-3 mm long, triangular-ovate, acute, entire to uneven, sometimes with a nerved midrib, rarely, if ever, overlapping; corolla campanulate, the lobes 1-1.5 mm long, triangular-ovate, erect to spreading, the tip often inflexed, acute, entire to granulate, often with a nerved midrib; stamens shorter than the corolla lobes; filaments slender, equal to the anthers, these oblong to triangular, 0.7 mm long; infrastaminal scales inserted or slightly exerted, abundantly fringed; ovary globose to slightly ovoid; styles 0.5-1.5 mm long; stigmas capitate; capsules globose, the apical depression evident, often slightly thickened apically, indehiscent; seeds mostly 4, oval. Known from several hosts in Davis, Millard, Salt Lake, Uintah, and Utah counties; widespread throughout the U. S. and tropical America, 24 (iv).

Cuscuta megalocarpa Rydb. Largefruit Dodder. [*C. umbosa* Hook.; *C. gronovii* var. *curta* Engelm.; *C. curta* (Engelm.) Rydb.]. Stems coarse to robust, 0.5 mm in

diameter (when dry), pale yellow; inflorescence a compact, few-flowered, paniculate cluster; flowers 5-merous, on short, stout pedicels, often with pellucid cells, 2-3 mm long; calyx united, much shorter than the corolla tube, the lobes 1-1.5 mm long, ovate, obtuse, entire, slightly overlapping; corolla campanulate, the lobes 0.7-0.9 mm long, obtuse to rounded, spreading to reflexed, entire; stamens shorter than or equaling the corolla lobes; filaments subulate, equaling the anthers; anthers oval, 0.6 mm long; infrastaminal scales inserted, not reaching the filaments, slightly fringed; ovary ovoid, the apex much thickened; styles short, 0.3-0.5 mm long; stigmas capitate; capsule large, 3-6 mm long, indehiscent; seeds 2-4, large, mostly over 2.0 mm long, roundish. On woody plants at higher elevations in Salt Lake and Utah counties; Saskatchewan to Manitoba, south to New Mexico; 7 (0).

Cuscuta occidentalis Millsp. Western Dodder. [*C. californica* var. *breviflora* Engelm.; *Grammica occidentalis* (Millsp.) Hadac & Chrtek]. Stems medium, to 0.3 mm in diameter (when dry), yellowish; inflorescence a small, compact to loose cluster; flowers 5-merous, 2-3 mm long, sessile or subsessile; calyx united, equaling the corolla tube or exceeding it, the lobes 2 mm long, narrowly ovate, acuminate, becoming thickened at the base, entire, not overlapping; corolla campanulate-globose, sometimes saccate between the calyx lobes, these lanceolate, 1.5-2 mm long, acuminate, erect to spreading, entire; stamens shorter than corolla lobes; filaments subulate, mostly longer than the anthers; anthers oval, 0.3-0.5 mm long; infrastaminal scales lacking; ovary globose; styles 0.5-1 (1.5) mm long; stigmas capitate; capsules globose, the apical depression present, membranous, surrounded by the persistent corolla, with the lobes often spread outward; seeds 4, oval. On several hosts in Emery, Morgan, Salt Lake, and Summit counties; Pacific Coast states inland to Idaho, Wyoming and Colorado; 17 (0). A closely related species, *C. californica* Choisy, may be present in Utah. It is distinguished from *C. occidentalis* by its longer, linear anthers (0.7-1 mm long), longer, exerted styles (1.5-2 mm), and by being pedicelled.

Cuscuta pentagona Engelm. Field Dodder. [*C. arvensis* Beyrich ex Engelm. in Gray; *C. arvensis* var. *pentagona* (Engelm.) Engelm.; *Epithymum arvense* Nieuwl. & Lunell; *Grammica pentagona* (Engelm.) W. A. Weber; *C. pentagona* var. *calycina* Engelm.; *C. arvensis* var. *calycina* (Engelm.) Beyrich ex Engelm. in Gray; *C. campestris* Yuncker; *Grammica campestris* (Yuncker) Hadac & Chrtek]. Stems medium, 0.4 mm diameter (when dry), yellowish; inflorescence a loose to crowded cluster; flowers 5-merous, 1-2 (3) mm long, pedicelled, the pedicels mostly stout, often slightly tuberculate throughout; calyx united, the lobes ca 0.9 mm long, as broad as long, ovate, entire, pellucid, overlapping, equaling the corolla tube; corolla campanulate, the lobes ca 1 mm long, triangular to broadly lanceolate, acute, entire, spreading, the tip often inflexed; stamens shorter than corolla lobes; filaments subulate, equaling the anthers; anthers oval, to 0.5 mm long; infrastaminal scales equaling the corolla tube, with the long fringe exerted; ovary globose to obconic, often visible and exposed at anthesis; styles 0.5-1 mm long; stigmas capitate; capsules globose to obconic, membranous, often tuberculate around the evident apical depression, indehiscent, the perianth persistent at the base of the capsule; seeds 2-4, ovate to oval.

Widespread species known from several hosts in Carbon, Kane, Salt Lake, San Juan, Sanpete, Uintah, Utah, Washington and Wayne counties; throughout the U. S. and tropical America; 48 (ii).

Cuscuta salina Engelm. in Gray Salt Dodder. [*C. californica* var. *squamigera* Engelm.; *C. squamigera* (Engelm.) Piper; *C. salina* var. *squamigera* (Engelm.) Yuncker; *Grammica salina* (Engelm.) Taylor & Macbride; *C. veatchii* var. *apoda* Yuncker; *C. nevadensis* Johnston; *C. salina* var. *apoda* (Yuncker) Yuncker]. Stems slender, orangish; inflorescence a few-flowered, umbellate-cymose cluster; flowers 5-merous, 2-4 mm long, short pedicelled; calyx united, the lobes 1-2 mm long, lanceolate to narrowly ovate, acute to acuminate, entire, slightly overlapping at the base, equaling the corolla tube; corolla tubular-campanulate, the lobes 1-2 mm long, erect to spreading, entire, occasionally granular; stamens shorter than the corolla lobes; filaments subulate, equaling the anthers; anthers oval to oblong, 0.5 mm long; infrastaminal scales inserted, with a short fringe; ovary ovoid; styles 0.4-0.8 mm long; stigmas capitate; capsule ovoid, slightly attenuate, apical depression wanting, surrounded by the withered corolla, indehiscent; seed 1, globose-ovoid. On a variety of hosts but especially on members of Chenopodeaceae in Davis, Salt Lake, Tooele, Washington, and Weber counties; British Columbia to Baja and east to Arizona; 11 (0).

Cuscuta warneri Yuncker Warner Dodder. Stems slender, yellow; inflorescence a few- to many-flowered cluster; flowers 5-merous, 2.0 mm long, short pedicelled, very papillous to turbiculate; calyx united, the lobes 0.8-1 mm long, triangular-ovate, shorter than the corolla tube, each lobe with a thickened, acute, conelike projection, 0.5-0.7 mm long; corolla tubular-campanulate, the lobes 1-1.2 mm long, triangular-ovate, acute, erect to inflexed, prominently papillose; stamens shorter than corolla lobes; filament subulate, equaling the anthers; anthers ovoid; infrastaminal scale inserted, sparingly toothed at the truncate apex, not or just reaching the filaments; ovary globose; styles slender, 0.5-0.7 mm long; stigmas capitate; capsule globose, with a prominent, shallowly lobed collar around the apical depression, smooth, membranous, finely striate, surrounded by the persistent perianth; seeds usually 2, oval. Known only from the type collection near Fillmore, Millard County; endemic; 1 (0). At the type locality, the Warner dodder was growing historically in a weedy area between a road and an alfalfa field on *Phyla cuneifolia*. The host plant is common in the area but several attempts at finding the Warner dodder have been unsuccessful.

DIPSACACEAE A. L. Juss.

Teasel Family

Plants herbaceous; stems stout, prickly; leaves opposite or whorled, simple to pinnately dissected; flowers epigynous, perfect, aggregated into dense heads with involucre bracts; calyx cup-shaped, 4-toothed; corolla 4-lobed, irregular, the lobes imbricate; stamens 4, distinct, or seldom 2 or 3, attached near the throat of the corolla tube, alternate with the lobes; pistil 1, the ovary inferior, 1-loculed; style 1, slender, with an entire or 2-lobed stigma; fruit an achene, crowned by the persistent calyx; $x = 5, 10$.

Dipsacus L.

Coarse biennial or perennial herbs; stems erect, stout, prickly; leaves opposite, sessile, usually connate; heads ovoid to cylindrical, dense; involucre bracts elongate, linear, spine-tipped, the bracts of the receptacle ovate to lanceolate, acuminate or awn-tipped; calyx minute, cupulate, 4-lobed and 4-angled, persistent on the achene; corolla 4-lobed, elongate; stamens 4.

Dipsacus sylvestris Hudson Teasel. [*D. fullonum* L. ssp. *sylvestris* Clapham in Clapham et al.]. Stems stout, 8-20 dm tall, striate, with prickles on the angles; leaves 20-60 cm long, sessile, the upper ones perfoliate, lanceolate to oblong-lanceolate, crenate-serrate or the upper entire, prickly, especially on the veins; heads 5-9 cm long, ovoid or somewhat cylindrical; involucre bracts linear, prickly on the margin, curving upward and as long as or longer than the head; bractlets of the receptacle with a stiff, straight awn; calyx silky, ca 1 mm long; corolla 8-14 mm long, the tube whitish, with pale purplish lobes ca 1 mm long; fruit ca 5 mm long; $2n = 16, 18$. Moist roadsides, ditch banks, marshes, and waste places at 1430 to 2660 m in Box Elder, Cache, Daggett, Davis, Salt Lake, Utah, and Wasatch counties; widespread in the U. S.; native to Europe; 9 (i). This plant is used in dried floral arrangements.

EBENACEAE Gurke in Engler & Prantl

Ebony Family

Trees with alternate, entire, deciduous leaves; flowers regular, imperfect, axillary, solitary or in cymes; calyx 4- or 5-lobed, persistent and accrescent in fruit; corolla 4- or 5-lobed, urceolate to campanulate; stamens 3 to many, inserted at corolla base; pistil 1, the ovary superior, usually many-loculed; ovules 1 or 2 per locule; fruit a several-locular berry; $x = 15$.

Diospyros L.

Trees with blackish, reticulate patterned bark, dioecious or essentially so; flowers axillary; corollas dimorphic, those of the pistillate flowers much larger than those of the staminate ones.

Diospyros virginiana L. Common Persimmon. Trees, mainly 5-12 m tall, the blackish wood very hard; leaves petiolate, the blades ovate-oblong to elliptic, 2.5-10 cm long or more, 1.5-7 cm wide, abruptly acuminate apically, rounded to cordate basally; peduncles very short; corolla of pistillate flowers pale yellow, campanulate-urceolate, 1-1.5 cm long, those of the staminate flowers much smaller; styles 4, bilobed at apex; ovary 8-loculed; fruit mainly 1-4 cm thick, astringent when unripe. Cultivated ornamental and fruit tree, escaping and established in Washington County; indigenous in the eastern U. S.; 4 (i).

ELAEAGNACEAE A. L. Juss.

Oleaster Family

Shrubs or trees with stellate or peltate, scalelike trichomes; leaves simple, alternate or opposite, entire; flowers perfect or imperfect, regular, borne in axillary clusters; perianth 4-lobed, in a single whorl from the apex of the hypanthium; stamens 4-8; pistil 1, the ovary superior

(though often appearing inferior), 1-loculed; styles and stigmas 1; fruit a dry, indehiscent achene enveloped by the fleshy, persistent hypanthium, hence drupelike; $x = 6, 10, 11, 13$.

1. Leaves alternate; flowers perfect or polygamous; stamens 4. *Elaeagnus*
- Leaves opposite; flowers perfect (or rarely imperfect); stamens 8. *Shepherdia*

Elaeagnus L.

Shrubs or trees with ascending, alternate branches; leaves alternate; flowers axillary, perfect or polygamous; hypanthium investing the ovary and produced upward as a tube usually longer than the spreading sepals, deciduous above the ovary, not glandular-thickened at the lobe apex; stamens 4; ovary wall bony.

1. Branchlets and leaves with silvery peltate scales only; leaves lance-oblong to linear-oblong or elliptic; cultivated, escaping, and established. *E. angustifolia*
- Branchlets and leaves with both silvery and brown peltate scales; leaves ovate to obovate, oblong, or elliptic; indigenous in Daggett and Summit counties. *E. commutata*

Elaeagnus angustifolia L. Russian Olive; Oleaster. Trees of small to moderate stature and rapid growth, mainly 5–12 m tall, with trunks 1–5 dm thick; stems often armed with coarse thorns; leaves 2–9 cm long, 5–38 mm wide, lanceolate to elliptic, silvery with peltate scales on both surfaces but less so above, hence the leaves often bicolorous; flowers deathly fragrant, 8–12 mm long, silvery, the lobes yellow ventrally and somewhat stellate-hairy; stamens 4; fruit olivelike, silvery or finally brown and glabrate, 1–2 cm long; $2n = 12, 28$. Cultivated shade tree, escaped and established in probably all Utah counties; widespread in the U.S.; introduced from Europe; 55 (iv). This plant is naturalized along drainages and in moist meadows over vast areas of the state.

Elaeagnus commutata Bernh. Silverberry. [*E. argentea* Pursh, not Moench]. Shrubs, mostly 1–2 m tall, the branchlets with brownish, peltate scales, unarmed; leaves 1.3–7 cm long, 5–30 mm wide, elliptic to oblanceolate or lanceolate, acute to obtuse or rounded apically, acute to obtuse basally, silvery on both sides and with some brown scales intermixed; flowers 1–4 per axil, 10–15 mm long, the lobes yellowish; stamens 4; fruit 6–10 mm long, the hypanthium base mealy, silvery; $2n = 28$. Riparian zone with willow and poplar at ca 1830 to 2440 m in Daggett and Summit counties; Alaska and Yukon, east to Quebec, south to Idaho, Wyoming, and Minnesota; 5 (i).

Shepherdia Nutt.

Shrubs with spreading to ascending, opposite branches; leaves opposite, green or greenish above, pale beneath, sparsely to densely brownish or silvery with peltate scales or stellate hairs; flowers axillary, perfect (or imperfect); perianth short-tubular, investing the ovary in pistillate flowers, not deciduous above the ovary; staminate flowers with 8 stamens alternating with glandular thickenings at the base of the perianth lobes; ovary wall somewhat woody, enclosed by the juicy hypanthium; fruit drupelike.

1. Leaves evergreen, oval to orbicular or ovate, rounded to obtuse at the base; fruit subglobose, the surface obscured by silvery scales; plants of southern Utah. *S. rotundifolia*

- Leaves deciduous, variously shaped, but usually much longer than broad; fruit red, the surface sparingly if at all scaly. 2
- 2(1). Plants armed with stout thorns, 1–4 m tall; leaves cuneate at the base; fruit red, edible; plants of riparian habitats. *S. argentea*
- Plants unarmed, commonly 0.5–2 m tall; leaves usually rounded at the base; fruit yellowish red, unpalatable. *S. canadensis*

Shepherdia argentea (Pursh) Nutt. Silver Buffaloberry. [*Hippophae argentea* Pursh; *Lepargyrea argentea* (Pursh) Nutt.]. Shrubs with spreading to ascending, opposite, frequently thorny branches; 2–4 m tall, the branchlets covered with silvery peltate scales; leaves petiolate, the blades 0.5–6 cm long, mainly 3–14 mm wide, oblong, elliptic, or lanceolate to oblanceolate, cuneate at the base, rounded to obtuse apically; petioles 2–12 mm long; flowers subsessile, clustered at the nodes, precocious, 2.5–4 mm long, the lobes yellowish; fruit 4–7 mm long, red, tart, edible; $2n = 26$. Stream banks and terraces, often where moist or wet, at 1400 to 2290 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Millard, Piute, San Juan, Sevier, Uintah, Utah, Tooele, and Wayne counties; British Columbia to Saskatchewan, south to California, Nevada, New Mexico, and North Dakota; 36 (vi).

Shepherdia canadensis (L.) Nutt. Soapberry. [*Hippophae canadensis* L.; *Lepargyrea canadensis* (L.) Greene]. Shrubs, mostly 0.5–2 m tall, the branchlets clothed with brown peltate scales; leaves 0.5–8 cm long, 3–30 (48) mm wide, ovate to lanceolate, rounded apically and basally, green above, pale or brownish beneath, sparingly to rather densely brownish scaly; flowers 1 to several per axil, 2–3 mm long, the lobes stramineous brownish; fruit 4–7 mm long, juicy, red, bitter and soapy; $2n = 22$. White fir, Douglas fir, aspen, bristlecone pine, lodgepole pine, and spruce-fir communities at 2040 to 3205 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Utah counties; Alaska to the Atlantic, south to Oregon, Nevada, Colorado, and New York; 48 (iv). The ill-flavored fruit is sometimes eaten, whipped with cream and with sugar added, as a frothy "ice cream."

Shepherdia rotundifolia Parry Roundleaf Buffaloberry. [*Lepargyrea rotundifolia* (Parry) Greene]. Shrubs mainly 1–2 m tall, but 1–4 m wide, the branchlets stellate-hairy with white or yellowish trichomes; leaves 0.5–4.2 cm long, 5–38 mm wide, ovate, oval, orbicular, lanceolate, rounded apically, the base rounded to obtuse, silvery green above, pale beneath, clothed with trichomes; flowers 1 to few per axil, 3.5–5 mm long, the lobes yellowish, opening flat; fruit 5–8 mm long, the surface obscured by stellate hairs. Blackbrush, ephedra, rabbitbrush, shadscale, pinyon-juniper, and ponderosa pine communities at 1220 to 2565 m in Emery, Garfield, Kane (type from valley of the Virgin); San Juan, Sevier (eastern border), Washington, and Wayne counties; Arizona (Colorado Plateau endemic; 70 (ix). This is a beautiful shrub. It festoons slopes with silvery clumps.

ELATINACEAE Dumort.

Waterwort Family

Annual herbs; leaves simple, opposite, with paired stipules between them; flowers small, regular, perfect,

axillary; sepals 2-5; petals 2-5, distinct; stamens 2-5 or 4-10; pistil 1, the ovary superior, 2- to 5-loculed, with axile placentation; style 1; fruit a septical capsule, the seeds several to many; x = 6, 9.

- 1. Flowers 5-merous; herbage glandular-pubescent; sepals scarious margined *Bergia*
- Flowers 2- to 4-merous; herbage glabrous; sepals not scarious margined *Elatine*

***Bergia* L.**

Annual, prostrate or ascending glandular-pubescent herbs; flowers solitary or fascicled, pedicelled, 5-merous; sepals cuspidate, the midrib thickened, scarious margined; petals oblong; stamens 5 or 10; capsules included in the calyx.

Bergia texana (Hook.) Seub. [*Merimea texana* Hook.]. Stems reclining or ascending, radiating from a taproot, mainly 5-40 cm long; leaves petiolate, lanceolate to oblanceolate or elliptic, 5-23 mm long, 3-7 mm wide, glandular-serrate; sepals 2.5-4 mm long; petals white; seeds brown and shining, ca 0.3 mm long, obscurely quadrate-reticulate, curved. Drying mudflats along streams and on pond margins at ca 1400 to 1435 m in Millard and Uintah counties; Washington to California, east to Mississippi; 5 (i).

***Elatine* L.**

Aquatic or amphibious (terrestrial), dwarf annuals; stems erect or prostrate; herbage glabrous; leaves opposite, sessile or petioled; flowers 1 or 2 per node; petals membranous; styles or stigmas 2-4; capsule membranous, septically dehiscent. Note: The genus is represented poorly in our herbaria, being collected only rarely. Therefore, all decisions presented below are tentative.

- 1. Capsules 4-loculed; seeds strongly curved, J- or U-shaped; stamens 8 *E. californica*
- Capsules 3-loculed; seeds gently curved, not as above; stamens usually 3 *E. triandra*

Elatine californica Gray. California Waterwort. Plants prostrate, mat-forming; leaves subsessile to short-petiolate, 4-12 mm long, obovate to oblanceolate; flowers pedicellate, the pedicels elongating at maturity, finally 1-2 times longer than the fruit; sepals 4, equal to subequal, oblong, united below and enlarging with the fruit; petals 4, obovate; stamens 8; capsule 4-carpelled; seeds strongly bent, rounded at one end, truncate at the other with a subapiculate base. Mud or shallow water of ponds and lakes at ca 1708 m in Cache County (Neese 12386 BRY); Washington to Montana, south to California and Arizona; 1 (0)

Elatine triandra Schkuhr Three-lobed waterwort. [*E. gracilis* Mason?; *E. rubella* Rydb.?]. Plants prostrate, mat-forming; leaves subsessile or short-petiolate, 3-15 mm long, linear to narrowly oblanceolate to spatulate or oblong; flowers sessile; sepals 3, subequal; petals 3, orbicular; stamens usually 3; capsule 3-carpelled; seeds merely curved, with mainly 15-25 pits per longitudinal row, rounded at both ends. Pond and lake margins at 2440 to 2700 m in Salt Lake and Utah counties; Washington and Alberta south to Arizona, New Mexico, Texas, and Mexico; Eurasia; 6 (0). Examination of scanning electron photomicrographs (BRY) of all specimens at BRY and UT

did not show any convincing evidence for separation of our materials into more than the one species. The similar *E. brachysperma* Gray might occur in Utah. It differs in having seeds with 9-15 pits per longitudinal row and leaves rounded (not emarginate) apically.

ERICACEAE A. L. Juss.

Heath Family

Shrubs or subshrubs; leaves simple, alternate, sometimes leathery or persistent; flowers perfect, regular, axillary, in terminal clusters, or solitary; sepals mostly 4 or 5, distinct or more or less connate; petals mostly 4 or 5, connate or distinct, the corolla rotate to funnellform or urn-shaped; stamens as many as the corolla lobes and alternate with them or twice as many, the anthers dehiscent by terminal pores or by longitudinal slits; pistil 1, the ovary superior or inferior, usually with 4-10 carpels and locules; style 1, the stigma capitate or lobed; fruit a capsule or a berry; x = 8-23.

Welsh, S. L. 1980. Ericaceae. pp. 40-44. In: Utah flora: Miscellaneous families. Great Basin Naturalist 40: 38-58.

- 1. Ovary inferior or apparently so 2
- Ovary superior 3
- 2(1). Plants prostrate shrublets, rooting along the stems; ovary superior but surrounded by the fleshy calyx when ripe and apparently inferior *Gaultheria*
- Plants erect or ascending, rooting only at the base; ovary inferior *Vaccinium*
- 3(1). Flowers borne in terminal corymbs, white, the segments of the corolla much longer than the short tube; leaves punctate below with yellow-glandular dots . . . *Ledum*
- Flowers solitary and axillary or in axillary racemes, rarely terminal, pink to lavender, the segments of the corolla much shorter than the tube; leaves lacking glandular punctae 4
- 4(3). Corolla broadly saucer-shaped or rotate, not constricted at the apex *Kalmia*
- Corolla campanulate to urn-shaped, often more or less constricted at the throat 5
- 5(4). Corolla campanulate; anthers lacking appendages; fruit a capsule embedded in a fleshy calyx *Gaultheria*
- Corolla urn-shaped; anthers 2-awned; fruit a berry . . . *Arctostaphylos*

***Arctostaphylos* Adams**

Evergreen prostrate to ascending or erect shrubs, often with purplish to orange brown, smooth bark; leaves alternate, simple entire, leathery-thickened; flowers in terminal panicles or racemes, perfect, regular; sepals usually 5; petals usually 5, united almost to the tips; corolla urn-shaped; stamens usually 10, included; anthers opening by falsely terminal pores, each with 2 hornlike appendages; ovary superior, usually 5-loculed; fruit fleshy, berrylike, 1- to several-seeded.

Adams, J. E. 1940. A systematic study of the genus *Arctostaphylos*. J. Elisha Mitchell Soc. 56: 1-62.

Eastwood, A. 1934. A revision of *Arctostaphylos* with keys and descriptions. Leaflet West. Bot. 1: 105-127.

- 1. Plants with creeping-prostrate stems; leaves obovate-spatulate, commonly less than 1.5 cm long . . . *A. uva-ursi*

- Plants with stems ascending to erect, leaves mostly ovate to lanceolate or elliptic, often more than 2 cm long 2
- 2(1). Calyx and pedicels puberulent with spreading glandular hairs; twigs and leaves puberulent throughout with spreading hairs; plants of Washington County . . . *A. pringlei*
- Calyx glabrous or nearly so; twigs and leaves puberulent or sessile to sparingly stipitate-glandular or almost or quite glabrous; plants of various distribution 3
- 3(2). Twigs and axis of inflorescence white-puberulent, not glandular; plants of Washington and Kane counties . . . *A. pungens*
- Twigs and axis of inflorescence glandular to glandular-puberulent; plants widely distributed *A. patula*

Arctostaphylos patula Greene Greenleaf Manzanita. [*Urva-ursi patula* (Greene) Abrams; *A. pungens* var. *platyphylla* Gray; *A. platyphylla* (Gray) Kuntze; *A. obtusifolia* Piper; *A. patula* var. *incarnata* Jepson; *A. pinetorum* Rollins; *A. parryana* var. *pinetorum* (Rollins) Weisl. & B. Schreiber]. Rounded shrubs with gnarled stems to 15 cm long or more, the bark smooth, cinnamon to reddish brown or purplish in color; branchlets glandular-puberulent and sometimes with long-spreading hairs as well; leaf blades (0.8) 1.8–4.7 cm long, (0.6) 1.5–4 cm wide, ovate to elliptic, lanceolate, or orbicular, obtuse to acute apically, rounded to truncate basally, glabrous or glandular, yellow green; petioles pubescent like the twigs; inflorescence paniculate, the axis and bracts glandular-puberulent and sometimes with some long hairs; pedicels glabrous; sepals glabrous; corolla pink to white, 5–8 mm long; ovary glabrous; fruit 8–11 mm thick, depressed-globose, glabrous, white to brown, with nutlets separable or not; $n = 13$. Usually associated with ponderosa pine at 1370 to 2830 m in Beaver, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; Colorado, Nevada, Oregon, Arizona, and California; 115 (xvii). The names *A. patula* and *A. platyphylla* both date as species from the same year, 1891; the question of which has priority is difficult to ascertain.

Arctostaphylos pringlei Parry Pink-bracted Manzanita. Rounded, erect shrubs to 20 dm tall or more, the bark smooth, dull red brown; branchlets densely glandular-hairy with long-spreading hairs; leaf blades (1.2) 1.8–4.2 cm long, (4) 8–20 mm wide, elliptic to lance-elliptic or lanceolate, obtuse to acute apically, truncate to rounded or obtuse basally, glandular-pubescent, gray green; petioles pubescent like the twigs; inflorescence paniculate or racemose, the axis and bracts glandular-hairy; corolla pink, 6.5–8.5 mm long; ovary glandular-hairy; fruit 6–10 mm thick, ovoid, glandular-hairy, red, with nutlets inseparable. Oak-juniper, manzanita, garrya, and mixed warm desert shrub communities at 1840 to 2750 m in Washington County; Arizona, California and Baja California; 5 (i).

Arctostaphylos pungens H.B.K. Mexican Manzanita. Erect or ascending, rounded shrubs to 20 dm tall or more, the bark smooth, red brown; branchlets canescent with a dense pubescence; leaf blades 1.6–4.7 (6) cm long, 0.5–3.2 cm wide, ovate to elliptic or oblong, rounded to acute apically, acute to rounded basally, puberulent on one or both sides, bright green; petioles pubescent like the twigs; inflorescence paniculate, the axis and bracts canescent; pedicels glabrous; sepals glabrous; corolla pink

to white, 5.5–8.5 mm long; ovary glabrous; fruit 5–8 mm thick, depressed-globose, glabrous, brownish red, with nutlets separable or not; $n = 13$. Pinyon, juniper, live oak communities at 1005 to 1895 m in Washington and Kane counties; California, Arizona, New Mexico, Texas; Mexico; 35 (viii).

Arctostaphylos uva-ursi (L.) Sprengel Kinnikinnick; Bearberry; Sandberry. [*Arbutus uva-ursi* L.; *Uva-ursi procumbens* Moench; *Mairania uva-ursi* (L.) Desv.; *U. buxifolia* S. F. Gray; *Arctostaphylos officinalis* Wimmer & Grab.; *A. procumbens* Patze, Mey. & Elkan; *U. uva-ursi* (L.) Britt. in Britt. & Br.; *Arctostaphylos media* Greene; *A. uva-ursi* var. *coactilis* Fern. & Macbr.; *A. uva-ursi* var. *adenotricha* Fern. & Macbr.]. Prostrate shrub with stoloniferous rooting stems, mat-forming, the branches ascending, the internodes usually apparent, puberulent and sometimes glandular, the bark exfoliating exposing dull brown under bark; leaf blades (0.6) 1–2.7 (3) cm long, 3–12 mm wide, oblanceolate to spatulate, rounded apically, cuneate to acute basally, glabrous or puberulent, especially on the margins, green; inflorescence racemose, the axis and bracts glandular; pedicels glabrous; corolla pink to white, 4–5.2 mm long; ovary glabrous; fruit 6–11 mm thick, globose, bright red, with separable nutlets; $n = 13, 26$. Ground layer in coniferous forests at 2140 to 3510 m in Daggett, Duchesne, Garfield, Salt Lake, San Juan, Sevier, Summit, Uintah, and Wasatch counties; Alaska and Yukon east to the Atlantic, south to California, New Mexico, Illinois, and Georgia; Eurasia; 22 (iii). This forms occasional hybrids with *A. patula*.

Gaultheria L.

Prostrate shrubs, the branchlets rooting; leaves alternate, thin, serrulate; flowers axillary, solitary, perfect, regular; calyx 5-lobed, united, enlarging and becoming fleshy at maturity; corolla campanulate, the lobes shorter than the tube; stamens usually 10, included, the filaments flattened, tapering to the apex; anthers opening by terminal pores, not awned; ovary superior, usually 5-loculed; fruit a loculicidally dehiscent capsule enclosed by the fleshy expanded calyx.

Gaultheria humifusa (Graham) Rydb. Alpine Wintergreen. [*Vaccinium humifusum* Graham; *G. myrsinites* Hook.]. Prostrate, scarcely woody plants with creeping, rooting stems to 2 dm long, glabrous or puberulent; leaves 6–15 mm long, 4–13 mm wide, oval to ovate or elliptic, rounded to obtuse apically and basally, serrulate; flowers solitary, axillary; calyx glabrous; corolla 3–4 mm long, campanulate, pink; fruit 5–7 mm thick, subglobose, red. Ground layer in coniferous forests and margins at 2900 to 3355 m in Duchesne and Summit counties; Colorado to California, north to Alberta and British Columbia; 5 (i).

Kalmia L.

Low shrubs with puberulent branches; leaves opposite, evergreen, leathery, decurrent, entire, revolute, glaucous beneath; flowers in terminal leafy-bracted corymbs or solitary, perfect, regular; calyx 5-lobed, the segments almost distinct; corolla bowl-shaped, the lobes shorter than the tube, the tube with 10 pouches in which the anthers are enclosed in bud; stamens usually 10, the filaments flattened, hairy below; anthers opening throughout, unawned; ovary superior, 5-loculed; fruit a septically dehiscent capsule.

Kalmia microphylla (Hook.) Heller Bog Laurel. [*K. glauca* var. *microphylla* Hook.; *K. polifolia* var. *microphylla* (Hook.) Rehder]. Erect slender shrubs, 7–15 cm tall; leaves 6–18 (30) mm long, 2–8 (12) mm wide, lance-oblong to elliptic, revolute, shining and green above, grayish beneath; corymbs mostly 2- to 6-flowered, the pedicels 1–3 cm long; sepals glabrous, ciliate; corollas 11–14 mm broad, pink; capsules 4–6 mm broad; 2n = 24. Spruce-fir and lodgepole pine communities, typically in meadows and along streams and lake margins at 2900 to 3750 m in Daggett, Duchesne, Summit, and Uintah counties; Alaska and Yukon south to California and Colorado; 19 (iv).

Ledum L.

Erect or spreading shrubs with glandular-puberulent branchlets; leaves alternate, evergreen, leathery, entire, revolute, pale below; flowers in terminal corymbs, perfect, regular; calyx small, the segments almost distinct; corolla rotate, the 5 petals distinct or nearly so; stamens usually 5–10, the filaments almost filiform, usually hairy below; anthers opening by terminal pores, unawned; ovary superior, 5-lobed; fruit a septically 5-valved capsule, opening at the base. Note: At least some species of this genus are poisonous to livestock.

Ledum glandulosum Nutt. Trapper's Tea. Plants mostly 5–15 dm tall, the branchlets puberulent and glandular dotted; leaves 1.1–3.4 (4) cm long, 4–14 (18) mm wide, elliptic to oblong, rounded to acute apically and basally, green above, pale to grayish beneath, glandular, the margin more or less revolute; flowers white, the segments to 5 mm long or more; pedicels commonly 1–2.5 cm long, puberulent near the base; capsules 3–6 mm long, puberulent and glandular. Meadows, stream banks, and bogs in open forest at 2600 to 3295 m in Duchesne, Salt Lake, Summit, and Uintah counties; British Columbia east to Montana and south to California, Nevada, and Wyoming; 13 (0).

Vaccinium L.

Decumbent-ascending to erect shrubs; leaves alternate, deciduous or more or less evergreen, entire or serrulate, flat, green or pale beneath; flowers solitary, axillary, or in terminal clusters, perfect, regular; calyx 4- to 6-lobed, united at the base; corolla urn-shaped or campanulate, the 4–6 lobes shorter than the tube; stamens 8–12, the filaments usually glabrous; anthers opening by pores at the ends of tubular beaks, usually 2-awned; ovary inferior, usually 4-locular; fruit a several-seeded berry.

Camp, W. H. 1942. A survey of the American species of *Vaccinium*, subgenus *Euvaccinium*. *Brittonia* 4: 205–247.

- 1. Branches bright green and angled; plants often less than 3 dm tall 2
- Branches neither bright green nor angled, or sometimes irregularly angled when dry; plants often more than 3 dm tall 3
- 2(1). Fruit red; grooves of branches usually glabrous; leaves often less than 12 mm long *V. scoparium*
- Fruit blue black or black; grooves of branches usually puberulent, leaves often over 12 mm long *V. myrtillus*
- 3(1). Flowers in clusters of 2–4, or solitary; leaves entire; calyx deeply lobed, the lobes persistent in fruit *V. occidentale*

- Flowers solitary in leaf axils; leaves more or less serrate; calyx shallowly lobed, the lobes deciduous in fruit 4
- 4(3). Plants mostly 1–3 dm tall; leaves serrate above the middle and inconspicuously below the middle, mainly 1–3 (4) cm long, oblanceolate to obovate *V. caespitosum*
- Plants mostly 4–7 dm tall or more; leaves serrate to the base or nearly so, commonly 2–6 cm long, elliptic to ovate *V. membranaceum*

Vaccinium caespitosum Michx. Dwarf Huckleberry. Plants 1–3 dm tall; twigs brownish, somewhat angled, puberulent or glabrous; leaves 0.7–4 cm long, 3–20 mm wide, oblanceolate to obovate, obtuse or less commonly acute to rounded apically, usually cuneate basally, serrulate from tip to below the middle; flower solitary, axillary, whitish to pink, the corollas 5–6 mm long, twice as long as thick; calyx obscurely lobed, the lobes deciduous in fruit; berries blue glaucous, subglobose, 5–8 mm broad, edible and good. Spruce-fir and alpine tundra communities at 2225 to 3420 m in Daggett, Duchesne, Emery, Garfield, Grand, San Juan, Summit, and Uintah counties; Alaska and Yukon east to Newfoundland and New Hampshire, south to California and Colorado; 17 (ii). Materials from Utah have previously passed under the names *V. membranaceum* Dougl. (see below) and *V. globulare* Rydb. The latter is not known for the state.

Vaccinium membranaceum Dougl. Mountain Huckleberry. Shrubs mostly 3–7 dm tall or more; twigs brownish, glabrous or puberulent; leaves 1.8–7 cm long, 1–3.4 cm wide, elliptic or less commonly ovate to obovate, acute to obtuse apically, acute to rounded basally, serrate almost throughout; flowers solitary, axillary, yellowish pink, the corollas ca 6 mm long, ca 1/3 longer than broad; calyx obscurely lobed, the lobes deciduous, berries purple, not glaucous, 7–9 mm broad, edible and good. Ponderosa pine, Douglas fir, and spruce-fir communities at 2500 to 3145 m in Cache, Carbon, Duchesne, San Juan, Summit, and Wasatch counties; British Columbia southward to California, Idaho, and Montana; 11 (0).

Vaccinium myrtillus L. Dwarf Billberry. [*V. oreophilum* Rydb., in part, type from the Uinta Mts.]. Plants mostly 0.5–3 dm tall; twigs seldom numerous and broomlike, green sharply angled, puberulent; leaves 1.1–3.9 cm long, 6–16 mm wide, ovate to lanceolate or elliptic, acute to obtuse apically, obtuse to rounded basally, serrulate almost or quite from base to apex; flowers solitary, axillary, pink, the corollas 4–5 cm long; calyx shallowly lobed; berry usually bluish, 5–8 mm broad; 2n = 24. Ponderosa pine, aspen, sagebrush, lodgepole pine, and spruce-fir communities at 2285 to 3355 m in Daggett, Duchesne, San Juan, Summit, and Uintah counties; British Columbia and Alberta south to Arizona and New Mexico; Eurasia; 16 (i). The dwarf billberry is a near congener of the very common *V. scoparium*, but can be distinguished by the larger size of its leaves and flowers and by the puberulent stems.

Vaccinium occidentale Gray Western Huckleberry. Plants mostly 2–6 dm tall, the twigs round, usually glabrous; leaves 6–21 mm long, 4–12 mm wide, oblanceolate, rounded to obtuse apically, acute basally, entire; flowers 2–4, or less commonly solitary in the axils, pinkish, the corollas 3.5–6 mm long; calyx definitely lobed, the lobes persistent in fruit; berries blue, glaucous, 4–6 mm thick. Lodgepole pine and spruce-fir communities at 2805 to 3510 m in in Duchesne, Morgan, Summit, and

Wasatch counties; British Columbia south to California and Idaho; 16 (viii).

Vaccinium scoparium Leiberg Grouseberry. [*V. myrtillos* var. *microphyllum* Hook.; *V. microphyllum* (Hook.) Rydb., not Rein.; *V. erythrocoecum* Rydb.]. Plants mostly 1–2.5 dm tall, the twigs numerous, broomlike, sharply angled, usually glabrous; leaves 6–13 mm long, 3–7 mm wide, ovate, obtuse to acute apically, rounded to obtuse basally, serrulate throughout; flowers solitary, axillary, pinkish, the corollas 2.5–3.5 mm long; calyx very shallowly lobed; berry bright red, drying red purple, 4–6 mm thick. Lodgepole pine and spruce-fir communities at 2500 to 3508 m in Carbon, Daggett, Duchesne, Salt Lake, Summit, Uintah, and Wasatch counties; British Columbia and Alberta south to California and Colorado; 32 (iii).

EUPHORBIACEAE A. L. Juss.

Spurge Family

Annual or perennial herbs or woody plants, the juice milky or watery; leaves simple, alternate or opposite (or whorled); flowers imperfect; sepals 4–6 or lacking (a calyxlike involucre, a cyathium, present in *Euphorbia*); petals 4–6, distinct, or commonly lacking; stamens 1 to many; pistil 1, the ovary superior, 3-loculed; styles 3 or 3-lobed; ovules 1 or 2 per locule; fruit a capsule; x = 6–14+.

Cronquist, A. 1983. Euphorbiaceae. Unpublished mss. Internountain Flora. New York Botanical Garden. 57 p.

- 1. Plants with milky juice; flowers borne in cyathia *Euphorbia*
- Plants with watery (though sometimes colored) juice; flowers with a calyx 2
- 2(1). Plants with persistent, opposite, linear, foliaceous cotyledons; plants annual, of sandy habitats in Kane and Washington counties *Reverchonia*
- Plants with alternate leaves, the cotyledons not persistent; plants of various duration, habitats, and distribution 3
- 3(2). Leaves palmately lobed, peltate, mostly over 5 cm wide; plants cultivated *Ricinus*
- Leaves pinnate, toothed or entire, mostly less than 2 cm wide; plants indigenous 4
- 4(3). Leaves long-petiolate, pubescent with appressed stellate hairs; plants of sandy sites in western and southern Utah *Croton*
- Leaves short-petiolate, pubescent with long, spreading, branched or simple hairs; plants mainly of limestone outcrops or gravels in western and southwestern Utah 5
- 5(4). Plants forming low, rounded clumps; pubescence of long, branched, stellate hairs; leaves not sharply serrate *Eremocarpus*
- Plants not especially clump-forming; pubescence mainly of long, simple, stinging hairs; leaves sharply serrate *Tragia*

Croton L.

Annual or perennial, appressed-stellate herbs; leaves alternate, petioled, simple, estipulate; flowers imperfect, the inflorescence racemose; calyx mostly 5-lobed; petals lacking; nectary disk present, the lobes or glands alternate with the petals; receptacle usually hairy; stamens

mostly 5 or more; pistillate flowers typically below the staminate; ovary typically 3-loculed; styles as many as the locules; capsule usually 3-lobed, 3- (or 1)-seeded; seeds carunculate, smooth, shiny.

Ferguson, A. M. 1901. Crotons of the United States. Ann. Rep. Missouri Bot. Gard. 12: 33–73.

- 1. Plants green, sparsely stellate-hairy, annual *C. texensis*
- Plants gray or gray green, densely stellate-hairy, perennial *C. californicus*

Croton californicus Muell.-Arg. Mohave Croton. [*C. longipes* Jones, type from near Leeds; *C. californicus* (var.) *longipes* (Jones) A. Ferg.]. Dioecious grayish or whitish perennials from taproots; herbage with appressed stellate hairs; stems simple or branched, mostly 2–10 dm tall; leaf blades 1–5 cm long, 5–25 mm wide, lance-oblong to elliptic or ovate, greenish above entire, obtuse to rounded apically; petiole 0.5–4 cm long; racemes mostly 1–3 cm long; calyx of staminate flowers 5-lobed, the lobes 1.5–2 mm long; petals none in flowers of either sex; stamens mostly 10–15, subequal to the calyx lobes; ovary 3-loculed; styles 1–2.5 mm long, palmately cleft or bifid; capsules 3–6 mm long; seeds 3, the caruncle large. Sand dunes and other sandy sites with sand sagebrush at 820 to 1220 m in Washington County; California, Nevada, and Arizona; 24 (v).

Croton texensis (Klotzsch) Muell.-Arg. Doveweed. [*Hendecandra texensis* Klotzsch]. Dioecious, scented, yellow green annuals from taproots, with sparse, appressed stellate hairs, commonly branched, mostly 1–6 dm tall; leaf blades mostly 1.5–6.5 cm long, 2–28 mm broad, lanceolate, to elliptic or oblong, entire, acute to acutish apically; petioles 0.5–1.5 cm long; cymes mostly 1–2 cm long; staminate calyx deeply 5-lobed, the lobes 1–1.5 mm long; petals lacking; stamens mostly 8–12, subequal to the calyx lobes; ovary 3-loculed; styles 1–2 mm long, 2 or more times bifid; capsules 4–6 mm long; seeds 1–3, 3.5–4 mm long; caruncle large. Sand dunes and other sandy sites at 1125 to 1680 m in Juab, Kane, Millard, and San Juan counties; Arizona to Texas and Mexico, and northeast to South Dakota; 17 (v).

Eremocarpus Benth.

Low, gray, scented, monoecious, annual herbs from taproots, pubescent with elongate stellate and stinging hairs; leaves alternate, entire, 3-veined; staminate flowers in terminal cymes, with 5- or 6-lobed calyx, lacking petals, with 6 or 7 stamens, the receptacle hairy; pistillate flowers, 1–3, lacking a perianth; ovary with 4 or 5 small glands at the base, 1-loculed, the style not divided; capsule 2-valved, 1-sided.

Eremocarpus setigerus (Hook.) Benth. Turkey-mullein. [*Croton setigerus* Hook.]. Plants dichotomously branched from the base, forming cushionlike clumps 3–20 cm tall; leaves 1.8–6 cm long, ovate to suborbicular; petioles about as long as the blades; staminate flowers pedicillate, the calyx ca 2 mm long, surpassed by the stamens; pistil pubescent; capsules ca 3–5 mm long; seeds ellipsoid, somewhat ridged. Creosote bush community at ca 824 m in Washington County; Washington and Idaho, south to California and Arizona; 3 (ii).

Euphorbia L.

Annual or perennial herbs; leaves simple, alternate, opposite, or whorled; flowers monoecious, borne in in

volucres called cyathia, these simulating a single flower and often with petaloid appendages on marginal glands; pistillate flowers solitary in center of the cyathium, pedicelled, lacking a calyx and corolla, the ovary 3-loculed; styles 3, usually bifid; staminate flowers without a calyx or corolla, in 5 fascicles, 1 to several per fascicle, the fascicles opposite the lobes of the involucre, each pedicel of 1 stamen often with a minute bract at base; capsules 3-loculed, 3-seeded, usually nodding. Note: The poinsettia of commerce, *Euphorbia pulcherrima* Willd. ex Klotsch, is widely grown under glass in Utah.

1. Upper bractate leaves white-margined or cyathium with conspicuous white petaloid appendages, the plants then perennial 2
- Upper bractate leaves green or red and the cyathium not with conspicuous white petaloid appendages or, if so, the plants mostly annual 3
- 2(1). Plants prostrate or ascending perennials; leaves less than 1 cm long; indigenous in Iron, Kane, and Washington counties *E. albomarginata*
- Plants erect annuals; leaves mainly 1.5-4 cm long; adventive or cultivated broadly *E. marginata*
- 3(2). Leaves all linear, mainly 4-10 times longer than broad; plants annual, the branches spreading umbrella-like above the ground or ascending-spreading 4
- Leaves not all linear, or if so, the plants perennial and the branches various 5
- 4(3). Capsules less than 1.7 mm long; stems usually less than 1 mm thick; seeds with transverse ridges; plants known from Washington County *E. revoluta*
- Capsules more than 1.8 mm long; stems usually at least 1 mm thick; seeds smooth; plants of rather broad distribution *E. parryi*
- 5(3). Leaves dimorphic, the lower obovate to elliptic, the upper ones linear; glands of the involucre 5; cyathia terminal, borne in forks of the stem . . . *E. nephradenia*
- Leaves usually all about alike; glands of involucre 1 or usually 4, the cyathia variously disposed 6
- 6(5). Uppermost leaves red or red spotted; foliage leaves often more or less lobed and violin-shaped; plants adventive in St. George *E. cyathiflora*
- Uppermost leaves green like the others; foliage leaves various, but not as above; plants indigenous or adventive 7
- 7(6). Leaves irregularly toothed or lobed; cyathium with a solitary gland; weedy species of gardens . . . *E. dentata*
- Leaves entire or essentially so; cyathia usually with 4 glands; plants weedy or not 8
- 8(7). Leaves symmetrical at the base, mainly alternate; inflorescence terminal, an umbel subtended by whorled leafy bracts; plants usually branched above, erect 9
- Leaves asymmetrical at the base, opposite; inflorescence of small clusters along the stems; plants branching from the base, often prostrate 14
- 9(8). Plants annual, from slender taproots 10
- Plants perennial, from caudices 11
- 10(9). Lower cauline leaves with distinctive filiform petioles; glands of cyathia horned at each end . . . *E. pephus*
- Lower cauline leaves tapering to a broad, short, petiolar base; glands of cyathia entire *E. spatulata*
- 11(9). Leaves thick, apparently spirally arranged, prominently mucronate; plants cultivated and escaping *E. myrsinites*

- Leaves not especially thickened or spirally arranged, not mucronate; plants indigenous or adventive 12
- 12(11). Leaves orbicular to ovate or broadly elliptic; plants from a caudex and taproot, indigenous . . . *E. brachycera*
- Leaves linear to narrowly oblong; plants from rootstock or rhizomes, sod-forming 13
- 13(12). Main leaves over 3 cm long and more than 3 mm wide; plants 3-7 dm tall *E. esula*
- Main leaves less than 2.5 cm long and 3 mm wide; plants 1-3 (4) dm tall *E. cyperissius*
- 14(8). Plants with a pluricipital caudex, perennial . . . *E. fendleri*
- Plants with slender taproots, annual 15
- 15(14). Glands of cyathia lacking appendages 16
- Glands of cyathia appendaged, this more or less petaloid 17
- 16(15). Leaves mainly 1.5-5 mm long, 1-3 mm wide, sessile, or shortly petiolate; seeds 0.8-1.3 mm long *E. micromera*
- Leaves mainly 5-12 mm long and 4-7 mm wide, petiolate; seeds 1.3-1.8 mm long *E. ocellata*
- 17(15). Herbage, ovary, and capsules evidently hairy 18
- Herbage, capsules, and fruits glabrous, but sometimes sparingly hairy when young, or the herbage hairy, but ovaries and capsules glabrous 20
- 18(17). Glandular appendages deeply cleft into 3-5 attenuate segments; leaves mostly 2-7 mm long, entire; plants indigenous in Washington County . . . *E. setiloba*
- Glandular appendages entire or toothed or lobed, but not with slender segments; leaves mostly more than 7 mm long, more or less serrulate; plants adventive . . . 19
- 19(18). Seeds with low, rounded, transverse ridges not whitened at the summit; capsules appressed hairy; styles divided less than half way to the base *E. maculata*
- Seeds with narrow, sharp, transverse ridges whitened on the summit; capsules spreading-hairy; styles divided almost to the base *E. prostrata*
- 20(17). Stems erect or erect-ascending, the larger leaves mainly 1.5-3 cm long *E. hyssopifolia*
- Stems prostrate, decumbent, or ascending, the larger leaves seldom over 1 cm long 21
- 21(20). Seeds with 3 or 4 transverse ridges . . . *E. glyptosperma*
- Seeds not transversely ridged *E. serpyllifolia*

Euphorbia albomarginata T. & G. Rattlesnake-weed. Perennial herbs from a caudex, glabrous; stems 3-25 cm long, prostrate; leaves opposite, 3-8 mm long, orbicular to ovate or oblong, the margin thin, hyaline, and entire; stipules united, forming a white-membranous scale with fringed or entire margin; cyathia solitary, axillary, 1.2-2 mm long, campanulate; glands transversely oblong, concave, brown to red brown, 0.5-0.8 mm long, the petaloid appendages white, conspicuous, entire or 3- to 5-lobed; staminate flowers 15-30; capsules 1.6-2.3 mm long; glabrous, ovoid, sharply angled; seeds rounded to quadrangular, cylindrical, 1.2-1.7 mm long, white, the surfaces smooth; n = 18, 24. Creosote bush, Joshua tree, burrobush, sand sagebrush, shadscale, and pinyon-juniper communities at 700 to 1830 m in Iron, Kane, and Washington counties; California, Nevada, Arizona, New Mexico, and Texas; 23 (vii).

Euphorbia brachycera Engelm. in Emory. Shorthorn Spurge. [*E. montanum* var. *robusta* Engelm.; *E. robusta*

(Engelm.) Small ex Britt. & Br.; *Tithymalus robusta* (Engelm.) Small ex Rydb.; *E. r.* var. *interioris* J. S. B. Norton, type from Wasatch Mts.]. Perennial herbs from a stout caudex, glabrous and glaucous or velvety hairy; stems 10–45 cm tall, erect or steeply ascending, usually numerous; leaves alternate (the cauline at least), typically 7–28 mm long and 3–25 mm wide, orbicular to spatulate or oblong, entire, the lower ones often mere bracts, the upper ones subverticillate below the umbellate inflorescence; branches of inflorescences dichotomous, with foliose, opposite bracts subtending each dichotomy; cyathia 2–3 mm long, obconic; glands 4, yellowish, transversely oblong, 1–2 mm wide, toothed marginally, the 2 lateral teeth somewhat enlarged; staminate flowers several; fruit 3–5 mm long, glabrous or pubescent; seeds 2.5–3.5 mm long, the surface pitted to almost smooth, whitish. Hanging garden, pinyon-juniper, mountain brush, sagebrush, and aspen communities at 1190 to 3205 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Morgan, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington and Wayne counties; Montana and South Dakota, south to California, Nevada, Arizona, New Mexico, and Texas; 88 (xx).

Euphorbia cyathophora Murray Annual Poinsettia. [*E. heterophylla* authors, not L.]. Annual herbs from a taproot, glabrous or essentially so; stems mostly 2–5 (7) dm tall, erect, simple or branched; leaves opposite below, becoming alternate above, petiolate, the blades often oblong in outline, but typically lobed and more or less violin-shaped, green above and pale beneath, or the uppermost red; stipules minute and glandlike; cyathia irregularly clustered, these subtended by reddish, foliose bracts, urceolate-campanulate, 2–2.5 mm long, toothed; gland usually solitary, deeply cupped, shallowly bilabiate, the opening narrowly oblong, green, sessile, not appendaged; staminate flowers many per cyathium; pistillate flowers long-exserted and reflexed at maturity; styles 3, bifid; capsule with 3 rounded lobes, 3–4 mm long; seed ovoid to subglobose, 2.9–3.1 mm long, dark brown, tuberculate; caruncle small. Along irrigation canals at ca 900 m in Washington County; widely distributed in North America; 2 (ii).

Euphorbia cyparissias L. Cypress Spurge. [*Tithymalus cyparissias* (L.) Hill]. Perennial herbs from a caudex and elongate, horizontal rhizome, glabrous and sometimes glaucous; stems mainly 10–40 cm tall, erect or steeply ascending, few to several; leaves alternate (at least the cauline ones), typically 5–25 mm long and 1.2–3 mm wide, linear to narrowly spatulate, entire, the lower one bracteate, those on branches below inflorescence very slender; inflorescence umbellate, but with some flowers from axils below the umbels, the rays ultimately dichotomous and with paired, broad, yellowish green bracts; cyathia 2–3 mm long, campanulate; glands 4, yellowish, transversely oblong, 1–1.5 mm wide, horned on each side; staminate flowers few; fruit ca 3 mm long, glandular-roughened; seeds 1.5–2 mm long, smooth; $2n = 20, 36, 40$. Weedy species of disturbed sites at lower elevations, and cultivated ornamental, in Cache, Salt Lake, and Utah counties; widely naturalized in U. S.; introduced from Europe; 6 (0).

Euphorbia dentata Michx. Toothed Spurge. [*Poinsettia dentata* (Michx.) Klotzsch & Garcke]. Annual herbs from taproots, puberulent to scabrous; stems erect, typi-

cally 2–7 dm tall, simple or branched; leaves mainly opposite, with petioles 0.5–2.5 cm long, the blades 1–9 cm long, 0.5–2.5 cm wide, lanceolate to ovate or orbicular, serrate to serrate-dentate; stipules reduced to glands or lacking; bracteate leaves subtending the inflorescence usually congested and enlarged; cyathia 2–3 mm long; glands solitary, with white, fimbriate lobes; fruit 3–3.5 mm high, glabrous; seeds 2.2–2.8 mm long, dark brown, tuberculate; $n = 28$. Weedy species of gardens and other disturbed sites at 1310 to 1465 m in Cache, Salt Lake, Tooele, and Utah counties; indigenous from Wyoming to Wisconsin, south to Arizona and Mexico; widely established elsewhere; 13 (0).

Euphorbia esula L. Leafy Spurge. [*Tithymalus esula* (L.) Hill]. Perennial herbs from a caudex and elongate, horizontal rhizome, glabrous; stems mainly 3–7 dm tall, erect or steeply ascending, few to several; leaves alternate (at least the cauline ones), typically 25–60 mm long and 2.5–7 mm wide, linear to narrowly oblong, entire, the lower ones often deciduous at anthesis, those on branches below the inflorescence not very slender; inflorescence umbellate, but with some flowers from axils below the umbels, the rays ultimately dichotomous and with paired, broad, greenish or yellowish bracts; cyathia 2–3 mm high; glands 4, yellowish, campanulate, transversely oblong, prominently horned on both edges; staminate flowers few; fruit 3–3.5 mm long, granular or tubercled; seeds 2–2.5 mm long, smooth; $2n = 16, 60, 64$. Weedy species of open habitats at 1400 to 2900 m in Box Elder, Cache, Salt Lake, Sanpete, Sevier, Uintah, Utah, Wasatch, and Weber counties; widely established in the U. S.; introduced from Eurasia; 13 (0).

Euphorbia fendleri T. & G. Fendler Euphorb. Perennial herbs from a caudex, glabrous, often suffused with purple; stems 5–20 cm long, prostrate; leaves opposite, 3–11 mm long, ovate to oval or lance-ovate to elliptic, the margins thick; stipules separate, linear-subulate, entire or forked, glabrous; cyathia solitary, axillary, 1.3–2 mm long, campanulate; glands transversely elliptic, concave, reddish, ca 1 mm long, the appendages white, crenate, about as wide as the gland, inconspicuous; staminate flowers 15–35; capsules typically 2–2.5 mm long, glabrous, rounded; seeds quadrangular, 2–2.2 mm long, white, the facets smooth or wrinkled. Creosote bush, blackbrush, salt desert shrub, mixed desert shrub, pinyon-juniper and ponderosa pine communities at 975 to 2320 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, San Juan, Uintah, Washington, and Wayne counties; Wyoming and South Dakota, south and southwest to California, Nevada, Arizona, New Mexico, and Texas; 196 (xxx). Should this species be confused with *E. albomarginata* the separate stipules are diagnostic.

Euphorbia glyptosperma Engelm. in Emory Ridge-seeded Spurge. Annual herbs from a slender taproot, glabrous; stems 3–20 cm long, prostrate or ascending; leaves opposite, 3–12 (15) mm long, entire or toothed apically, oblong, short-petiolate; stipules subulate, alternate, lacinate or dissected; cyathia solitary, axillary, 0.4–1 mm long, obconic; glands transversely oblong-elliptic, 0.2–0.4 mm long, with white appendages as wide as or wider than the glands, these more or less crenate; staminate flowers commonly 4 (1–5); capsules 1.5–1.7 mm long, glabrous, rather sharply angled; seeds quadrangular, 1–1.3 mm long, white to tan, the surfaces with 3 or

4 transverse ridges; $n = 11$. Weedy species of open places such as gardens and roadsides, but also in blackbrush, mixed desert shrub, pinyon-juniper and ponderosa pine communities at 850 to 2105 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Garfield, Kane, Millard, Salt Lake, San Juan, Tooele, Uintah, Utah, Washington, and Wayne counties; widespread in the U. S.; 41 (xi).

Euphorbia hyssopifolia L. Annual herbs from slender taproots, glabrous or with long, spreading, soft hairs; stems 10–35 cm long, erect or ascending; leaves opposite 3–35 mm long, 4–10 mm wide, oblong to elliptic, serrulate throughout, short-petiolate; stipules separate or connate, more or less lacerate; cyathia solitary, terminal and axillary, glabrous, campanulate to obconic, 1–1.5 mm high; glands transversely elliptic, 0.3–0.4 mm long, greenish, with a white, uniform, entire appendage; staminate flowers mostly 4–15; capsule glabrous, 1.6–2.1 mm long, rounded; seeds quadrangular, 1–1.4 mm long, the faces irregularly ridged, depressed, or pitted, dark brown. Weedy species in Washington County; widely distributed in warm temperate U. S.; 6 (iv).

Euphorbia maculata L. Spotted Spurge. [*E. supina* Raf.]. Annual herbs from slender taproots, villous to puberulent; stem 3–40 cm long, prostrate; leaves opposite, mostly 4–15 mm long, 2–5 mm wide, oblong to elliptic or ovate, serrulate to subentire, sometimes with a purple blotch medially; stipules distinct, subulate, often lacerate; cyathia few to several, congested, on short lateral branches, obconic, 0.5–1 mm tall; glands transversely elongate, ca 0.2 mm long, with a narrow, white, crenulate appendage; staminate flowers 2–5; capsule strigose, sharply angled, ca 1.4–1.5 mm long; seeds quadrangular, ca 1 mm long, the surfaces smooth or with low transverse ridges; $n = 28$. Weedy species of open sites at 850 to 1405 m in Cache, Salt Lake, Utah, Washington, and Weber counties; widespread in temperate North America; 13 (vi).

Euphorbia marginata Pursh Snow on the Mountain. Annual herbs from slender taproots, glabrous to long-hairy; stems mostly 20–100 cm tall, erect; leaves alternate or subopposite above, mostly 1.5–10 cm long, 1–3 cm wide, oblong to ovate or elliptic, entire; inflorescence cymose, the bracteate leaves whorled or opposite, lanceolate, entire, white margined or entirely white; cyathia subcylindric to campanulate, mostly 3–4 mm long, hairy, the 5 glands oblong, depressed, with white appendages 2–3 mm long; capsules 5–8 mm wide, serrate, usually pubescent; seeds ca 4 mm long; $2n = 56$. Gardens, canal banks, and other open sites at 950 to 1405 m in Salt Lake, Utah, and Washington counties; indigenous in central U. S., now widely grown as an ornamental and escaping or established; 2 (ii). This and other cultivated euphorbs result in human poisonings in the U. S.

Euphorbia micromera Boiss. [*E. podagrica* Johnston.]. Annual herbs from slender taproots; glabrous; stems 7–25 cm long, prostrate; leaves opposite, 2–7 mm long 1–4 mm wide, entire, short-petiolate to subsessile; stipules usually distinct, subulate and more or less lacinate or pectinately ciliate; cyathia campanulate, 0.5–0.9 mm tall; glands discoid, pink or red purple, lacking appendages or these mere rudiments; staminate flowers 2–5; capsules glabrous, 1.2–1.4 mm long, rounded; seeds quadrangular, whitish, 0.8–1.3 mm long, the surface smooth or faintly wrinkled. Weedy species of open sites near habita-

tions, and in creosote bush, blackbrush, and mixed desert shrub communities at 850 to 1740 m in Garfield, San Juan, Wayne, and Washington counties; California, Nevada, New Mexico, Texas, and Mexico; 8 (v).

Euphorbia myrsinites L. Blue Spurge. Coarse, perennial, clumpforming herbs, glabrous, glaucous; stems mainly 6–45 cm long, sprawling-ascending; leaves alternate but spirally arranged, rosettelike at the stem apex, 0.8–3 cm long, 0.6–2.5 cm wide, oblanceolate to obovate, subsessile, cuneate basally, apiculate; stipules lacking; inflorescence umbellate, the rays dichotomously branched, each dichotomy subtended by paired orbicular, green bracts; cyathia campanulate, 4–5 mm long, the glands transversely crescent-shaped, produced at each end as lobed horns; capsules glabrous, 5–7 mm high; seeds 3–4.5 mm long, sculptured to almost smooth; $2n = 20$. Cultivated ornamental, escaping, persisting and established in Cache, Salt Lake, Summit, Uintah, and Utah counties; sporadic in western U. S.; 8 (i).

Euphorbia nephradenia Barneby Utah Spurge. Annual herbs from slender taproots, strigulose; stems erect or ascending, branched; leaves opposite, dimorphic, the lower ones lanceolate to oblanceolate, obovate, or elliptic, 10–33 mm long, 4–9 mm wide, the upper linear to linear-lanceolate, 10–40 mm long, 1–2.5 mm wide, short-petiolate; stipules lacking; cyathia solitary in stem forks or leaf axils, 1–1.5 mm high, strigulose, campanulate; glands greenish, transversely elliptic, 0.8–1 mm wide, with yellow green, entire appendages ca 0.2–0.4 mm long; capsules 2.8–3.2 mm long, rounded; seeds ovoid, 2.1–2.6 mm long, grayish mottled, smooth or punctate, mat-saltbush, blackbrush, ephedra, and mixed sandy desert shrub communities at 1155 to 1465 m in Emery, Garfield, Kane (type from Cottonwood Canyon), and Wayne counties; Colorado (a Plateau endemic); 10 (iv).

Euphorbia ocellata Dur. & Hilg. Eyed Spurge. Annual herbs from slender taproots, glabrous; stems prostrate, mainly 8–20 cm long; leaves opposite, dimorphic, those on the main stems obliquely ovate-lanceolate, acute, the blades 5–10 mm long and 2–7 mm wide, those of congested lateral branches much smaller, all short-petiolate; stipules mostly distinct, subulate or wider, entire or fimbriate; cyathia solitary, solitary, turbinate to campanulate, 1.5–2 mm long; glands not appendaged, discoid to ellipsoid, ca 0.6 mm wide; staminate flowers 40–60; capsules glabrous, 2–2.5 mm high, obtuse; seeds ovoid, 1.3–1.6 mm long, smooth or nearly so, whitish or brownish. Sand dunes and other sandy sites in salt and sand desert shrub communities at a 1730 to 1465 m in Millard, Tooele, and Utah counties; Idaho, Nevada, and California; 8 (iii). Our plants are assignable to var. *arenicola* (Parish) Jepson [*E. arenicola* Parish].

Euphorbia parryi Engelm. Parry Spurge. Annual herbs from slender taproots, glabrous, spreading umbrellalike to prostrate; leaves opposite, mainly 10–35 mm long and 1–3 mm wide, linear, entire; stipules distinct, linear, often fimbriate; cyathia clustered, mainly 1–13, campanulate, 1.2–1.7 mm high; glands transversely oval, ca 0.4 mm long, the appendage ca 0.2–0.4 mm wide, yellowish, entire; capsules 1.5–2 mm long, the lobes obtuse; seeds ovoid, 3–angled, 1.2–1.8 mm long, roughened to smooth, grayish mottled to whitish. Sand dunes and other sandy sites in blackbrush, sand sagebrush, ephedra, purple-sage, and pinyon-juniper communities

at 820 to 1865 m in Emery, Garfield, Grand, Kane, San Juan, Washington (type from near St. George), and Wayne counties; Nevada, California, Arizona, New Mexico, Texas, and Mexico; 84 (xxvi).

Euphorbia peplus L. Petty Spurge. Annual herbs from slender taproots, glabrous; stems erect, mainly 10–30 cm tall, simple or branched from near the base; cauline leaves alternate, mainly 3–25 mm long and 3–15 mm wide, obovate to oval, entire, short-petiolate; bracteate leaves ovate; inflorescence umbellate, the rays dichotomously branched, each dichotomy subtended by paired orbicular bracts; cyathia ca 1–1.5 mm high, campanulate; glands transversely elongate, yellow, bearing a hornlike projection at each end; capsules ca 2 mm long, each lobe with a dorsal keel; seeds oblong, 1.2–1.5 mm long, subtriangular, the outer faces each with 3 or 4 pits, the 2 inner ones with a longitudinal groove; $2n = 16$. Weeds of gardens and other open sites at 1310 to 1405 m in Cache, Carbon, Salt Lake, and Utah counties; widely established in North America; adventive from Eurasia; 8 (0).

Euphorbia prostrata Ait. Prostrate Spurge. Annual herbs from slender taproots, villous; stems 10–35 cm long, prostrate; leaves opposite, mostly 3–11 mm long and 1.5–4.5 mm wide, oblong to elliptic, entire or serrulate, not blotched; stipules usually distinct, subulate, often lacerate; cyathia few to several, congested on short lateral branches, obconic, 0.6–0.9 mm tall; glands transversely oval to oblong, 0.2–0.3 mm long, with a white appendage broader than the gland; staminate flowers 4; capsules glabrous or thinly pilose on the faces, long-hairy on the angles, 1–1.4 mm long; seeds quadrangular, ca 1 mm long, the surfaces with transverse ridges; $2n = 18, 20$. Cracks in sidewalks and other disturbed sites at ca 1400 m in Salt Lake, Utah, and Washington counties; widely established in the U. S.; introduced from eastern U. S.; 5 (iii).

Euphorbia revoluta Engelm. Revolute Spurge. Annual herbs from slender taproots, glabrous; stems 3–23 cm long, erect, with branches spreading-ascending, usually less than 1 mm thick; leaves opposite, mostly 3–25 mm long and 1–1.2 mm wide, entire, revolute; stipules distinct, entire, linear-subulate; cyathia solitary in the forks or appearing cymose and clustered apically, 0.7–0.9 mm long, campanulate; glands 4, discoid, to 0.3 mm long, the appendages white to purple, or obsolete, usually ovate, about equaling the gland; staminate flowers 3–8; capsules 1.3–1.7 mm long, ovoid, glabrous; seeds sharply angled, 1.2–1.5 mm long, transversely ridged. Creosote bush and Joshua tree community at ca 1220 m in Iron and Washington counties; Arizona to Texas and Colorado, south to Mexico; 3 (i).

Euphorbia serpyllifolia Pers. Thyme-leaved Spurge. Annual herbs from slender taproots, glabrous; stems prostrate, 5–30 cm long; leaves opposite, 3–12 mm long and 1.5–4 mm wide, oblong to obovate, entire or serrulate towards the apex; stipules distinct, subulate, often fimbriate; cyathia solitary, 1.2–1.5 mm long, campanulate; glands transversely oblong, 0.2–0.5 mm long, with narrow white appendages with crenate margins; staminate flowers 5–10 or more; capsules sharply angled, 1.5–1.9 mm long; seeds sharply quadrangular, 1–1.4 mm long, the surfaces smooth or somewhat pitted, white to brownish; $n = 11$. Gardens, roadside, and other open habitats in blackbrush, sagebrush, pinyon-juniper and mountain brush communities at 1155 to 2745 m in

Beaver, Box Elder, Cache, Duchesne, Emery, Garfield, Juab, Millard, Salt Lake, Sanpete, Sevier, Tooele, Uintah, Utah, and Washington counties; widely distributed in North America; 29 (vii).

Euphorbia setiloba Engelm. in Torr. Fringed Spurge. [*Chamaesyce setiloba* (Engelm.) Millsp. ex Parish]. Annual herbs from slender taproots, spreading hairy throughout; stems prostrate, mainly 10–20 cm long; leaves opposite, mostly 2–7 mm long and 2–5 mm wide, elliptic to ovate-oblong or oblanceolate, entire; stipules obsolete; cyathia clustered, ca 1 mm long, turbinate, constricted above; glands 4, each with a deeply cleft white or pinkish petaloid appendage ca 0.3–0.7 mm long, the segments slender and attenuate; staminate flowers 3–7; capsules evidently 3-lobed, mostly 1–1.2 mm thick; seeds strongly angled, mainly 0.8–1 mm long, transversely wrinkled-rugose, brownish. Creosote bush, Joshua tree, and other warm desert shrub communities at 1000 to 1375 m in Washington County; California and Nevada east to Texas and south to Mexico; 6 (v).

Euphorbia spathulata Lam. Prairie Spurge. Annual herbs from slender taproots, glabrous; stems 8–30 (45) cm tall, simple or branched; leaves alternate, 6–30 mm long, 4–20 mm wide, obovate to spatulate, serrulate (subentire), subsessile; stipules lacking; inflorescence umbellate, the rays dichotomously branched, each dichotomy subtended by ovate-oblong paired green bracts; cyathia ca 1 mm tall, campanulate; glands small, yellow, transversely oval; capsules 2–3 mm long, warty; seeds 1.2–1.5 mm long, brown, reticulate to ellipsoid. Pinyon-juniper and ponderosa pine communities at ca 1525 to 1830 m in Salt Lake, San Juan, and Washington counties; widespread in western U. S.; Mexico and South America; 5 (i).

Reverchonia Gray

Glabrous, monoecious, annual herbs from taproots; leaves alternate (the cotyledons foliaceous and opposite), entire, stipulate; flowers borne in compact, bracteolate cymes in leaf axils on lateral branches; pistillate flowers central, the staminate lateral; staminate flowers with 4-lobed calyx, the stamens arising from the margin of a 4-lobed disk, the 2 stamens opposite the outer lobes of the calyx; petals lacking; pistillate flowers with 6-lobed calyx; petals lacking; pistil of 3 united carpels; stigma 3, bilobed; capsules 3-locular, the seeds 2 per locule, trigonous, grooved along the ventral margin.

Webster, G. L. 1963. The genus *Reverchonia* (Euphorbiaceae). *Rhodora* 65:193–207.

Reverchonia arenaria Gray Sandspurge. Plants 4–30 cm tall, erect; stems with spreading, curved-ascending branches from the base; leaves mainly 15–40 mm long, linear-oblong to narrowly elliptic, subsessile or short petiolate; stipules membranous, lance-acuminate, often red purple; sepals ca 1.5–2.5 mm long, constricted above the middle, the staminate one more or less inflexed; capsule pedicellate, this recurved, subglobose, 7–10 mm wide; seeds 4.5–6.5 mm long, trigonous, dark reddish brown, smooth dorsally, papillate on radial surfaces. Sand dunes with *Vancouveria*, yucca, dropseed, scurfpea, sophora, sagebrush, ponderosa pine, and pinyon-juniper communities at 1220 to 1895 m in Kane and Washington counties; Arizona, New Mexico, Texas, Oklahoma, and New Mexico; 14 (vi).

Ricinus L.

Monoecious coarse annuals, glabrous, glaucous; leaves alternate, petiolate, palmately lobed; flowers racemose or

paniculate, the pistillate above the staminate; calyx 3- to 5-lobed; petals lacking; disk none; stamens many, the filaments branched; ovary 3-loculed and 3-ovuled; styles 3, bifid and plumose; capsules with spinelike projections; seeds smooth, variously marked and colored.

Ricinus communis L. Castor-bean. Ornamental annual herbs, mainly 10-20 dm tall; leaves palmately 5- to 11-lobed, 5-15 (25) cm wide or more, the lobes serrate or doubly so; seeds oblong-ellipsoid, flattened, 10-14 mm long, lustrous, variously red- or purple-mottled; 2n = 10, 20. Cultivated border plant in lower elevation portions of Utah, seldom escaping but not persisting; widely grown in the U. S.; introduced from the Old World; 1 (0). In warmer areas the plant is a shrub, but is grown in Utah as a frost sensitive annual. The plants are considered to be poisonous to humans, especially the attractive beetlelike seeds.

Tragia L.

Monoecious perennial herbs with watery juice and stinging hairs; leaves alternate, stipulate, petiolate, simple, serrate; flowers borne in bracteate racemes, these opposite the leaves or terminal, the staminate ones above, the pistillate few and placed below, each with a bract; petals lacking; staminate calyx 3- to 5-lobed; stamens commonly 3-5, the filaments short; pistillate calyx 3- to 8-lobed; style 3-lobed; capsule 3-loculed, bristly, 3-seeded.

Tragia ramosa Torr. [*T. stylaris* Muell.-Arg.]. Perennial herbs from a woody root and caudex; herbage pubescent with coarse stinging hairs and the stem puberulent as well; stems erect or ascending, mainly 10-30 cm tall; leaves 10-30 mm long, 2-15 mm wide, lance-ovate, ovate, or oblong-lanceolate, coarsely and sharply serrate; stipules triangular-attenuate, often purplish; staminate flowers 2-4, the calyx ca 1 mm long; pistillate flowers solitary, the calyx 1.5-2 mm long; capsule 6-8 mm wide; seeds globose, brown, smooth, ca 2 mm thick. Ledges and coarse talus in mixed desert shrub, shrub-grass, and juniper communities at ca 915 to 1710 m in Beaver and Washington counties; California and Nevada, east to Kansas and Missouri; 5 (iii).

FAGACEAE Dumort.

Beech Family

Deciduous trees or shrubs; leaves alternate, lobed, dentate, or less commonly entire; flowers monoecious, usually axillary on young shoots; staminate flowers with a 4- to 7-lobed perianth, borne in slender catkins or in peduncled heads; pistillate flowers solitary or in threes, with a 4- to 8-lobed perianth, borne sessile, subsessile, or in pedunculate, subcapitate catkins; pistil 1, the ovary inferior, usually 3-loculed and with 3 styles, a single ovule maturing; fruit a nut; x = 11-13. Note: The American chestnut, *Castanea dentata* (Marshall) Borkh., has been grown successfully in Utah.

- 1. Staminate flowers in pendulous, long-peduncled heads; pistillate flowers usually in pairs; winter buds long, slender, sharp-pointed; leaves 2-ranked, with prominent lateral veins *Fagus*
- Staminate flowers in slender catkins; pistillate flowers solitary; winter buds seldom, if ever, long and slender; leaves variously arranged, but not as above *Quercus*

Fagus L.

Trees; bark smooth, ash-gray or purplish; leaves simple, strongly straight-veined; flowers appearing with the leaves, the staminate ones yellowish, in pendulous heads; stamens 8-16, with slender filaments; pistillate flowers usually paired at peduncle apex, invested by bractlets, the inner 4 forming a connate involucre; calyx lobes 6; ovary 3-loculed, with 2 ovules per locule; nutlets 2 per coriaceous involucre.

- 1. Leaves with 9-14 pairs of veins, serrate *F. grandifolia*
- Leaves with 5-9 pairs of veins, denticulate to undulate *F. sylvatica*

Fagus grandifolia Ehrh. American Beech. Trees to 25 m tall or more and with trunk diameter to 1 m or more; bark smooth, ash-gray; branches horizontally spreading; leaves petiolate, the blades 2-13 cm long, 1-7 cm wide, ovate-elliptic to oblong-elliptic, cuneate to rounded or subcordate basally, strongly 9- to 14-veined; staminate flowers yellow, with 5- to 7-cleft calyx; nutlets usually 2, thin-shelled, edible. Cultivated shade and ornamental tree, long persisting at lower elevation portions of Utah; indigenous in eastern U. S.; 3 (0).

Fagus sylvatica L. European Beech. Trees to 15 m tall or more and with a trunk diameter of 6 dm or more; bark smooth, gray to purplish; branches variously oriented; leaves petiolate, the blades 2-9 cm long, 1.5-5 cm wide, elliptic to obovate, cuneate to obtuse basally, strongly 5- to 9-veined; staminate flowers yellowish; nutlets usually 2, edible; 2n = 24. Cultivated ornamental trees, long persisting in low elevation portions of Utah; introduced from Europe; 12 (0). Numerous cultivars are present, including pendulous and purple-leaved forms.

Quercus L.

Trees or shrubs; wood hard, ring-porous, with prominent rays; pith stellate in cross-section; leaves alternate, lobed, toothed, or entire; staminate flowers in usually pendulous, naked catkins; bracts caducous; calyx with 2-8 lobes; stamens 3-12; pistillate flowers with a sub-trilocular, 6-ovuled ovary; stigma 3-lobed, enclosed by a scaly involucre, this hardened and cuplike, surrounding the base of the nut or acorn.

 Welsh, S. L. 1986. *Quercus* (Fagaceae) in the Utah flora. *Great Basin Nat.* 46: 107-111.

- 1. Plants shrubby, seldom arborescent, leaves with lobes spinescent or sharply angled, or with typically 3-6 pairs of lateral lobes, or seldom entire; indigenous or sometimes cultivated 2
- Plants becoming trees; leaves variously lobed, seldom or sometimes as above, in part, cultivated 5
- 2(1). Leaves evergreen, the lobes of teeth spinescent, or seldom entire; plants of Washington, and, less commonly, of Kane and San Juan counties, hybridizing with the following *Q. turbinella*
- Leaves deciduous (persistent in some hybrids), the lobes variously angled or rounded, but seldom, if ever, truly spinescent; plants of broad or other distribution . . . 3

- 3(2). Leaf lobes typically 1–2 times longer than the width of the leaf axis, rounded to obtuse or less commonly acute and often bilobed apically; plants broadly distributed *Q. gambelii*
- Leaf lobes seldom if ever as long as the width of the leaf axis, acute to acuminate apically 4
- 4(3). Plants deciduous, colonial in sandy sites, typically with branch ends protruding above the substrate 1–10 dm; acorns mostly over 15 mm long and about as broad; hybridizing with the former along canyons *Q. havardii*
- Plants semi-evergreen, mainly 10–30 dm tall or more, or if deciduous, then typically hairy above and densely so beneath, forming clones within and adjacent to stands of *Q. gambelii*, and occurring as scattered individuals where *Q. gambelii* and *Q. turbinella* or *Q. havardii* coexist; acorns typically less than 15 mm long and less than 10 mm wide, if formed at all *Q. pauciloba* and *Q. eastwoodiae* (hybrids)
- 5(1). Leaves or lobes bristle-tipped *Q. rubra*
- Leaves or lobes rounded to obtuse, or sometimes merely mucronate 6
- 6(5). Leaves shallowly lobed to sinuate-dentate; petiole very short; bark exfoliating; acorns pedunculate ... *Q. bicolor*
- Leaves mostly deeply lobed; petioles typically more than 12 mm long; bark various; acorns sessile or pedunculate (in *Q. robur*) 7
- 7(6). Leaves glabrous; acorns on long peduncles ... *Q. robur*
- Leaves pubescent or glaucous, at least beneath; acorns sessile or subsessile 8
- 8(7). Leaves with 2 or 3 pairs of lobes, the one sinus extending nearly to the midrib; acorn cup often with long, fringing scales; plants commonly grown ... *Q. macrocarpa*
- Leaves with 3–5 pairs of lobes, the sinuses half-way or more to the midrib; acorn cup not distinctly fringed; plants uncommonly grown *Q. alba*

Quercus alba L. White Oak. Trees to 25 m tall or more; bark pale, flaky; branchlets greenish to reddish brown; leaves white hairy when young, finally glabrate and glaucous beneath, 3–16 cm long or more, obovate to oblong-obovate in outline, the sinuses obliquely descending about half way or more to the midrib, the lobes 4–10, oblong, entire or again apically lobed; involucre cup sessile or subsessile, ca 1/3 as long as the acorn, bowl shaped, clothed with imbricate, puberulent scales; acorn 2–3 cm long. Cultivated shade and specimen trees at scattered sites in lower elevation portions of Utah; introduced from the eastern U. S.; 4 (0). This species is thought to be an eastern vicariad of *Q. gambelii*, q. v.

Quercus bicolor Willd. in Muhl. Swamp-white Oak. Trees to 25 m tall or more; bark gray, flaky; branchlets grayish to brown; leaves white tomentose beneath, puberulent to glabrate above, 4–22 cm long or more, obovate to oblanceolate in outline, the sinuses extending mostly much less than half way to the midrib, the lobes 10–20, rounded to triangular; involucre cups borne on peduncles 2–10 cm long, ca 1/3 as long as the acorn, clothed with woody scales (the upper ones awn-pointed); acorns 2–3 cm long. This is a rather commonly grown shade tree in lower elevation portions of Utah; introduced from the eastern U. S.; 5 (0).

Quercus eastwoodiae Rydb. (hybrid) Plants assignable to this hybrid are similar to those described as *Q. x pauciloba*, but they tend to be more densely hairy, to have hairs persistent on the upper surface, even in age,

and to be less distinctly green, even if bicolored. They represent the hybrids and presumed introgressants involving *Q. havardii* and *Q. gambelii* as parental types. The plants are present in blackbrush, other warm desert shrub, mountain brush, pinyon-juniper, and Douglas-fir communities at 1130 to 1830 m in Garfield, Grand, Kane, and San Juan (type from Butler Wash) counties; Arizona; 13 (ii).

Quercus gambelii Nutt. Gambel Oak. [*Q. stellata* var. *utahensis* A. DC., type from west of Salt Lake City (?); *Q. utahensis* (A. DC.) Rydb.]. Clonal, deciduous shrubs or small trees, or less commonly trees to 10 m tall and with a trunk diameter to 6 dm or more thick, spreading by rhizomes; leaves densely grayish or yellowish stellate hairy on both surfaces when young, in age stellate hairy and paler beneath but glabrate and green and subglossy above, 2.4–17 cm long, 1–11 cm wide, obovate to elliptic in outline, the sinuses obliquely descending about 1/4–3/4 to the midrib, the lateral lobes (0) 2–10, oblong to lance-oblong, entire or notched apically and sometimes again laterally; staminate catkins 3.5–5 cm long; involucre cup 3–10 mm long, 10–17 mm wide, short-pedunculate to subsessile, ca 1/4–1/2 the length of the acorn, clothed with imbricate, densely hairy scales; acorns 8–18 mm long, 7–15 mm thick. Mountain brush, sagebrush, pinyon-juniper, ponderosa pine, and aspen communities at 1125 to 2745 m in all Utah counties, except Daggett and Rich (?), Wyoming, Colorado, New Mexico, Arizona, Nevada, Texas, and Mexico; 206 (xxi). The plants extend below the usual elevational range for the species along the canyons in the Colorado drainage system. Gambel oak is central to a series of problematical taxa, belonging in a broad sense to the *Q. undulata* Torr. complex, in which every degree of consanguinity is recognized. See *Q. x pauciloba* and *Q. x eastwoodiae* in this treatment for discussion of hybrids. Plants with acorns 27–35 mm long and cups 20–25 mm wide from the east side of Lake Powell in San Juan County are regarded as var. *bonina* Welsh (type from Goodhope Bay).

Quercus havardii Rydb. Shinnery Oak. [*Q. undulata* authors, not Torr.]. Clonal, deciduous, sand-binding shrubs, or, less commonly, small trees to 2 m or more; leaves densely grayish to yellowish stellate-hairy on both sides when young, less densely so in age, but only slightly, if at all, paler beneath than above, even in age, 1.5–5.5 cm long, 0.9–3.3 cm wide, oblanceolate to elliptic in outline, with usually 6–10 toothlike lateral lobes, these typically apiculate-acuminate and sometimes further notched or toothed apically; catkins 1–2.5 cm long; involucre cups 7–10 mm long, 14–18 mm wide, subsessile, ca 1/4–1/3 the length of the acorn, clothed with imbricate, densely hairy scales; acorns 15–23 mm long, 14–18 mm thick. Blackbrush, ephedra, Vanclveva, purple sage, and pinyon-juniper communities, usually in sand, at 1125 to 2135 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona, New Mexico, Oklahoma, and Texas; 54 (x). The shinnery oak, as it occurs in Utah and adjacent Arizona, is more or less influenced by intergradation with the partially sympatric *Q. gambelii* and *Q. turbinella* (Tucker 1970). Intermediates between both of those parental types and *Q. havardii* are known. However, in the sandy footslope of the San Rafael Swell in Emery and Wayne counties and adjacent portions of the Navajo Basin of Utah and Arizona, the species is more or less stable and tends to be habitat specific. Our material is regarded as var. *tuckeri* Welsh (type from E of Kens Lake, San Juan County).

Quercus macrocarpa Michx. Bur Oak. Trees to 25 m tall or more and with trunks to 1 m in diameter or more; twigs often corky winged; bark rough, blackish gray; leaves deciduous, 5–20 cm long, 3–15 cm wide, obovate in outline, rather deeply incised with 2–4 sinuses per side, at least one pair of sinuses reaching almost to the midrib, the lobes oblong or clavate, usually bilobed apically, finally rounded, the lower surfaces villous and gray-puberulent; petioles 5–25 mm long; staminate catkins 3–4 cm long; pistillate catkins short-pedunculate, few-flowered; acorns maturing in 1 year, the cups solitary, on peduncles 1–2 cm long; involucre cups 1.5–2.5 cm long or more, 2.5–6 cm wide, the margins fringed with attenuate upper scales; acorns 2.5–5 cm long, 1.8–4 cm wide. This is a rather commonly cultivated shade tree in Utah; introduced from the eastern U. S.; 14 (0).

Quercus pauciloba Rydb. (hybrid) Clonal, deciduous to semievergreen shrubs or small trees mainly 2–4 m tall and with trunks 4–15 cm in diameter; leaves stellate-hairy on both surfaces when young, becoming sparingly so to glabrate on one or both sides in age, bicolored (more or less), typically green to dark green above and paler beneath, 2–10 cm long, 1–7 cm wide, usually with (0) 4–8 toothlike lateral lobes, these typically apiculate and sometimes apiculate-acuminate, rarely some of them again notched or toothed; staminate catkins 3–4 cm long; pistillate catkins, mature involucre cups, and mature acorns not present in specimens examined. Sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1220 to 2045 m in Beaver, Iron, Juab, Kane, Millard, Salt Lake, Tooele, Utah, Washington, and Weber counties; Colorado, Arizona, and Nevada; 11 (0). Specimens designated as *Q. x pauciloba* consist of an aggregation of hybrids and presumed introgressants involving *Q. gambelii* and *Q. turbinella* as parental types.

Quercus robur L. English Oak. Trees to 25 m tall or more and with trunks to 1 m in diameter; bark grayish, flaky; leaves deciduous, 4–15 cm long, 2–11 cm wide, obovate to oblanceolate in outline, with 4–7 pairs of lobes, the sinuses descending 1/4–3/4 the distance to the midvein, sometimes bilobed apically, otherwise rounded; petioles 3–5 mm long; staminate catkins 3–5 cm long; pistillate catkins few-flowered, on peduncles 2–7 cm long; cups 9–12 mm long, 15–18 mm wide, ca 1/4 as long as the acorn; acorns 2.5–3.5 cm long; 2n = 24. This species is rather commonly grown in Utah; introduced from Europe; 9 (0).

Quercus rubra L. Red Oak. [*Q. borealis* Michx. f.]. Trees to 25 m tall or more and with trunks to 1 m in diameter; leaves deciduous, 6–20 cm long, 4–15 cm wide, oblanceolate to obovate in outline, with 3–5 pairs of lateral lobes, the sinuses descending 1/4–3/4 of the distance to the midvein, the lobes often again toothed or lobed, aristate-attenuate; petiole 1.5–5 cm long; staminate catkins 5–10 cm long; pistillate catkins on peduncles to ca 0.5 cm long; cup 4–7 mm long, 18–25 mm wide, ca 1/4 as long as the acorn; acorns 2–3 cm long. Cultivated shade tree in Utah; introduced from the eastern U. S.; 14 (0).

Quercus turbinella Greene Turbinella Live-oak. Clump-forming (clonal?) evergreen shrubs or, less commonly, small trees, mainly 1–4 m tall and with stem diameters to 2 dm; leaves yellowish stellate-hairy on both surfaces when young, finally glabrate and glaucous above, not especially bicolored, typically 1.3–4 cm long, 0.7–2.4

cm wide, lanceolate to oblong or suborbicular in outline, with 2–6 pairs of lateral, spine-tipped teeth or entire; staminate catkins 1–3 cm long; involucre cup 6–8 mm long, 10–14 mm wide, ca 1/4 as long as the acorn; acorns 12–24 mm long, 7–10 mm thick. Chaparral (oak, manzanita, ceanothus), pinyon-juniper, and riparian communities at 820 to 1710 m in Kane, San Juan, and Washington counties; Nevada and Arizona; 39 (iv).

FRANKENIACEAE S. F. Gray

Alkali-heath Family

Annual herbs or shrubs; leaves simple, entire, opposite, decussate; stipules lacking, but bases of leaves of the pair connected by a ciliate line; flowers regular, solitary or cymose; sepals 4–7, the tube of the calyx more or less angled, persistent in fruit; petals 4–7, distinct; stamens 4–7; pistil 1, the ovary superior, 1-loculed, with 2–4 parietal placentae; styles 2–4, partly united; fruit a capsule; x = 10, 15.

Frankenia L.

A single genus with characteristics of the family.

- 1. Plants annual, with very slender stems, known from Salt Lake County *F. pulverulenta*
- Plants woody, low shrubs, not definitely known from Utah, but to be expected in eastern San Juan County ..
..... *F. jamesii* Torr. in Gray

Frankenia pulverulenta L. Annual herbs, the stems mainly 3–30 cm long, procumbent and often mat-forming or rarely erect, puberulent; leaves mainly 1–5 mm long, 0.5–4 mm wide, obovate to oblong or spatulate, usually flat, glabrous or sparingly puberulent above, densely puberulent beneath; flowers dense, secund, in short, terminal or axillary spikes; calyx 2.5–4 mm long; petals 3.5–5 mm long, oblong to obovate, pale to deep violet; 2n = 20. Saline substrates at ca 1280 m in Salt Lake County; introduced from Europe; 4 (0).

FUMARIACEAE DC.

Fumitory Family

Annual, biennial, or perennial herbs with watery juice; leaves alternate or basal; flowers perfect, irregular; sepals 2, bractlike; petals 4, the 2 outer ones spreading at the apex and one or both saccate or spurred at the base, the 2 inner ones united over the stigma; stamens 6, diadelphous, 3 per set; pistil 1, the ovary superior, 1-loculed; style 1, the stigma bilobed; fruit a capsule; x = 6, 7, 8+.

- 1. Flowers 2-spurred or bigibbous at the base, heart-shaped, solitary *Fumaria*
- Flowers 1-spurred, not heart-shaped, several to numerous, borne in racemes or panicles 2
- 2(1). Flowers purplish, mainly 5–10 mm long; fruit 1-seeded, globose, indehiscent *Fumaria*
- Flowers yellow, white, or purplish, mostly 12–25 mm long; fruit few- to many-seeded, dehiscent *Corydalis*

Corydalis Medicus

Annual, biennial, or perennial herbs from taproots; leaves basal and cauline, once or twice compound; flowers

in terminal or axillary racemes or panicles, showy; sepals 2, scalelike, caducous; petals 4, the outer pair dissimilar, only 1 petal spurred or saccate at the base; capsules slender or thickened.

Owney, C. B. 1947. Monograph of the North American species of *Corydalis*. Ann. Missouri Bot. Gard. 34: 197-258.

1. Stems stout, usually over 50 cm tall; corolla white, rose, or purple, 17-25 mm long, the spur longer than the body; capsule reflexed *C. caseyana*
- Stems slender, less than 50 cm tall; corolla yellow, 12-18 mm long; capsules erect-ascending *C. aurea*

Corydalis aurea Willd. Golden Corydalis. [*C. engelmannii* var. *exaltata* Fedde, type from the La Sal Mts.]. Annual or biennial (or perennial), glaucous herbs from taproots, 6-40 cm long; stems simple or with few to several decumbent-ascending branches; leaves 1-4 times pinnately compound, the ultimate segments linear to oblong; racemes few- to many-flowered, the pedicels longer than the spur; sepals 1-3 mm long, yellowish or whitish; corolla yellow, 1-18 mm long, the spur 3-67 mm long; capsules 1.5-3 cm long, torulose, usually curved-ascending. Warm desert shrub, cool desert shrub, pinyon-juniper, sagebrush, mountain brush, aspen, spruce-fir, and alpine tundra communities at 800 to 3355 m in probably all Utah counties; Alaska and Yukon east to the Atlantic, south to Mexico; 125 (xiv). This is a beautiful ubiquitous plant.

Corydalis caseyana Gray [*Capnodes brachycarpum* Rydb., type from Alta]. Perennial herbs from tuberous roots, mainly 1-10 dm tall, fistulose, simple or branched above; herbage glabrous, glaucous; leaves cauline, 2-3 times pinnately compound or pinnatifid, the ultimate segments elliptic to lanceolate or oblong; flowers numerous, borne in racemes or panicles, the pedicels shorter than the spurs; sepals ovate, 2-4 mm long, whitish; corolla 17-25 mm long, white or pinkish, purple-tipped, the spur 7-13 mm long; capsule 0.8-1.5 cm long, ovoid to ellipsoid, usually reflexed. Mountain brush, aspen, spruce-fir, and alpine meadow communities at ca 1890 to 3050 m in Salt Lake, Utah, Wasatch, and Weber counties; Oregon to California and Colorado; 11 (0). Utah materials belong to ssp. *brachycarpa* (Rydb.) Ownbey.

Dicentra Bernh.

Perennial, scapose, glaucous herbs from fascicled, tuberous roots; leaves basal, once or twice ternately compound; flowers solitary, pinkish; sepals 2, deciduous; outer petals saccate, the tips recurved; inner petals enlarged and connate apically, often sagittate above the claw, fruit an elongate capsule with several seeds.

Dicentra uniflora Kellogg Steershead. Low perennial herbs from tuberous roots; scales and leaves thin and pale below ground level; leaves long-petiolate, subequal to the scapes; scapes 4-10 cm tall, bearing 1 or 2 bracts below the solitary flower; sepals ca 4 mm long; corolla pinkish or white, cordate basally, the outer petals widely spreading; inner petals erect, often purple-tipped; capsule ovoid-ellipsoid, 10-13 mm long. Mountain brush and aspen-forb communities at 1525 to 2745 m in Box Elder, Cache, Millard, Salt Lake, Summit, Tooele, Utah, and Wasatch counties; Washington to Wyoming, south to California; 10 (0). Bleeding-heart, *D. spectabilis* (L.) Lem., is a commonly grown ornamental in Utah.

Fumaria L.

Annual, caulescent, glabrous and glaucous annuals from taproots; leaves ternately 2 or 3 times compound into narrow segments; flowers small, borne in racemes; sepals 2, small, closely appressed; petals gibbous basally, elongate and more or less connivent, the outer pair dilated apically, the inner pair coherent at the apex; fruit 1-seeded, indehiscent, globose.

Fumaria officinalis L. Erect or sprawling annual herbs, mainly 1.5-6 dm tall; leaves petiolate, with filiform petioles and very slender ultimate segments; flowers few to numerous in axillary racemes; petals reddish purple, the tips dark purple, 5-10 mm long, the spur 2-4 mm long; fruit ca 2.5 mm thick; 2n = 28, 32. Weedy species of disturbed sites in sagebrush, mixed desert shrub, and mountain brush communities at 1310 to 1740 m in Cache, Millard, Salt Lake, and Utah counties; sporadic in the U. S.; adventive from Europe; 11 (i).

GARRYACEAE Lindl.

Silk-tassel Family

Evergreen shrubs or small trees with somewhat quadrangular branchlets; leaves simple, opposite, leathery; flowers dioecious and apetalous, borne in pendulous catkins, the staminate borne in 3's in the axil of each of the decussate, connate bracts, these with 4-lobed calyx (the lobes often connate apically); pistillate flowers solitary in bract axils, with calyx lacking or 2-lobed; stamens 4, alternate with the sepals; pistil 1, the ovary inferior, 1-loculed; styles 2, persistent; fruit a 2-seeded berry; seeds dark purple to black; x = 11.

Garrya Dougl.

Evergreen shrubs; branchlets 4-angled; leaves shortly petiolate; flowers unisexual; pistillate flowers almost sessile, solitary in bract axils; fruit a bitter berry.

Garrya flavescens Wats. Shrubs 1.5-3.5 m tall, grayish; twigs and leaves cinereous-pubescent; leaves ovate to broadly elliptic, 2-3.5 cm wide, 3.5-6 cm long, the petioles 3-10 mm long; aments 3-5 cm long, densely silky; fruit broadly ovoid, 6-8 mm long, silky. Ponderosa pine, mountain brush, and pinyon-juniper communities at 1300 to 2500 m in Washington County; Nevada and Arizona; 9 (iv). The plants flower at a season when collectors are not usually active, which results in herbarium specimens being mostly in fruit. The flavor of the plant is bad. Flowering occurs in (December) January and February.

GENTIANACEAE A. L. Juss.

Gentian Family

Annual, biennial, or perennial herbs with bitter juice; stems prostrate to erect, glabrous; leaves mostly opposite or whorled, the cauline ones sessile, often somewhat connate and clasping, the basal ones often petiolate, simple, entire, lacking stipules; flowers perfect, regular, solitary, or in cymose clusters; calyx 2- to 5-lobed; corolla 4- or 5-lobed, the lobes often convolute in bud; stamens 4 or 5, alternate with the corolla lobes, adnate to the corolla tube; pistil 1, the ovary superior, 1-loculed, with 2 pari-

etal placentae; style 1 or lacking; stigma usually 2-lobed; fruit a 2-valved capsule; $x = 5-13$.

Allred, K. 1976. The plant family Gentianaceae in Utah. Great Basin Naturalist 36: 483-495.

Holmgren, N. H. 1984. Gentianaceae, pp. 4-23. In: Intermountain Flora. Vol. 4. New York Botanical Garden, Bronx, New York.

1. Corolla rotate, with 1 or 2 fringed glands on the upper surface of each petal *Swertia*
- Corolla tubular-campanulate, funnellform, or salverform, without fringed glands 2
- 2(1). Corolla pink to rose; anthers becoming spirally twisted in age *Centaurium*
- Corolla usually blue, yellowish, or whitish, but not pink; anthers not spirally twisted in age 3
- 3(2). Corolla plicate, folded in the sinuses; calyx tube with an intermembrane rim *Gentiana*
- Corolla not plicate in the sinuses; calyx tube without an intermembrane rim 4
- 4(3). Corolla 5.5-16 (24) mm long, the lobes entire; seeds nearly smooth *Gentianella*
- Corolla (16) 28-70 mm long, the lobes fringed; seeds papillose *Gentianopsis*

Centaurium Hill

Plants annual, the stems erect, glabrous, sparingly branched; leaves opposite, sessile or clasping; flowers white to pink or rose, in terminal cymes; calyx 4- or 5-lobed, the segments linear; corolla salverform, with 4 or 5 lobes; stamens inserted on the corolla tube near the throat, alternate with the lobes, the anthers exerted and twisting at maturity; ovary 1-loculed, the style filiform and caducous; fruit a fusiform or oblong-ovoid capsule.

1. Corolla lobes 7-12 mm long, only somewhat shorter than the tube; anthers linear; basal leaves spatulate *C. calycosum*
- Corolla lobes 3-7 mm long, half as long as the tube; anthers oblong; basal leaves oblong to linear .. *C. exaltatum*
